1333 (LA–12943) **Effects of soluble organic complexants and their degradation products on the removal of selected radionuclides from high-level waste. Part II: Distributions of Sr, Cs, Tc, and Am onto 32 absorbers from four variations of Hanford tank 101-SY simulant solution.** Marsh, S.F. (Sandia National Labs., Albuquerque, NM (United States)); Svitra, Z.V.; Bowen, S.M. Los Alamos National Lab., NM (United States). Apr 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95013479. Distribution: UC-2030. Source: OSTI; NTIS; INIS; GPO Dep.

Many of the radioactive waste storage tanks at U.S. Department of Energy facilities contain organic compounds that have been degraded by radiolysis and chemical reactions during decades of storage. In this second part of our three-part investigation of the effects of soluble organic complexants and their degradation products, we measured the sorption of strontium, cesium, technetium, and americium onto 32 absorbers that offer high sorption of these elements in the absence of organic complexants. The four solutions tested were (1) a simulant for a 3:1 dilution of Hanford Tank 101-SY contents that initially contained ethylenediaminetetraacetic acid (EDTA), (2) this simulant after gamma-irradiation to 34 Mrads, (3) the unirradiated simulant after treatment with a hydrothermal organic-destruction process, and (4) the irradiated simulant after hydrothermal processing. For each of 512 element/absorber/solution combinations, we measured distribution coefficients (Kds) twice for each period for dynamic contact periods of 30 min, 2 h, and 6 h to obtain information about sorption kinetics. On the basis of our 3,072 measured Kd values, the sorption of strontium and americium is significantly decreased by the organic components of the simulant solutions, whereas the sorption of cesium and technetium appears unaffected by the organic components of the simulant solutions.

1334 (LA–13000) **Effects of soluble organic complexants and their degradation products on the removal of selected radionuclides from high-level waste. Part 3, Distributions of Sr, Cs, Tc, Pu, and Am onto 33 absorbers from four variations of a 3:1 dilution of Hanford complexant concentrate (CC) simulant: Part 4, The effects of varying dilution ratios on the distributions of Sr, Cs, Tc, Pu, and Am onto 12 absorbers.** Marsh, S.F. (Sandia National Labs., Albuquerque, NM (United States)); Svitra, Z.V.; Bowen, S.M. Los Alamos National Lab., NM (United States). Sep 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96000291. Distribution: UC-2030. Source: OSTI; NTIS; INIS; GPO Dep.

Many of the radioactive waste storage tanks at USDOE facilities contain organic compounds that have been degraded by radiolysis and chemical reactions during decades of storage. Objective of this study was to measure effects of soluble organic complexants and their degradation products on sorption of Sr, Cs, Tc, Pu and Am onto 33 absorbers that in the absence of these organic compounds offer high sorption of these elements. The elements were in a generic simulant for Hanford complexant concentrate supernate that initially contained six organic complexants: EDTA, HEDTA, NTA, citrate, gluconate, and iminodiacetate. This simulant was tested as prepared and after gamma-irradiation to approximately 34 Mrads. Two other variations consisted of the unirradiated and irradiated simulants after treatment at 450C and 15,000 psi in a hydrothermal organic-destruction process. These experiments were conducted with a 3:1 water-to-simulant dilution of each of the four simulant variations. To determine effects of varying dilution ratios on the sorption of these five elements from the unirradiated and gamma-irradiated simulants that were not treated with the hydrothermal process, we measured their distribution from a 1:1 dilution, using 1 M NaOH as the diluent, onto the 12 best-performing absorbers. We then measured the sorption of these five elements from solutions having diluent-simulant ratios of 0, 0.5, 2.0, and 3.0 onto the three absorbers that performed best for sorbing Sr, Pu and Am from the 1:1 dilution. For each of 900 element/absorber/solution combinations, we measured distribution coefficients (Kd values) twice for each period for dynamic contact periods of 30 min, 2 h, and 6 h to obtain information about absorber stability and sorption kinetics. The 5400 measured Kd values indicate that the sorption of Sr, Pu, and Am is significantly decreased by the organic complexants in these simulant solutions, whereas the sorption of Cs and Tc is much less affected.

1335 (LA-SUB–95-191) **Acoustic imaging of underground storage tank wastes: A feasibility study. Final report.** Turpening, R. (Massachusetts Inst. of Tech., Cambridge, MA (United States). Earth Resources Lab.); Zhu, Z.; Caravana, C.; Matarese, J.; Turpening, W. Los Alamos National Lab., NM (United States); Massachusetts Inst. of Tech., Cambridge, MA (United States). Earth Resources Lab. [1995]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96006856. Source: OSTI; NTIS; INIS; GPO Dep.

The objectives for this underground storage tank (UST) imaging investigation are: (1) to assess the feasibility of using acoustic methods in UST wastes, if shown to be feasible, develop and assess imaging strategies; (2) to assess the validity of using chemical simulants for the development of acoustic methods and equipment. This investigation examined the velocity of surrogates, both salt cake and sludge surrogates. In addition collected seismic cross well data in a real tank (114-TX) on the Hanford Reservation. Lastly, drawing on the knowledge of the simulants and the estimates of the velocities of the waste in tank 114-TX the authors generated a hypothetical model of waste in a tank and showed that non-linear travel time tomographic imaging would faithfully image that stratigraphy.

1336 (LA-SUB–96-36) **Los Alamos National Laboratory environmental restoration program group audit report for underground storage tank removal: Audit ER-92- 04, July 22–August 11, 1992.** Gillespie, P.F. (Los Alamos Technical Associates, Inc., NM (United States)). Los Alamos National Lab., NM (United States); Los Alamos Technical Associates, Inc., NM (United States). 31 Aug 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96009555. Source: OSTI; NTIS; INIS; GPO Dep.

Audit ER-92-04 was conducted on activities being performed by Waste Management (EM-7), Environmental Protection (EM-8), and Environmental Restoration (EM-13) groups for the LANL's underground storage tank removal program. Scope of the audit was limited to an evaluation of the implementation of the State of New Mexico requirements for underground storage-tank removal. Activities were evaluated using requirements specified in the State of New Mexico Environmental Improvement Board Underground Storage Tank Regulations, EIB/USTR. Two recommendations are made: (1) that a single organization be given the responsibility and authority for the implementation of the program, and (2) that the requirements of the NM State environmental improvement board underground storage tank regulations be reviewed and a Los Alamos procedure written to address requirements and interfaces not contained in SOP-EM7-D&D-001.

1337 (LA-UR–94-4234) **Long-term safety issues associated with mixer pump operation.** Kubic, W.L. Jr. Los Alamos National Lab., NM (United States). [1994]. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95016876. Source: OSTI; NTIS; INIS; GPO Dep.

In this report, we examine several long-term issues: the effect of pump operation on future gas release events (GREs), uncontrolled chemical reactions, chronic toxic gas releases, foaming, and erosion and corrosion. Heat load in excess of the design limit, uncontrolled chemical reactions, chronic toxic gas releases, foaming, and erosion and corrosion have been shown not to be safety concerns. The effect of pump operation on future GREs could not be quantified. The problem with evaluating the long-term effects of pump operation on GREs is a lack of knowledge and uncertainty. In particular, the phenomena governing gas retention, particle size distribution, and settling are not well understood, nor are the interactions among these factors understood. There is a possibility that changes in these factors could increase the size of future GREs. Bounding estimates of the potential increase in size of GREs are not possible because of a lack of engineering data. Proper management of the hazards can reduce, but not eliminate, the possibility of undesirable changes. Maintaining temperature within the historical limits can reduce the possibility of undesirable changes. A monitoring program to detect changes in the gas composition and crust thickness will help detect slowly occurring changes. Because pump operation has be shown to eliminate GREs, continued pump operation can eliminate the hazards associated with future GREs.

1338 (ORNL–6854) **Extraction of nitric acid, uranyl nitrate, and bismuth nitrate from aqueous nitric acid solutions with CMPO.** Spencer, B.B. Oak Ridge National Lab., TN (United States). Aug 1995. 223p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96000899. Source: OSTI; NTIS; INIS; GPO Dep.

DOE sponsored development of the transuranium extraction (TRUEX) process for removing actinides from radioactive wastes. The solvent is a mixture of CMPO and TBP. Since the extraction characteristics of CMPO are not as well understood as those of TBP, the extraction of nitric acid, uranyl nitrate, and bismuth nitrate with CMPO (dissolved in n-dodecane) were studied. Results indicate that CMPO extracts nitric acid with a 1:1 stoichiometry; equilibrium constant is 2. 660$\pm$0.092 at 25 C, and extraction enthalpy is -5. 46$\pm$0.46 kcal/mol. Slope analysis indicates that uranyl nitrate extracts with a mixed equilibria of 1:1 and 2:1 stoichiometries in nearly equal proportion. Equil. constant of the 2: 1 extraction was $1.213 \times 10^6 \pm 3.56 \times 10^4$ at 25 C; reaction enthalpy was -9.610$\pm$0.594 kcal/mol. Nitration complexation constant is 8.412$\pm$0.579, with an enthalpy of -10.72±1.87 kcal/mol. Bismuth nitrate also extracts with a mixed equilibria of (perhaps) 1:1 and 2:1 stoichiometries. A 2:1 extraction equilibrium and a nitrate complexation adequately model the data. Kinetics and enthalpies were also measured.

1339 (ORNL/ER–257) **Structural analysis of underground gunite storage tanks. Environmental Restoration Program.** Oak Ridge National Lab., TN (United States). Aug 1995. 204p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006603. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the structural analysis of the 50-ft diameter underground gunite storage tanks constructed in 1943 and located in the Oak Ridge National Laboratory (ORNL) South Tank Farm, known as Facility 3507 in the 3500-3999 area. The six gunite tanks (W-5 through W-10) are spaced in a 2 × 3 matrix at 60 ft on centers with 6 ft of soil cover. Each tank (Figures 1, 2, and 3) has an inside diameter of 50 ft, a 12-ft vertical sidewall having a thickness of 6 in. (there is an additional 1.5-in. inner liner for much of the height), and a spherical domed roof (nominal thickness is 10 in.) rising another 6 ft, 3 in. at the center of the tank. The thickness of both the sidewall and the domed roof increases to 30 in. near their juncture. The tank floor is nominally 3-in. thick, except at the juncture with the wall where the thickness increases to 9 in. The tanks are constructed of gunite (a mixture of Portland cement, sand, and water in the form of a mortar) sprayed from the nozzle of a cement gun against a form or a solid surface. The floor and the dome are reinforced with one layer of welded wire mesh and reinforcing rods placed in the radial direction. The sidewall is reinforced with three layers of welded wire mesh, vertical $\frac{1}{2}$-in. rods, and 21 horizontal rebar hoops (attached to the vertical rods) post-tensioned to 35,000 psi stress. The haunch at the sidewall/roof junction is reinforced with 17 horizontal rebar hoops post-tensioned with 35,000 to 40,000 psi stress. The yield strength of the post-tensioning steel rods is specified to be 60,000 psi, and all other steel is 40,000 psi steel. The specified 28-day design strength of the gunite is 5,000 psi.

1340 (ORNL/ER–365) **Evaluation of phase 1 and phase 2 sampling and analysis data for the Gunite and Associated Tanks at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); MACTEC, Oak Ridge, TN (United States). Mar 1996. 281p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; AC05-96OR22464. Order Number DE96009365. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

The Gunite and Associated Tanks (GAAT) are located at Oak Ridge National Laboratory in Waste Area Grouping 1. GAAT is designated as a Comprehensive Environmental Response, Compensation, and Liability Act site. GAAT is considered a high priority for remediation because of the potential risk associated with the contaminants of concern and the condition of the Gunite walls. The objective of this report is to (1) support the GAAT treatability study and (2) provide input to the Record of Decision for the remediation of selected tanks that are part of the North Tank Farm and the South Tank Farm. This report presents a statistical and operational evaluation of GAAT sampling and analysis of data from various tanks in the North Tank Farm and the South Tank Farm.

1341 (ORNL/ER/Sub–87-99053/74) **Results of Fall 1994 sampling of gunite and associated tanks at the Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge Inst. for Science and Education, TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States). Jun 1995. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016128. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration Program.

This Technical Memorandum, was developed under Work Breakdown Structure 1.4.12.6.1.01.41.12.02. 11 (Activity Data Sheet 3301, "WAG 1"). This document provides the Environmental Restoration Program with analytical results from liquid and sludge samples from the Gunite and Associated Tanks (GAAT). Information provided in this report forms part of the technical basis for criticality safety, systems safety, engineering design, and waste management as they apply to the GAAT treatability study and remediation.

1342 (ORNL/ER/Sub–87-99053/79) **Results of 1995 characterization of Gunite and Associated Tanks at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States). Feb 1996. 118p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96012206. Source: OSTI; NTIS; INIS; GPO Dep.

This technical memorandum (TM) documents the 1995 characterization of eight underground radioactive waste tanks at Oak Ridge National Laboratory (ORNL). These tanks belong to the Gunite and Associated Tanks (GAAT) operable unit, and the characterization is part of the ongoing GAAT remedial investigation/feasibility study (RI/FS) process. This TM reports both field observations and analytical results; analytical results are also available from the Oak Ridge Environmental Information System (OREIS) data base under the project name GAAT (PROJ-NAME = GAAT). This characterization effort (Phase II) was a follow-up to the "Phase I" sampling campaign reported in Results of Fall 1994 Sampling of Gunite and Associated Tanks at the Oak Ridge National Laboratory, Oak Ridge, Tennessee, ORNL/ER/Sub/87-99053/74, June 1995. The information contained here should be used in conjunction with that in the previous TM. The sampling plan is documented in ORNL Inactive Waste Tanks Sampling and Analysis Plan, ORNL/RAP/LTR-88/24, dated April 1988, as amended by Addendum 1, Revision 2: ORNL Inactive Tanks Sampling and Analysis Plan, DOE/OR/02-1354&D2, dated February 1995. Field team instructions are found in ORNL RI/FS Project Field Work Guides 01-WG-20, Field Work Guide for Sampling of Gunite and Associated Tanks, and 01-WG-21, Field Work Guide for Tank Characterization System Operations at ORNL. The field effort was conducted under the programmatic and procedural umbrella of the ORNL RI/FS Program, and the analysis was in accordance with ORNL Chemical and Analytical Sciences Division (CASD) procedures. The characterization campaign is intended to provide data for criticality safety, engineering design, and waste management as they apply to the GAAT treatability study and remediation. The Department of Energy (DOE) Carlsbad office was interested in results of this sampling campaign and provided funding for certain additional sample collection and analysis.

1343 (ORNL/TM–12784) **Application of the TRUEX process to highly irradiated targets.** Felker, L.K.; Benker, D.E. Oak Ridge National Lab., TN (United States). Mar 1995. 37p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC05-84OR21400. Order Number DE95011630. Source: OSTI; NTIS; INIS; GPO Dep.

The Radiochemical Engineering Development Center (REDC) at Oak Ridge National Laboratory processes highly irradiated targets for the Mark 42 program to separate americium, curium, and plutonium. Argonne National Laboratory (ANL) has developed the TRUEX process for the removal of transuranic elements from aqueous waste streams and a computer model that aids in the design of potential flowsheets. Because the TRUEX process is attractive for application to the large volumes of high-activity tank wastes stored at various Department of Energy sites, a test of the process on the highly irradiated Mark 42 target material would yield useful information on the performance of the process under "real" conditions. Researchers at ANL used the Generic TRUEX Model (GTM) to design a TRUEX flowsheet to process Mark 42 target material. Researchers at the REDC refurbished the Solvent Extraction Test Facility mixer-settler contactors and conducted three test runs using the TRUEX process. The results from the three demonstration tests are presented along with the predicted results from the GTM.

1344 (ORNL/TM-12935) **Tank Focus Area Pretreatment Program. FY 1995 Program Management Plan.** Morrison, M.I. (Midwest Technical Inc., Oak Ridge, Tennessee (United States)); McGinnis, C.P.; Wilkenson, W.T.; Hunt, R.D. Oak Ridge National Lab., TN (United States). Feb 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012546. Source: OSTI; NTIS; INIS; GPO Dep.

This program management plan (PMP) describes the FY 1995 project plans for the Pretreatment Program of the Tank Focus Area. The Tank Focus Area is one of five areas of environmental concerns originally identified by the Deputy Assistant Secretary for Technology Development (EM-50). Projects in the Tank Focus Area relate to the remediation of liquid waste stored in underground storage tanks at various US Department of Energy sites. The Pretreatment Program is an organizational unit performing work within the Tank Focus Area. The function of the Pretreatment Program is to develop, test, evaluate, and demonstrate new technologies, with emphasis on separations. The 11 Pretreatment Program projects for FY 1995 are (1) Cesium Extraction Testing, (2) Comprehensive Supernate Treatment, (3) Hot Cell Studies, (4) Cesium Removal Demonstration, (5) Out-of-Tank Evaporator Demonstration, (6) Crossflow Filtration, (7) Technical Interchange with CEA, (8) TRUEX Applications, (9) NAC/NAG Process Studies (conducted at Oak Ridge National Laboratory), (10) NAC/NAG Process and Waste Form Studies (conducted at Florida International University), and (11) Program Management. Section 2 of this PMP contains a separate subsection for each FY 1995 project. A brief description of the project, a schedule of major milestones, and a breakdown of costs are provided for each project. The PMP also contains sections that describe the project controls that are in place. Quality assurance, document control, the project management system, and the management organization are described in these sections.

1345 (ORNL/TM-13017) **Sampling and analysis of inactive radioactive waste tanks W-17, W-18, WC-5, WC-6, WC-8, and WC-11 through WC-14 at ORNL.** Sears, M.B.; Giaquinto, J.M.; Griest, W.H.; Pack, R.T.; Ross, T.; Schenley, R.L. Oak Ridge National Lab., TN (United States). Dec 1995. 195p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006191. Source: OSTI; NTIS; INIS; GPO Dep.

The sampling and analysis of nine inactive liquid low-level waste (LLLW) tanks at the Oak Ridge National Laboratory (ORNL) are described-tanks W-17, W-18, WC-5, WC-6, WC-8, and WC-11 through WC-14. Samples of the waste tank liquids and sludges were analyzed to determine (1) the major chemical constituents, (2) the principal radionuclides, (3) metals listed on the US Environmental Protection Agency (EPA) Contract Laboratory Program Inorganic Target Analyte List, (4) organic compounds, and (5) some physical properties. The organic chemical characterization consisted of determinations of the EPA Contract Laboratory Program Target Compound List volatile and semivolatile compounds, pesticides, and polychlorinated biphenyis (PCBs). This report provides data (1) to meet requirements under the Federal Facility Agreement (FFA) for the Oak Ridge Reservation to characterize the contents of LLLW tanks which have been removed from service and (2) to support planning for the treatment and disposal of the wastes.

1346 (ORNL/TM-13034) **A facility design for repackaging ORNL CH-TRU legacy waste in Building 3525.** Huxford, T.J. (Oak Ridge National Lab., TN (United States)); Cooper, R.H. Jr.; Davis, L.E.; Fuller, A.B.; Gabbard, W.A.; Smith, R.B.; Guay, K.P.; Smith, L.C. Oak Ridge National Lab., TN (United States). Jul 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008645. Source: OSTI; NTIS; INIS; GPO Dep.

For the last 25 years, the Oak Ridge National Laboratory (ORNL) has conducted operations which have generated solid, contact-handled transuranic (CH-TRU) waste. At present the CH-TRU waste inventory at ORNL is about 3400 55-gal drums retrievably stored in RCRA-permitted, aboveground facilities. Of the 3400 drums, approximately 2600 drums will need to be repackaged. The current US Department of Energy (DOE) strategy for disposal of these drums is to transport them to the Waste Isolation Pilot Plant (WIPP) in New Mexico which only accepts TRU waste that meets a very specific set of criteria documented in the WIPP-WAC (waste acceptance criteria). This report describes activities that were performed from January 1994 to May 1995 associated with the design and preparation of an existing facility for repackaging and certifying some or all of the CH-TRU drums at ORNL to meet the WIPP-WAC. For this study, the Irradiated Fuel Examination Laboratory (IFEL) in Building 3525 was selected as the reference facility for modification. These design activities were terminated in May 1995 as more attractive options for CH-TRU waste repackaging were considered to be available. As a result, this document serves as a final report of those design activities.

1347 (ORNL/TM-13045) **DUSCOBS - a depleted-uranium silicate backfill for transport, storage, and disposal of spent nuclear fuel.** Forsberg, C.W.; Pope, R.B.; Ashline, R.C.; DeHart, M.D.; Childs, K.W.; Tang, J.S. Oak Ridge National Lab., TN (United States). 30 Nov 1995. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96011586. Source: OSTI; NTIS; INIS; GPO Dep.

A Depleted Uranium Silicate COntainer Backfill System (DUSCOBS) is proposed that would use small, isotopically-depleted uranium silicate glass beads as a backfill material inside storage, transport, and repository waste packages containing spent nuclear fuel (SNF). The uranium silicate glass beads would fill all void space inside the package including the coolant channels inside SNF assemblies. Based on preliminary analysis, the following benefits have been identified. DUSCOBS improves repository waste package performance by three mechanisms. First, it reduces the radionuclide releases from SNF when water enters the waste package by creating a local uranium silicate saturated groundwater environment that suppresses (1) the dissolution and/or transformation of uranium dioxide fuel pellets and, hence, (2) the release of radionuclides incorporated into the SNF pellets. Second, the potential for long-term nuclear criticality is reduced by isotopic exchange of enriched uranium in SNF with the depleted uranium (DU) in the glass. Third, the backfill reduces radiation interactions between SNF and the local environment (package and local geology) and thus reduces generation of hydrogen, acids, and other chemicals that degrade the waste package system. In addition, the DUSCOBS improves the integrity of the package by acting as a packing material and ensures criticality control for the package during SNF storage and transport. Finally, DUSCOBS provides a potential method to dispose of significant quantities of excess DU from uranium enrichment plants at potential economic savings. DUSCOBS is a new concept. Consequently, the concept has not been optimized or demonstrated in laboratory experiments.

1348 (PNL–8557-Rev.1) **Calculation of reaction energies and adiabatic temperatures for waste tank reactions.** Burger, L.L. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002322. Source: OSTI; NTIS; INIS; GPO Dep.

Continual concern has been expressed over potentially hazardous exothermic reactions that might occur in Hanford Site underground waste storage tanks. These tanks contain many different oxidizable compounds covering a wide range of concentrations. The chemical hazards are a function of several interrelated factors, including the amount of energy (heat) produced, how fast it is produced, and the thermal absorption and heat transfer properties of the system. The reaction path(s) will determine the amount of energy produced and kinetics will determine the rate that it is produced. The tanks also contain many inorganic compounds inert to oxidation. These compounds act as diluents and can inhibit exothermic reactions because of their heat capacity and thus, in contrast to the oxidizable compounds, provide mitigation of hazardous reactions. In this report the energy that may be released when various organic and inorganic compounds react is computed as a function of the reaction-mix composition and the temperature. The enthalpy, or integrated heat capacity, of these compounds and various reaction products is presented as a function of temperature; the enthalpy of a given mixture can then be equated to the energy release from various reactions to predict the maximum temperature which may be reached. This is estimated for several different compositions. Alternatively, the amounts of various diluents required to prevent the temperature from reaching a critical value can be estimated. Reactions taking different paths, forming different products such as N_2O in place of N_2 are also considered, as are reactions where an excess of caustic is present. Oxidants other than nitrate and nitrite are considered briefly.

1349 (PNL–10069) **Integrity assessment plan for PNL 300 area radioactive hazardous waste tank system. Final report.** Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 231p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008034. Source: OSTI; NTIS; INIS; GPO Dep.

The Pacific Northwest Laboratory (PNL), operated by Battelle Memorial Institute under contract to the U.S. Department of Energy, operates tank systems for the U.S. Department of Energy, Richland Operations Office (DOE-RL), that contain dangerous waste constituents as defined by Washington State Department of Ecology (WDOE) Dangerous Waste Regulations, Washington Administrative Code (WAC) 173-303-040(18). Chapter 173-303-640(2) of the WAC requires the performance of integrity assessments for each existing tank system that treats or stores dangerous waste, except those operating under interim status with compliant secondary containment. This Integrity Assessment Plan (IAP) identifies all tasks that will be performed during the integrity assessment of the PNL-operated Radioactive Liquid Waste Systems (RLWS) associated with the 324 and 325 Buildings located in the 300 Area of the Hanford Site. It describes the inspections, tests, and analyses required to assess the integrity of the PNL RLWS (tanks, ancillary equipment, and secondary containment) and provides sufficient information for adequate budgeting and control of the assessment program. It also provides necessary information to permit the Independent, Qualified, Registered Professional Engineer (IQRPE) to approve the integrity assessment program.

1350 (PNL–10100) **Tank characterization report for single-shell Tank B-201.** Heasler, P.G.; Remund, K.M.; Tingey, J.M.; Baird, D.B.; Ryan, F.M. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 93p. Sponsored by USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). DOE Contract AC06-87RL10930 ; AC06-76RL01830. Order Number DE95001311. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to characterize the waste in single shell Tank B-201. Characterization includes the determination of the physical, chemical (e.g., concentrations of elements and organic species), and radiological properties of the waste. These determinations are made using analytical results from B-201 core samples as well as historical information about the tank. The main objective is to determine average waste properties: but in some cases, concentrations of analytes as a function of depth were also determined. This report also consolidates the available historical information regarding Tank B-201, arranges the analytical information from the recent core sampling in a useful format, and provides an interpretation of the data within the context of what is known about the tank.

1351 (PNL–10175-Suppl.1) **Ferrocyanide safety project: Comparison of actual and simulated ferrocyanide waste properties.** Scheele, R.D. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002223. Source: OSTI; NTIS; INIS; GPO Dep.

In 1995, available subsegment samples of wastes taken from the Hanford Site underground radioactive waste storage tanks 241-C-112 (C-112) and 241-C-109 (C-109) were reanalyzed to determine the nickel concentrations in the samples and to determine whether the use of a nickel crucible in the analytical sample preparation biased the reported nickel concentrations reported by Simpson and coworkers and in the original report that this report supplements. The reanalysis strategy to determine nickel was to use a sodium peroxide flux in a zirconium crucible instead of the previously used potassium hydroxide flux in a nickel crucible. This supplemental report provides the results of the reanalyses and updates tables from the original report which reflect the new nickel analyses. Nickel is important with respect to management of the potentially reactive ferrocyanide wastes as it is one of the key defining characteristics of the solids that resulted from scavenging radiocesium using ferrocyanides. In Hanford Site wastes, few other processes introduced nickel into the wastes other than radiocobalt scavenging, which was often coupled with the ferrocyanide-scavenging process. Thus the presence of nickel in a waste provides strong evidence that the original waste was or contained ferrocyanide waste at one time. Given the potential import of nickel as a defining characteristic and marker for ferrocyanide wastes, the Pacific Northwest Laboratory's (PNL) Analytical Chemistry Laboratory (ACL) reanalyzed available samples from tanks C-112 and C-109 using inductively coupled argon plasma/atomic emission spectrometry (ICP/AES) and an alternative sample preparation method which precluded contamination of the analytical samples with nickel.

1352 (PNL–10213) **Organic tank safety project: Preliminary results of energetics and thermal behavior studies of model organic nitrate and/or nitrite mixtures and a simulated organic waste.** Scheele, R.D.; Sell, R.L.; Sobolik, J.L.; Burger, L.L. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95017064. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of years of production and recovery of nuclear defense materials and subsequent waste management at the Hanford Site, organic-bearing radioactive high-level wastes (HLW) are currently stored in large (up to 3. ML) single-shell storage tanks (SSTs). Because these wastes contain both fuels (organics) and the oxidants nitrate and nitrite, rapid energetic reactions at certain conditions could occur. In support of Westinghouse Hanford Company's (WHC) efforts to ensure continued safe storage of these organic- and oxidant-bearing wastes and to define the conditions necessary for reactions to occur, we measured the thermal sensitivities and thermochemical and thermokinetic properties of mixtures of selected organics and sodium nitrate and/or nitrite and a simulated Hanford organic-bearing waste using thermoanalytical technologies. These thermoanalytical technologies are used by chemical reactivity hazards evaluation organizations within the chemical industry to assess chemical reaction hazards.

1353 (PNL–10248) **Vapor space characterization of waste tank 241-BY-106: Results from samples collected through the vapor sampling system on July 8, 1994.** Lucke, R.B.; Pool, K.H.; Ligotke, M.W.; Clauss, T.W.; McVeety, B.D.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001197. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the details of the inorganic and organic analysis that was performed on samples from the headspace of Hanford waste tank 241-BY-106. The results described were obtained to support the safety and toxicological evaluations. A summary of the results for the inorganic and organic analytes is included, as well as, a detailed description of the results which appears in the text.

1354 (PNL–10255) **Evaluation of HWVP feed preparation chemistry for an NCAW simulant – Fiscal year 1993: Effect of noble metals concentration on offgas generation and ammonia formation.** Patello, G.K.; Wiemers, K.D.; Bell, R.D.; Smith, H.D.; Williford, R.E.; Clemmer, R.G. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 149p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010687. Source: OSTI; NTIS; INIS; GPO Dep.

The High-Level Waste Vitrification Program is developing technology for the Department of Energy to immobilize high-level and transuranic wastes as glass for permanent disposal. Pacific Northwest Laboratory (PNL) is conducting laboratory-scale melter feed preparation studies using a HWVP simulated waste slurry, Neutralized Current Acid Waste (NCAW). A FY 1993 laboratory-scale study focused on the effects of noble metals (Pd, Rh, and Ru) on feed preparation offgas generation and NH_3 production. The noble metals catalyze H_2 and NH_3 production, which leads to safety concerns. The information gained from this study is intended to be used for technology development in pilot scale testing and design of the Hanford High-Level Waste Vitrification Facility. Six laboratory-scale feed preparation tests were performed as part of the FY 1993 testing activities using nonradioactive NCAW simulant. Tests were performed with 10%, 25%, 50% of nominal noble metals content. Also tested were 25% of the nominal Rh and a repeat of 25% nominal noble metals. The results of the test activities are described. 6 refs., 28 figs., 12 tabs.

1355 (PNL–10256) **Vapor space characterization of waste tank 241-BY-105: Results from samples collected on 7/7/94.** Pool, K.H.; Ligotke, M.W.; Clauss, T.W.; Lucke, R.B.; McVeety, B.D.; McCulloch, M.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012229. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes organic and inorganic results from vapors of the Hanford single-shell waste storage Tank 241-BY-105 (referred to as Tank BY-105). The results described here were obtained to support safety and toxicological evaluations. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. Several organic analytes were quantitatively determined, but quantities of non-TO-14 analytes were only estimated. Approximately 40 tentatively identified organic analytes were observed above the detection limit of (ca.) 10 ppb, but standards for most of these were not available at the time of analysis, and their quantitative determination is beyond the scope of this study. The SUMMA™ Canisters were also analyzed for components listed in U.S. Environmental Protection Agency (EPA) compendium Method TO-14. Of these only a few were observed above the 2-ppb detection limits. These are summarized in Table 3.1. Estimated quantitations also determined were of tentatively identified compounds (TICs). A summary of these results shows quantities of all TICs above the concentration of ca. 10 ppb. This consists of more than 40 organic analytes. The 6 organic analytes with the highest estimated concentrations are shown in Table 1. These 6 analytes account for approximately 45% of the total organic components in Tank BY-105. Detailed descriptions of the results appear in the text. Unlike tanks previously studied, normal paraffin hydrocarbons (NPHs) did not contribute significantly to the total organic concentration of the vapor headspace of Tank BY-105. The total concentration of TICs detected in the tank headspace samples was also much lower than that seen in other reported tanks averaging 6.5 Mg/m^3 for all three canisters collected.

1356 (PNL–10257) **Vapor space characterization of waste Tank 241-BY-107: Results from in situ sample collected on 3/25/94.** Sharma, A.K.; Lucke, R.B.; Clauss, T.W.; McVeety, B.D.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015808. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes organic results from vapors of the Hanford single-shell waste storage Tank 241-BY-107 (referred to as Tank BY-107). Samples for selected inorganic compounds were obtained but not anlayzed (Section 2.0). Quantitative results were obtained for several organic analytes, but quantities of analytes not listed in US Environmental Protection Agency (EPA) compendium Method TO-14 were estimated. Approximately 80 tentatively identified organic analytes were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and their quantitative determination is beyond the scope of this study. The SUMMATM canister samples were also analyzed for the 41 organic compounds listed in EPA compendium Method TO-14. Of these, only a few were observed above the 2-ppbv detection limits. These are summarized in Table 3.1. Estimated quantities were determined of tentatively identified compounds (TICs). A summary of these results shows quantities of all TICs above the concentration of ca. 10 ppbv. This consists of more than 80 organic analytes. The 12 organic analytes with the highest estimated concentrations are shown.

1357 (PNL–10282) **Vapor space characterization of waste tank 241-BY-105 (in situ): Results from samples collected on May 9, 1994.** McVeety, B.D.; Pool, K.H.; Ligotke, M.W.; Clauss, T.W.; Lucke, R.B.; Sharma, A.K.; McCulloch, M.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012230. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from in situ samples obtained from the tank headspace of the Hanford waste storage Tank 241-BY-105 (referred to as Tank BY-105). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds NH_3, NO_2, NO, HCN, and H_2O. Sampling for sulfur oxides was not requested. Results of the inorganic samples were affected by sampling errors that led to an undefined uncertainty in sample volume. Consequently, tank-headspace concentrations are estimated only. Thirty-nine tentatively identified organic analytes were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and their quantitation is beyond the scope of this study. In addition, we looked for the 41 standard TO-14 analytes. Of these, only a few were observed above the 2-ppbv detection limit. The 16 organic analytes with the highest estimated concentrations are listed. These 16 analytes account for approximately 68% of the total or organic components in Tank BY-105.

1358 (PNL–10284) **Vapor space characterization of waste Tank 241-BY-106 (in situ): Results from samples collected on 5/4/94 and 5/5/94.** Clauss, T.W.; Ligotke, M.W.; Pool, K.H.; Lucke, R.B.; McVeety, B.D.; Sharma, A.K.; McCulloch, M.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95011682. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from in situ samples obtained from the headspace of the Hanford waste storage Tank 241-BY-106 (referred to as Tank BY-106). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds NH_3, NO_2, NO, HCN, and H_2O. Sampling for sulfur oxides was not requested. Organic compounds were also quantitatively determined. Twenty-three organic tentatively identified compounds (TICS) were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and the reported concentrations are semiquantitative estimates. In addition, the authors looked for the 41 standard TO-14 analytes. Of these, only a few were observed above the 2-ppbv detection limit. The 10 organic analytes with the highest estimated concentrations are listed in Table 1. The 10 analytes account for approximately 64% of the total organic components in Tank BY-106. Tank BY-106 is on the Ferrocyanide Watch List.

1359 (PNL–10288) **Vapor space characterization of waste Tank 241-BY-108: Results from in situ sample collected on March 24, 1994. Waste Tank Vapor Project.** McVeety, B.D.; Lucke, R.B.; Clauss, T.W.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015814. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the details of the organic analysis that was performed on samples from the headspace of Hanford waste tank 241-BY-108. The results described were obtained to support the safety and toxicological evaluations. A summary of the results for the organic analytes is included, as well as, a detailed description of the results which appears in the text.

1360 (PNL–10351) **Vapor space characterization of waste Tank 241-C-108: Results from samples collected through the vapor sampling system on 8/5/94.** Lucke, R.B.; Ligotke, M.W.; Pool, K.H.; Clauss, T.W.; Sharma, A.K.; McVeety, B.D.; McCulloch, M.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001902. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-C-108 (referred to as Tank C-108). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water vapor (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. Organic compounds were also quantitatively determined. Two organic tentatively identified compounds (TICs) were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and the reported concentrations are semiquantitative estimates. In addition, the authors looked for the 41 standard TO-14 analytes. Of these, only a few were observed above the 2-ppbv detection limit. The five organic analytes with the highest estimated concentrations are listed in Table 1. The five analytes account for approximately 85% of the total organic components in Tank C-108.

1361 (PNL–10360) **Analysis of organic carbon and moisture in Hanford single-shell tank waste.** Toth, J.J.; Heasler, P.G.; Lerchen, M.E.; Hill, J.G.; Whitney, P.D. Pacific Northwest Lab., Richland, WA (United States). May 1995. 162p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95014506. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents a revised analysis performed by Pacific Northwest Laboratory involving the organic carbon laboratory measurement data for Hanford single-shell tanks (SSTs) obtained from a review of the laboratory analytical data. This activity has as its objective to provide a best-estimate, including confidence levels, of total organic carbon (TOC) and moisture in each of the 149 SSTs at Hanford. The TOC and moisture information presented in this report is useful as part of the criteria to identify SSTs for additional measurements, or monitoring for the Organic Safety Program. In April 1994, an initial study of the organic carbon in Hanford single-shell tanks was completed at PNL. That study reflected the estimates of TOC based on tank characterizations datasets that were available at the time. Also in that study, estimation of dry basis TOC was based on generalized assumptions pertaining to the moisture of the tank wastes. The new information pertaining to tank moisture and TOC data that has become available from the current study influences the best estimates of TOC in each of the SSTs. This investigation of tank TOC and moisture has resulted in improved estimates based on waste phase: saltcake, sludge, or liquid. This report details the assumptions and methodologies used to develop the estimates of TOC and moisture in each of the 149 SSTs at Hanford.

1362 (PNL–10361) **Vapor space characterization of waste Tank 241-BY-104 (in situ): Results from samples collected on 4/22/94.** Pool, K.H.; Ligotke, M.W.; Clauss, T.W.; Lucke, R.B.; McVeety, B.D.; Sharma, A.K.; McCulloch, M.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 21p. Sponsored by USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). DOE Contract AC06-87RL10930 ; AC06-76RL01830. Order Number DE96001811. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from in situ samples obtained from the space of the Hanford waste storage Tank 241-BY-104 (referred to as Tank BY-104). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds NH_3, NO_2, NO, HCN, and H_2O. Sampling for sulfur oxides was not requested. Several organic compounds were also quantitatively determined. Eighty-nine tentatively identified organic analytes were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and the reported concentrations are semi-quantitative estimates. In addition, the 41 standard TO 14 analytes were sought. Of these, only a few were observed above the 2-ppbv detection limit. The 10 organic analytes with the highest estimated concentrations are listed in Table 1. These 10 analytes account for approximately 48% of the total organic components in the headspace of Tank BY-104. Detailed results appear in the text. Tank BY-104 is on the Ferrocyanide Watch List.

1363 (PNL–10366) **Vapor space characterization of waste Tank 241-C-109 (in situ): Results from samples collected on 6/23/94.** Clauss, T.W.; Ligotke, M.W.; Pool, K.H.; Lucke, R.B.; McVeety, B.D.; Sharma, A.K.; McCulloch, M.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001901. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes organic analyses results from in situ samples obtained from the headspace of the Hanford waste storage Tank 241-C-109 (referred to as Tank C-109). The results described here were obtained to support safety and toxicological evaluations. Organic compounds were quantitatively determined. Thirteen organic tentatively identified compounds (TICs) were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and the reported concentrations are semiquantitative estimates. In addition, the authors looked for the 40 standard TO-14 analytes. Of these, only one was observed above the 2-ppbv calibrated instrumental detection limit. However, it is believed, even though the values for dichlorodifluoromethane and trichlorofluoromethane are below the instrumental detection limit, they are accurate at these low concentrations. The six analytes account for approximately 100% of the total organic components in Tank C-109. These six organic analytes with the highest estimated concentrations are listed in Summary Table 1. Detailed descriptions of the results appear in the text.

1364 (PNL–10367) **Vapor space characterization of waste Tank 241-C-111 (in situ): Results from samples collected on 6/20/94.** Ligotke, M.W.; Pool, K.H.; Lucke, R.B.; McVeety, B.D.; Clauss, T.W.; McCulloch, M.; Young, J.S.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001900. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from in situ samples obtained from the headspace of the Hanford waste storage Tank 241-C-111 (referred to as Tank C-111). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Summary Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), hydrogen cyanide (HCN), and water vapor (H_2O). Sampling for sulfur oxides was not requested. Organic compounds were quantitatively determined. Five organic tentatively identified compounds (TICs) were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and the reported concentrations are semiquantitative estimates. In addition, the authors looked for the 40 standard TO-14 analytes and observed 39. None of these compounds were above the 2-ppbv calibrated instrumental detection limit. However, it is believed that the detection of dichlorodifluoromethane and methyl benzene are real at these low concentrations. The five organic analytes with the highest estimated concentrations are listed in Summary Table 1. The five analytes account for approximately 100% of the total organic components in Tank C-111.

1365 (PNL–10369) **HWVP feed preparation chemistry for an NCAW simulant, fiscal year 1992: Evaluation of offgas generation and ammonia formation.** Smith, H.D.; Wiemers, K.D.; Langowski, M.H.; Matheson, J.D.; Merz, M.D.; Powell, M.R.; Larson, D.E. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 302p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010774. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Waste Vitrification Plant (HWVP) was being designed for the US Department of Energy (DOE) to immobilize high-level and transuranic wastes as glass for permanent disposal. Pacific Northwest Laboratory (PNL) supported the HWVP design activities by conducting laboratory-scale studies using an HWVP simulated waste slurry. PNL collected and evaluated data to provide a basis for predicting the HWVP feed processing chemistry as a function of feed composition and operation variables, recommending criteria for chemical adjustments, and providing guidelines with respect to important control parameters to consider during routine and upset plant operation. Conditions that affect the slurry processing chemistry were evaluated in terms of processing conditions, offgas compositions and peak generation rates, and changes in slurry compositions. A standard offgas profile defined in terms of three reaction phases, decomposition of H_2CO_3, destruction of NO_2^- and production of H_2 and NH_3, was used as a baseline against which changes were evaluated. The test variables included NO_2 concentration, acid neutralization capacity, process temperature, HCOOH addition rate, and the presence of selected process-related organics and a processed slurry (heel). Results indicate that pH is an important parameter influencing the N_2O/NO_x generation ratio; NO_2^- can both inhibit and activate rhodium as a catalyst for HCOOH decomposition to CO_2 and H_2; and the presence of a process "heel" appears to accelerate the formation of a separate reduced-metal phase. Temperature was observed to strongly influence the H_2 generation rate. The process chemistry described in this document provides a preliminary bases for predicting the behavior of alternative feed streams and process steps applicable to future generation vitrification plants.

1366 (PNL–10388) **Organic analysis of ambient samples collected near Tank 241-C-103: Results from samples collected on May 12, 1994.** Clauss, T.W.; Ligotke, M.W.; McVeety, B.D.; Lucke, R.B.; Young, J.S.; McCulloch, M.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015771. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes organic analyses results from ambient samples collected both upwind and through the vapor sampling system (VSS) near Hanford waste storage Tank 241-C-103 (referred to as Tank C-103). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed. Quantitative results were obtained for organic compounds. Five organic tentatively identified compounds (TICS) were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and the reported concentrations are semiquantitative estimates. In addition, we looked for the 40 standard TO-14 analytes. We observed 39. Of these, only one was observed above the 2-ppbv calibrated instrument detection limit. Dichloromethane was above the detection limits using both methods, but the result from the TO-14 method is traceable to a standard gas mixture and is considered more accurate. Organic analytes were found only in the sample collected through the VSS, suggesting that these compounds were residual contamination from a previous sampling job. Detailed descriptions of the results appear in the text.

1367 (PNL–10389) **Vapor space characterization of waste tank 241-BY-109 (in situ): Results from samples collected on 9/22/94.** Pool, K.H.; Clauss, T.W.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015404. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from in situ samples obtained from the headspace of the Hanford waste storage Tank 241-BY-109 (referred to as Tank BY-109). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Summary Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. Organic compounds were also quantitatively determined. Twenty-three organic tentatively identified compounds (TICs) were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and the reported concentrations are semiquantitative estimates. In addition, we looked for the 40 standard TO-14 analytes. We observed 38. Of these, only a few were observed above the 2-ppbv calibrated instrument detection limit. The ten organic analytes with the highest estimated concentrations are listed in Summary Table 1. The ten analytes account for approximately 84% of the total organic components in Tank BY-109.

1368 (PNL–10412) **Permeation of Tank C-103 sludge simulant by organic solvent.** Gerber, M.A. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010424. Source: OSTI; NTIS; INIS; GPO Dep.

The plan for stabilizing underground storage tanks (USTs) calls for draining the supernate from the tanks; however, there is concern that draining the supernate from Tank C-103 will degrade safety in the tank. The sludge in Tank C-103 contains ranges in depth from 1 to 1.5 m and is covered by both an aqueous phase and a separate organic layer. The main concern is that draining the supernate will cause the solvent to permeate the sludge solids and provide a source of fuel for a fire on the surface of the drained sludge. The question of whether the solvent will permeate sludge that is 1 to 1.5 m deep after the tank is dewatered is the purpose of the tests conducted and described in this report. Evaluation of the solvent permeation mechanism required the preparation of solvent, supernate, and sludge simulants based on the known chemistry of Tank C-103. Solvent and aqueous phase supernate simulants are based on the results of fiscal year 1994 sampling of the tank solvent and supernate. Sludge simulant is based on the chemical analyses of tank sludge samples retrieved in 1986. Experiments were conducted with each simulant to evaluate solvent permeation under matric potentials ranging from 0.8 m to 1.8 m of supernate. The amount of solvent recovered for each experiment was recorded as well as the maximum amount of solvent that could be din the sludge based on solvent recovered from resuspended sludge and solvent not recovered. The wt% of water remaining in the sludge was also recorded for each experiment, which was determined by measuring the weight of the sludge after drying it. One observation noted from the test results is that the finer sludge material tended to have a greater amount of solvent loss compared to the coarser sludge material at comparable levels of vacuum. At this time, there is no explanation.

1369 (PNL–10412-Rev.1) **Permeation of Tank C-103 sludge simulant by organic solvent. Revision 1.** Gerber, M.A. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95017017. Source: OSTI; NTIS; INIS; GPO Dep.

The plan for stabilizing underground storage tanks calls for draining the supernate from the tanks; however, there is concern that draining the supernate from Tank C-103 will degrade safety in the tank. The sludge in Tank C-103 contains ranges in depth from 1 to 1.5 m and is covered by both an aqueous phase and a separate organic layer. The main concern is that draining the supernate will cause the solvent to permeate the sludge solids and provide a source of fuel for a fire on the surface of the drained sludge. The question of whether the solvent will permeate sludge that is 1 to 1.5 m deep after the tank is dewatered is the purpose of the tests conducted and described in this report.

1370 (PNL–10418) **Vapor space characterization of waste tank 241-C-109: Results from samples collected on 8/10/94.** Pool, K.H. (and others); Clauss, T.W.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015406. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes results of the analyses of tank-headspace samples taken from the Hanford waste Tank 241-C-109 (referred to as Tank C-109). Pacific Northwest Laboratory (PNL) contracted with Westinghouse Hanford Company (WHC) to provide sampling devices and to analyze inorganic and organic analytes collected from the tank headspace and ambient air near the tank. The sample job was designated S4053, and samples were collected by WHC on August 10, 1994, using the vapor sampling system (VSS). Sampling devices, including six sorbent trains (for inorganic analyses) and five SUMMA™ canisters (for organic analyses) were supplied to the WHC sampling staff on August 8. Samples were taken (by WHC) from the tank headspace on August 10 and were returned to PNL from the field on August 12. The samples were inspected upon delivery to the 326/23B laboratory and logged into PNL record book 55408 before implementation of PNL Technical Procedure PNL-TVP-07. Custody of the sorbent traps was transferred to PNL personnel performing the inorganic analysis and stored at refrigerated ($\leq$10°C) temperature until the time of analysis. The canister was stored in the 326/23B laboratory at ambient (25°C) temperature until time of analysis. Access to the 326/23B laboratory is limited to PNL personnel working on the waste-tank safety program. Analyses described in this report were performed at PNL in the 300 area of the Hanford Reservation. Analytical methods that were used are described in the text. In summary, sorbent traps for inorganic analyses containing sample materials were either weighed (for water analysis) or desorbed with the appropriate aqueous solutions (for ammonia (NH_3) or nitrite (NO_2) analyses). The aqueous extracts were analyzed either by selective electrode or by ion chromatography (IC). Organic analyses were performed using cryogenic preconcentration followed by gas chromatography/mass spectrometry (GC/MS).

1371 (PNL–10464) **Fiscal year 1993 1/25-scale sludge mobilization testing.** Powell, M.R.; Golcar, G.R.; Hymas, C.R.; McKay, R.L. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 161p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95011404. Source: OSTI; NTIS; INIS; GPO Dep.

Sixteen 1/25-scale sludge mobilization experiments were conducted in fiscal year (FY) 1993. The results of this testing are presented in this document. The ability of a single, centrally-located, scale model mixer pump to resuspend a layer of simulated tank sludge was evaluated for five different simulant types. The resistance of these simulants to the mobilizing action of the mixer pump jets was not found to adequately correlate with simulant vane shear strength. The data indicate that the simulant cohesion, as quantified by tensile strength, may provide a good measure of mobilization resistance. A single test was done to evaluate whether indexed mixer pump rotation is significantly more effective than the planned continuous oscillation. No significant difference was found in the sludge mobilization caused by these two modes of operation. Two tests were conducted using a clay-based sludge simulant that contained approximately 5 wt% soluble solids. The distance to which the mixer pump jets were effective for this simulant was approximately 50% greater than on similar simulants that did not contain soluble solids. The implication is that sludge dissolution effects may significantly enhance the performance of mixer pumps in some tanks. The development of a means to correlate the magnitude of this effect with waste properties is a direction for future work. Two tests were performed with the goal of determining whether the 1/25-scale sludge mobilization data can be scaled linearly to 1/12-scale. The two 1/25-scale tests were conducted using the same simulant recipe as had been used in previous 1/12-scale tests. The difficulty of matching the 1/25-scale simulants, with those used previously is thought to have adversely affected the results. Further tests are needed to determine whether the data from sludge mobilization tests can be linearly scaled.

1372 (PNL–10466) **Vapor space characterization of waste tank 241-C-105: Results from samples collected on 2/16/94.** Clauss, T.W.; Lucke, R.B.; McVeety, B.D. Pacific Northwest Lab., Richland, WA (United States). Jun

1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015405. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes results of the analyses of tank-headspace samples taken from the Hanford waste Tank 241-C-105 (referred to as Tank C-105). Pacific Northwest Laboratory (PNL) contracted with Westinghouse Hanford Company (WHC) to provide sampling devices and to analyze inorganic and organic analytes collected from the tank headspace. For organic analyses, six SUMMA™ canisters were delivered to WHC on COC 0061 11 on 2/14/94. At the request of WHC, an additional six SUMMA™ canisters were supplied on COC 005127 on 2/16/94. Samples were collected by WHC from the headspace of Tank C-105 through the VSS on 2/16/94, but only three SUMMA™ canisters were returned to PNL using COC 0061 11 on 2/18/94. The canisters were stored in the 326/23B laboratory at ambient (25°C) temperature until the time of the analysis. Analyses described in this report were performed at PNL in the 300 area of the Hanford Reservation. Analytical methods that were used are described in the text. In summary, sorbent traps for inorganic analyses containing sample materials were either weighed (for water analysis) or desorbed with the appropriate aqueous solutions. The aqueous extracts were analyzed either by selective electrode or by ion chromatography (IC). Organic analyses were performed using cryogenic preconcentration followed by gas chromatography/mass spectrometry (GC/MS).

1373 (PNL–10468) **Vapor space characterization of waste tank 241-BY-107: Results from samples collected on 10/26/94.** Clauss, T.W. (and others); Ligotke, M.W.; Pool, K.H. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002222. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes results of the analyses of tank-headspace samples taken from the Hanford waste Tank 241-BY-107 (referred to as Tank BY-107). Pacific Northwest Laboratory (PNL) contracted with Westinghouse Hanford Company (WHC) to provide sampling devices and to analyze inorganic and organic analytes collected from the tank headspace and ambient air near the tank. The organic analytes for TO-14 compounds were extended to include 15 analytes identified by the Toxicological Review Panel for Tank C-103 and reported in Toxicological Evaluation of Analytes from Tank 241-C-103 PAE-10189. While these analytes are only of toxicological concern for Tank C-103, program management included these analytes for future tank analyses as identified in the fiscal year work plan. This plan is attached to a letter dated 9/30/94 and addressed to Mr. T. J. Kelly of WHC. The plan also requires PNL to analyze for the permanent gases as shown in Table 3.5. The sample job was designated S4077, and samples were collected by WHC on October 26, 1994, using the vapor sampling system (VSS). Sampling devices, including six sorbent trains (for inorganic analyses), and six SUMMA™ canisters (for organic analyses) were supplied to the WHC sampling staff on October 24. Samples were taken (by WHC) from the tank headspace on October 26 and were returned to PNL from the field on November 8. Inorganic (sorbent trap) samples were delivered to PNL on chain of custody (COC) 008071. The SUMMA™ canisters were delivered on COC 008070. Three SUMMA™ canister samples were stored at the PNL 326/23B laboratory pending further instruction from WHC to send them to the Oregon Graduate Institute (OGI) for analysis.

1374 (PNL–10473) **Vapor space characterization of waste tank 241-TY-101 (in situ): Results from samples collected on August 5, 1994. Waste Tank Vapor Program.** Pool, K.H.; Ligotke, M.W.; McVeety, B.D.; McCulloch, M.; Goheen, S.C.; Clauss, T.W.; Lucke, R.B.; Young, J.S.; Fruchter, J.S. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016041. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the details of the inorganic and organic analysis that was performed on samples from the headspace of Hanford waste tank 241-TY-101. The results described were obtained to support the safety and toxicological evaluations. A summary of the results for the inorganic and organic analytes is included, as well as, a detailed description of the results which appears in the text.

1375 (PNL–10491) **Vapor space characterization of waste tank 241-C-101: Results from samples collected on 9/1/94.** Lucke, R.B. (and others); Clauss, T.W.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002229. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes results of the analyses of tank-headspace samples taken from the Hanford waste Tank 241-C-101 (referred to as Tank C-101) and the ambient air collected - 30 ft upwind near the tank and through the VSS near the tank. Pacific Northwest Laboratory (PNL) contracted with Westinghouse Hanford Company (WHC) to provide sampling devices and to analyze inorganic and organic analytes collected from the tank headspace and ambient air near the tank. The sample job was designated S4056, and samples were collected by WHC on September 1, 1994, using the vapor sampling system (VSS). The samples were inspected upon delivery to the 326/23B laboratory and logged into PNL record book 55408 before implementation of PNL Technical Procedure PNL-TVP-07. Custody of the sorbent traps was transferred to PNL personnel performing the inorganic analysis and stored at refrigerated ($\leq$ 10°C) temperature until the time of analysis. The canisters were stored in the 326/23B laboratory at ambient (25°C) temperature until the time of the analysis. Access to the 326/23B laboratory is limited to PNL personnel working on the waste-tank safety program. Analyses described in this report were performed at PNL in the 300 area of the Hanford Reservation. Analytical methods that were used are described in the text. In summary, sorbent traps for inorganic analyses containing sample materials were either weighed (for water analysis) or desorbed with the appropriate aqueous solutions (for NH_3, NO_2, and NO analyses). The aqueous extracts were analyzed either by selective electrode or by ion chromatography (IC). Organic analyses were performed using cryogenic preconcentration followed by gas chromatography/mass spectrometry (GC/MS).

1376 (PNL–10495) **Vapor space characterization of waste Tank 241-BY-108: Results from samples collected on 10/27/94.** McVeety, B.D. (and others); Clauss, T.W.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 31p. Sponsored by USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). DOE Contract AC06-87RL10930 ; AC06-76RL01830. Order Number DE96001899. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the

Hanford waste storage Tank 241-BY-108 (referred to as Tank BY-108). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water vapor (H_2O). Trends in NH_3 and H_2O samples indicated a possible sampling problem. Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, the authors looked for the 40 TO-14 compounds plus an additional 15 analytes. Of these, 17 were observed above the 5-ppbv reporting cutoff. Also, eighty-one organic tentatively identified compounds (TICs) were observed above the reporting cutoff (ca.) 10 ppbv, and are reported with concentrations that are semiquantitative estimates based on internal standard response factors. The nine organic analytes with the highest estimated concentrations are listed in Summary Table 1 and account for approximately 48% of the total organic components in the headspace of Tank BY-108. Three permanent gases, hydrogen (H_2), carbon dioxide (CO_2), and nitrous oxide (N_2O) were also detected. Tank BY-108 is on the Ferrocyanide Watch List.

1377 (PNL–10498) **Vapor space characterization of waste tank 241-C-106: Results from samples collected on February 15, 1994.** McVeety, B.D.; Clauss, T.W.; Young, J.S.; Ligotke, M.W.; Goheen, S.C.; Lucke, R.B.; Pool, K.H.; McCulloch, M.; Fruchter, J.S. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015772. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the details of the inorganic and organic analysis that was performed on samples from the headspace of Hanford waste tank 241-C-106. The results described were obtained to support the safety and toxicological evaluations. A summary of the results for the inorganic and organic analytes is included, as well as, a detailed description of the results which appears in the text.

1378 (PNL–10499) **Vapor space characterization of waste Tank 241-C-104: Results from samples collected on 2/17/94 and 3/3/94.** Lucke, R.B.; McVeety, B.D.; Clauss, T.W.; Pool, K.H.; Young, J.S.; McCulloch, M.; Ligotke, M.W.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 28p. Sponsored by USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). DOE Contract AC06-87RL10930 ; AC06-76RL01830. Order Number DE96001898. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-C-104 (referred to as Tank C-104). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Summary Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), sulfur oxides (SO_x), and water vapor (H_2O). Organic compounds were also quantitatively determined. Occupational Safety and Health Administration (OSHA) versatile sampler (OVS) tubes were analyzed for tributyl phosphate. Twenty-four organic tentatively identified compounds (TICs) were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and the reported concentrations are semiquantitative estimates. In addition, the authors looked for the 40 standard TO-14 analytes. Of these, two were observed above the 2-ppbv calibrated instrument detection limit. The 10 organic analytes with the highest estimated concentrations are listed in Summary Table 1. These 10 analytes account for approximately 88% of the total organic components in Tank C 104. Tank C-104 is not on any of the Watch Lists.

1379 (PNL–10505) **Vapor space characterization of waste tank 241-BY-110: Results for samples collected on 11/11/94.** Clauss, T.W. (and others); Ligotke, M.W.; Pool, K.H. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015445. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-BY-110 (referred to as Tank BY-110). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2, nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, we looked for the 40 TO-14 compounds plus an additional 15 analytes. Of these, 10 were observed above the 5-ppbv reporting cutoff. Forty-six organic tentatively identified compounds (TICS) were observed above the reporting cutoff of (ca.) 10 ppbv, and are reported with concentrations that are semiquantative estimates based on internal standard response factors. The 10 organic analytes with the highest estimated concentrations are listed and account for approximately 78% of the total organic components in Tank BY-110. Two permanent gases, carbon dioxide (CO_2) and nitrous oxide (N_2O), were also detected.

1380 (PNL–10510) **Redox reaction and foaming in nuclear waste glass melting.** Ryan, J.L. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000871. Source: OSTI; NTIS; INIS; GPO Dep.

This document was prepared by Pacific Northwest Laboratory (PNL) and is an attempt to analyze and estimate the effects of feed composition variables and reducing agent variables on the expected chemistry of reactions occurring in the cold cap and in the glass melt in the nuclear waste glass Slurry-fed, joule-heated melters as they might affect foaming during the glass-making process. Numerous redox reactions of waste glass components and potential feed additives, and the effects of other feed variables on these reactions are reviewed with regard to their potential effect on glass foaming. A major emphasis of this report is to examine the potential positive or negative aspects of adjusting feed with formic acid as opposed to other feed modification techniques including but not limited to use of other reducing agents. Feed modification techniques other than the use of reductants that should influence foaming behavior include control of glass melter feed pH through use of nitric acid. They also include partial replacement of sodium salts by lithium salts. This latter action (b) apparently lowers glass viscosity and raises surface tension. This replacement should decrease foaming by decreasing foam stability.

1381 (PNL–10511) **Laboratory studies of gas generation and potential for tank wall corrosion during blending of high-level wastes at the West Valley Demonstration Project.** Gray, W.J.; Westerman, R.E. Pacific Northwest Lab., Richland, WA (United States). May 1995. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012764. Source: OSTI; NTIS; INIS; GPO Dep.

Laboratory experiments were conducted to simulate the transfer of acidic THOREX waste from Tank 8D-4 into the alkaline PUREX waste in Tank 8D-2 at West Valley. The purpose of the experiments was to explore means of minimizing the production of nitric oxide (NO) gas during mixing of the two wastes and to assess the potential for the gas to further react in the vapor space possibly leading to enhanced corrosion of the tank walls. Forty one THOREX/PUREX mixing tests were conducted to explore the effects of stirring rate, pH, THOREX addition rate, THOREX or PUREX dilution, and temperature. The two most important criteria for minimizing NO production were to maintain some degree of agitation and the keep the pH in the PUREX high, preferably >12. Steel corrosion tests were performed in the presence of low partial pressures of NO_2 and liquid water or water vapor. The NO_2 (from oxidation of NO in the vapor space) concentrations were representative of those derived from the THOREX/PUREX mixing tests. It was concluded that no significant corrosion of the tank walls would be expected under the anticipated THOREX/PUREX mixing conditions if the exposure was short (<100 days).

1382 (PNL–10514) **Assessment of Tank 241-C-106 temperature response indications.** Eyler, L.L. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010425. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents an assessment of waste tank 241-C-106 temperature response indications. The results are obtained through evaluation of historical data for FIC surface level data and temperature indication data from thermocouples in risers 8 and 14, contained in the SACS and TMACS databases. Computer analysis is used to augment observations and conclusions about hypothesized mechanisms present in the tank that could explain the data observations. From the historical temperature indications of risers 8 and 14 (neglecting the ventilation outages), several general observational conclusions are drawn that support hypotheses explaining more recently observed behavior.

1383 (PNL–10517) **NCAW feed chemistry: Effect of starting chemistry on melter offgas and iron redox.** Smith, P.A.; Vienna, J.D.; Merz, M.D. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008005. Source: OSTI; NTIS; INIS; GPO Dep.

The Pacific Northwest Laboratory (PNL) Vitrification Technology Development (PVTD) program has been established to develop technology to support immobilization of selected Hanford wastes. The effort of the PVTD program is directed by the U.S. Department of Energy (DOE). This report is part of the effort and focuses on the effect of starting waste chemistry on the vitrification process. The objective of the investigation was the evaluation of the effect of starting chemistry on the cold cap behavior in the vitrification of simulated neutralized current acid waste (NCAW). In addition this investigation provides an initial laboratory investigation of the cold cap and method for evaluation of alternate reductants.

1384 (PNL–10564) **Evaluation of Hanford high level waste vitrification chemistry for an NCAW simulant – FY 1994: Potential exothermic reactions in the presence of formic acid, glycolic acid, and oxalic acid.** Sills, J.A. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016774. Source: OSTI; NTIS; INIS; GPO Dep.

A potential for an uncontrollable exothermic reaction between nitrate and organic salts during preparation of a high level waste melter feed has been identified. In order to examine this potential more closely, the thermal behavior of simulated neutralized current acid waste (NCAW) treated with various organic reductants was studied. Differential scanning calorimetry (DSC) measurements were collected on simulated waste samples and their supernates treated with organics. Organic reductants used were formic acid, glycolic acid, and oxalic acid. For comparison, samples of untreated simulant and untreated simulant with added noble metals were tested. When heated, untreated simulant samples both with and without noble metals showed no exothermic behavior. All of the treated waste simulant samples showed exothermic behavior. Onset temperatures of exothermic reactions were 120 C to 210 C. Many onset temperatures, particularly those for formic acid treated samples, are well below 181 C, the estimated maximum steam coil temperature (considered to be a worst case maximum temperature for chemical process tank contents). The enthalpies of the reactions were -180×10^{-3} J/Kg supernate (−181 J/g) for the oxalic acid treated simulant supernate to $-1,150 \times 10^{-3}$ J/Kg supernate (−1,153 J/g) for the formic acid treated simulant supernate.

1385 (PNL–10570) **External corrosion of tanks 8D-1 and 8D-2. Final report.** Mackey, D.B.; Westerman, R.E. Pacific Northwest Lab., Richland, WA (United States). May 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96004518. Source: OSTI; NTIS; INIS; GPO Dep.

Tanks 8D-1 and 8D-2 at the West Valley Nuclear Services (WVNS) site, West Valley, New York, rest on layers of perlite brick contained within steel pans. The pans tend to collect water, which can contact the tanks directly and which also can be "wicked" to the external surfaces of the tank through the perlite brick. The presence of air in the tank vault is conducive to the formation of oxygen concentration cells, which can promote localized corrosion of the carbon steel tank wall. Pacific Northwest Laboratory conducted an experiment to estimate the extent to which the external surfaces of the tanks could have corroded in the 30 years since their construction. Specimens of carbon steel, similar to that used in the tank construction, were partially embedded in an upright position in particulate perlite in closed containers. The water line in the containers.was maintained at two levels: above the perlite level (high water level tests) and below the bottoms of the specimens (low water level tests). The water used in the tests was obtained from the pan of tank 8D-1. The containers were maintained in an aerated condition. Specimens were examined after 3-, 6-, 12-, 18-, 24-, and 30-month exposures.

1386 (PNL–10582) **Fiscal year 1994 1/25-scale sludge mobilization testing.** Powell, M.R. (Pacific Northwest Lab., Richland, WA (United States)); Gates, C.M.;

Hymas, C.R.; Sprecher, M.A.; Morter, N.J. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 256p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016773. Source: OSTI; NTIS; INIS; GPO Dep.

There are 28 one-million-gallon double-shell radioactive waste tanks on the Hanford Reservation in southeastern Washington State. The waste in these tanks was generated during processing of nuclear materials. Solids-laden slurries were placed into many of the tanks. Over time, the waste solids have settled to form a layer of sludge in the bottom of these tanks. The sludge layer thickness varies from tank to tank with some having only a few centimeters or no sludge up to some tanks which have about 4.5 m (15 ft) of sludge. It is planned that the waste will be removed from these tanks as part of the overall Hanford site cleanup efforts. Jet mixer pumps are to be placed into the tanks to stir up (mobilize) the sludge and form a uniform slurry suitable for pumping to downstream processing facilities. These mixer pumps use powerful jets of tank fluid directed horizontally out of two, diametrically opposed nozzles near the tank bottom. These fluid jets impinge upon the sludge and stir it up. The amount of sludge mobilized by the mixer pump jets depends not only on the jet properties, but also on the ability of the sludge to resist the jets. It is the goal of the work described in this document to develop the ability to predict how much sludge will be mobilized by the mixer pumps based on the size and velocity of the mixer pump jets and the physical and chemical properties of the tank sludge.

1387 (PNL–10584) **Vapor space characterization of waste Tank 241-SX-106: Results from samples collected on 3/24/95.** Klinger, G.S. (and others); Clauss, T.W.; Litgotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002065. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-SX-106 (referred to as Tank SX-106). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, 4 were observed above the 5-ppbv reporting cutoff. Three tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 7 organic analytes identified are listed in Table 1 and account for approximately 100% of the total organic components in Tank SX-106. Carbon dioxide (CO_2) was the only permanent gas detected. Tank SX-106 is on the Ferrocyanide Watch List.

1388 (PNL–10587) **Vapor space characterization of waste tank 241-S-102: Results from samples collected on 3/14/95.** Pool, K.H. (and others); McVeety, B.D.; Clauss, T.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001138. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-S-102 (referred to as Tank S-102). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, 11 were observed above the 5-ppbv reporting cutoff. Eleven tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 95% of the total organic components in Tank S-102. Two permanent gases, hydrogen (H_2) and nitrous oxide (N_2O), were also detected.

1389 (PNL–10588) **Vapor space characterization of waste tank 241-U-111: Results from samples collected on February 28, 1995. Waste Tank Vapor Program.** Clauss, T.W.; Pool, K.H.; McVeety, B.D.; Bredt, O.P.; Goheen, S.C.; Ligotke, M.W.; Lucke, R.B.; Klinger, G.S.; Fruchter, J.S. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016042. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the details of the inorganic and organic analysis that was performed on samples from the headspace of Hanford waste tank 241-U-111. The results described were obtained to support the safety and toxicological evaluations. A summary of the results for the inorganic and organic analytes is included, as well as, a detailed description of the results which appears in the text.

1390 (PNL–10589) **Tank Waste Remediation System Guide.** Robershotte, M.A.; Dirks, L.L.; Seaver, D.A.; Bothers, A.J.; Madden, M.S. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015134. Source: OSTI; NTIS; INIS; GPO Dep.

The scope, number and complexity of Tank Waste Remediation System (TWRS) decisions require an integrated, consistent, and logical approach to decision making. TWRS has adopted a seven-step decision process applicable to all decisions. Not all decisions, however, require the same degree of rigor/detail. The decision impact will dictate the appropriate required detail. In the entire process, values, both from the public as well as from the decision makers, play a key role. This document concludes with a general discussion of the implementation process that includes the roles of concerned parties.

1391 (PNL–10593) **Vapor space characterization of waste Tank 241-U-106: Results from samples collected on March 7, 1995. Waste Tank Vapor Program.** Klinger, G.S. (and others); Lucke, R.B.; McVeety, B.D. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016043. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-U-106 (referred to as Tank U-106). The results described here were obtained to support safety and toxicological evaluations. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O) Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. The NH_3 concentration was 16% greater than that determined from an ISS sample obtained in August 1994; the H_2O concentration was about 10% less. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, 5 were observed in two or more canisters above the 5-ppbv reporting cutoff. Eleven organic tentatively identified compounds (TICS) were observed in two or more canisters above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes with the highest estimated concentrations account for approximately 90% of the total organic components in Tank U-106. Three permanent gases, nitrous oxide (N_2O), hydrogen (H_2) and carbon dioxide (COD were also detected.

1392 (PNL–10594) **Vapor space characterization of waste tank 241-TX-105: Results from samples collected on December 20, 1994. Waste Tank Vapor Project.** Klinger, G.S. (and others); Ligotke, M.W.; Lucke, R.B. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016040. Source: OSTI; NTIS; GPO Dep.

This document presents the details of the inorganic and organic analysis that was performed on samples from the headspace of Hanford waste tank 241-TX-105. The results described were obtained to support the safety and toxicological evaluations. A summary of the results for the inorganic and organic analytes is included, as well as, a detailed description of the results which appears in the text.

1393 (PNL–10595) **Waste Tank Vapor Program: Vapor space characterization of Waste Tank 241-T-107. Results from samples collected on January 18, 1995.** Pool, K.H. (and others); Lucke, R.B.; McVeety, B.D. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016039. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-T-107 (referred to as Tank T-107). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, I was observed above the 5-ppbv reporting cutoff. Six organic tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The estimated concentration of all 7 organic analytes observed in the tank headspace are listed in Table I and account for approximately 100% of the total organic components in Tank T-107. Two permanent gases, carbon dioxide (CO_2) and nitrous oxide (N_2O), were also detected in the tank-headspace samples.

1394 (PNL–10597) **Vapor space characterization of waste tank 241-TY-103 (in situ): Results from samples collected on August 5, 1994.** Pool, K.H. (and others); McVeety, B.D.; Clauss, T.W. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015813. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the details of the inorganic and organic analysis that was performed on samples from the headspace of Hanford waste tank 241-TY-103. The results described were obtained to support the safety and toxicological evaluations. A summary of the results for the inorganic and organic analytes is included, as well as, a detailed description of the results which appears in the text.

1395 (PNL–10599) **Vapor space characterization of waste Tank 241-BY-111: Results from samples collected on November 15, 1994.** Lucke, R.B. (and others); Ligotke, M.W.; McVeety, B.D. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015750. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes results of the analyses of tank-headspace samples taken from the Hanford waste Tank 241-BY-111 (referred to as Tank By-111). Pacific Northwest Laboratory (PNL) contracted with Westinghouse Hanford company (WHC) to provide sampling devices and to analyze inorganic and organic analytes collected from the tank headspace and ambient air near the tank. The target analytes for TO- 14 compounds were extended to include 14 analytes identified by the Toxicological Review Panel for Tank C-103 and reported by Mahlum et al. (1994). Program management included these analytes for future tank analyses as identified in the fiscal year work plan. This plan is attached to a letter dated 9/30/94 and addressed to Mr. T.J. Kelly of WHC. The plan also requires PNL to analyze for the permanent gases as shown in Table 3.7. The sample job was designated S4083, and samples wee collected by WHC on November 16, 1994, using the vapor sampling system (VSS). The results of the analyses are expected to be used to estimate the potential toxicity of tank-headspace gas as described in Data Quality Objectives for Generic In-Tank Health and Safety Vapor Issue Resolution, WHC-SD-WM-DQO-002, Rev. 0.

1396 (PNL–10625) **Vapor space characterization of waste tank 241-TX-118: Results from samples collected on 12/16/94.** Lucke, R.B. (and others); Ligotke, M.W.; McVeety, B.D. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001136. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-TX-118 (referred to as Tank TX-118). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, 3 were observed above the 5-ppbv reporting cutoff. Twenty three organic tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv, and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 84% of the total organic components in Tank TX-118. Two permanent gases, carbon dioxide (CO_2) and nitrous oxide (N_2O), were also detected.

1397 (PNL–10637) **Identification of physical properties for the retrieval data quality objective process.** Gates, C.M.; Beckette, M.R. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015443. Source: OSTI; NTIS; INIS; GPO Dep.

This activity supports the retrieval data quality objective (DQO) process by identifying the material properties that are important to the design, development, and operation of retrieval equipment; the activity also provides justification for characterizing those properties. These properties, which control tank waste behavior during retrieval operations, are also critical to the development of valid physical simulants for designing retrieval equipment. The waste is to be retrieved in a series of four steps. First, a selected retrieval technology breaks up or dislodges the waste into subsequently smaller pieces. Then, the dislodged waste is conveyed out of the tank through the conveyance line. Next, the waste flows into a separator unit that separates the gaseous phase from the liquid and solid phases. Finally, a unit may be present to condition the slurried waste before transporting it to the treatment facility. This document describes the characterization needs for the proposed processes to accomplish waste retrieval. Baseline mobilization technologies include mixer pump technology, sluicing, and high-pressure water-jet cutting. Other processes that are discussed in this document include slurry formation, pneumatic conveyance, and slurry transport. Section 2.0 gives a background of the DQO process and the different retrieval technologies. Section 3.0 provides the mechanistic descriptions and material properties critical to the different technologies and processes. Supplemental information on specific technologies and processes is provided in the appendices. Appendix A contains a preliminary sluicing model, and Appendices B and C cover pneumatic transport and slurry transport, respectively, as prepared for this document. Appendix D contains sample calculations for various equations.

1398 (PNL–10642) **Vapor space characterization of waste tank 241-BX-104: Results from samples collected on 12/30/94.** Pool, K.H. (and others); Ligotke, M.W.; McVeety, B.D. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001134. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-BX-104 (referred to as Tank BX-104). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained. for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SOx) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, 13 were observed above the 5-ppbv reporting cutoff. Sixty-six organic tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes, with the highest estimated concentrations are listed in Table 1 and account for approximately 70% of the total organic components in Tank BX-104. Two permanent gases, carbon dioxide (CO_2) and nitrous oxide (N_2O), were also detected.

1399 (PNL–10643) **Vapor space characterization of waste tank 241-C-112: Results from samples collected on 8/11/94.** Ligotke, M.W. (and others); McVeety, B.D.; Pool, K.H. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001137. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-C-112 (referred to as Tank C-112). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. Organic compounds were also quantitatively determined. Five organic tentatively identified compounds (TICs) were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and the reported concentrations are semiquantitative estimates. In addition, we looked for the 40 standard TO-14 analytes. None were observed above the 2-ppbv detection limit. The five organic analytes with the highest concentration are listed in Table 1 and account for 100% of the total organic components in Tank C-112.

1400 (PNL–10644) **Vapor space characterization of waste tank 241-TY-103: Results from samples collected on 4/11/95.** Ligotke, M.W. (and others); Clauss, T.W.; Pool, K.H. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001135. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-TY-103 (referred to as Tank TY-103). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, 16 were observed above the 5-ppbv reporting cutoff. Sixteen tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 95% of the total organic components in Tank TY-103. Two permanent gases, carbon dioxide (CO_2) and nitrous oxide (N_2O), were also detected.

1401 (PNL–10645) **Waste Tank Vapor Program: Vapor space characterization of waste tank 241-C-110. Results from samples collected on August 18, 1994.** Ligotke, M.W. (and others); Clauss, T.W.; Pool, K.H. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001198. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the details of the inorganic and organic analysis that was performed on samples from the headspace of Hanford waste tank 24l-C-110. The results described were obtained to support the safety and toxicological evaluations. A summary of the results for the inorganic and organic analytes is included, as well as, a detailed description of the results which appears in the text.

1402 (PNL–10646) **Waste Tank Vapor Program: Vapor space characterization of waste tank 241;C-102: Results from samples collected on August 23, 1994.** Klinger, G.S. (and others); Clauss, T.W.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001417. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the details of the inorganic and organic analysis that was performed on samples from the headspace of Hanford waste tank 241-C-102. The results described were obtained to support the safety and toxicological evaluations. A summary of the results for the inorganic and organic analytes is included, as well as, a detailed description of the results which appears in the text.

1403 (PNL–10647) **Vapor space characterization of Waste Tank 241-TY-104: Results from samples collected on 4/27/95.** Klinger, G.S. (and others); Olsen, K.B.; Clauss, T.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 31p. Sponsored by USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). DOE Contract AC06-87RL10930 ; AC06-76RL01830. Order Number DE96002032. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-TY-104 (referred to as Tank TY-104). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, 8 were observed above the 5-ppbv reporting cutoff. Five tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 94% of the total organic components in Tank TY-104. Nitrous oxide (N_2O) was the only permanent gas detected in the tank-headspace samples. Tank TY-104 is on the Ferrocyanide Watch List.

1404 (PNL–10648) **Waste Tank Vapor Program: Vapor space characterization of waste tank 241-T-111. Results from samples collected on January 20, 1995.** Klinger, G.S.; Clauss, T.W.; Ligotke, M.W.; Pool, K.H.; McVeety, B.D.; Olsen, K.B.; Bredt, O.P.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001150. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the details of the inorganic and organic analysis that was performed on samples from the headspace of Hanford waste tank 241-T-111. The results described were obtained to support the safety and toxicological evaluations. A summary of the results for the inorganic and organic analytes is included, as well as, a detailed description of the results which appears in the text.

1405 (PNL–10650) **Tanks focus area multiyear program plan - FY96-FY98.** Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 176p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016637. Source: OSTI; NTIS; INIS; GPO Dep.

The Tanks Focus Area (TFA) Multiyear Program Plan (MYPP) presents the recommended TFA technical program. The recommendation covers a 3-year funding outlook (FY96-FY98), with an emphasis on FY96 and FY97. In addition to defining the recommended program, this document also describes the processes used to develop the program, the implementation strategy for the program, the references used to write this report, data on the U.S. Department of Energy (DOE) tank site baselines, details on baseline assumptions and the technical elements, and a glossary.

1406 (PNL–10655) **Statistical analysis of shard and canister glass correlation test.** Pulsipher, B. Pacific Northwest National Lab., Richland, WA (United States). Dec 1990. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96012315. Source: OSTI; NTIS; GPO Dep.

The vitrification facility at West Valley, New York will be used to incorporate nuclear waste into a vitrified waste form. Waste Acceptance Preliminary Specifications (WAPS) will be used to determine the acceptability of the waste form product. These specifications require chemical characterization of the waste form produced. West Valley Nuclear Services (WVNS) intends to characterize canister contents by obtaining shard samples from the top of the canisters prior to final sealing. A study was conducted to determine whether shard samples taken from the top of canisters filled with vitrified nuclear waste could be considered representative and therefore used to characterize the elemental composition of the entire canister contents. Three canisters produced during the SF-12 melter run conducted at WVNS were thoroughly sampled by core drilling at several axial and radial locations and by obtaining shard samples from the top of the canisters. Chemical analyses were performed and the resulting data were statistically analyzed by Pacific

Northwest Laboratory (PNL). If one can assume that the process controls employed by WVNS during the SF-12 run are representative of those to be employed during future melter runs, shard samples can be used to characterize the canister contents. However, if batch-to-batch variations cannot be controlled to the acceptable levels observed from the SF-12 data, the representativeness of shard samples will be in question. The estimates of process and within-canister variations provided herein will prove valuable in determining the required frequency and number of shard samples to meet waste form qualification objectives.

1407 (PNL–10661) **Bubble retention in synthetic sludge: Testing of alternative gas retention apparatus.** Rassat, S.D.; Gauglitz, P.A. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016635. Source: OSTI; NTIS; INIS; GPO Dep.

Several of the underground storage tanks currently used to store waste at Hanford have been placed on the Flammable Gas Watch List, because the waste is either known or suspected to generate, store, and episodically release flammable gases. The objective of this experimental study is to develop a method to measure gas bubble retention in simulated tank waste and in diluted simulant. The method and apparatus should (1) allow for reasonably rapid experiments, (2) minimize sample disturbance, and (3) provide realistic bubble nucleation and growth. The scope of this experimental study is to build an apparatus for measuring gas retention in simulated waste and to design the apparatus to be compatible with future testing on actual waste. The approach employed for creating bubbles in sludge involves dissolving a soluble gas into the supernatant liquid at an elevated pressure, recirculating the liquid containing the dissolved gas through the sludge, then reducing the pressure to allow bubbles to nucleate and grow. Results have been obtained for ammonia as the soluble gas and SY1-SIM-91A, a chemically representative simulated tank waste. In addition, proof-of-principle experiments were conducted with both ammonia and CO_2 as soluble gases and sludge composed of 90-micron glass beads. Results are described.

1408 (PNL–10681) **The behavior, quantity, and location of undissolved gas in Tank 241-SY-101.** Brewster, M.E.; Gallagher, N.B.; Hudson, J.D.; Stewart, C.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002822. Source: OSTI; NTIS; GPO Dep.

Mitigation of episodic flammable gas releases from Hanford Waste Tank 241-SY-101 was accomplished in July 1993 with the installation of a mixer pump that prevents gas retention. But is has not been possible until recently to measure the effects of mixing on the waste or how much gas remains and where it is located. Direct measurements of the void fraction and rheology of the mixed waste by the void fraction instrument (VFI) and ball rheometer along with previous data provide estimates of the location, quantity, and behavior of undissolved gas in the tank. This report documents the compilation and integration of the information that enables this understanding.

1409 (PNL–10683) **Thermal modeling of tanks 241-AW-101 and 241-AN-104 with the TEMPEST code.** Antoniak, Z.I.; Recknagle, K.P. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016038. Source: OSTI; NTIS; INIS; GPO Dep.

The TEMPEST code was exercised in a preliminary study of double-shell Tanks 241 -AW-101 and 241-AN-104 thermal behavior. The two-dimensional model used is derived from our earlier studies on heat transfer from Tank 241-SY-101. Several changes were made to the model to simulate the waste and conditions in 241-AW-101 and 241-AN-104. The nonconvective waste layer was assumed to be 254 cm (100 in.) thick for Tank 241-AW-101, and 381 cm (150 in.) in Tank 241-AN-104. The remaining waste was assumed, for each tank, to consist of a convective layer with a 7.6-cm (3-inch) crust on top. The waste heat loads for 241-AW-101 and 241-AN-104 were taken to be 10 kW (3.4E4 Btu/hr) and 12 kW (4.0E4 Btu/hr), respectively. Present model predictions of maximum and convecting waste temperatures are within 1.7°C (3°F) of those measured in Tanks 241-AW-101 and 241-AN-104. The difference between the predicted and measured temperature is comparable to the uncertainty of the measurement equipment. These models, therefore, are suitable for estimating the temperatures within the tanks in the event of changing air flows, waste levels, and/or waste configurations.

1410 (PNL–10694) **Bayesian methods for the combination of core sampling data with historical models for tank characterization.** York, J.C. (Pacific Northwest Lab., Richland, WA (United States)); Remund, K.M.; Chen, G.; Simpson, B.C.; Brown, T.M. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95017600. Source: OSTI; NTIS; INIS; GPO Dep.

A wide variety of information is available on the contents of the nuclear waste tanks at the Hanford site. This report describes an attempt to combine several sources of information using a Bayesian statistical approach. This methodology allows the combination of multiple disparate information sources. After each source of information is summarized in terms of a probability distribution function (pdf), Bayes' theorem is applied to combine them. This approach has been applied to characterizing tanks B-110, B-111, and B-201. These tanks were chosen for their simple waste matrices: B-110 and B-111 contain mostly 2C waste, and B-201 contains mostly 224 waste. Additionally,, the results of this analysis axe used to make predictions for tank T-111 (which contains both 2C and 224 waste). These predictions are compared to the estimates based on core samples from tank T-111.

1411 (PNL–10697) **Ferrocyanide tank safety program: Cesium uptake capacity of simulated ferrocyanide tank waste. Final report.** Burgeson, I.E.; Bryan, S.A. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000750. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this project is to determine the capacity for ^{137}Cs uptake by mixed metal ferrocyanides present in Hanford Site waste tanks, and to assess the potential for aggregation of these ^{137}Cs-exchanged materials to form "hot-spots" in the tanks. This research, performed at Pacific Northwest Laboratory (PNL) for Westinghouse Hanford Company, stems from concerns regarding possible localized radiolytic heating within the tanks. After ferrocyanide was added to 18 high-level waste tanks in the 1950s, some of the ferrocyanide tanks received considerable quantities of saltcake waste that was rich in ^{137}Cs. If radioactive cesium was exchanged and concentrated by the nickel ferrocyanide present in the tanks, the associated heating could cause tank temperatures to rise above the safety limits specified for the ferrocyanide-containing tanks, especially if the supernate in the tanks is pumped out and the waste becomes drier.

1412 (PNL–10702) **Vapor space characterization of Waste Tank 241-U-105: Results from samples collected on 2/24/95.** Pool, K.H. (Pacific Northwest Lab., Richland, WA (United States)); Clauss, T.W.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002030. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-U-105 (referred to as Tank U-105). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, six were observed above the 5-ppbv reporting cutoff. Three tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. All nine of the organic analytes identified are listed in Table 1 and account for 100% of the total organic components in Tank U-105. Nitrous oxide (N_2O) was the only permanent gas detected in the tank-headspace sample. Tank U-105 is on the Hydrogen Watch List.

1413 (PNL–10703) **Vapor space characterization of waste Tank 241-BY-103: Results from samples collected on 11/1/94.** McVeety, B.D. (and others); Klinger, G.S.; Clauss, T.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 29p. Sponsored by USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). DOE Contract AC06-87RL10930 ; AC06-76RL01830. Order Number DE96001810. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-BY-103 (referred to as Tank BY-103). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Trends in NH_3 and H_2O samples indicated a possible minor sampling problem. Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for target organic analytes, 39 TO-14 compounds, plus an additional 14 analytes. Of these, four were observed above the 5-ppbv reporting cutoff. Fourteen organic tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv, and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 88% of the total organic components in Tank BY-103. Two permanent gases, carbon dioxide (CO_2) and nitrous oxide (N_2O), were also detected in the tank headspace. Carbon monoxide (CO) and carbon dioxide (CO_2) were detected in the ambient air sample. Tank BY-103 is on the Ferrocyanide Watch List.

1414 (PNL–10704) **Vapor space characterization of waste Tank 241-B-103: Results from samples collected on 2/8/95.** Ligotke, M.W. (and others); Pool, K.H.; Lucke, R.B. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001905. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-B-103 (referred to as Tank B-103). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water vapor (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, five were observed above the 5-ppbv reporting cutoff. Twenty-six organic tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv, and are reported with concentrations that are semiquantitative estimates based on internal standard response factors. Twenty-three TICs were measured in two or more SUMMA™ canisters. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 66% of the total organic components in Tank BB-103. Two permanent gases, carbon dioxide (CO_2) and nitrous oxide (N_2O), were also detected. Tank B-103 is on the Organic Watch List.

1415 (PNL–10706) **Vapor space characterization of waste Tank 241-TY-101: Results from samples collected on 4/6/95.** Klinger, G.S.; Clauss, T.W.; Ligotke, M.W.; Pool, K.H.; McVeety, B.D.; Olsen, K.B.; Bredt, O.P.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002063. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-TY-101 (referred to as Tank TY-101). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water vapor (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Off these, 5 were observed above the 5-ppbv reporting cutoff. One tentatively identified compound (TIC) was observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The six organic analyses identified are listed in Table 1 and account for approximately 100% of the total organic components in Tank TY-101. Two permanent gases, carbon dioxide (CO_2) and nitrous oxide (N_2O), were also detected. Tank TY-101 is on the Ferrocyanide Watch List.

1416 (PNL–10712) **Washing and caustic leaching of Hanford tank sludges: Results of FY 1995 studies.** Rapko, B.M.; Lumetta, G.J.; Wagner, M.J. Pacific Northwest Lab., Richland, WA (United States). 11 Aug 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95017592. Source: OSTI; NTIS; INIS; GPO Dep.

During the past few years, the primary mission at the US Department of Energy's Hanford Site has changed from producing plutonium to environmental restoration. Large volumes of high-level radioactive wastes (HLW), generated during past Pu production and other operations, are stored in underground tanks on site. The current plan for remediating the Hanford tank farms consists of waste retrieval, pretreatment, treatment (immobilization), and disposal. The HLW will be immobilized in a borosilicate glass matrix; the resulting glass canisters will then be disposed of in a geologic repository. Because of the expected high cost of HLW immobilization and disposal, pretreatment processes will be implemented to reduce the volume of borosilicate glass produced in processing the tank wastes. This document describes sludge washing and caustic leaching tests conducted in FY 1995 at the Pacific Northwest Laboratory (PNL) at the request of Westinghouse Hanford Company. These tests were performed using sludges from seven Hanford waste tanks – B-111, BX-107, C-103, S-104, SY-103, T-104, and T-111. The primary and secondary types of waste stored in each of these tanks are given in Table 1. 1. The data collected in this effort will be used to support the March 1998 Tri-Party Agreement decision on the extent of pretreatment to be performed on the Hanford tank sludges (Ecology, EPA, and DOE 1994).

1417 (PNL–10713) **Ferrocyanide safety project ferrocyanide aging studies FY 1995 annual report.** Lilga, M.A. (and others); Alderson, E.V.; Hallen, R.T. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001342. Source: OSTI; NTIS; INIS; GPO Dep.

This annual report gives the results of the work conducted by the Pacific Northwest Laboratory in FY 1995 on Task 3 of the Ferrocyanide Safety Project, Ferrocyanide Aging Studies. Aging refers to the dissolution and hydrolysis of simulated Hanford ferrocyanide waste in alkaline aqueous solutions by radiolytic and chemical means. The ferrocyanide simulant primarily used in these studies was dried In-Farm-1B, Rev. 7, prepared by Westinghouse Hanford Company to simulate the waste generated when the In-Farm flowsheet was used to remove radiocesium from waste supernates in single-shell tanks at the Hanford Site. In the In-Farm flowsheet, nickel ion and ferrocyanide anion were added to waste supernates to precipitate sodium nickel ferrocyanide, $Na_2NiFe(CN)_6$, and co-precipitate radiocesium. Once the radiocesium was removed, supernates were pumped from the tanks, and new wastes from cladding removal processes or from evaporators were added. These new wastes were typically highly caustic, having hydroxide ion concentrations of over 1 M and as high as 4 M. The Aging Studies task is investigating reactions this caustic waste may have had with the precipitated ferrocyanide waste in a radiation field. In previous Aging Studies research, $Na_2NiFe(CN)_6$ in simulants was shown to dissolve in basic solutions, forming insoluble $Ni(OH)_2$ and soluble $Na_4Fe(CN)_6$. The influence on solubility of base strength, sodium ion concentration, anions, and temperature was previously investigated. The results may indicate that even ferrocyanide sludge that did not come into direct contact with highly basic wastes may also have aged significantly.

1418 (PNL–10723) **Solid-phase characterization in flammable-gas-tank sludges by electron microscopy.** Liu, J.; Pederson, L.R.; Qang, L.Q. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001362. Source: OSTI; NTIS; INIS; GPO Dep.

The crystallinity, morphology, chemical composition, and crystalline phases of several Tank 241-SY-101 (hereinafter referred to as SY-101) and Tank 241-SY-103 (hereinafter referred to as SY-103) solid samples were studied by transmission electron microscopy (TEM), electron energy dispersive spectroscopy (EDS), and electron diffraction. The main focus is on the identification of aluminum hydroxide thought to be present in these tank samples. Aluminum hydroxide was found in SY-103, but not in SY-101. This difference can be explained by the different OH/Al ratios found in the two tank samples: a high OH/Al ratio in SY-101 favors the formation of sodium aluminate, but a low OH/Al ratio in SY-103 favors aluminum hydroxide. These results were confirmed by a magnetic resonance study on SY-101 and SY-103 simulant. The transition from aluminum hydroxide to sodium aluminate occurs at an OH/Al molar ratio of 3.6. It is believed that the study of $Al(OH)_3$ was not affected by sample preparation because all $Al(OH)_3$ is in the solid form according to the NMR experiments. There is no $Al(OH)_3$ in the liquid. It is, therefore, most likely that the observation of $Al(OH)_3$ is representative of the real sludge sample, and is not affected by drying. Similar conclusions also apply to other insoluble phases such as iron and chromium.

1419 (PNL–10725) **Scoring methods and results for qualitative evaluation of public health impacts from the Hanford high-level waste tanks. Integrated Risk Assessment Program.** Buck, J.W.; Gelston, G.M.; Farris, W.T. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001200. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this analysis is to qualitatively rank the Hanford Site high-level waste (HLW) tanks according to their potential public health impacts through various (groundwater, surface water, and atmospheric) exposure pathways. Data from all 149 single-shell tanks (SSTs) and 23 of the 28 double-shell tanks (DSTs) in the Tank Waste Remediation System (TWRS) Program were analyzed for chemical and radiological carcinogenic as well as chemical noncarcinogenic health impacts. The preliminary aggregate score (PAS) ranking system was used to generate information from various release scenarios. Results based on the PAS ranking values should be considered relative health impacts rather than absolute risk values.

1420 (PNL–10729) **Vapor space characterization of Waste Tank 241-U-107: Results from samples collected on 2/17/95.** McVeety, B.D. (and others); Clauss, T.W.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002027. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-U-107 (referred to as Tank U-107). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, 10 were observed above the 5-ppbv reporting cutoff. Sixteen organic tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv, and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 88% of the total organic components in Tank U-107. Nitrous oxide (N_2O) was the only permanent gas detected in the tank-headspace samples. Tank U-107 is on the Organic and the Hydrogen Watch Lists.

1421 (PNL–10730) **Vapor space characterization of Waste Tank 241-U-106 (in situ): Results from samples collected on 8/25/94.** Ligotke, M.W. (and others); Lucke, R.B.; Pool, K.H. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002028. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from in situ samples obtained from the headspace of the Hanford waste storage Tank 241-U-106 (referred to as Tank U-106). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not performed. In addition, the authors looked for the 39 TO-14 compounds plus an additional 14 target analytes. Of these, six were observed above the 5-ppbv reporting cutoff. Ten organic tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv in two or more of the three samples collected and are reported with concentrations that are semiquantitative estimates based on internal standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 89% of the total organic components in Tank U-106. Methyl isocyanate, a compound of possible concern in Tank U-106, was not detected. Tank U-106 is on the Organic Watch List.

1422 (PNL–10732) **Vapor space characterization of waste Tank 241-TX-118 (in situ): Results from samples collected on 9/7/94.** Thomas, B.L.; Clauss, T.W.; Ligotke, M.W.; Pool, K.H.; McVeety, B.D.; Olsen, K.B.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001906. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from in situ samples obtained from the headspace of the Hanford waste storage Tank 241-TX-118 (referred to as Tank TX-118). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), hydrogen cyanide (CHN), and water (H_2O). Sampling for sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 13 analytes. Hexane, normally included in the additional analytes, was removed because a calibration standard was not available during analysis of Tank TX-118 SUMMA™ canisters. Of these, 12 were observed above the 5-ppbv reporting cutoff. Fourteen tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 86% of the total organic components in Tank TX-118. Permanent gas analysis was not conducted on the tank-headspace samples. Tank TX-118 is on both the Ferrocyanide and Organic Watch List.

1423 (PNL–10733) **Vapor space characterization of Waste Tank 241-S-111: Results from samples collected on 3/21/95.** Klinger, G.S. (and others); Clauss, T.W.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002031. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-S-111 (referred to as Tank S-111). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, seven were observed above the 5-ppbv reporting cutoff. Five tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 98% of the total organic components in Tank S-111. Two permanent gases, hydrogen (H_2) and nitrous oxide (N_2O), were also detected. Tank S-111 is on the Hydrogen Watch List.

1424 (PNL–10736) **Vapor space characterization of waste Tank 241-C-107: Results from samples collected on 9/29/94.** Pool, K.H. (and others); Clauss, T.W.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002066. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-C-107 (referred to as Tank C-107). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water vapor (H_2O). Sampling for sulfur oxides (SO_x) was not requested. Organic compounds were also quantitatively determined. Twenty organic tentatively identified compounds (TICs) were observed above the detection limit of (ca.) 10 ppbv, but standards for most of these were not available at the time of analysis, and the reported concentrations are semiquantitative estimates. In addition, the authors looked for the 55 TO-14 extended analytes. Of these, 3 were observed above the 5-ppbv detection limit. The 10 organic analytes with the highest estimated concentrations are listed in Summary Table 1 and account for approximately 96% of the total organic components in Tank C-107. Two permanent gases, carbon dioxide and nitrous oxide, were also detected.

1425 (PNL--10737) **Vapor space characterization of Waste Tank 241-TY-104 (in situ): Results from samples collected on 8/5/94.** Ligotke, M.W. (and others); Pool, K.H.; Lucke, R.B. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002029. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from in situ samples obtained from the headspace of the Hanford waste storage Tank 241-TY-104 (referred to as Tank TY-104). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not performed. In addition, the authors looked for the 39 TO-14 compounds plus an additional 14 analytes. Of these, eight were observed above the 5-ppbv reporting cutoff. Twenty-four organic tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 86% of the total organic components in Tank TY-104. Tank TY-104 is on the Ferrocyanide Watch List.

1426 (PNL--10740) **Gas bubble retention and its effect on waste properties: Retention mechanisms, viscosity, and tensile and shear strengths.** Gauglitz, P.A. (and others); Rassat, S.D.; Powell, M.R. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95017707. Source: OSTI; NTIS; INIS; GPO Dep.

Several of the underground nuclear storage tanks at Hanford have been placed on a flammable gas watch list, because the waste is either known or suspected to generate, store, and episodically release flammable gases. Because retention and episodic release of flammable gases from these tanks containing radioactive waste slurries are critical safety concerns, Pacific Northwest Laboratory (PNL) is studying physical mechanisms and waste properties that contribute to the episodic gas release from these storage tanks. This study is being conducted for Westinghouse Hanford Company as part of the PNL Flammable Gas project. Previous investigations have concluded that gas bubbles are retained by the slurry or sludge that has settled at the bottom of the tanks; however, the mechanisms responsible for the retention of these bubbles are not well understood. Understanding the rheological behavior of the waste, particularly of the settled sludge, is critical to characterizing the tendency of the waste to retain gas bubbles and the dynamics of how these bubbles are released from the waste. The presence of gas bubbles is expected to affect the rheology of the sludge, specifically its viscosity and tensile and shear strengths, but essentially no literature data are available to assess the effect of bubbles. The objectives of this study were to conduct experiments and develop theories to understand better how bubbles are retained by slurries and sludges, to measure the effect of gas bubbles on the viscosity of simulated slurries, and to measure the effect of gas bubbles on the tensile and shear strengths of simulated slurries and sludges. In addition to accomplishing these objectives, this study developed correlations, based on the new experimental data, that can be used in large-scale computations of waste tank physical phenomena.

1427 (PNL--10749) **Hanford single-shell tank grouping study.** Remund, K.M.; Anderson, C.M.; Simpson, B.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001887. Source: OSTI; NTIS; INIS; GPO Dep.

A tank grouping study has been conducted to find Hanford single-shell tanks with similar waste properties. The limited sampling resources of the characterization program could be allocated more effectively by having a better understanding of the groups of tanks that have similar waste types. If meaningful groups of tanks can be identified, tank sampling requirements may be reduced, and the uncertainty of the characterization estimates may be narrowed. This tank grouping study considers the analytical sampling information and the historical information that is available for all single-shell tanks. The two primary sources of historical characterization estimates and information come from the Historical Tank Content Estimate (HTCE) Model and the Sort on Radioactive Waste Tanks (SORWT) Model. The sampling and historical information are used together to come up with meaningful groups of similar tanks. Based on the results of analyses presented in this report, credible tank grouping looks very promising. Some groups defined using historical information (HTCE and SORWT) correspond well with those based on analytical data alone.

1428 (PNL--10755) **A survey and description of candidate technologies to support single shell tank waste retrieval, leak detection, monitoring, and mitigation.** Lewis, R.E.; Teel, S.S.; Wegener, W.H.; Iwatate, D.F. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000727. Source: OSTI; NTIS; INIS; GPO Dep.

This report was initially designed to provide a comprehensive review of potential leak detection technologies (LDTs). To this end, the report would contain several sections outlining the selection process. The purpose was twofold:(I) the reader would have a clear understanding of why specific technologies were recommended or not recommended, and (2) the reader could apply the same process in the future as new LDTs become available. Curtailment of project scope has prevented the development of the requisite judging criteria. The report has been modified accordingly. Section 2 of this report presents the baseline and guiding assumptions that were used to judge the LDTs. These assumptions include the environment where the technologies would be employed, the potential leak detection targets, and anticipated leak mechanisms. Section 3 presents a brief review of the methods used to arrive at the recommended LDTs. It also includes a description of the different technology families considered. Section 4 presents the recommended LDTs along with detailed descriptions of each that include sensitivities, operating parameters, and costs.

1429 (PNL–10761) **Effect of colloidal aggregation on the sedimentation and rheological properties of tank waste.** Rector, D.R.; Bunker, B.C. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000745. Source: OSTI; NTIS; INIS; GPO Dep.

Tank farm experience and work performed under the Tank Waste Treatment Science task of the Tank Waste Remediation System (TWRS) Pretreatment Technology Development Project indicate that colloidal interactions can have an enormous impact on tank waste processing. This report provides the theoretical and experimental background required to understand how such agglomeration phenomena control the sedimentation and theological behavior of colloidal tank wastes. First, the report describes the conditions under which the colloidal particles present in tank sludge are expected to aggregate. Computational models have been developed to predict solution conditions leading to agglomeration, and to predict the rate and size of aggregate growth. The models show that tank sludge should be heavily agglomerated under most baseline processing conditions. Second, the report describes models used to predict sedimentation rates and equilibrium sediment density profiles based on knowledge of agglomerate structures. The sedimentation models provide a self-consistent picture that explains the apparent discrepancies between bench-top experiments and tank-farm experience. Finally, both discrete and empirical models are presented that can be used to rationalize and predict the rheological properties of colloidal sludge suspensions. In all cases, model predictions are compared and contrasted with experimental results. The net results indicate that most of the observed behaviors of real sludges can be predicted, understood, and perhaps ultimately controlled by understanding a few key central concepts regarding agglomeration phenomena.

1430 (PNL–10762) **Tank Waste Treatment Science Task quarterly report for October–December 1994.** LaFemina, J.P. (and others); Anderson, G.S.; Blanchard, D.L. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000732. Source: OSTI; NTIS; GPO Dep.

The Pretreatment Technology Development Project is one of seven Tank Waste Remediation System (TWRS) projects being conducted at Pacific Northwest Laboratory (PNL). A key objective of this project, which includes the Tank Waste Treatment Science Task, is to provide the technical basis and scientific understanding to support TWRS baseline decisions and actions, in particular, the 1998 sludge pretreatment decision regarding the level of pretreatment to be incorporated into the tank waste process flowsheets being developed by Westinghouse Hanford Company. This report details work performed by the Tank Waste Treatment Science Task during the first quarter of FY 1995 (October–December 1994) in support of the project objective. Specific activities discussed in the main text are: analytical methods development; sludge dissolution modeling; sludge characterization studies; sludge component speciation; pretreatment chemistry evaluation; and colloidal studies for solid-liquid separations.

1431 (PNL–10763) **Tank Waste Treatment Science Task quarterly report for January–March 1995.** LaFemina, J.P.; Anderson, G.S.; Blanchard, D.L. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000728. Source: OSTI; NTIS; GPO Dep.

The pretreatment Technology Development Project is one of seven Tank Waste Remediation (TWRS) System projects being conducted at the Pacific Northwest Laboratory. A key objective of this Project, and of the Tank Waste Treatment Science Task within it, is to provide the technical basis and scientific understanding to support TWRS baseline decisions and actions; in particular, TPA Milestone M50-03, the 1998 sludge pretreatment decision regarding the level of pretreatment to be incorporated into the tank waste process flowsheets. Work performed by this task during the second quarter of FY 1995 (January–March 1995) is detailed in this report. Work for the first quarter reported in Tank Waste Treatment Science Task, Quarterly Report for October–December 1994.

1432 (PNL–10766) **Removal of strontium and transuranics from Hanford tank waste via addition of metal cations and chemical oxidant: FY 1995 test results.** Orth, R.J.; Zacher, A.H.; Schmidt, A.J.; Elmore, M.R.; Elliott, K.R.; Neuenschwander, G.G.; Gano, S.R. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000714. Source: OSTI; NTIS; INIS; GPO Dep.

Chelating organics and some of their degradation products in the Hanford tank waste, such as EDTA, HEDTA, and NTA act to solubilize strontium and transuranics (TRU) in the tank waste supernatant. Displacement of strontium and TRU will facilitate the removal of these radionuclides via precipitation/filtration, ion exchange, or solvent extraction so that low-level waste feed specifications can be met. Pacific Northwest Laboratory has investigated two methods for releasing organic-complexed strontium and TRU components to allow for effective pretreatment of tank waste supernatant: metal cation addition (to promote displacement and flocculation) and chemical oxidant (pennanganate) addition (to promote chelator destruction/defunctionalization and possibly flocculation). These methods, which can be conducted at near-ambient. temperatures and pressures, could be deployed as intank processes.

1433 (PNL–10772) **Chemical and radiation stability of SuperLig®644, resorcinol-formaldehyde, and CS-100 cesium ion exchange materials.** Brown, G.N. (and others); Adami, S.R.; Bray, L.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000819. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

At the request of the Initial Pretreatment Module Project within Westinghouse Hanford Company, Pacific Northwest Laboratory (PNL) conducted this study for the Efficient Separations and Processing Crosscutting Program (ESP) under the task "Develop and Test Sorbents." The purpose of the study was to assess and compare the chemical and radiolytic stability of several cesium-selective ion exchange materials in simulated alkaline Hanford tank waste matrices. Pretreatment of nuclear process wastes to remove of cesium and other radionuclides by ion exchange was proposed previously as one method of minimizing the amount of high-level radioactive waste at Hanford. In this study, PNL evaluated three cesium-selective materials SuperLig®644, resorcinol-formaldehyde (R-F), and CS-100 for chemical and radiation stability in 1 M NaOH and a simulated neutralized current acid waste (NCAW). The objective of the study is to investigate the stability of the newly produced SuperLig®644 under a variety of conditions in an attempt to simulate and predict the degradation process. The following specific conclusions and recommendations resulted from the study.

1434 (PNL–10773) **Hanford tank clean up: A guide to understanding the technical issues.** Gephart, R.E.; Lundgren, R.E. Pacific Northwest Lab., Richland, WA (United States). [1995]. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96004127. Source: OSTI; NTIS; INIS; GPO Dep.

One of the most difficult technical challenges in cleaning up the US Department of Energy's (DOE) Hanford Site in southeast Washington State will be to process the radioactive and chemically complex waste found in the Site's 177 underground storage tanks. Solid, liquid, and sludge-like wastes are contained in 149 single- and 28 double-shelled steel tanks. These wastes contain about one half of the curies of radioactivity and mass of hazardous chemicals found on the Hanford Site. Therefore, Hanford cleanup means tank cleanup. Safely removing the waste from the tanks, separating radioactive elements from inert chemicals, and creating a final waste form for disposal will require the use of our nation's best available technology coupled with scientific advances, and an extraordinary commitment by all involved. The purpose of this guide is to inform the reader about critical issues facing tank cleanup. It is written as an information resource for the general reader as well as the technically trained person wanting to gain a basic understanding about the waste in Hanford's tanks – how the waste was created, what is in the waste, how it is stored, and what are the key technical issues facing tank cleanup. Access to information is key to better understanding the issues and more knowledgeably participating in cleanup decisions. This guide provides such information without promoting a given cleanup approach or technology use.

1435 (PNL–10777) **Advanced organic analysis and analytical methods development: FY 1995 progress report. Waste Tank Organic Safety Program.** Wahl, K.L. (and others); Campbell, J.A.; Clauss, S.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000731. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the work performed during FY 1995 by Pacific Northwest Laboratory in developing and optimizing analysis techniques for identifying organics present in Hanford waste tanks. The main focus was to provide a means for rapidly obtaining the most useful information concerning the organics present in tank waste, with minimal sample handling and with minimal waste generation. One major focus has been to optimize analytical methods for organic speciation. Select methods, such as atmospheric pressure chemical ionization mass spectrometry and matrix-assisted laser desorption/ionization mass spectrometry, were developed to increase the speciation capabilities, while minimizing sample handling. A capillary electrophoresis method was developed to improve separation capabilities while minimizing additional waste generation. In addition, considerable emphasis has been placed on developing a rapid screening tool, based on Raman and infrared spectroscopy, for determining organic functional group content when complete organic speciation is not required. This capability would allow for a cost-effective means to screen the waste tanks to identify tanks that require more specialized and complete organic speciation to determine tank safety.

1436 (PNL–10778) **K-Basin spent nuclear fuel characterization data report.** Abrefah, J.; Gray, W.J.; Ketner, G.L.; Marschman, S.C.; Pyecha, T.D.; Thornton, T.A. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 180p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003600. Source: OSTI; NTIS; INIS; GPO Dep.

The spent nuclear fuel (SNF) project characterization activities will be furnishing technical data on SNF stored at the K Basins in support of a pathway for placement of a "stabilized" form of SNF into an interim storage facility. This report summarizes the results so far of visual inspection of the fuel samples, physical characterization (e.g., weight and immersion density measurements), metallographic examinations, and controlled atmosphere furnace testing of three fuel samples shipped from the KW Basin to the Postirradiation Testing Laboratory (PTL). Data on sludge material collected by filtering the single fuel element canister (SFEC) water are also discussed in this report.

1437 (PNL–10781) **The effect of dilution on the gas-retention behavior of Tank 241-SY-101 waste.** Bredt, P.R.; Tingey, S.M.; Shade, E.H. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000747. Source: OSTI; NTIS; INIS; GPO Dep.

The effect of dilution on gas retention in waste from Tank 241-SY-101 was investigated. A composite sample was prepared from material collected during the Window "C" and Window "E" sampling events. The composite contained material from both the convective and nonconvective layer in the proportions existing in the tank. Operation of the mixer pump in Tank 241-SY-101 has homogenized the tank material, and dilution of the current waste would require additional mixing; therefore, no attempt was made to use unhomogenized tank waste to prepare the composite. The composite was diluted with 2 M NaOH at ratios of 0.5:1, 0.75: 1, 1:1, and 3:1 per volume (2 M NaOH:tank waste).

1438 (PNL–10785) **Solubilities of gases in simulated Tank 241-SY-101 wastes.** Norton, J.D.; Pederson, L.R. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 35p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC06-76RL01830. Order Number DE96000713. Source: OSTI; NTIS; INIS; GPO Dep.

Oxygen, nitrogen, hydrogen, methane, and nitrous oxide solubilities were evaluated as a function of temperature in SYI-SIM-93B, a homogeneous simulated waste mixture containing sodium hydroxide, sodium nitrite, sodium nitrate, sodium aluminate, and sodium carbonate, the principal inorganic constituents of the wastes in Tank 241-SY-101. Ammonia solubility data for this simulated waste was obtained as a function of temperature in an earlier study. The choice of a homogeneous waste mixture in this study has the advantage of eliminating complications associated with a changing electrolyte concentration as a function of temperature that would be encountered with a slurry simulant. Dissolution is one of the means by which gases may be retained in Hanford Site wastes. While models are available to estimate gas solubilities in electrolyte solutions, few data are in existence that pertain to highly concentrated, multicomponent electrolytes such as those stored in Hanford Site waste tanks.

1439 (PNL–10794) **Organic tanks safety program FY95 waste aging studies.** Camaioni, D.M.; Samuels, W.D.; Clauss, S.A.; Lenihan, B.D.; Wahl, K.L.; Campbell, J.A.; Shaw, W.J. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003371. Source: OSTI; NTIS; INIS; GPO Dep.

This report gives the second year's findings of a study of how thermal and radiological processes may change the composition of organic compounds in the underground tanks at Hanford. Efforts were focused on the global reaction kinetics in a simulated waste exposed to γ rays and the reactions of organic radicals with nitrite ion. The gas production is predominantly radiolytic. Decarboxylation of carboxylates is probably an aging pathway. TBP was totaly consumed in almost every run. Radiation clearly accelerated consumption of the other compounds. EDTA is more reactive than citrate. Oximes and possibly organic nitro compounds are key intermediates in the radiolytic redox reactions of organic compounds with nitrate/nitrite. Observations are consistent with organic compounds being progressively degraded to compounds with greater numbers of C-O bonds and fewer C-H and C-C bonds, resulting in an overall lower energy content. If the radwaste tanks are adequately ventilated and continually dosed by radioactivity, their total energy content should have declined. Level of risk depends on how rapidly carboxylate salts of moderate energy content (including EDTA fragments) degrade to low energy oxalate and formate.

1440 (PNL–10797) **Probabilistic finite element modeling of waste rollover.** Khaleel, M.A. (Pacific Northwest Lab., Richland, WA (United States)); Cofer, W.F.; Al-fouqaha, A.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 40p. Sponsored by USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). DOE Contract AC06-87RL10930 ; AC06-76RL01830. Order Number DE96001146. Source: OSTI; NTIS; INIS; GPO Dep.

Stratification of the wastes in many Hanford storage tanks has resulted in sludge layers which are capable of retaining gases formed by chemical and/or radiolytic reactions. As the gas is produced, the mechanisms of gas storage evolve until the resulting buoyancy in the sludge leads to instability, at which point the sludge "rolls over" and a significant volume of gas is suddenly released. Because the releases may contain flammable gases, these episodes of release are potentially hazardous. Mitigation techniques are desirable for more controlled releases at more frequent intervals. To aid the mitigation efforts, a methodology for predicting of sludge rollover at specific times is desired. This methodology would then provide a rational basis for the development of a schedule for the mitigation procedures. In addition, a knowledge of the sensitivity of the sludge rollovers to various physical and chemical properties within the tanks would provide direction for efforts to reduce the frequency and severity of these events. In this report, the use of probabilistic finite element analyses for computing the probability of rollover and the sensitivity of rollover probability to various parameters is described.

1441 (PNL–10803) **A simplified model of saltcake moisture distribution. Letter report.** Simmons, C.S. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002935. Source: OSTI; NTIS; INIS; GPO Dep.

This letter report describes the formulation of a simplified model for finding the moisture distribution in a saltcake waste profile that has been stabilized by pumping out the drainable interstitial liquid. The model is based on assuming that capillarity mainly governs the distribution of moisture in the porous saltcake waste. A stead upward flow of moisture driven by evaporation from the waste surface is conceptualized to occur for isothermal conditions. To obtain hydraulic parameters for unsaturated conditions, the model is calibrated or matched to the relative saturation distribution as measured by neutron probe scans. The model is demonstrated on Tanks 104-BY and 105-TX as examples. A value of the model is that it identifies the key physical parameters that control the surface moisture content in a waste profile. Moreover, the model can be used to estimate the brine application rate at the waste surface that would raise the moisture content there to a safe level. Thus, the model can be applied to help design a strategy for correcting the moisture conditions in a saltcake waste tank.

1442 (PNL–10808) **Tank Vapor Characterization Project: Vapor space characterization of waste Tank A-101, Results from samples collected on June 8, 1995.** Pool, K.H.; Clauss, T.W.; McVeety, B.D.; Evans, J.C.; Thomas, B.L.; Olsen, K.B.; Fruchter, J.S.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003222. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the analytical results of vapor samples taken from the headspace of the waste storage tank 241-A-101 (Tank A-101) at the Hanford Site in Washington State. The results described in this report were obtained to characterize the vapors present in the tank headspace and to support safety evaluations and tank-farm operations. The results include air concentrations of selected inorganic and organic analytes and grouped compounds from samples obtained by Westinghouse Hanford Company (WHC) and provided for analysis to Pacific Northwest National Laboratory (PNL). Analyses were performed by the Vapor Analytical Laboratory (VAL) at PNL. Analyte concentrations were based on analytical results and, where appropriate, sample volumes provided by WHC. A summary of the results is listed in Table 1. Detailed descriptions of the analytical results appear in the text.

1443 (PNL–10809) **Tank Vapor Characterization Project. Headspace vapor characterization of Hanford Waste Tank AX-102: Results from samples collected on June 27, 1995.** Clauss, T.W.; Pool, K.H.; Evans, J.C.; McVeety, B.D.; Thomas, B.L.; Olsen, K.B.; Fruchter, J.S.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003173. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the analytical results of vapor samples taken from the headspace of the waste storage tank 241-AX-102 (Tank AX-102) at the Hanford Site in Washington State. The results described in this report were obtained to characterize the vapors present in the tank headspace and to support safety evaluations and tank-farm operations. The results include air concentrations of selected inorganic and organic analytes and grouped compounds from samples obtained by Westinghouse Hanford Company (WHC) and provided for analysis to Pacific Northwest Laboratory (PNL). Analyses were performed by the Vapor Analytical Laboratory (VAL) at PNL. Analyte concentrations were based on analytical results and, where appropriate, sample volumes provided by WHC. Detailed descriptions of the analytical results appear in the text.

1444 (PNL–10811) **Tank Vapor Characterization Project: Headspace vapor characterization of Hanford Waste Tank U-204, Results from samples collected on August 8, 1995.** Clauss, T.W.; Evans, J.C.; McVeety, B.D.; Pool, K.H.; Thomas, B.L.; Olsen, K.B.; Fruchter, J.S.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003224. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the analytical results of vapor samples taken from the headspace of the waste storage tank 241-U-204 (Tank U-204) at the Hanford Site in Washington State. The results described in this report were obtained to characterize the vapors present in the tank headspace and to support safety evaluations and tank-farm operations. The results include air concentrations of selected inorganic and organic analytes and grouped compounds from samples obtained by Westinghouse Hanford Company (WHC) and provided for analysis to Pacific Northwest National Laboratory (PNL). Analyses were performed by the Vapor Analytical Laboratory (VAL) at PNL. Analyte concentrations were based on analytical results and, where appropriate, sample volumes provided by WHC. A summary of the results is listed. Detailed descriptions of the analytical results appear in the text.

1445 (PNL–10812) **Tank Vapor Characterization Project: Headspace vapor characterization of Hanford Waste Tank U-203, Results from samples collected on August 8, 1995.** Pool, K.H.; Clauss, T.W.; Evans, J.C.; McVeety, B.D.; Thomas, B.L.; Olsen, K.B.; Fruchter, J.S.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003225. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the analytical results of vapor samples taken from the headspace of the waste storage tank 241-U-203 (Tank U-203) at the Hanford Site in Washington State. The results described in this report were obtained to characterize the vapors present in the tank headspace and to support safety evaluations and tank-farm operations. The results include air concentrations of selected inorganic and organic analytes and grouped compounds from samples obtained by Westinghouse Hanford Company (WHC) and provided for analysis to Pacific Northwest Laboratory (PNL). Analyses were performed by the Vapor Analytical Laboratory (VAL) at PNL. Analyte concentrations were based on analytical results and, where appropriate, sample volumes provided by WHC. A summary of the results is listed. Detailed descriptions of the analytical results appear in the text.

1446 (PNL–10813) **Vapor space characterization of waste Tank 241-U-103: Results from samples collected on 2/15/95.** Ligotke, M.W.; Pool, K.H.; Clauss, T.W.; McVeety, B.D.; Klinger, G.S.; Olsen, K.B.; Bredt, O.P.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002064. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage Tank 241-U-103 (referred to as Tank U-103). The results described her were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water vapor (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, 11 were observed above the 5-ppbv reporting cutoff. Eleven tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The 10 organic analytes with the highest estimated concentrations are listed in Table 1 and account for approximately 90% of the total organic components in Tank U-103. Two permanent gases, hydrogen (H_2) and nitrous oxide (N_2O), were also detected. Tank U-103 is on the Hydrogen Watch List.

1447 (PNL–10814) **Vapor space characterization of waste Tank 241-SX-103: Results from samples collected on 3/23/95.** Ligotke, M.W.; Clauss, T.W.; Pool, K.H.; McVeety, B.D.; Klinger, G.S.; Olsen, K.B.; Bredt, O.P.; Fruchter, J.S.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002057. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes inorganic and organic analyses results from samples obtained from the headspace of the Hanford waste storage tank 241-SX-103 (referred to as Tank SX-103). The results described here were obtained to support safety and toxicological evaluations. A summary of the results for inorganic and organic analytes is listed in Table 1. Detailed descriptions of the results appear in the text. Quantitative results were obtained for the inorganic compounds ammonia (NH_3), nitrogen dioxide (NO_2), nitric oxide (NO), and water vapor (H_2O). Sampling for hydrogen cyanide (HCN) and sulfur oxides (SO_x) was not requested. In addition, quantitative results were obtained for the 39 TO-14 compounds plus an additional 14 analytes. Of these, two were observed above the 5-ppbv reporting cutoff. Two tentatively identified compounds (TICs) were observed above the reporting cutoff of (ca.) 10 ppbv and are reported with concentrations that are semiquantitative estimates based on internal-standard response factors. The four organic analytes identified are listed in Table 1 and account for approximately 100% of the total organic components in Tank SX-103. Carbon dioxide (CO_2) was the only permanent gas detected in the tank-headspace samples. Tank SX-103 is on the Hydrogen Watch List.

1448 (PNL–10815) **Dilution physics modeling: Dissolution/precipitation chemistry.** Onishi, Y.; Reid, H.C.; Trent, D.S. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000813. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents progress made to date on integrating dilution/precipitation chemistry and new physical models into the TEMPEST thermal-hydraulics computer code. Implementation of dissolution/precipitation chemistry models is necessary for predicting nonhomogeneous, time-dependent, physical/chemical behavior of tank wastes with and without a variety of possible engineered remediation and mitigation activities. Such behavior includes chemical reactions, gas retention, solids resuspension, solids dissolution and generation, solids settling/rising, and convective motion of physical and chemical species. Thus this model development is important from the standpoint of predicting the consequences of various engineered activities, such as mitigation by dilution, retrieval, or pretreatment, that can affect safe operations. The integration of a dissolution/precipitation chemistry module allows the various phase species concentrations to enter into the physical calculations that affect the TEMPEST hydrodynamic flow calculations. The yield strength model of non-Newtonian sludge correlates yield to a power function of solids concentration. Likewise, shear stress is concentration-dependent, and the dissolution/precipitation chemistry calculations develop the species concentration evolution that produces fluid flow resistance changes. Dilution of waste with pure water, molar concentrations of sodium hydroxide, and other chemical streams can be analyzed for the reactive species changes and hydrodynamic flow characteristics.

1449 (PNL–10821) **Screening the Hanford tanks for trapped gas.** Whitney, P. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 365p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001141. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site is home to 177 large, underground nuclear waste storage tanks. Hydrogen gas is generated within the waste in these tanks. This document presents the results of a screening of Hanford's nuclear waste storage tanks for the presence of gas trapped in the waste. The method used for the screening is to look for an inverse correlation between waste level measurements and ambient atmospheric pressure. If the waste level in a tank decreases with an increase in ambient atmospheric pressure, then the compressibility may be attributed to gas trapped within the waste. In this report, this methodology is not used to estimate the volume of gas trapped in the waste. The waste level measurements used in this study were made primarily to monitor the tanks for leaks and intrusions. Four measurement devices are widely used in these tanks. Three of these measure the level of the waste surface. The remaining device measures from within a well embedded in the waste, thereby monitoring the liquid level even if the liquid level is below a dry waste crust. In the past, a steady rise in waste level has been taken as an indicator of trapped gas. This indicator is not part of the screening calculation described in this report; however, a possible explanation for the rise is given by the mathematical relation between atmospheric pressure and waste level used to support the screening calculation. The screening was applied to data from each measurement device in each tank. If any of these data for a single tank indicated trapped gas, that tank was flagged by this screening process. A total of 58 of the 177 Hanford tanks were flagged as containing trapped gas, including 21 of the 25 tanks currently on the flammable gas watch list.

1450 (PNL–10822) **Flammable Gas Safety Program: Mechanisms of gas generation from simulated SY Tank Farm wastes. Progress report, FY 1994.** Barefield, E.K. (Georgia Inst. of Tech., Atlanta, GA (United States). School of Chemistry and Biochemistry); Boadtright, D.; Deshpande, A.; Doctorovich, F.; Liotta, C.L.; Neumann, H.M.; Seymore, S. Pacific Northwest Lab., Richland, WA (United States); Georgia Inst. of Tech., Atlanta, GA (United States). School of Chemistry and Biochemistry. Sep 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001199. Source: OSTI; NTIS; INIS; GPO Dep.

This is the final report for work done at Georgia Tech during Fiscal Year 1994. The objectives of this work were to develop a better understanding of the mechanism of formation of flammable gases in the thermal decomposition of metal complexants, such as HEDTA and sodium glycolate, in simulated SY waste mixtures. This project is a continuation of work begun under earlier contracts with Westinghouse Hanford Co. Three major areas are discussed: development of a reliable analysis for dissolved ammonia, the initiation of long term studies of HEDTA decomposition in stainless steel vessels and product analyses through 3800 h, and further consideration of product analyses and kinetic data reported in FY 1993 for decomposition of HEDTA and sodium glycolate in Teflon-lined glass vessels. A brief exploration was also made of the speciation of aluminum(I1I) in the presence of HEDTA as a function of pH using ^{27}Al NMR.

1451 (PNL–10837) **Moisture measurement for high-level-waste tanks using copper activation probe in cone penetrometer.** Reeder, P.L.; Stromswold, D.C.; Brodzinski, R.L.; Reeves, J.H.; Wilson, W.E. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 50p. Sponsored by USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). DOE Contract AC06-87RL10930 ; AC06-76RL01830. Order Number DE96001812. Source: OSTI; NTIS; INIS; GPO Dep.

Laboratory tests have established the feasibility of using neutron activation of copper as a means for measuring the moisture in Hanford's high-level radioactive waste tanks. The performance of the neutron activation technique to measure moisture is equivalent to the neutron moisture gauges or neutron logs commonly used in commercial well-logging. The principle difference is that the activation of ^{64}Cu ($t_{1/2}$ = 12.7 h) replaces the neutron counters used in moisture gauges or neutron logs. For application to highly radioactive waste tanks, the Cu activation technique has the advantage that it is insensitive to very strong gamma radiation fields or high temperatures. In addition, this technique can be deployed through tortuous paths or in confined spaces such as within the bore of a cone penetrometer. However, the results are not available in "real-time". The copper probe's sensitivity to moisture was measured using simulated tank waste of known moisture content. This report describes the preparation of the simulated waste mixtures and the experiments performed to demonstrate the capabilities of the neutron activation technique. These experiments included determination of the calibration curve of count rate versus moisture content using a single copper probe, measurement of the calibration curve based on "near-field " to "far-field" counting ratios using a multiple probe technique, and profiling the activity of the copper probe as a function of the vertical height within a simulated waste barrel.

1452 (PNL–10840) **Historical Tank Content Estimate (HTCE) and sampling estimate comparisons.** Remund, K.M. (and others); Chen, G.; Hartley, S.A. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002679. Source: OSTI; NTIS; INIS; GPO Dep.

There has been a substantial effort over the years to characterize the waste content in Hanford's waste tanks. This characterization is vital to future efforts to retrieve, pretreat, and dispose of the waste in the proper manner. The present study is being conducted to help escalate this effort. This study compares estimates from two independent tank characterization approaches. One approach is based on tank sampling while the other is based on historical records. In order to statistically compare the two independent approaches, quantified variabilities (or uncertainty estimates) around the estimates of the mean concentrations are required. For the sampling-based estimates, the uncertainty estimates are provided in the Tank Characterization Reports (TCR's). However, the historically based estimates are determined from a model, and therefore possess no quantified variabilities. Steps must be taken to provide quantified variabilities for these estimates. These steps involve a parameter influence study (factorial experiment study) and an uncertainty analysis (Monte Carlo study) of the Historical Tank Content Estimate (HTCE). The purpose of the factorial experiment is to identify in the Hanford Defined Wastes (HDW) model which parameters, as they vary, have the largest effect on the HTCE. The results of this study provide the proper input parameters for the Monte Carlo study. The two estimates (HTCE and sampling-based) can then be compared. The purpose of the Monte Carlo study is to provide estimates of variability around the estimate derived the historical records.

1453 (PNL–10865) **In situ determination of rheological properties and void fraction: Hanford Waste Tank 241-SY-103.** Shepard, C.L. (Pacific Northwest Lab., Richland, WA (United States)); Stewart, C.W.; Alzheimer, J.M.; Terrones, G.; Chen, G.; Wilkins, N.E. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003562. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the operation of the void fraction instrument (VFI) and ball rheometer in Hanford Tank 241-SY-103. The two instruments were deployed through risers 17C and 22A in July and August 1995 to gather data on the gas content and rheology of the waste. The results indicate that the nonconvective sludge layer contains up to 12% void and an apparent viscosity of 104 to 105 cP with a yield strength less than 210 Pa. The convective layer measured zero void and had no measurable yield strength. Its average viscosity was about 45 cP, and the density was less than 1.5 g/cc. The average void fraction was 0.047 $\pm$ 0.015 at riser 17C and 0.091 $\pm$ 0.015 at riser 22A. The stored gas volume based on these void fraction measurements is 213 $\pm$ 42 M^3 at 1 atmosphere.

1454 (PNL–10870) **Running scenarios using the Waste Tank Safety and Operations Hanford Site model.** Stahlman, E.J. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003081. Source: OSTI; NTIS; INIS; GPO Dep.

Management of the Waste Tank Safety and Operations (WTS&O) at Hanford is a large and complex task encompassing 177 tanks and having a budget of over $500 million per year. To assist managers in this task, a model based on system dynamics was developed by the Massachusetts Institute of Technology. The model simulates the WTS&O at the Hanford Tank Farms by modeling the planning, control, and flow of work conducted by Managers, Engineers, and Crafts. The model is described in Policy Analysis of Hanford Tank Farm Operations with System Dynamics Approach (Kwak 1995b) and Management Simulator for Hanford Tank Farm Operations (Kwak 1995a). This document provides guidance for users of the model in developing, running, and analyzing results of management scenarios. The reader is assumed to have an understanding of the model and its operation. Important parameters and variables in the model are described, and two scenarios are formulated as examples.

1455 (PNL–10873) **Waste Tank Vapor Characterization Project: Annual status report for FY 1995.** Ligotke, M.W.; Fruchter, J.S.; Huckaby, J.L.; Birn, M.B.; McVeety, B.D.; Evans, J.C. Jr.; Pool, K.H.; Silvers, K.L.; Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003223. Source: OSTI; NTIS; INIS; GPO Dep.

This report compiles information collected during the Fiscal Year 1995 pertaining to the waste tank vapor characterization project. Information covers the following topics: project management; organic sampling and analysis; inorganic sampling and analysis; waste tank vapor data reports; and the waste tanks vapor database.

1456 (PNL–10890) **324 Building REC and HLV Tank Closure Plan.** Becker-Khaleel, B (Scienfific Ecology Group, Inc. Richland, WA (United States)); Schlick, K. Pacific Northwest Lab., Richland, WA (United States). Dec 1995. 91p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96006078. Source: OSTI; NTIS; INIS; GPO Dep.

This closure plan describes the activities necessary to close the 324 Radiochemical Engineering Cells (REC) and High-Level Vault (HLV) in accordance with the Washington State Dangerous Waste regulations. To provide a complete description of the activities required, the closure plan relies on information contained in the 324 Building B-Cell Safety Cleanout Project (BCCP) plans, the 324 Building REC HLV Interim Waste Management Plan (IWMP), the Project Management Plan for Nuclear Facilities Management 300 Area Compliance Program, and the 324 High Level Vault Interim Removal Action Project (project management plan [PMP]). The IWMP addresses the management of mixed waste in accordance with state and federal hazardous waste regulations. It provides a strategy for managing high-activity mixed waste in compliance with Resource Conservation and Recovery Act (RCRA) requirements or provides for an alternative management approach for the waste. The BCCP outlines the past, present, and future activities necessary for removing from B-Cell the solid waste, including mixed waste generated as a result of historical research and development (R&D) activities conducted in the cell. The BCCP also includes all records and project files associated with the B-Cell cleanout. This information is referenced throughout the closure plan. The PMP sets forth the plans, organization, and systems that Pacific Northwest National Laboratory (PNNL) will use to direct and control the 324 High-Level Vault Interim Removal Action Project. This project will develop and implement a treatment strategy that will remove and stabilize the inventory of liquid waste from the 324 HLV tanks. The PMP also provides for flushing and sampling the flush solution.

1457 (PNL–10893) **The effect of dilution on the gas retention behavior of Tank 241-SY- 103 waste.** Bredt, P.R.; Tingey, S.M. Pacific Northwest Lab., Richland, WA (United States). Jan 1996. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96004519. Source: OSTI; NTIS; INIS; GPO Dep.

Twenty-five of the 177 underground waste storage tanks on the Hanford Site have been placed on the Flammable Gas watch list. These 25 tanks, containing high-level waste generated during plutonium and uranium processing, have been identified as potentially capable of accumulating flammable gases above the lower flammability limit (Babad et al. 1991). In the case of Tanks 241-SY-101 and 241-SY-103, it has been proposed that diluting the tank waste may mitigate this hazard (Hudson et al. 1995; Stewart et al. 1994). The effect of dilution on the ability of waste from Tank 241-SY-103 to accumulate gas was studied at Pacific Northwest National Laboratory. A similar study has been completed for waste from Tank 241-SY-101 (Bredt et al. 1995). Because of the additional waste-storage volume available in Tank 241-SY-103 and because the waste is assumed to be similar to that currently in Tank 241-SY-101, Tank 241-SY-103 became the target for a demonstration of passive mitigation through in-tank dilution. In 1994, plans for the in-tank dilution demonstration were deferred pending a decision on whether to pursue dilution as a mitigation strategy. However, because Tank 241-SY-103 is an early retrieval target, determination of how waste properties vary with dilution will still be required.

1458 (PNL-SA–24044) **Carbonylation as a separation technique for removal of non-radioactive species for tank waste.** Visnapuu, A. (Bureau of Mines, Rolla, MO (United States). Rolla Research Center); Hollenberg, G.W.; Creed, R.F. Jr. Pacific Northwest Lab., Richland, WA (United States). May 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. U.S. Bureau of Mines. (CONF-9405155–3: 18. actinide separations conference, Durango, CO (United States), 23-26 May 1994). Order Number DE95014176. Source: OSTI; NTIS; INIS; GPO Dep.

Much of the waste generated from five decades of weapons production in the US Department of Energy complex contains highly radioactive constituents. With the high cost of permanent disposal space, it is necessary to separate as many of the nonradioactive species from the radioactive as possible. This paper discusses the transfer of carbonyl processing technology from mineral beneficiation and powder metallurgy operations to the separation of Fe and Ni from radioactively contaminated waste streams. Samples of simulated composite Hanford Tank Waste residue were first processed with a calcine/dissolution technique which resulted in a residue powder consisting of 31.9 pct Fe and 3.3 pct Ni. Because of the specification for waste glass compositions, these two constituents become important in determining the number of waste glass logs produced. Pyrometallurgical reduction of the residue powders, followed by subsequent carbonylation, extracted up to 92.0 pct of the Fe and 95.7 pct of the Ni. The resultant product contained as little as 4.9 pct Fe and 0.3 pct Ni. At this level, Fe would no longer be a limiting constituent in the waste glass.

1459 (PNL-SA–24720) **Hanford high level waste: Sample Exchange/Evaluation (SEE) Program.** King, A.G. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940815–113: SPECTRUM '94: international nuclear and hazardous waste management conference, Atlanta, GA (United States), 14-18 Aug 1994). Order Number DE95014639. Source: OSTI; NTIS; INIS; GPO Dep.

The Pacific Northwest Laboratory (PNL)/Analytical Chemistry Laboratory (ACL) and the Westinghouse Hanford Company (WHC)/Process Analytical Laboratory (PAL) provide analytical support services to various environmental restoration and waste management projects/programs at Hanford. In response to a US Department of Energy – Richland Field Office (DOE-RL) audit, which questioned the comparability of analytical methods employed at each laboratory, the Sample Exchange/Exchange (SEE) program was initiated. The SEE Program is a selfassessment program designed to compare analytical methods of the PAL and ACL laboratories using sitespecific waste material. The SEE program is managed by a collaborative, the Quality Assurance Triad (Triad). Triad membership is made up of representatives from the WHC/PAL, PNL/ACL, and WHC Hanford Analytical Services Management (HASM) organizations. The Triad works together to design/evaluate/implement each phase of the SEE Program.

1460 (PNL-SA–25033) **West Valley Demonstration Project full-scale canister impact tests.** Whittington, K.F. (Pacific Northwest Lab., Richland, WA (United States)); Alzheimer, J.M.; Lutz, C.E. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950917–17: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE96002632. Source: OSTI; NTIS; INIS; GPO Dep.

Five West Valley Nuclear Services (WVNS) high-level waste (HLW) canisters were impact tested during 1994 to demonstrate compliance with the drop test requirements of the Waste Acceptance Product Specifications. The specifications state that the canistered waste form must be able to survive a 7–m (23 ft) drop unbreached. The 10-gauge (0.125 in. wall thickness) stainless steel canisters were approximately 85% filled with simulated vitrified waste and weighed about 2100 kg (4600 lb). Each canister was dropped vertically from a height of 7 m (23 ft) onto an essentially unyielding surface. The integrity of the canister was determined by the application and analysis of strain circles, dimensional measurements, and helium leak testing. The canisters were also visually inspected before and after the drop for physical damage. The results of the impact test verify that the canisters survived the 7–m drops unbreached. Therefore, these results demonstrate that the reference canister meets the drop test specification of the Waste Acceptance Product Specification.

1461 (PNL-SA–25132) **Hazardous waste retrieval strategies using a high-pressure water jet scarifier.** Hatchell, B.K. (Pacific Northwest Lab., Richland, WA (United States)); Rinker, M.W.; Mullen, O.D. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9508192–1: 8. American water jet conference, Houston, TX (United States), 27-30 Aug 1995). Order Number DE96002631. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Dislodging and Conveyance Program is sponsored by the US Department of Energy Office of Technology Development to investigate waste dislodging and conveyance processes suitable for the retrieval of high-level radioactive waste. This program, represented by industry, national laboratories, and academia, has proposed a baseline technology of high-pressure water jet dislodging and pneumatic conveyance integrated as a scarifier as a means of retrieval of waste inside Hanford single-shell tanks. A testing program has been initiated to investigate system deployment techniques to determine appropriate mining strategies, level of control, sensor requirements, and address integration issues associated with deploying the scarifier by a long robotic manipulator arm. A test facility denoted the Hydraulics Testbed (HTB) is being constructed to achieve these objectives and to allow longer-duration, multiple-pass tests on large waste fields using a versatile gantry-style manipulator. Mining strategy tests with materials simulating salt cake and sludge waste forms will be conducted to evaluate the effectiveness of mining strategies, forces related to scarifier and conveyance line, and retrieval rate. This paper will describe the testbed facility and testing program and present initial test results to date.

1462 (PNL-SA–25954) **Noble metal-catalyzed homogeneous and heterogeneous processes in treating simulated nuclear waste media with formic acid.** King, R.B. (Univ. of Georgia, Athens, GA (United States)); Bhattacharyya, N.K.; Smith, H.D. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9509175–1: 8. international symposium on relations between homogeneous and heterogeneous catalysis, Balatonfuered (Hungary), 10-14 Sep 1995). Order Number DE96002718. Source: OSTI; NTIS; INIS; GPO Dep.

Simulants for the Hanford Waste Vitrification Plant feed containing the major non-radioactive components Al, Cd, Fe, Mn, Nd, Ni, Si, Zr, Na, CO_3^{2-}, NO_3-, and NO_2- were used to study reactions of formic acid at 90°C catalyzed by the noble metals Ru, Rh, and/or Pd found in significant quantities in uranium fission products. Such reactions were monitored using gas chromatography to analyze the CO_2, H_2, NO, and N_2O in the gas phase and a microammonia electrode to analyze the NH_4+/NH_3 in the liquid phase as a function of time. The following reactions have been studied in these systems since they are undesirable side reactions in nuclear waste processing: (1) Decomposition of formic acid to CO_2 + H_2 is undesirable because of the potential fire and explosion hazard of H_2. Rhodium, which was introduced as soluble $RhCl_3$-$3H_2O$, was found to be the most active catalyst for H_2 generation from formic acid above ~ 80°C in the presence of nitrite ion. The H_2 production rate has an approximate pseudo first-order dependence on the Rh concentration, (2) Generation of NH_3 from the formic acid reduction of nitrate and/or nitrite is undesirable because of a possible explosion hazard from NH_4NO_3 accumulation in a waste processing plant off-gas system. The Rh-catalyzed reduction of nitrogen-oxygen compounds to ammonia by formic acid was found to exhibit the following features: (a) Nitrate rather than nitrite is the principal source of NH_3. (b) Ammonia production occurs at the expense of hydrogen production. (c) Supported rhodium metal catalysts are more active than rhodium in any other form, suggesting that ammonia production involves heterogeneous rather than homogeneous catalysis.

1463 (PNL-SA–26071) **Waste forms based on Cs-loaded silicotitanates.** Balmer, M.L.; Bunker, B.C. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950401–18: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE95014169. Source: OSTI; NTIS; INIS; GPO Dep.

Silicotitanate ion exchange materials are being considered for removal of radioactive Cs and Sr from tank wastes at the Hanford site. The phase evolution as a function of heat treatment temperature for several sol gel derived compositions within the Cs_2O-SiO_2-TiO_2 system was investigated, in order to determine if an adequate waste form can be achieved by direct thermal conversion. The Cs leach rates and Cs loss during heat treatment of select materials were measured. Some compositions which contain large amounts of Ti melt to form a glass with reasonably low aqueous leach rates. A new Cs-silicotitanate material with a structure isomorphous to pollucite was discovered. This material forms at low temperatures (700–800 C) where Cs volatility is negligible. The silicotitanate-pollucite exhibits extremely low leach rates (1.42 g/m^2day) at 90 C, and has been identified as a promising waste form for Cs containment.

1464 (PNL-SA–26111) **Enterprise wide transparent information access.** Brown, J. Pacific Northwest Lab., Richland, WA (United States). May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505236–1: Sybase Users Group conference, Dallas, TX (United States), 15-18 May 1995). Order Number DE95014198. Source: OSTI; NTIS; INIS; GPO Dep.

The information management needs of the Department of Energy (DOE) represents a fertile domain for the development of highly sophisticated yet intuitive enterprise-wide computing solutions. These solutions must support business operations, research agendas, technology development efforts, decision support, and other application areas with a user base ranging from technical staff to the highest levels of management. One area of primary interest is in the Environmental Restoration and Waste Management Branch of DOE. In this arena, the issue of tracking and managing nuclear waste related to the long legacy of prior defense production and research programs is one of high visibility and great concern. The Tank Waste Information Network System (TWINS) application has been created by the Pacific Northwest Laboratory (PNL) for the DOE to assist in managing and accessing the information related to this mission. The TWINS solution addresses many of the technical issues faced by other efforts to provide integrated information access to a wide variety of stakeholders. TWINS provides secure transparent access to distributed heterogeneous multimedia information sources from around the DOE complex. The users interact with the information through a consistent user interface that presents the desired data in a common format regardless of the structure of the source information. The solutions developed by the TWINS project represent an integration of several technologies and products that can be applied to other mission areas within DOE and other government agencies. These solutions are now being applied to public and private sector problem domains as well. The successful integration and inter-operation of both commercial and custom modules into a flexible and extensible information architecture will help ensure that new problems facing DOE and other clients can be addressed more rapidly in the future by re-use of existing tools and techniques proven viable through the TWINS efforts.

1465 (PNL-SA–26219) **Chemical durability of simulated nuclear glasses containing water.** Li, H. (Pacific Northwest Lab., Richland, WA (United States)); Tomozawa, M. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950401–21: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE95014178. Source: OSTI; NTIS; INIS; GPO Dep.

The chemical durability of simulated nuclear waste glasses having different water contents was studied. Results from the product consistency test (PCT) showed that glass dissolution increased with water content in the glass. This trend was not observed during MCC-1 testing. This difference was attributed to the differences in reactions between glass and water. In the PCT, the glass network dissolution controlled the elemental releases, and water in the glass accelerated the reaction rate. On the other hand, alkali ion exchange with hydronium played an important role in the MCC-1. For the latter, the amount of water introduced into a leached layer from ion-exchange was found to be much greater than that of initially incorporated water in the glass. Hence, the initial water content has no effect on glass dissolution as measured by the MCC-1 test.

1466 (PNL-SA–26441) **High level waste at Hanford: Potential for waste loading maximization.** Hrma, P.R.; Bailey, A.W. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950917–18: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE96002608. Source: OSTI; NTIS; INIS; GPO Dep.

The loading of Hanford nuclear waste in borosilicate glass is limited by phase-related phenomena, such as crystallization or formation of immiscible liquids, and by breakdown of the glass structure because of an excessive concentration of modifiers. The phase-related phenomena cause both processing and product quality problems. The deterioration of product durability determines the ultimate waste loading limit if all processing problems are resolved. Concrete examples and mass-balance based calculations show that a substantial potential exists for increasing waste loading of high-level wastes that contain a large fraction of refractory components.

1467 (PNNL–10748) **Thermal and combined thermal and radiolytic reactions involving nitrous oxide, hydrogen, nitrogen, and ammonia in contact with tank 241-SY-101 simulated waste.** Bryan, S.A.; Pederson, L.R. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96009209. Source: OSTI; NTIS; INIS; GPO Dep.

Work described in this report was conducted at Pacific Northwest National Laboratory (PNNL) for the Flammable Gas Safety Project, the purpose of which is to develop information needed to support Westinghouse Hanford Company (WHC) in their efforts to ensure the safe interim storage of wastes at the Hanford Site. Described in this report are the results of tests to evaluate the rates of thermal and combined thermal and radiolytic reactions involving flammable gases in the presence of Tank 241-SY-101 simulated waste. Flammable gases generated by the radiolysis of water and by the thermal and radiolytic decomposition of organic waste constituents may themselves participate in further reactions. Examples include the decomposition of nitrous oxide to yield nitrogen and oxygen, the reaction of nitrous oxide and hydrogen to produce nitrogen and water, and the reaction of nitrogen and hydrogen to produce ammonia. The composition of the gases trapped in bubbles in the wastes might therefore change continuously as a function of the time that the gas bubbles are retained.

1468 (PNNL–10883) **Use of organic functional group concentrations as a means of screening for energetics.** Burgeson, I.E.; Bryan, S.A.; Camaioni, D.M.; Hallen, R.T.; Lerner, B.D.; Scheele, R.D. Pacific Northwest National Lab., Richland, WA (United States). Jun 1996. 89p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96014004. Source: OSTI; NTIS; INIS; GPO Dep.

One of the safety concerns associated with the waste tanks on the Hanford site is the presence of organics in a highly oxidizing environment that could potentially act as a fuel source to maintain a propagating reaction. To determine this risk, it is necessary to determine the amount of high enthalpy organics present in the tanks. Currently, the primary ways of obtaining this information are to either rely on tank-fill histories, which are often unreliable and do not account for waste-aging processes, or obtain samples from the tank and speciate the organics present through a series of analytical procedures. While organic speciation has been successful in providing very valuable information about organics present in the tanks and the waste aging processes that are occurring in general, it can be costly and time consuming analyzing a large number of waste tanks. Differential scanning calorimetry has previously been used to obtain heat of reaction measurements of Hanford tank waste samples. However, differential scanning calorimetry is shown here to inadequately measure calculated heats of reaction of simulant tank mixtures. Overall, the preliminary results presented here, suggest that indeed Fourier transform infrared and Raman spectroscopy would be useful screening tools for determination of C-H and COO- organic content in tank waste samples analyzed in a hot cell environment. These techniques however, are not truly quantitative for this application and would be primarily used for identifying tanks of potential safety concern that would require further, more detailed confirmatory analysis by organic speciation techniques.

1469 (PNNL–10927) **Waste mixing and diluent selection for the planned retrieval of Hanford Tank 241-SY-102: A preliminary assessment.** Onishi, Y.; Hudson, J.D. Pacific Northwest Lab., Richland, WA (United States). Jan 1996. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96004513. Source: OSTI; NTIS; INIS; GPO Dep.

This preliminary assessment documents a set of analyses that were performed to determine the potential for Hanford waste Tank 241-SY-102 waste properties to be adversely affected by mixing the current tank contents or by injecting additional diluent into the tank during sludge mobilization. As a part of this effort, the effects of waste heating that will occur as a result of mixer pump operations are also examined. Finally, the predicted transport behavior of the resulting slurries is compared with the waste acceptance criteria for the Cross-Site Transfer System (CSTS). This work is being performed by Pacific Northwest National Laboratory in support of Westinghouse Hanford Company's W-211 Retrieval Project. We applied the equilibrium chemical code, GMIN, to predict potential chemical reactions. We examined the potential effects of mixing the current tank contents (sludge and supernatant liquid) at a range of temperatures and, separately, of adding pure water at a volume ratio of 1:2:2 (sludge:supernatant liquid:water) as an example of further diluting the current tank contents. The main conclusion of the chemical modeling is that mixing the sludge and the supernate (with or without additional water) in Tank 241-SY-102 dissolves all sodium-containing solids (i.e., $NaNO_3(s)$, thenardite, $NaF(s)$, and halite), but does not significantly affect the amorphous $Cr(OH)_3$ and calcite phase distribution. A very small amount of gibbsite [$Al(OH)_3(s)$] might precipitate at 25°C, but a somewhat larger amount of gibbsite is predicted to dissolve at the higher temperatures. In concurrence with the reported tank data, the model affirmed that the interstitial solution within the sludge is saturated with respect to many of the solids species in the sludge, but that the supernatant liquid is not in saturation with many of major solids species in sludge. This indicates that a further evaluation of the sludge mixing could prove beneficial.

1470 (PNNL–10937) **A systematic look at Tank Waste Remediation System privatization.** Holbrook, J.H.; Duffy, M.A.; Vieth, D.L.; Sohn, C.L. Pacific Northwest National Lab., Richland, WA (United States). Jan 1996. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96011471. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Tank Waste Remediation System (TWRS) Program is to store, treat, immobilize, and dispose, or prepare for disposal, the Hanford radioactive tank waste in an environmentally sound, safe, and cost effective manner. Highly radioactive Hanford waste includes current and future tank waste plus the cesium and strontium capsules. In the TWRS program, as in other Department of Energy (DOE) clean-up activities, there is an increasing gap between the estimated funding required to enable DOE to meet all of its clean-up commitments and level of funding that is perceived to be available. Privatization is one contracting/management approach being explored by DOE as a means to achieve cost reductions and as a means to achieve a more outcome-oriented program. Privatization introduces the element of competition, a proven means of establishing true cost as well as achieving significant cost reduction.

1471 (PNNL–10945) **Fiscal year 1995 laboratory scale studies of Cs elution in Tank 8D-1 and sludge dissolution in tank 8D-2.** Sills, J.A.; Patello, G.K.; Roberts, J.S.; Wiemers, K.D.; Elmore, M.R.; Richmond, W.G.; Russell, R.L. Pacific Northwest Lab., Richland, WA (United States). Apr 1996. 257p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96009900. Source: OSTI; NTIS; INIS; GPO Dep.

During Phase I of West Valley Demonstration project waste remediation, an estimated 95% of the zeolite currently in tank 8D-1 will be transferred to tank 8D-2, leaving behind residual Cs-loaded zeolite which will require treatment to remove the Cs. After phase I vitrification, tank 8D-2 will contain residual waste from PUREX and THOREX and spent Cs-loaded zeolite. The residual waste will require treatment. Oxalic acid has been proposed for eluting Cs from zeolite in tank 8D-1 and dissolving radionuclides in tank 8D-2. Laboratory tests were performed to determine optimum Cs elution and sludge dissolution conditions and to evaluate effects of multiple contacts, long-term contacts, presence of corrosion products, lack of agitation, temperature of tank contents, and oxalic acid concentration. Mild steel corrosion tests were also conducted.

1472 (PNNL–10946) **Value-based performance measures for Hanford Tank Waste Remedition System (TWRS) Program.** Keeney, R.L.; von Winterfeldt, D. Pacific Northwest Lab., Richland, WA (United States). Jan 1996. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96006405. Source: OSTI; NTIS; INIS; GPO Dep.

The Tank Waste Remediation Systems (TWRS) Program is responsible for the safe storage, retrieval, treatment, and preparation for disposal of high-level waste currently stored in underground storage tanks at the Hanford site in Richland. The TWRS program has adopted a logical approach to decision making that is based on systems engineering and decision analysis (Westinghouse Hanford Company, 1995). This approach involves the explicit consideration of stakeholder values and an evaluation of the TWRS alternatives in terms of these values. Such evaluations need to be consistent across decisions. Thus, an effort was undertaken to develop a consistent, quantifiable set of measures that can be used by TVVRS to assess alternatives against the stakeholder values. The measures developed also met two additional requirements: 1) the number of measure should be relatively small; and 2) performance with respect to the measures should be relatively easy to estimate.

1473 (PNNL–10970) **Test for Fauske and Associates to perform tube propagation experiments with simulated Hanford tank wastes.** Carlson, C.D. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96006404. Source: OSTI; NTIS; INIS; GPO Dep.

This test plan, prepared at Pacific Northwest National Laboratory for Westinghouse Hanford Company, provides guidance for performing tube propagation experiments on simulated Hanford tank wastes and on actual tank waste samples. Simulant compositions are defined and an experimental logic tree is provided for Fauske and Associates (FAI) to perform the experiments. From this guidance, methods and equipment for small-scale tube propagation experiments to be performed at the Hanford Site on actual tank samples will be developed. Propagation behavior of wastes will directly support the safety analysis (SARR) for the organic tanks. Tube propagation may be the definitive tool for determining the relative reactivity of the wastes contained in the Hanford tanks. FAI have performed tube propagation studies previously on simple two- and three-component surrogate mixtures. The simulant defined in this test plan more closely represents actual tank composition. Data will be used to support preparation of criteria for determining the relative safety of the organic bearing wastes.

1474 (PNNL–10970-Rev.1) **Test plan for Fauske and Associates to perform tube propagation experiments with simulated Hanford tank wastes.** Carlson, C.D. (Pacific Northwest National Lab., Richland, WA (United States)); Babad, H. Pacific Northwest Lab., Richland, WA (United States). May 1996. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96010266. Source: OSTI; NTIS; INIS; GPO Dep.

1475 (PNNL–10971) **TWRS privatization support project waste characterization database development.** Pacific Northwest National Lab., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). Nov 1995. 331p. Sponsored by USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008765. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest National Laboratory requested support from ICF Kaiser Hanford Company in assembling radionuclide and chemical analyte sample data and inventory estimates for fourteen Hanford underground storage tanks: 241-AN-102, -104, -105, -106, and -107, 241-AP-102, -104, and -105, 241-AW-101, -103, and -105, 241 AZ-101 and -102; and 241-C-109. Sample data were assembled for sixteen radionuclides and thirty-five chemical analytes. The characterization data were provided to Pacific Northwest National Laboratory in support of the Tank Waste Remediation Services Privatization Support Project. The purpose of this report is to present the results and document the methodology used in preparing the waste characterization information data set to support the Tank Waste Remediation Services Privatization Support Project. This report describes the methodology used in assembling the waste characterization information and how that information was validated by a panel of independent technical reviewers. Also, contained in this report are the various data sets created: the master data set, a subset, and an unreviewed data set. The master data set contains waste composition information for Tanks 241-AN-102 and -107, 241-AP-102 and -105, 241-AW-101; and 241-AZ-101 and -102. The subset contains only the validated analytical sample data from the master data set. The unreviewed data set contains all collected but unreviewed sample data for Tanks 241-AN-104, -105, and -106; 241-AP-104; 241-AW-103 and-105; and 241-C-109. The methodology used to review the waste characterization information was found to be an accurate, useful way to separate the invalid or questionable data from the more reliable data. In the future, this methodology should be considered when validating waste characterization information.

1476 (PNNL–10971-Vol.1) **TWRS privatization support project waste characterization database development. Volume 1.** Brevick, C.H. (ICF Kaiser Hanford Co., Richland, WA (United States)). Pacific Northwest National Laboratory requested support from ICF Kaiser Hanford Company in assembling radionuclide and chemical analyte sample data and inventory estimates for fourteen Hanford under-ground storage tanks: 241-AN-102, -104, -105, -106, and -107, 241-AP-102, -104, and -105; 241-AW-101, -103, and -105, 241-AZ-101 and-102; and 241-C-109. Sample data were assembled for sixteen radio nuclides and thirty five chemical analytes. The characterization data were provided to Pacific Northwest National Laboratory in support of the Tank Waste Remediation Services Privatization Support Project. The purpose of this report is to present the results and document the methodology used in preparing the waste characterization information data set to support the Tank Waste Remediation Services Privatization Support Project. This report describes the methodology used in assembling the waste characterization information and how that information was validated by a panel of independent technical reviewers. Also, contained in this report are the various data sets created., the master data set, a subset, and an unreviewed data set .

1477 (PNNL–10971-Vol.2) **TWRS privatization support project waste characterization database development. Volume 2.** Brevick, C.H. (ICF Kaiser Hanford Co., Richland, WA (United States)). Pacific Northwest Lab., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). Nov 1995. 279p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008929. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

This appendix contains the radionuclide and chemical analyte subset data tables. These data tables contain all of the validated waste characterization information collected for the TWRS Privatization Support Project.

1478 (PNNL–10974) **Characterization and process technology capabilities for Hanford tank waste disposal.** Buelt, J.L.; Weimer, W.C.; Schrempf, R.E. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008849. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to describe the Pacific Northwest National Laboratory's (the Laboratory) capabilities in characterization and unit process and system testing that are available to support Hanford tank waste processing. This document is organized into two parts. The first section discusses the Laboratory's extensive experience in solving the difficult problems associated with the characterization of Hanford tank wastes, vitrified radioactive wastes, and other very highly radioactive and/or heterogeneous materials. The second section of this document discusses the Laboratory's radioactive capabilities and facilities for separations and waste form preparation/testing that can be used to Support Hanford tank waste processing design and operations.

1479 (PNNL–10976) **WVNS Tank Farm Process Support: Experimental evaluation of an inert gas (nitrogen) to mitigate external corrosion of high-level waste storage tanks.** Elmore, M.R. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96007092. Source: OSTI; NTIS; INIS; GPO Dep.

Corrosion of the carbon steel waste storage tanks at West Valley Nuclear Services continues to be of concern, especially as the planned duration of waste storage time increases and sludge washing operations are conducted. The external surfaces of Tanks 8D-1 and 8D-2 have been exposed for more than 10 years to water that has intruded into the tank vaults. Visual inspection of the external tank surfaces using a remote video camera has shown indications of heavy corrosion in localized areas on the tank walls. Tests on mild steel specimens under simulated tank vault conditions showed that corrosion is related to the availability of oxygen for the corrosion reactions; consequently, removing oxygen as one of the reactants should effectively eliminate corrosion. In terms of the waste tanks, excluding oxygen from the annular vault space, such as by continuous flushing with an inert gas, should substantially decrease corrosion of the external surfaces of the mild steel tanks (100% exclusion of oxygen is probably not practicable). Laboratory corrosion testing was conducted at Pacific Northwest National Laboratory to give a preliminary assessment of the ability of nitrogen-inerting to reduce steel corrosion. This report summarizes test results obtained after 18-month corrosion tests comparing "nitrogen-inerted" corrosion with "air-equilibrated" corrosion under simulated tank vault conditions.

1480 (PNNL–10978) **Gas generation from Tank 241-SY-103 waste.** Bryan, S.A.; King, C.M.; Pederson, L.R.; Forbes, S.V.; Sell, R.L. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96009073. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes progress made in evaluating mechanisms by which flammable gases are generated in Hanford double-shell tank wastes, based on the results of laboratory tests using actual waste from Tank 241-SY-103. The objective of this work is to establish the identity and stoichiometry of degradation products formed in actual tank wastes by thermal and radiolytic processes as a function of temperature. The focus of the gas generation tests on Tank 241-SY-103 samples is first the effect of temperature on gas generation (volume and composition). Secondly, gas generation from irradiation of Tank 241-SY-103 samples at the corresponding temperatures as the thermal-only treatments will be measured in the presence of an external radiation source (using a ^{137}Cs capsule). The organic content will be measured on a representative sample prior to gas generation experiments and again at the termination of heating and irradiation. The gas generation will be related to the extent of organic species consumption during heating. Described in this report are experimental methods used for producing and measuring gases generated at various temperatures from highly radioactive actual tank waste, and results of gas generation from Tank 241-SY-103 waste taken from its convective layer. The accurate measurement of gas generation rates from actual waste from highly radioactive waste tanks is needed to assess the potential for producing and storing flammable gases within the waste tanks. This report addresses the gas generation capacity of the waste from the convective layer of Tank 241-SY-103, a waste tank listed on the Flammable Gas Watch List due to its potential for flammable gas accumulation above the flammability limit.

1481 (PNNL–10980) **The incorporation of P, S, Cr, F, Cl, I, Mn, Ti, U, and Bi into simulated nuclear waste glasses: Literature study.** Langowski, M.H. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–T3C-95-111). Order Number DE96008426. Source: OSTI; NTIS; INIS; GPO Dep.

Waste currently stored on the Hanford Reservation in underground tanks will be into High Level Waste (HLW) and Low Level Waste (LLW). The HLW melter will high-level and transuranic wastes to a vitrified form for disposal in a geological repository. The LLW melter will vitrify the low-level waste which is mainly a sodium solution. Characterization of the tank wastes is still in progress, and the pretreatment processes are still under development Apart from tank-to-tank variations, the feed delivered to the HLW melter will be subject to process control variability which consists of blending and pretreating the waste. The challenge is then to develop glass formulation models which can produce durable and processable glass compositions for all potential vitrification feed compositions and processing conditions. The work under HLW glass formulation is to study and model glass and melt pro functions of glass composition and temperature. The properties of interest include viscosity, electrical conductivity, liquidus temperature, crystallization, immiscibility durability. It is these properties that determine the glass processability and ac waste glass. Apart from composition, some properties, such as viscosity are affected by temperature. The processing temperature may vary from 1050°C to 1550°C dependent upon the melter type. The glass will also experience a temperature profile upon cooling. The purpose of this letter report is to assess the expected vitrification feed compositions for critical components with the greatest potential impact on waste loading for double shell tank (DST) and single shell tank (SST) wastes. The basis for critical component selection is identified along with the planned approach for evaluation. The proposed experimental work is a crucial part of model development and verification.

1482 (PNNL–10981) **Hanford Waste Vitrification Plant hydrogen generation.** King, R.B. (and others); King, A.D. Jr.; Bhattacharyya, N.K. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PHTD–K0959). Order Number DE96008427. Source: OSTI; NTIS; INIS; GPO Dep.

The most promising method for the disposal of highly radioactive nuclear wastes is a vitrification process in which the wastes are incorporated into borosilicate glass logs, the logs are sealed into welded stainless steel canisters, and the canisters are buried in suitably protected burial sites for disposal. The purpose of the research supported by the Hanford Waste Vitrification Plant (HWVP) project of the Department of Energy through Battelle Pacific Northwest Laboratory (PNL) and summarized in this report was to gain a basic understanding of the hydrogen generation process and to predict the rate and amount of hydrogen generation during the treatment of HWVP feed simulants with formic acid. The objectives of the study were to determine the key feed components and process variables which enhance or inhibit the.production of hydrogen. Information on the kinetics and stoichiometry of relevant formic acid reactions were sought to provide a basis for viable mechanistic proposals. The chemical reactions were characterized through the production and consumption of the key gaseous products such as H_2. CO_2, N_20, NO, and NH_3. For this mason this research program relied heavily on analyses of the gases produced and consumed during reactions of the HWVP feed simulants with formic acid under various conditions. Such analyses, used gas chromatographic equipment and expertise at the University of Georgia for the separation and determination of H_2, CO, CO_2, N_2, N_2O and NO.

1483 (PNNL–10982) **Hanford waste vitrification plant hydrogen generation study: Preliminary evaluation of alternatives to formic acid.** King, R.B.; Bhattacharyya, N.K.; Kumar, V. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C94-03-02R). Order Number DE96008857. Source: OSTI; NTIS; INIS; GPO Dep.

Oxalic, glyoxylic, glycolic, malonic, pyruvic, lactic, levulinic, and citric acids as well as glycine have been evaluated as possible substitutes for formic acid in the preparation of feed for the Hanford waste vitrification plant using a nonradioactive feed stimulant UGA-12M1 containing substantial amounts of aluminum and iron oxides as well as nitrate and nitrite at 90C in the presence of hydrated rhodium trichloride. Unlike formic acid none of these carboxylic acids liberate hydrogen under these conditions and only malonic and citric acids form ammonia. Glyoxylic, glycolic, malonic, pyruvic, lactic, levulinic, and citric acids all appear to have significant reducing properties under the reaction conditions of interest as indicated by the observation of appreciable amounts of N_2O as a reduction product of,nitrite or, less likely, nitrate at 90C. Glyoxylic, pyruvic, and malonic acids all appear to be unstable towards decarboxylation at 90C in the presence of $Al(OH)_3$. Among the carboxylic acids investigated in this study the α-hydroxycarboxylic acids glycolic and lactic acids appear to be the most interesting potential substitutes for formic acid in the feed preparation for the vitrification plant because of their failure to produce hydrogen or ammonia or to undergo decarboxylation under the reaction conditions although they exhibit some reducing properties in feed stimulant experiments.

1484 (PNNL–10984) **PNL vitrification technology development project high-waste loaded high-level waste glasses for high-temperature melter: Letter report.** Kim, D.; Hrma, P.R. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008177. Source: OSTI; NTIS; INIS; GPO Dep.

For vitrification of high-level wastes (HLW) at the Hanford Site, a Joule-heated overflow type melter with bottom draining capability and capable of operating at temperatures up to 1500°C is being developed. The original proposed Hanford Waste Vitrification Plant (HWVP) melter used a 1150°C processing temperature and was tested using glasses with up to 28 wt% waste oxide loading for NCAW (Neutralized Current Acid Waste). The goal of the high-temperature melter (HTM) is the volume reduction of the final product and increase of the waste processing rate by processing high-waste loaded glasses at higher temperatures. This would dramatically decrease waste disposal and processing costs. The aim of glass development for the HTM is to determine compositions and melting temperatures for processible and acceptable glasses with a high waste loading. Glass property/composition models for viscosity and liquidus temperature developed in the Glass Envelope Definition (GED) study were used. The results of glass formulation and experimental testing are presented for NCAW and DST/SST (Double-Shell Tank/Single-Shell Tank) Blend waste. Although the purpose of this report was to summarize the glass development study with Blend waste only, the results with NCAW were needed because glass development with Blend waste was based on the results from the glass development study with NCAW.

1485 (PNNL–10986) **The effect of chromium oxide on the properties of simulated nuclear waste glasses.** Vojtech, O. (and others); Sussmilch, J.; Urbanec, Z. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 344p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C95-02-01V). Order Number DE96008339. Source: OSTI; NTIS; INIS; GPO Dep.

A study of the effect of chromium on the properties of selected glasses was performed in the frame of a Contract between Battelle, Pacific Northwest Laboratories and Nuclear Research Institute, ReZ. In the period from July 1994 to June 1995 two borosilicate glasses of special composition were prepared according to the PNL procedure and their physical and structural characteristics of glasses were studied. This Final Report contains a vast documentation on the properties of all glasses studied. For the preparation of the respective technology more detailed study of physicochemical properties and crystallinity of investigated systems would be desirable.

1486 (PNNL–10987) **Effect of composition and temperature on the properties of High-Level Waste (HLW) glasses melting above 1200°C (Draft).** Vienna, J.D. (and others); Hrma, P.R.; Schweiger, M.J. Pacific Northwest National Lab., Richland, WA (United States). Feb 1996. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008204. Source: OSTI; NTIS; INIS; GPO Dep.

Increasing the melting temperature of HLW glass allows an increase of waste loading (thus reducing product volume) and the production of more durable glasses at a faster melting rate. However, HLW glasses that melt at high temperatures differ in composition from glasses formulated for low temperature (~1150°C). Consequently, the composition of high-temperature glasses falls in a region previously not well tested or understood. This report represents a preliminary study of property/composition relationships of high-temperature Hanford HLW glasses using a one-component-at-a-time change approach. A test matrix has been designed to explore a composition region expected for high-temperature high-waste loading HLW glasses to be produced at Hanford. This matrix was designed by varying several key components (SiO_2, B_2O_3, Na_2O, Li_2O, Fe_2O_3, Al_2O_3, ZrO_2, Bi_2O_3, P_2O_5, UO_2, TiO_2, Cr_2O_3, and others) starting from a glass based on a Hanford HLW all-blend waste. Glasses were fabricated and tested for viscosity, glass transition temperature, electrical conductivity, crystallinity, liquidus temperature, and PCT release. The effect of individual components on glass properties was assessed using first- and second- order empirical models. The first-order component effects were compared with those from low-temperature HLW glasses.

1487 (PNNL–10988) **Feed specification for the double-shell tank/single shell tank waste blend for high-level waste vitrification process and melter testing.** Tracey, E.M.; Merz, M.D.; Patello, G.K.; Wiemers, K.D. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008007. Source: OSTI; NTIS; INIS; GPO Dep.

The High-Level Waste (HLW) Vitrification Program is developing technology for the Department of Energy to immobilize high-level and transuranic waste as glass for permanent disposal. In support of the program, Pacific Northwest Laboratory (PNL) is conducting laboratory-scale melter feed preparation studies and HLW melter testing which require a simulated HLW feed. The simulant HLW feed represents a blend of the waste from 177 single shell and double shell tanks. The waste blend composition is based on normalized track radionuclide components (TRAC), historical tank data, and assumptions on the pretreatment of the waste. The HLW simulant feed specification for the waste blend composition provides direction for the preparation of laboratory-scale and large-scale HLW blend simulant to be used in melter feed preparation studies and melter testing.

1488 (PNNL–10989) **Annual progress report to Battelle Pacific Northwest National Laboratories on prediction of phase separation of simulated nuclear waste glasses.** Sung, Y.M.; Tomozawa, M. Pacific Northwest National Lab., Richland, WA (United States). Feb 1996. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C95-02-01GG). Order Number DE96008726. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this research is to predict the immiscibility boundaries of multi-component borosilicate glasses, on which many nuclear waste glass compositions are based. The method used is similar to the prediction method of immiscibility boundaries of multi-component silicate glass systems successfully made earlier and is based upon the superposition of immiscibility boundaries of simple systems using an appropriate parameter. This method is possible because many immiscibility boundaries have similar shapes and can be scaled by a parameter. In the alkali and alkaline earth binary silicate systems, for example, the critical temperature and compositions were scaled using the Debye-Hueckel theory. In the present study on borosilicate systems, first, immiscibility boundaries of various binary alkali and alkaline borate glass systems (e.g. BaO-B_2O_3) were examined and their critical temperatures were evaluated in terms of Debye-Hueckel theory. The mixing effects of two alkali and alkaline-earth borate systems on the critical temperature were also explored. Next immiscibility boundaries of ternary borosilicate glasses (e.g. Na_2O-SiO_2-B_2O_3, K_2O-SiO_2-B_2O_3, Rb_2O-SiO_2-B_2O_3, and Cs_2O-SiO_2-B_2O_3) were examined. Their mixing effects are currently under investigation.

1489 (PNNL–10991) **Dry-out and low temperature calcination of DST/SST waste blend high temperature melter feed.** Smith, H.D.; Tracey, E.M. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008199. Source: OSTI; NTIS; !NIS; GPO Dep.

The FY1994 DST/SST blend was prepared in accordance with the DST/SST blend feed specification. The laboratory preparation steps and observations were compared with an existing experience base to verify the acceptability of the feed specification for simulant make-up. The most significant test results included a variety of features. Ferrocyanide breaks down to NH_3 plus formate, during the low-temperature calcining phase of the tests. Ferrocyanide displayed no redox reactivity with the nitrates and nitrites contained in the slurry in the absence of sugar. Sugar displays a redox reaction with the nitrates and nitrites in the blend similar to the redox. reaction observed in the LLW feed simulant. Boiling of a free flowing slurry occurs at temperatures below about 120°C. When about 45% of the total water loss has occurred, the feed slurry congeals and continues to lose water, shrinking and developing shrinkage cracks. Water stops coming off between 350°C and 400°C. Slurry shear strength and viscosity strongly increase as the weight percent solids increases from 20 wt% to 45 wt%. The 45 wt% solids corresponds to approximately a 40 % water loss. The principle beat sensitivity for this material is the exothermic reaction which is activated when the temperature exceeds about 250°C. The breakdown of ferrocyanide to ammonia and formate under strongly basic conditions may begin at temperatures less than 100°C, but the rate increased strongly with increasing temperature and appeared to be completed in the time of our tests. Differential thermal analysis (DTA) results on feed slurry without and with ferrocyanide showed only endothermic behavior. This is consistent with the dry out and low temperature calcine studies which did not indicate any exothermic behavior for the feed slurry with and without ferrocyanide.

1490 (PNNL–10992) **Evaluation of high-level waste vitrification feed preparation chemistry for an NCAW simulant, FY 1994: Alternate flowsheets (DRAFT).** Smith, H.D.; Merz, M.D.; Wiemers, K.D.; Smith, G.L. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 125p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008179. Source: OSTI; NTIS; INIS; GPO Dep.

High-level radioactive waste stored in tanks at the U.S. Department of Energy's (DOE's) Hanford Site will be pretreated to concentrate radioactive constituents and fed to the vitrification plant A flowsheet for feed preparation within the vitrification plant (based on the Hanford Waste Vitrification Plant (HWVP) design) called for HCOOH addition during the feed preparation step to adjust rheology and glass redox conditions. However, the potential for generating H_2 and NH_3 during treatment of high-level waste (HLW) with HCOOH was identified at Pacific Northwest Laboratory (PNL). Studies at the University of Georgia, under contract with Savannah River Technology Center (SRTC) and PNL, have verified the catalytic role of noble metals (Pd, Rh, Ru), present in the waste, in the generation of H_2 and NH_3. Both laboratory-scale and pilot-scale studies at SRTC have documented the H_2 and NH_3 generation phenomenal Because H_2 and NH_3 may create hazardous conditions in the vessel vapor space and offgas system of a vitrification plant, reducing the H_2 generation rate and the NH_3 generation to the lowest possible levels consistent with desired melter feed characteristics is important. The Fiscal Year 1993 and 1994 studies were conducted with simulated (non-radioactive), pre-treated neutralized current acid waste (NCAW). Neutralized current acid waste is a high-level waste originating from the plutonium/uranium extraction (PUREX) plant that has been partially denitrated with sugar, neutralized with NaOH, and is presently stored in double-shell tanks. The non-radioactive simulant used for the present study includes all of the trace components found in the waste, or substitutes a chemically similar element for radioactive or very toxic species. The composition and simulant preparation steps were chosen to best simulate the chemical processing characteristics of the actual waste.

1491 (PNNL–10996) **Minor component study for simulated high-level nuclear waste glasses (Draft).** Li, H.; Langowskim, M.H.; Hrma, P.R.; Schweiger, M.J.; Vienna, J.D.; Smith, D.E. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–T3C-95-125). Order Number DE96008249. Source: OSTI; NTIS; INIS; GPO Dep.

Hanford Site single-shell tank (SSI) and double-shell tank (DSI) wastes are planned to be separated into low activity (or low-level waste, LLW) and high activity (or high-level waste, HLW) fractions, and to be vitrified for disposal. Formulation of HLW glass must comply with glass processibility and durability requirements, including constraints on melt viscosity, electrical conductivity, liquidus temperature, tendency for phase segregation on the molten glass surface, and chemical durability of the final waste form. A wide variety of HLW compositions are expected to be vitrified. In addition these wastes will likely vary in composition from current estimates. High concentrations of certain troublesome components, such as sulfate, phosphate, and chrome, raise concerns about their potential hinderance to the waste vitrification process. For example, phosphate segregation in the cold cap (the layer of feed on top of the glass melt) in a Joule-heated melter may inhibit the melting process (Bunnell, 1988). This has been reported during a pilot-scale ceramic melter run, PSCM-19, (Perez, 1985). Molten salt segregation of either sulfate or chromate is also hazardous to the waste vitrification process. Excessive (Cr, Fe, Mn, Ni) spinel crystal formation in molten glass can also be detrimental to melter operation.

1492 (PNNL–11007) **Recycle Waste Collection Tank (RWCT) simulant testing in the PVTD feed preparation system.** Abrigo, G.P.; Daume, J.T.; Halstead, S.D.; Myers, R.L.; Beckette, M.R.; Freeman, C.J.; Hatchell, B.K. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 232p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–K101-C94-04-14E). Order Number DE96008350. Source: OSTI; NTIS; INIS; GPO Dep.

(This is part of the radwaste vitrification program at Hanford.) RWCT was to routinely receive final canister decontamination sand blast frit and rinse water, Decontamination Waste Treatment Tank bottoms, and melter off-gas Submerged Bed Scrubber filter cake. In order to address the design needs of the RWCT system to meet performance levels, the PNL Vitrification Technology (PVTD) program used the Feed Preparation Test System (FPTS) to evaluate its equipment and performance for a simulant of RWCT slurry. (FPTS is an adaptation of the Defense Waste Processing Facility feed preparation system and represents the initially proposed Hanford Waste Vitrification Plant feed preparation system designed by Fluor-Daniel, Inc.) The following were determined: mixing performance, pump priming, pump performance, simulant flow characterization, evaporator and condenser performance, and ammonia dispersion. The RWCT test had two runs, one with and one without tank baffles.

1493 (PNNL–11010) **Vitrification of noble metals containing NCAW simulant with an engineering scale melter (ESM): Campaign report.** Grunewald, W.; Roth, G.; Tobie, W.; Weisenburger, S.; Weiss, K.; Elliott, M.; Eyler, L.L. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 306p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PHTD–K967). Order Number DE96008349. Source: OSTI; NTIS; INIS; GPO Dep.

ESM has been designed as a 10th-scale model of the DWPF-type melter, currently the reference melter for nitrification of Hanford double shell tankwaste. ESM and related equipment have been integrated to the existing mockup vitrification plant VA-WAK at KfK. On June 2-July 10, 1992, a shakedown test using 2.61 m^3 of NCAW (neutralized current acid waste) simulant without noble metals was performed. On July 11-Aug. 30, 1992, 14.23 m^3 of the same simulant with nominal concentrations of Ru, Rh, and Pd were vitrified. Objective was to investigate the behavior of such a melter with respect to discharge of noble metals with routine glass pouring via glass overflow. Results indicate an accumulation of noble metals in the bottom area of the flat-bottomed ESM. About 65 wt% of the noble metals fed to the melter could be drained out, whereas 35 wt% accumulated in the melter, based on analysis of glass samples from glass pouring stream in to the canisters. After the melter was drained at the end of the campaign through a bottom drain valve, glass samples were taken from the residual bottom layer. The samples had significantly increased noble metals content (factor of 20-45 to target loading). They showed also a significant decrease of the specific electric resistance compared to bulk glass (factor of 10). A decrease of 10- 15% of the resistance between he power electrodes could be seen at the run end, but the total amount of noble metals accumulated was not yet sufficient enough to disturb the Joule heating of the glass tank severely.

1494 (PNNL–11013) **Evaluation of Phase II glass formulations for vitrification of Hanford Site low-level waste.** Feng, X. (and others); Hrma, P.R.; Schweiger, M.J. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–T3B-95-206). Order Number DE96008235. Source: OSTI; NTIS; INIS; GPO Dep.

A vendor glass formulation study was carried out at Pacific Northwest Laboratory (PNL), supporting the Phase I and Phase II melter vendor testing activities for Westinghouse Hanford Company. This study is built upon the LLW glass optimization effort that will be described in a separate report. For Phase I vendor melter testing, six glass formulations were developed at PNL and additional were developed by Phase I vendors. All the doses were characterized in terms of viscosity and chemical durability by the 7-day Product Consistency Test. Twelve Phase II glass formulations (see Tables 3.5 and 3.6) were developed to accommodate 2.5 wt% P_2O_5 and 1.0 wt% SO_3 without significant processing problems. These levels of P_2O_5 and SO_3 are expected to be the highest possible concentrations from Hanford Site LLW streams at 25 wt% waste loading in glass. The Phase H compositions formulated were 6 to 23 times more durable than the environmental assessment (EA) glass. They melt within the temperature range of 1160° to 1410°C to suit different melting technologies. The composition types include boron-free for volatilization sensitive melters; boron-containing glasses for cold-cap melters; Zr-containing, glasses for enhanced long-term durability; and Fe-containing glasses for reducing melting temperature and melt volatility while maintaining chemical durability.

1495 (PNNL–11015) **Compilation of information on melter modeling.** Eyler, L.L. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C95-03-01C1-Pt.A). Order Number DE96008259. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of the task described in this report is to compile information on modeling capabilities for the High-Temperature Melter and the Cold Crucible Melter and issue a modeling capabilities letter report summarizing existing modeling capabilities. The report is to include strategy recommendations for future modeling efforts to support the High Level Waste (HLW) melter development.

1496 (PNNL–11016) **Hanford high-level waste melter system evaluation data packages.** Elliott, M.L.; Shafer, P.J.; Lamar, D.A.; Merrill, R.A.; Grunewald, W.; Roth, G.; Tobie, W. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 365p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C95-03-01C4). Order Number DE96008348. Source: OSTI; NTIS; INIS; GPO Dep.

The Tank Waste Remediation System is selecting a reference melter system for the Hanford High-Level Waste vitrification plant. A melter evaluation was conducted in FY 1994 to narrow down the long list of potential melter technologies to a few for testing. A formal evaluation was performed by a Melter Selection Working Group (MSWG), which met in June and August 1994. At the June meeting, MSWG evaluated 15 technologies and selected six for more thorough evaluation at the Aug. meeting. All 6 were variations of joule-heated or induction-heated melters. Between the June and August meetings, Hanford site staff and consultants compiled data packages for each of the six melter technologies as well as variants of the baseline technologies. Information was solicited from melter candidate vendors to supplement existing information. This document contains the data packages compiled to provide background information to MSWG in support of the evaluation of the six technologies. (A separate evaluation was performed by Fluor Daniel, Inc. to identify balance of plant impacts if a given melter system was selected.)

1497 (PNNL–11018) **Letter report: Cold crucible melter assessment.** Elliott, M.L. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C94-04-20B). Order Number DE96008351. Source: OSTI; NTIS; INIS; GPO Dep.

One of the activities of the PNL Vitrification Technology Development (PVTD) Project is to assist the Tank Waste Remediation Systems (TWRS) Program in determining which melter systems should be performance tested for potential implementation in the high-level waste (HLW) vitrification plant. The Richland Operations Office (RL) has recommended that the Cold Crucible Melter (CCM) be evaluated as a candidate "next generation" melter. As a result, the CCM System Evaluation cost account was established under the PVTD Project so that the CCM could be initially assessed on a high-priority basis. This letter report summarizes a brief initial review and assessment of the CCM. Using the recommendations made in this document, Westinghouse Hanford Company (WHC) and RL will make a decision regarding the urgency of performance testing the CCM. If the decision is favorable, a subcontract will be negotiated for performance testing of a CCM using Hanford HLW simulants in a pilot-scale facility. Because of the aggressive nature of the schedule, the CCM evaluation was not rigorous. The evaluation consisted of a literature review and interviews with proponents of the technology during a recent trip to France. This letter report summarizes the evaluation and makes recommendations regarding further work in this area.

1498 (PNNL–11021) **Initial ACTR retrieval technology evaluation test material recommendations.** Powell, M.R. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96010133. Source: OSTI; NTIS; INIS; GPO Dep.

Millions of gallons of radiaoctive waste are contained in underground storage tanks at Hanford (SE Washington). Techniques for retrieving much of this waste from the storage tanks have been developed. Current baseline approach is to use sluice jets for single-shell tanks and mixer pumps for double-shell tanks. The Acquire Commercial Technology for Retrieval (ACTR) effort was initiated to identify potential improvements in or alternatives to the baseline waste retrieval methods. Communications with a variety of vendors are underway to identify improved methods that can be implemented at Hanford with little or no additional development. Commercially available retrieval methods will be evaluated by a combination of testing and system-level cost estimation. Current progress toward developing waste simulants for testing ACTR candidate methods is reported; the simulants are designed to model 4 different types of tank waste. Simulant recipes are given for wet sludge, hardpan/dried sludge,hard saltcake, and soft saltcake. Comparisons of the waste and simulant properties are documented in this report.

1499 (PNNL–11029) **Evaluation of HWVP feed preparation chemistry for an NCAW simulant – Fiscal Year 1991: Evaluation of offgas generation, reductant requirements and thermal stability: Technical report.** Wiemers, K.D.; Langowski, M.H.; Powell, M.R.; Larson, D.E. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008181. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Waste Vitrification Plant (HWVP) is being designed for the Department of Energy to immobilize pretreated radioactive high-level waste and transuranic waste as glass for permanent disposal. Laboratory studies were conducted to characterize HWVP slurry chemistry during selected processing steps, using pretreated Neutralized Current Acid Waste (NCAW) simulant. Laboratory tests were designed to provide bases for determining the potential for hazardous gas generation, making chemical adjustments for glass redox control, and assessing the potential for rapid exothermic reactions of dried NCAW slurry. Offgas generation rates and the total moles of gas released as a function of selected pretreated NCAW components and process variables were measured. An emphasis was placed on identifying conditions that initiate significant H_2 generation. Glass redox measurements, using $Fe^{+2}/\Sigma Fe$ as an indicator of the glass oxidation state, were made to develop guidelines for HCOOH addition. Thermal analyses of dried NCAW simulant were conducted to assess the potential of a rapid uncontrollable exothermic reaction in the chemical processing cell tanks.

1500 (PNNL–11033) **HWVP submerged bed scrubber waste treatment by ion exchange at high pH.** Bray, L.A.; Carson, K.J.; Elovich, R.J.; Eakin, D.E. Pacific Northwest National Lab., Richland, WA (United States). Mar 1996. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008203. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Waste Vitrification Plant (HWVP) is expected to produce aqueous waste streams that will require further processing for cesium, strontium, and transuranic (TRU) removal prior to incorporation into grout. Fluor Daniel, Inc. has recommended that zeolite be added to these waste streams for adsorption of cesium (Cs) and strontium (Sr) following pH adjustment by sodium hydroxide (NAOH) addition. Filtration will then used to remove the TRU elements associated with the process solids and the zeolite containing the Cs and Sr.

1501 (PNNL–11036) **OWL models update and use for TWRS strategy development.** Hoza, M. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C95-02-04A). Order Number DE96008335. Source: OSTI; NTIS; INIS; GPO Dep.

High Level Waste (HLW) at Hanford will be converted to a borosilicate glass for disposal. The glass will need to meet both processability and durability restrictions. The processability conditions will ensure that the glass has properties (viscosity, electrical conductivity, and liquidus temperature) within ranges known to be acceptable for the vitrification process. Durability restrictions will ensure that the resultant glass will meet quantitative criteria for disposal in a repository. An experimental program, the Composition Variation Study (CVS), is developing property models which correlate physical properties to glass compositions. Property models have been developed for the viscosity, electrical conductivity and liquidus temperature of the glass melt, and durability of the glass. The property models are described in the above report. Bounds on property values, limits on the composition of individual components in the glass, and other restrictions are also published in the report.

1502 (PNNL–11037) **Development of models and software for liquidus temperatures of glasses of HWVP products. Final report.** Hrma, P.R. (and others); Vienna, J.D.; Pelton, A.D. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008205. Source: OSTI; NTIS; INIS; GPO Dep.

In an earlier report [92 Pel] was described the development of software and thermodynamic databases for the calculation of liquidus temperatures of glasses of HWVP products containing the components SiO_2-B_2O_3-Na_2O-Li_2O-CaO-MgO-Fe_2O_3-Al_2O_3-ZrO_2-"others". The software package developed at that time consisted of the EQUILIB program of the F*A*C*T computer system with special input/output routines. Since then, Battelle has purchased the entire F*A*C*T computer system, and this fully replaces the earlier package. Furthermore, with the entire F*A*C*T system, additional calculations can be performed such as calculations at fixed O_2, SO_2 etc. pressures, or graphing of output. Furthermore, the public F*A*C*T database of over 5000 gaseous species and condensed phases is now accessible. The private databases for the glass and crystalline phases were developed for Battelle by optimization of thermodynamic and phase diagram data. That is, all available data for 2- and 3-component sub-systems of the 9-component oxide system were collected, and parameters of model equations for the thermodynamic properties were found which best reproduce all the data. For representing the thermodynamic properties of the glass as a function of composition and temperature, the modified quasichemical model was used. This model was described in the earlier report [92 Pel] along with all the optimizations. With the model, it was possible to predict the thermodynamic properties of the 9-component glass, and thereby to calculate liquidus temperatures. Liquidus temperatures measured by Battelle for 123 CVS glass compositions were used to test the model and to refine the model by the addition of further parameters.

1503 (PNNL–11039) **A summary report on feed preparation offgas and glass redox data for Hanford waste vitrification plant: Letter report.** Merz, M.D. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PHTD–C93-03-02L). Order Number DE96008423. Source: OSTI; NTIS; INIS; GPO Dep.

Tests to evaluate feed processing options for the Hanford Waste Vitrification Plant (HWVP) were conducted by a number of investigators, and considerable data were acquired for tests of different scale, including recent full-scale tests. In this report, a comparison was made of the characteristics of feed preparation observed in tests of scale ranging from 57 ml to full-scale of 28,000 liters. These tests included Pacific Northwest Laboratory (PNL) laboratory-scale tests, Kernforschungszentrums Karlsruhe (KfK) melter feed preparation, Research Scale Melter (RSM) feed preparation, Integrated DWPF Melter System (IDMS) feed preparation, Slurry Integrated Performance Testing (SIPT) feed preparation, and formic acid addition to Hanford Neutralized Current Acid Waste (NCAW) care samples.' The data presented herein were drawn mainly from draft reports and include system characteristics such as slurry volume and depth, sweep gas flow rate, headspace, and heating and stirring characteristics. Operating conditions such as acid feed rate, temperature, starting pH, final pH, quantities and type of frit, nitrite, nitrate, and carbonate concentrations, noble metal content, and waste oxide loading were tabulated. Offgas data for CO_2, NO_x, N_2O, NO_2, H_2 and NH_3 were tabulated on a common basis. Observation and non-observation of other species were also noted.

1504 (PNNL–11040) **HWVP NCAW melter feed rheology FY 1993 testing and analyses: Letter report.** Smith, P.A. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 197p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008182. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Waste Vitrification Plant (HWVP) program has been established to immobilize selected Hanford nuclear wastes before shipment to a geologic repository. The HWVP program is directed by the U.S. Department of Energy (DOE). The Pacific Northwest Laboratory (PNL) provides waste processing and vitrification technology to assist the design effort. The focus of this letter report is melter feed rheology, Process/Product Development, which is part of the Task in the PNL HWVP Technology Development (PHTD) Project. Specifically, the melter feed must be transported to the liquid fed ceramic melter (LFCM) to ensure

HWVP operability and the manufacture of an immobilized waste form. The objective of the PHTD Project slurry flow technology development is to understand and correlate dilute and concentrated waste, formatted waste, waste with recycle addition, and melter feed transport properties. The objectives of the work described in this document were to examine frit effects and several processing conditions on melter feed rheology. The investigated conditions included boiling time, pH, noble metal containing melter feed, solids loading, and aging time. The results of these experiments contribute to the understanding of melter feed rheology. This document is organized in eight sections. This section provides the introductory remarks, followed by Section 2.0 that contains conclusions and recommendations. Section 3.0 reviews the scientific principles, and Section 4.0 details the experimental methods. The results and discussion and the review of related rheology data are in Sections 5.0 and 6.0, respectively. Section 7.0, an analysis of NCAW melter feed rheology data, provides an overall review of melter feed with FY 91 frit. References are included in Section 8.0. This letter report satisfies contractor milestone PHTD C93-03.02E, as described in the FY 1993 Pacific Northwest Hanford Laboratory Waste Plant Technology Development (PHTD) Project Work Plan.

1505 (PNNL–11042) **Compilation of information on modeling of inductively heated cold crucible melters.** Lessor, D.L. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008033. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this communication, Phase B of a two-part report, is to present information on modeling capabilities for inductively heated cold crucible melters, a concept applicable to waste immobilization. Inductively heated melters are those in which heat is generated using coils around, rather than electrodes within, the material to be heated. Cold crucible or skull melters are those in which the melted material is confined within unmelted material of the same composition. This phase of the report complements and supplements Phase A by Loren Eyler, specifically by giving additional information on modeling capabilities for the inductively heated melter concept. Eyler discussed electrically heated melter modeling capabilities, emphasizing heating by electrodes within the melt or on crucible walls. Eyler also discussed requirements and resources for the computational fluid dynamics, heat flow, radiation effects, and boundary conditions in melter modeling; the reader is referred to Eyler's discussion of these. This report is intended for use in the High Level Waste (HLW) melter program at Hanford. We sought any modeling capabilities useful to the HLW program, whether through contracted research, code license for operation by Department of Energy laboratories, or existing codes and modeling expertise within DOE.

1506 (PNNL–11043) **Offgas characterization from the radioactive NCAW core sample (102-AZ-C1) and simulant during HWVP feed preparation testing: Letter report.** Langowski, M.H.; Morrey, E.V.; Tingey, J.M.; Beckette, M.R. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 89p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PHTD–C93-03-08A). Order Number DE96008425. Source: OSTI; NTIS; INIS; GPO Dep.

The primary objective of the Radioactive Process/Product Laboratory Testing (RPPLT) is to provide preliminary confirmation that the nonradioactive waste feed stimulant recipe is adequate for addressing the testing needs of design, safety, waste form qualification (WFO), and permitting of the Hanford Waste Vitrification Plant HWVP). The information contained In this letter report specifically addresses offgas production during the formating, digestion, and recycle addition of the third Neutralized Current Acid Waste (NCAW) core sample and core stimulant. Testing was conducted using a laboratory-scale version of the HWVP flowsheet.

1507 (PNNL–11045) **Detailed design data package: 3.1a-Film cooler pressure drop data; Item 3.2a - SBS packing selection; Item 3.2b, 3.2c - Pressure drop data for SBS distribution plate; and Item 3.2e - SBS distribution plate and liquid risers. PHTD pilot-scale melter testing system cost account milesonte 1.2.2.04.15A.** Whyatt, G.A.; Anderson, L.D.; Evans, J. II. National Renewable Energy Lab., Golden, CO (United States). Mar 1996. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008201. Source: OSTI; NTIS; INIS; GPO Dep.

This data package transmits information collected on the Liquid-Fed Ceramic Melter (LFCM) offgas system prior to melter feeding operations. Injection of steam to the melter plenum was used to simulate feeding of the melter. Steam surge cases were studied under steady-state surge conditions. Dynamic surges will be examined under data needs. The Fluor data needs included two blank tables requesting specific information for data needs 3.1 and 3.2. These tables are provided in Tables S.1 and S.2 below with the requested information filled in.

1508 (PNNL–11050) **Technical Note: Updated durability/composition relationships for Hanford high-level waste glasses.** Piepel, G.F.; Hartley, S.A.; Redgate, P.E. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–T3C-95-126). Order Number DE96008856. Source: OSTI; NTIS; INIS; GPO Dep.

This technical note presents empirical models developed in FYI 995 to predict durability as functions of glass composition. Models are presented for normalized releases of B, Li, Na, and Si from the 7-day Product Consistency Test (PCT) applied to quenched and canister centerline cooled (CCC) glasses as well as from the 28-day Materials Characterization Center-1 (MCC-1) test applied to quenched glasses. Models are presented for Composition Variation Study (CVS) data from low temperature melter (LTM) studies (Hrma, Piepel, et al. 1994) and high temperature melter (HTM) studies (Vienna et al. 1995). The data used for modeling in this technical note are listed in Appendix A.

1509 (PNNL–11051) **PNL vitrification technology development project glass formulation strategy for LLW vitrification.** Kim, D.; Hrma, P.R.; Westsik, J.H. Jr. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C95-02-01AD). Order Number DE96008859. Source: OSTI; NTIS; INIS; GPO Dep.

This Glass Formulation Strategy describes development approaches to optimize glass compositions for Hanford's low-level waste vitrification between now and the projected low-level waste facility start-up in 2005. The objectives of the glass formulation task are to develop optimized glass compositions with satisfactory long-term durability, acceptable processing characteristics, adequate flexibility to handle waste variations, maximize waste loading to practical limits, and to develop methodology to respond to further waste variations.

1510 (PNNL–11054) **Report for Westinghouse Hanford Company: Makeup procedures and characterization data for modified DSSF and modified remaining inventory simulated tank waste.** Lokken, R.O. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C95-02-03D). Order Number DE96008858. Source: OSTI; NTIS; INIS; GPO Dep.

The majority of defense wastes generated from reprocessing spent reactor fuel at Hanford are stored in underground Double-Shell Tanks (DST) and in older Single-Shell Tanks (SST). The Tank Waste Remediation System (TWRS) Program has the responsibility of safely managing and immobilizing these tank wastes for disposal. A reference process flowsheet is being developed that includes waste retrieval, pretreatment, and vitrification. Melter technologies for vitrifying low-level tank wastes are being evaluated by Westinghouse Hanford Company. Chemical simulants are being used in the technology testing. For the first phase of low-level waste (LLW) vitrification simulant development, two waste stream compositions were investigated. The first waste simulant was based on the analyses of six tanks of double-shell slurry feed (DSSF) waste and on the projected composition of the wastes exiting the pretreatment operations. A simulant normalized to 6 M sodium was based on the anticipated chemical concentrations after ion exchange and initial separations. The same simulant concentrated to 10 M sodium would represent a waste that had been concentrated by evaporation to reduce the overall volume. The second LLW simulant, referred to as the remaining inventory (RI), included wastes not included in the DSSF tanks and the projected LLW fraction of single-shell tank wastes.

1511 (PNNL–11067) **Final technical report: Atmospheric emission analysis for the Hanford Waste Vitrification plant.** Andrews, G.L.; Rhoads, K.C. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (HWVP–89-IVR0010101C). Order Number DE96008428. Source: OSTI; NTIS; INIS; GPO Dep.

This report is an assessment of chemical and radiological effluents that are expected to be released to the atmosphere from the Hanford Waste Vitrification Plant (HWVP). The report is divided into two sections. In the first section, the impacts of carbon monoxide (CO) and nitrogen oxides as NO_2 have been estimated for areas within the Hanford Site boundary. A description of the dispersion model used to estimate CO and NO_2 average concentrations and Hanford Site meteorological data has been included in this section. In the second section, calculations were performed to estimate the potential radiation doses to a maximally exposed off-site individual. The model used to estimate the horizontal and vertical dispersion of radionuclides is also discussed.

1512 (PNNL–11068) **Potential enhancements to addressing programmatic risk in the tank waste remediation system (TWRS) program.** Brothers, A.; Fassbender, L.; Bilyard, G.; Levine, L. Pacific Northwest Lab., Richland, WA (United States). Apr 1996. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96010454. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest National Laboratory (PNNL) conducted a Tank Waste Remediation System (TWRS) Risk Management methodology development task. The objective of this task was to develop risk management methodology focused on (1) the use of programmatic risk information in making TWRS architecture selection decisions and (2) the identification/evaluation/selection of TWRS risk-handling actions. Methods for incorporating programmatic risk/uncertainty estimates into trade studies are provided for engineers/analysts. Methods for identifying, evaluating, and selecting risk-handling actions are provided for managers. The guidance provided in this report is designed to help decision-makers make difficult judgments. Current approaches to architecture selection decisions and identification/evaluation/selection of risk-handling actions are summarized. Three categories of sources of programmatic risk (parametric, external, and organizational) are examined. Multiple analytical approaches are presented to enhance the current alternative generation and analysis (AGA) and risk-handling procedures. Appendix A describes some commercially available risk management software tools and Appendix B provides a brief introduction to quantification of risk attitudes. The report provides three levels of analysis for enhancing the AGA Procedure: (1) qualitative discussion coupled with estimated uncertainty ranges for scores in the alternatives-by-criteria matrix; (2) formal elicitation of probability distributions for the alternative scores; and (3) a formal, more structured, comprehensive risk analysis. A framework is also presented for using the AGA programmatic risk analysis results in making better decisions. The report also presents two levels of analysis for evaluation and selection of risk-handling actions: (1) qualitative analysis and judgmental rankings of alternative actions, and (2) Simple Multi-Attribute Rating Technique (SMART).

1513 (PNNL–11089) **The chemistry of sludge washing and caustic leaching processes for selected Hanford tank wastes.** Rapko, B.M.; Blanchard, D.L.; Colton, N.G.; Felmy, A.R.; Liu, J.; Lumetta, G.J. Pacific Northwest National Lab., Richland, WA (United States). Mar 1996. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96009074. Source: OSTI; NTIS; INIS; GPO Dep.

A broad-based study on washing and caustic leaching of Hanford tank sludges was performed in FY 1995 to gain a better understanding of the basic chemical processes that underlie this process. This approach involved testing of the baseline sludge washing and caustic leaching method on several Hanford tank sludges, and characterization of the solids both before and after testing by electron microscopy, X-ray diffraction, and X-ray absorption spectroscopy. A thermodynamically based model was employed to help understand the factors involved in individual specie distribution in the various stages of the sludge washing and caustic leaching treatment. The behavior of the important chemical and radiochemical components throughout the testing is summarized and reviewed in this report.

1514 (PNNL–11091) **Tanks Focus Area FY 1996 Site Needs Assessment.** Pacific Northwest National Lab., Richland, WA (United States). Mar 1996. 174p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008987. Source: OSTI; NTIS; INIS; GPO Dep.

The Tanks Focus Area's (TFA's) mission is to manage an integrated technology development program that results in the application of technology to safely and efficiently accomplish tank waste remediation across the US Department of

Energy (DOE) complex. The TFA uses a systematic process for developing its annual program that draws from the tanks technology development needs expressed by four DOE tank waste sites–Hanford, Idaho, Oak Ridge, and Savannah River Sites. The process is iterative and involves four steps: (1) identify and validate tank technology needs at these four sites, (2) define a technical program that responds to these needs, (3) select specific tasks and schedules that accomplish program objectives, and (4) develop integrated teams to carry out selected tasks. This document describes the first of these four steps: identification of sites' tank technology needs. This step concentrates solely on needs identification, collection, and validation. Funding requirements and specific scope of responsive technical activities are not considered until later steps in program definition. This year, the collection and validation of site needs were accomplished through written input from the Site Technology Coordination Groups (STCGs). The TFA recognizes the importance of a continuing solid partnership with the sites through the STCG and DOE as well as contractor users and, therefore, ensured site participation and close coordination throughout the process.

1515 (PNNL–11098) **Comparison of simulants to actual neutralized current acid waste: Process and product testing of three NCAW core samples from Tanks 101-AZ and 102-AZ.** Morrey, E.V.; Tingey, J.M. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 275p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008029. Source: OSTI; NTIS; INIS; GPO Dep.

A vitrification plant is planned to process the high-level waste (HLW) solids from Hanford Site tanks into canistered glass logs for disposal in a national repository. Programs have been established within the Pacific Northwest Laboratory Vitrification Technology Development (PVTD) Project to test and model simulated waste to support design, feed processability, operations, permitting, safety, and waste-form qualification. Parallel testing with actual radioactive waste is being performed on a laboratory-scale to confirm the validity of using simulants and glass property models developed from simulants. Laboratory-scale testing has been completed on three radioactive core samples from tanks 101-AZ and 102-AZ containing neutralized current acid waste (NCAW), which is one of the first waste types to be processed in the high-level waste vitrification plant under a privatization scenario. Properties of the radioactive waste measured during process and product testing were compared to simulant properties and model predictions to confirm the validity of simulant and glass property models work. This report includes results from the three NCAW core samples, comparable results from slurry and glass simulants, and comparisons to glass property model predictions.

1516 (PNNL–11120) **Comparison of organic and inorganic ion exchangers for removal of cesium and strontium from simulated and actual Hanford 241-AW-101 DSSF tank waste.** Brown, G.N. (and others); Bray, L.A.; Carlson, C.D. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96011468. Source: OSTI; NTIS; INIS; GPO Dep.

A number of organic and inorganic exchangers are being developed and evaluated for cesium removal from Hanford tank wastes. The exchangers of interest that are investigated in this work include powdered (IONSIV® IE-910; referred to as IE-910) and engineered (IONSIV® IE-911; referred to as IE-911) forms of the crystalline silico-titanate (CST) inorganic sorbent developed by Sandia National Laboratories (SNL)/Texas A and M and prepared by UOP; a phenol-formaldehyde (CS-100) resin developed by Rohm and Haas; a resorcinol-formaldehyde (R-F) polymer developed at the Westinghouse Savannah River Company (WSRC) and produced by Boulder Scientific; an inorganic zeolite exchanger produced by UOP (IONSIV® TIE-96; referred to as TIE-96); an inorganic sodium titanate produced by Allied Signal/Texas A and M (NaTi); and a macrocyclic organic resin developed and produced by IBC Advanced Technologies (SuperLig® 644; referred to as SL-644). Several of these materials are still under development and may not be in the optimal form. The work described in this report involves the direct comparison of the ion exchange materials for the pretreatment of actual and simulated Hanford tank waste. Data on the performance of all of the exchangers with simulated and actual double shell slurry feed (DSSF) is included. The DSSF waste is a mixture of the supernate from tanks 101-AW (70%), 106-AP (20%) and 102-AP (10%). The comparative parameters include radionuclide removal efficiency under a variety of conditions and material properties (e.g., bed density and percent removable water). Cesium and strontium distribution (K_d), lambda ($\lambda = K_d \times \rho_b$), and decontamination factors (DF) are compared as a function of exchanger contact duration, solution composition (Na and Cs concentration), exchanger/waste phase ratio, and multiple sequential contacts.

1517 (PNNL–11122) **Cesium ion exchange using actual waste: Column size considerations.** Brooks, K.P. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96011239. Source: OSTI; NTIS; INIS; GPO Dep.

It is presently planned to remove cesium from Hanford tank waste supernates and sludge wash solutions using ion exchange. To support the development of a cesium ion exchange process, laboratory experiments produced column breakthrough curves using wastes simulants in 200 mL columns. To verify the validity of the simulant tests, column runs with actual supernatants are being planned. The purpose of these actual waste tests is two-fold. First, the tests will verify that use of the simulant accurately reflects the equilibrium and rate behavior of the resin compared to actual wastes. Batch tests and column tests will be used to compare equilibrium behaviors and rate behaviors, respectively. Second, the tests will assist in clarifying the negative interactions between the actual waste and the ion exchange resin, which cannot be effectively tested with simulant. Such interactions include organic fouling of the resin and salt precipitation in the column. These effects may affect the shape of the column breakthrough curve. The reduction in column size also may change the shape of the curve, making the individual effects even more difficult to sort out. To simplify the evaluation, the changes due to column size must be either understood or eliminated. This report describes the determination of the column size for actual waste testing that best minimizes the effect of scale-down. This evaluation will provide a theoretical basis for the dimensions of the column. Experimental testing is still required before the final decision can be made. This evaluation will be confined to the study of CS-100 and R-F resins with NCAW simulant and to a limited extent DSSF waste simulant. Only the cesium loading phase has been considered.

1518 (PNNL–11127) **Glass formulation for phase 1 high-level waste vitrification.** Vienna, J.D.; Hrma, P.R. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96011467. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study is to provide potential glass formulations for prospective Phase 1 High-Level Waste (HLW) vitrification at Hanford. The results reported here will be used to aid in developing a Phase 1 HLW vitrification request for proposal (RFP) and facilitate the evaluation of ensuing proposals. The following factors were considered in the glass formulation effort: impact on total glass volume of requiring the vendor to process each of the tank compositions independently versus as a blend; effects of imposing typical values of B_2O_3 content and waste loading in HLW borosilicate glasses as restrictions on the vendors (according to WAPS 1995, the typical values are 5–10 wt% B_2O_3 and 20–40 wt% waste oxide loading); impacts of restricting the processing temperature to 1,150 C on eventual glass volume; and effects of caustic washing on any of the selected tank wastes relative to glass volume.

1519 (PNNL–11133) **Mechanisms of stability of armored bubbles: FY 1995 progress report.** Rossen, W.R.; Das, S.K. Pacific Northwest Lab., Richland, WA (United States). Apr 1996. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96010453. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental and theoretical studies of stabilization of liquid films between bubbles were undertaken as part of an effort to model gas release in waste tanks at the Hanford nuclear reservation. Synthetic Hanford waste created here showed solids accumulation at bubble surfaces and some stabilization of bubbles in a froth upon sparging with nitrogen. Dilational interfacial rheological measurements indicate increasing hydrophobicity with increasing EDTA concentration in the wastes. There is greater dilational elasticity of the interface with solid particles present on the interface. Theoretical modeling of a 2D liquid film between bubbles containing one row of solid particles suggests that in 3D such a film would be unstable unless the solids all touch. This hints at a possible mechanism for bubble stabilization, if it can be argued that slowly evolving interfaces, as bubbles grow toward each other in the sludge, have solids closely packed, but that rapid expansion of gas during a rollover event forces the films to expand without additional solids.

1520 (PNNL–11146) **Defining waste acceptance criteria for the Hanford Replacement Cross-Site Transfer System.** Hudson, J.D. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96010132. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a methodology for defining waste acceptance criteria for the Hanford Replacement Cross-Site Transfer System (RCSTS). This methodology includes characterization, transport analysis, and control. A framework is described for each of these functions. A tool was developed for performing the calculations associated with the transport analysis. This tool, a worksheet that is available in formats acceptable for a variety of PC spreadsheet programs, enables a comparison of the pressure required to transport a given slurry at a rate that particulate suspension is maintained to the pressure drop available from the RCSTS.

1521 (PNNL–11169) **Utility and infrastructure needs for private tank waste processing.** Reynolds, B.A. Pacific Northwest Lab., Richland, WA (United States). May 1996. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (WHC-SD-WM-DSD–002). Order Number DE96011223. Source: OSTI; NTIS; INIS; GPO Dep.

This document supports the development of the Draft TWRS Privatization RFP. The document provides summaries of a wide variety of utility infrastructure and support services that are available at the Hanford Site. The needs of the privatization contractors are estimated and compared to the existing infrastructure. Recommendations are presented on the preferred and alternate routes of supplying the identifies requirements.

1522 (PNNL–11186) **Comparison of vapor sampling system (VSS) and in situ vapor sampling (ISVS) methods on Tanks C-107, BY-108, and S-102.** Huckaby, J.L. (and others); Edwards, J.A.; Evans, J.C. Pacific Northwest National Lab., Richland, WA (United States). May 1996. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96011527. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this report is to evaluate the equivalency of two methods used to sample nonradioactive gases and vapors in the Hanford Site high-level waste tank headspaces. In addition to the comparison of the two sampling methods, the effects of an in-line fine particle filter on sampling results are also examined to determine whether results are adversely affected by its presence. This report discusses data from a January 1996 sampling.

1523 (PNNL–11211) **Ferrocyanide safety project ferrocyanide aging studies. Final report.** Lilga, M.A. (and others); Hallen, R.T.; Alderson, E.V. Pacific Northwest Lab., Richland, WA (United States). Jun 1996. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96013208. Source: OSTI; NTIS; INIS; GPO Dep.

This final report gives the results of the work conducted by Pacific Northwest National Laboratory (PNNL) from FY 1992 to FY 1996 on the Ferrocyanide Aging Studies, part of the Ferrocyanide Safety Project. The Ferrocyanide Safety Project was initiated as a result of concern raised about the safe storage of ferrocyanide waste intermixed with oxidants, such as nitrate and nitrite salts, in Hanford Site single-shell tanks (SSTs). In the laboratory, such mixtures can be made to undergo uncontrolled or explosive reactions by heating dry reagents to over 200°C. In 1987, an Environmental Impact Statement (EIS), published by the U.S. Department of Energy (DOE), Final Environmental Impact Statement, Disposal of Hanford Defense High-Level Transuranic and Tank Waste, Hanford Site, Richland, Washington, included an environmental impact analysis of potential explosions involving ferrocyanide-nitrate mixtures. The EIS postulated that an explosion could occur during mechanical retrieval of saltcake or sludge from a ferrocyanide waste tank, and concluded that this worst-case accident could create enough energy to release radioactive material to the atmosphere through ventilation openings, exposing persons offsite to a short-term radiation dose of approximately 200 mrem. Later, in a separate study (1990), the General Accounting Office postulated a worst-case accident of one to two orders of magnitude greater than that postulated in the DOE EIS. The uncertainties regarding the safety envelope of the Hanford Site ferrocyanide waste tanks led to the declaration of the Ferrocyanide Unreviewed Safety Question (USQ) in October 1990.

1524 (PNNL–11212) **Hydrogen and oxygen concentrations in IXCs: A compilation.** Liljegren, L.M.; Terrones, G.T.; Melethil, P.K. Pacific Northwest National Lab., Richland, WA (United States). Jun 1996. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96012242. Source: OSTI; NTIS; INIS; GPO Dep.

This paper contains four reports and two internal letters that address the estimation of hydrogen and oxygen concentrations in ion exchange columns that treat the water of the K-East and K-West Basins at Hanford. The concern is the flammability of this mixture of gases and planning for safe transport during decommissioning. A transient will occur when the hydrogen filter is temporarily blocked by a sandbag. Analyses are provided for steady-state, transients, and for both wet and dry resins.

1525 (PNNL–11222) **Probability of ignition of reactive wastes by rotary sampling drills.** Heasler, P.G. Pacific Northwest Lab., Richland, WA (United States). Jun 1996. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96013198. Source: OSTI; NTIS; INIS; GPO Dep.

Sampling with a rotary drill could potentially cause a fire in some Hanford tanks. If the rotary drill experiences a failure while in fuel-rich, dry waste, the waste could be ignited by the hot drill bit. For the saltcake tanks subject to this hazard, this report presents a methodology for calculating the probabilities of fire due to core drill failure. The methodology utilizes sampling data from tank characterization studies to determine the amount of reactive waste in the tanks.

1526 (PNNL–11233) **Oxidative dissolution of chromium from Hanford Tank sludges under alkaline conditions.** Rapko, B.M.; Lumetta, G.J.; Wagner, M.J. Pacific Northwest Lab., Richland, WA (United States). Jul 1996. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96013204. Source: OSTI; NTIS; INIS; GPO Dep.

Because of the expected high cost of vitrifying and disposing of high-level waste at the U.S. Department of Energy's Hanford Site, pretreatment processes are being developed to reduce the anticipated volume of borosilicate glass. Sludge washing and caustic leaching, the baseline sludge pretreatment process, is expected to leach out a substantial portion of the ^{137}Cs, possibly other radionuclides, and a significant portion of such major nonradionuclides as Al or P. The decontaminated solution will be routed to the low-level waste stream, where it will be immobilized in a glass matrix. The leached solids, which will contain the transuranic elements and ^{90}Sr, will be handled as high-level waste. Previous studies indicate that poor removal of chromium in the +3 oxidation state [Cr(III)] occurs during baseline pretreatment. Because the concentration of Cr allowed in high level waste glass is low, a relatively small amount of Cr in the sludge can have a relatively large impact on the volume of high level waste glass produced. For this reason, additional leach steps to remove Cr would be desirable, and oxidative alkaline leaching has been proposed as a simple addition to the baseline sludge pretreatment. This report describes small-scale screening tests on the oxidative alkaline leaching of Cr performed with actual Hanford tank sludges.

1527 (PNNL–11237) **Evaluation of the potential for significant ammonia releases from Hanford waste tanks.** Palmer, B.J.; Anderson, C.M.; Chen, G.; Cuta, J.M.; Ferryman, T.A.; Terrones, G. Pacific Northwest Lab., Richland, WA (United States). Jul 1996. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96013494. Source: OSTI; NTIS; INIS; GPO Dep.

Ammonia is ubiquitous as a component of the waste stored in the Hanford Site single-shell tanks (SSTs) and double-shell tanks (DSTs). Because ammonia is both flammable and toxic, concerns have been raised about the amount of ammonia stored in the tanks and the possible mechanisms by which it could be released from the waste into the head space inside the tanks as well as into the surrounding atmosphere. Ammonia is a safety issue for three reasons. As already mentioned, ammonia is a flammable gas and may contribute to a flammability hazard either directly, if it reaches a high enough concentration in the tank head space, or by contributing to the flammability of other flammable gases such as hydrogen (LANL 1994). Ammonia is also toxic and at relatively low concentrations presents a hazard to human health. The level at which ammonia is considered Immediately Dangerous to Life or Health (IDLH) is 300 ppm (WHC 1993, 1995). Ammonia concentrations at or above this level have been measured inside the head space in a number of SSTs. Finally, unlike hydrogen and nitrous oxide, ammonia is highly soluble in aqueous solutions, and large amounts of ammonia can be stored in the waste as dissolved gas. Because of its high solubility, ammonia behaves in a qualitatively different manner from hydrogen or other insoluble gases. A broader range of scenarios must be considered in modeling ammonia storage and release.

1528 (PNNL–11247) **Mechanisms of gas generation from simulated SY tank farm wastes: FY 1995 progress report.** Barefield, E.K.; Boatright, D.; Deshpande, A.; Doctorovich, F.; Liotta, C.L.; Neumann, H.M.; Seymore, S. Pacific Northwest Lab., Richland, WA (United States). Jul 1996. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96014096. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this work is to develop a better understanding of the mechanism of formation of flammable gases in the thermal decomposition of metal complexants such as HEDTA and sodium glycolate in simulated SY tank farm waste mixtures. This report summarizes the results of work done at the Georgia Institute of Technology in fiscal year 1995. Topics discussed are (1) long-term studies of the decomposition of HEDTA in simulated waste mixtures under an argon atmosphere at 90 and 120°C, including time profiles for disappearance of HEDTA and appearance of products and the quantitative analysis of the kinetic behavior; (2) considerations of hydroxylamine as an intermediate in the production of nitrogen containing gases by HEDTA decomposition; (3) some thoughts on the revision of the global mechanism for thermal decomposition of HEDTA under argon; (4) preliminary long-term studies of the decomposition of HEDTA in simulated waste under an oxygen atmosphere at 120°C; (5) estimation of the amount of NH_3 in the gas phase above HEDTA reaction mixtures; and (6) further, examination of the interaction of aluminum with nitrite ion using ^{27}Al NMR spectroscopy. Section 2 of this report describes the work conducted over the last three years at GIT. Section 3 contains a discussion of the kinetic behavior of HEDTA under argon; Section 4 discusses the role of hydroxylamine. Thermal decomposition of HEDTA to ED3A is the subject of Section 5, and decomposition of HEDTA in simulated waste mixtures under oxygen is covered in Section 6. In Section 7 we estimate ammonia in the gas phase; the role of aluminum is discussed in Section 8.

1529 (SAND–93-1000) **Data report on the Waste Isolation Pilot Plant Small-Scale Seal Performance Test, Series F grouting experiment.** Ahrens, E.H. (Sandia National Labs., Albuquerque, NM (United States)); Dale, T.F.; Van Pelt, R.S. Sandia National Labs., Albuquerque, NM (United States). Mar 1996. 341p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010871. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

SSSPT-F was designed to evaluate sealing materials at WIPP. It demonstrated: (1) the ability to practically and consistently produce ultrafine cementitious grout at the grouting site, (2) successful, consistent, and efficient injection and permeation of the grout into fractured rock at the repository horizon, (3) ability of the grout to penetrate and seal microfractures, (4) procedures and equipment used to inject the grout. Also techniques to assess the effectiveness of the grout in reducing the gas transmissivity of the fractured rock were evaluated. These included gas-flow/tracer testing, post-grout coring, pre- and post-grout downhole televiewer logging, slab displacement measurements, and increased loading on jacks during grout injection. Pre- and post-grout diamond drill core was obtained for use in ongoing evaluations of grouting effectiveness, degradation, and compatibility. Diamond drill equipment invented for this test successfully prevented drill cuttings from plugging fractures in grout injection holes.

1530 (SAND–93-1378) **An introduction to the mechanics of performance assessment using examples of calculations done for the Waste Isolation Pilot Plant between 1990 and 1992.** Rechard, R.P. Sandia National Labs., Albuquerque, NM (United States). Oct 1995. 301p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96004113. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides an overview of the process used to assess the performance of the Waste Isolation Pilot Plant (WIPP), a proposed repository for transuranic wastes that is located in southeastern New Mexico. The quantitative metrics used in the performance-assessment (PA) process are those put forward in the Environmental Protection Agency's Environmental Standards for the Management and Disposal of Spent Nuclear Fuel, High-Level and Transuranic Radioactive flasks (40 CFR 191). Much has been written about the individual building blocks that comprise the foundation of PA theory and practice, and that WIPP literature is well cited herein. However, the present approach is to provide an accurate, well documented overview of the process, from the perspective of the mechanical steps used to perform the actual PA calculations. Specifically, the preliminary stochastic simulations that comprise the WIPP PAs of 1990, 1991. and 1992 are summarized.

1531 (SAND–93-1986) **Coupled multiphase flow and closure analysis of repository response to waste-generated gas at the Waste Isolation Pilot Plant (WIPP).** Freeze, G.A. (INTERA Inc., Austin, TX (United States)); Larson, K.W.; Davies, P.B. Sandia Labs., Livermore, CA (United States). Oct 1995. 500p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96004541. Source: OSTI; NTIS; INIS; GPO Dep.

A long-term assessment of the Waste Isolation Pilot Plant (WIPP) repository performance must consider the impact of gas generation resulting from the corrosion and microbial degradation of the emplaced waste. A multiphase fluid flow code, TOUGH2/EOS8, was adapted to model the processes of gas generation, disposal room creep closure, and multiphase (brine and gas) fluid flow, as well as the coupling between the three processes. System response to gas generation was simulated with a single, isolated disposal room surrounded by homogeneous halite containing two anhydrite interbeds, one above and one below the room. The interbeds were assumed to have flow connections to the room through high-permeability, excavation-induced fractures. System behavior was evaluated by tracking four performance measures: (1) peak room pressure; (2) maximum brine volume in the room; (3) total mass of gas expelled from the room; and (4) the maximum gas migration distance in an interbed. Baseline simulations used current best estimates of system parameters, selected through an evaluation of available data, to predict system response to gas generation under best-estimate conditions. Sensitivity simulations quantified the effects of parameter uncertainty by evaluating the change in the performance measures in response to parameter variations. In the sensitivity simulations, a single parameter value was varied to its minimum and maximum values, representative of the extreme expected values, with all other parameters held at best-estimate values. Sensitivity simulations identified the following parameters as important to gas expulsion and migration away from a disposal room: interbed porosity; interbed permeability; gas-generation potential; halite permeability; and interbed threshold pressure. Simulations also showed that the inclusion of interbed fracturing and a disturbed rock zone had a significant impact on system performance.

1532 (SAND–94-0251) **A summary of methods for approximating salt creep and disposal room closure in numerical models of multiphase flow.** Freeze, G.A. (INTERA, Inc., Albuquerque, NM (United States)); Larson, K.W.; Davies, P.B. Sandia National Labs., Albuquerque, NM (United States). Oct 1995. 240p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96004115. Source: OSTI; NTIS; INIS; GPO Dep.

Eight alternative methods for approximating salt creep and disposal room closure in a multiphase flow model of the Waste Isolation Pilot Plant (WIPP) were implemented and evaluated: Three fixed-room geometries three porosity functions and two fluid-phase-salt methods. The pressure-time-porosity line interpolation method is the method used in current WIPP Performance Assessment calculations. The room closure approximation methods were calibrated against a series of room closure simulations performed using a creep closure code, SANCHO. The fixed-room geometries did not incorporate a direct coupling between room void volume and room pressure. The two porosity function methods that utilized moles of gas as an independent parameter for closure coupling. The capillary backstress method was unable to accurately simulate conditions of re-closure of the room. Two methods were found to be accurate enough to approximate the effects of room closure; the boundary backstress method and pressure-time-porosity line interpolation. The boundary backstress method is a more reliable indicator of system behavior due to a theoretical basis for modeling salt deformation as a viscous process. It is a complex method and a detailed calibration process is required. The pressure lines method is thought to be less reliable because the results were skewed towards SANCHO results in simulations where the sequence of gas generation was significantly different from the SANCHO gas-generation rate histories used for closure calibration. This limitation in the pressure lines method is most pronounced at higher gas-generation rates and is relatively insignificant at lower gas-generation rates. Due to its relative simplicity, the pressure lines method is easier to implement in multiphase flow codes and simulations have a shorter execution time.

1533 (SAND–94-0890) **A sensitivity analysis of the WIPP disposal room model: Phase 1.** Labreche, D.A. (RE/SPEC, Inc., Albuquerque, NM (United States)); Beikmann, M.A.; Osnes, J.D.; Butcher, B.M. Sandia National Labs., Albuquerque, NM (United States). Jul 1995. 321p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95016749. Source: OSTI; NTIS; INIS; GPO Dep.

The WIPP Disposal Room Model (DRM) is a numerical model with three major components constitutive models of TRU waste, crushed salt backfill, and intact halite – and several secondary components, including air gap elements, slidelines, and assumptions on symmetry and geometry. A sensitivity analysis of the Disposal Room Model was initiated on two of the three major components (waste and backfill models) and on several secondary components as a group. The immediate goal of this component sensitivity analysis (Phase I) was to sort (rank) model parameters in terms of their relative importance to model response so that a Monte Carlo analysis on a reduced set of DRM parameters could be performed under Phase II. The goal of the Phase II analysis will be to develop a probabilistic definition of a disposal room porosity surface (porosity, gas volume, time) that could be used in WIPP Performance Assessment analyses. This report documents a literature survey which quantifies the relative importance of the secondary room components to room closure, a differential analysis of the creep consolidation model and definition of a follow-up Monte Carlo analysis of the model, and an analysis and refitting of the waste component data on which a volumetric plasticity model of TRU drum waste is based. A summary, evaluation of progress, and recommendations for future work conclude the report.

1534 (SAND–94-0991) **Tracing early breccia pipe studies, Waste Isolation Pilot Plant, southeastern New Mexico: A study of the documentation available and decision-making during the early years of WIPP.** Power, D.W. (HC 12, Anthony, TX (United States)). Sandia National Labs., Albuquerque, NM (United States). Jan 1996. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96004946. Source: OSTI; NTIS; INIS; GPO Dep.

Breccia pipes in southeastern New Mexico are local dissolution-collapse features that formed over the Capitan reef more than 500,000 years ago. During early site studies for the Waste Isolation Pilot Plant (WIPP), the threat to isolation by these features was undetermined. Geophysical techniques, drilling, and field mapping were used beginning in 1976 to study breccia pipes. None were found at the WIPP site, and they are considered unlikely to be a significant threat even if undetected. WIPP documents related to breccia pipe studies were assembled, inspected, and analyzed, partly to present a history of these studies. The main objective is to assess how well the record reflects the purposes, results, and conclusions of the studies from concept to decision-making. The main record source was the Sandia WIPP Central File (SWCF). Early records (about 1975 to 1977) are very limited, however, about details of objectives and plans predating any investigation. Drilling programs from about 1977 were covered by a broadly standardized statement of work, field operations plan, drilling history, and basic data report. Generally standardized procedures for peer, management, and quality assurance review were developed during this time. Agencies such as the USGS conducted projects according to internal standards. Records of detailed actions for individual programs may not be available, though a variety of such records were found in the SWCF. A complete written record cannot be reconstructed. With persistence, a professional geologist can follow individual programs, relate data to objectives (even if implied), and determine how conclusions were used in decision-making. 83 refs.

1535 (SAND–94-1376) **WIPP Benchmark calculations with the large strain SPECTROM codes.** Callahan, G.D. (RE/SPEC, Inc., Rapid City, SD (United States)); DeVries, K.L. Sandia National Labs., Albuquerque, NM (United States); RE/SPEC, Inc., Rapid City, SD (United States). Aug 1995. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95016954. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides calculational results from the updated Lagrangian structural finite-element programs SPECTROM-32 and SPECTROM-333 for the purpose of qualifying these codes to perform analyses of structural situations in the Waste Isolation Pilot Plant (WIPP). Results are presented for the Second WIPP Benchmark (Benchmark II) Problems and for a simplified heated room problem used in a parallel design calculation study. The Benchmark II problems consist of an isothermal room problem and a heated room problem. The stratigraphy involves 27 distinct geologic layers including ten clay seams of which four are modeled as frictionless sliding interfaces. The analyses of the Benchmark II problems consider a 10-year simulation period. The evaluation of nine structural codes used in the Benchmark II problems shows that inclusion of finite-strain effects is not as significant as observed for the simplified heated room problem, and a variety of finite-strain and small-strain formulations produced similar results. The simplified heated room problem provides stratigraphic complexity equivalent to the Benchmark II problems but neglects sliding along the clay seams. The simplified heated problem does, however, provide a calculational check case where the small strain-formulation produced room closures about 20 percent greater than those obtained using finite-strain formulations. A discussion is given of each of the solved problems, and the computational results are compared with available published results. In general, the results of the two SPECTROM large strain codes compare favorably with results from other codes used to solve the problems.

1536 (SAND–94-1495) **Variability in properties of Salado Mass Concrete.** Wakeley, L.D. (US Army Engineer Waterways Experiment Station, Vicksburg, MS (United States)); Harrington, P.T.; Hansen, F.D. Sandia National Labs., Albuquerque, NM (United States). Aug 1995. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95016731. Source: OSTI; NTIS; INIS; GPO Dep.

Salado Mass Concrete (SMC) has been developed for use as a seal component in the Waste Isolation Pilot Plant. This concrete is intended to be mixed from pre-bagged materials, have an initial slump of 10 in., and remain pumpable and placeable for two hours after mixing. It is a mass concrete because it will be placed in monoliths large enough that the heat generated during cement hydration has the potential to cause thermal expansion and subsequent cracking, a phenomenon to avoid in the seal system. This report describes effects on concrete properties of changes in ratio of water to cement, batch size, and variations in characteristics of different lots of individual components of the concrete. The research demonstrates that the concrete can be prepared from laboratory-batched or pre-bagged dry materials in batches from 1.5 ft^3 to 5.0 yd^3, with no chemical admixtures other than the sodium chloride added to improve bonding with the host rock, at a water-to-cement ratio ranging from 0.36 to 0.42. All batches prepared according to established procedures had adequate workability for at least 1.5 hours, and achieved or exceeded the target compressive strength of 4500 psi at 180 days after casting. Portland cement and fly ash from different lots or sources did not have a measurable effect on concrete properties, but variations in a shrinkage-compensating cement used as a component of the concrete did appear to affect workability. A low initial temperature and the water-reducing and set-retarding functions of the salt are critical to meeting target properties.

1537 (SAND–94-2268C) **Application of Latin hypercube sampling to RADTRAN 4 truck accident risk sensitivity analysis.** Mills, G.S.; Neuhauser, K.S.; Kanipe, F.L. Sandia National Labs., Albuquerque, NM (United States). [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–1: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE95006817. Source: OSTI; NTIS; INIS; GPO Dep.

The sensitivity of calculated dose estimates to various RADTRAN 4 inputs is an available output for incident-free analysis because the defining equations are linear and sensitivity to each variable can be calculated in closed mathematical form. However, the necessary linearity is not characteristic of the equations used in calculation of accident dose risk, making a similar tabulation of sensitivity for RADTRAN 4 accident analysis impossible. Therefore, a study of sensitivity of accident risk results to variation of input parameters was performed using representative routes, isotopic inventories, and packagings. It was determined that, of the approximately two dozen RADTRAN 4 input parameters pertinent to accident analysis, only a subset of five or six has significant influence on typical analyses or is subject to random uncertainties. These five or six variables were selected as candidates for Latin Hypercube Sampling applications. To make the effect of input uncertainties on calculated accident risk more explicit, distributions and limits were determined for two variables which had approximately proportional effects on calculated doses: Pasquill Category probability (PSPROB) and link population density (LPOPD). These distributions and limits were used as input parameters to Sandia's Latin Hypercube Sampling code to generate 50 sets of RADTRAN 4 input parameters used together with point estimates of other necessary inputs to calculate 50 observations of estimated accident dose risk.Tabulations of the RADTRAN 4 accident risk input variables and their influence on output plus illustrative examples of the LHS calculations, for truck transport situations that are typical of past experience, will be presented .

1538 (SAND–94-2274) **Actinide chemistry research supporting the Waste Isolation Pilot Plant (WIPP): FY94 results.** Novak, C.F. (ed.). Sandia National Labs., Albuquerque, NM (United States). Aug 1995. 153p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95016768. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains six reports on actinide chemistry research supporting the Waste Isolation Pilot Plant (WIPP). These reports, completed in FY94, are relevant to the estimation of the potential dissolved actinide concentrations in WIPP brines under repository breach scenarios. Estimates of potential dissolved actinide concentrations are necessary for WIPP performance assessment calculations. The specific topics covered within this document are: the complexation of oxalate with Th(IV) and U(VI); the stability of Pu(VI) in one WIPP-specific brine environment both with and without carbonate present; the solubility of Nd(III) in a WIPP Salado brine surrogate as a function of hydrogen ion concentration; the steady-state dissolved plutonium concentrations in a synthetic WIPP Culebra brine surrogate; the development of a model for Nd(III) solubility and speciation in dilute to concentrated sodium carbonate and sodium bicarbonate solutions; and the development of a model for Np(V) solubility and speciation in dilute to concentrated sodium Perchlorate, sodium carbonate, and sodium chloride media.

1539 (SAND–94-2563/2) **Performance assessment of the direct disposal in unsaturated tuff or spent nuclear fuel and high-level waste owned by USDOE: Volume 2, Methodology and results.** Rechard, R.P. (ed.). Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 679p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011840. Source: OSTI; NTIS; INIS; GPO Dep.

This assessment studied the performance of high-level radioactive waste and spent nuclear fuel in a hypothetical repository in unsaturated tuff. The results of this 10-month study are intended to help guide the Office of Environment Management of the US Department of Energy (DOE) on how to prepare its wastes for eventual permanent disposal. The waste forms comprised spent fuel and high-level waste currently stored at the Idaho National Engineering Laboratory (INEL) and the Hanford reservations. About 700 metric tons heavy metal (MTHM) of the waste under study is stored at INEL, including graphite spent nuclear fuel, highly enriched uranium spent fuel, low enriched uranium spent fuel, and calcined high-level waste. About 2100 MTHM of weapons production fuel, currently stored on the Hanford reservation, was also included. The behavior of the waste was analyzed by waste form and also as a group of waste forms in the hypothetical tuff repository. When the waste forms were studied together, the repository was assumed also to contain about 9200 MTHM high-level waste in borosilicate glass from three DOE sites. The addition of the borosilicate glass, which has already been proposed as a final waste form, brought the total to about 12,000 MTHM.

1540 (SAND–94-2571) **Steam reforming as a method to treat Hanford underground storage tank (UST) wastes.** Miller, J.E. (and others); Kuehne, P.B. (eds.). Sandia National Labs., Albuquerque, NM (United States). Jul 1995. 72p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC04-94AL85000. Order Number DE95016460. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes a Sandia program that included partnerships with Lawrence Livermore National Laboratory and Synthetica Technologies, Inc. to design and test a steam reforming system for treating Hanford underground storage tank (UST) wastes. The benefits of steam reforming the wastes include the resolution of tank safety issues and improved radionuclide separations. Steam reforming destroys organic materials by first gasifying, then reacting them with high temperature steam. Tests indicate that up to 99% of the organics could be removed from the UST wastes by steam exposure. In addition, it was shown that nitrates in the wastes could be destroyed by steam exposure if they were first distributed as a thin layer on a surface. High purity alumina and nickel alloys were shown to be good candidates for materials to be used in the severe environment associated with steam reforming the highly alkaline, high nitrate content wastes. Work was performed on designing, building, and demonstrating components of a 0.5 gallon per minute (gpm) system suitable for radioactive waste treatment. Scale-up of the unit to 20 gpm was also considered and is feasible. Finally, process demonstrations conducted on non-radioactive waste surrogates were carried out, including a successful demonstration of the technology at the 0.1 gpm scale.

1541 (SAND–94-3069) **Computational implementation of a systems prioritization methodology for the Waste Isolation Pilot Plant: A preliminary example.** Helton, J.C. (Arizona State Univ., Tempe, AZ (United States). Dept. of Mathematics); Anderson, D.R.; Baker, B.L. Sandia National Labs., Albuquerque, NM (United States). Apr 1996. 343p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010892. Source: OSTI; NTIS; INIS; GPO Dep.

A systems prioritization methodology (SPM) is under development to provide guidance to the US DOE on experimental programs and design modifications to be supported in the development of a successful licensing application for the Waste Isolation Pilot Plant (WIPP) for the geologic disposal of transuranic (TRU) waste. The purpose of the SPM is to determine the probabilities that the implementation of different combinations of experimental programs and design modifications, referred to as activity sets, will lead to compliance. Appropriate tradeoffs between compliance probability, implementation cost and implementation time can then be made in the selection of the activity set to be supported in the development of a licensing application. Descriptions are given for the conceptual structure of the SPM and the manner in which this structure determines the computational implementation of an example SPM application. Due to the sophisticated structure of the SPM and the computational demands of many of its components, the overall computational structure must be organized carefully to provide the compliance probabilities for the large number of activity sets under consideration at an acceptable computational cost. Conceptually, the determination of each compliance probability is equivalent to a large numerical integration problem. 96 refs., 31 figs., 36 tabs.

1542 (SAND–94-3173) **Effect of explicit representation of detailed stratigraphy on brine and gas flow at the Waste Isolation Pilot Plant.** Christian-Frear, T.L. (Sandia National Labs., Albuquerque, NM (United States). Geohydrology Dept.); Webb, S.W. Sandia National Labs., Albuquerque, NM (United States). Apr 1996. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010896. Source: OSTI; NTIS; INIS; GPO Dep.

Stratigraphic units of the Salado Formation at the Waste Isolation Pilot Plant (WIPP) disposal room horizon includes various layers of halite, polyhalitic halite, argillaceous halite, clay, and anhydrite. Current models, including those used in the WIPP Performance Assessment calculations, employ a "composite stratigraphy" approach in modeling. This study was initiated to evaluate the impact that an explicit representation of detailed stratigraphy around the repository may have on fluid flow compared to the simplified "composite stratigraphy" models currently employed. Sensitivity of model results to intrinsic permeability anisotropy, interbed fracturing, two-phase characteristic curves, and gas-generation rates were studied. The results of this study indicate that explicit representation of the stratigraphy maintains higher pressures and does not allow as much fluid to leave the disposal room as compared to the "composite stratigraphy" approach. However, the differences are relatively small. Gas migration distances are also different between the two approaches. However, for the two cases in which explicit layering results were considerably different than the composite model (anisotropic and vapor-limited), the gas-migration distances for both models were negligible. For the cases in which gas migration distances were considerable, van Genuchten/Parker and interbed fracture, the differences between the two models were fairly insignificant. Overall, this study suggests that explicit representation of the stratigraphy in the WIPP PA models is not required for the parameter variations modeled if "global quantities" (e.g., disposal room pressures, net brine and gas flux into and out of disposal rooms) are the only concern.

1543 (SAND–95-0186C) **Effects of Hanford tank simulant waste on plastic packaging to components.** Nigrey, P.J.; Dickens, T.G. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000 ; AC04-76DP00789. (CONF-951203–4: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003069. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed a chemical compatibility program for the evaluation of plastic packaging components which may be incorporated in packaging for transporting mixed waste forms. Consistent with the methodology outlined in this paper, we have performed the second phase of this experimental program to determine the effects of simulant Hanford Tank mixed wastes on packaging materials. This effort involved the comprehensive testing of five plastic liner materials in the aqueous mixed waste simulant. The testing protocol involved exposing the respective materials to ~1, 3, 6, and 40 kGy of gamma radiation followed by 7, 14, 28, 180 day exposures to the waste simulant at 18, 50, and 60°C. From the limited data analyses performed to date in this study, we have identified the fluorocarbon Kel-F™ as having the greatest chemical compatibility after having been exposed to 40 kGy gamma radiation followed by exposure to the Hanford Tank simulant mixed waste at 60°C. The most stricking observation from this study was the poor performance of Teflon under these conditions.

1544 (SAND–95-0329) **Formulation and computational aspects of plasticity and damage models with**

application to quasi-brittle materials. Chen, Z. (New Mexico Engineering Research Institute, Albuquerque, NM (United States)); Schreyer, H.L. Sandia National Labs., Albuquerque, NM (United States). Sep 1995. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96001864. Source: OSTI; NTIS; GPO Dep.

The response of underground structures and transportation facilities under various external loadings and environments is critical for human safety as well as environmental protection. Since quasi-brittle materials such as concrete and rock are commonly used for underground construction, the constitutive modeling of these engineering materials, including post-limit behaviors, is one of the most important aspects in safety assessment. From experimental, theoretical, and computational points of view, this report considers the constitutive modeling of quasi-brittle materials in general and concentrates on concrete in particular. Based on the internal variable theory of thermodynamics, the general formulations of plasticity and damage models are given to simulate two distinct modes of microstructural changes, inelastic flow and degradation of material strength and stiffness, that identify the phenomenological nonlinear behaviors of quasi-brittle materials. The computational aspects of plasticity and damage models are explored with respect to their effects on structural analyses. Specific constitutive models are then developed in a systematic manner according to the degree of completeness. A comprehensive literature survey is made to provide the up-to-date information on prediction of structural failures, which can serve as a reference for future research.

1545 (SAND–95-1120) **Case studies of sealing methods and materials used in the salt and potash mining industries.** Eyermann, T.J. (RE/SPEC Inc., Rapid City, SD (United States)); Sambeek, L.L. Van; Hansen, F.D. Sandia National Labs., Albuquerque, NM (United States). Nov 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96004950. Source: OSTI; NTIS; INIS; GPO Dep.

Sealing methods and materials currently used in salt and potash industries were surveyed to determine if systems analogous to the shaft seal design proposed for the Waste Isolation Pilot Plant (WIPP) exist. Emphasis was first given to concrete and then expanded to include other materials. Representative case studies could provide useful design, construction, and performance information for development of the WIPP shaft seal system design. This report contains a summary of engineering and construction details of various sealing methods used by mining industries for bulkheads and shaft liners. Industrial experience, as determined from site visits and literature reviews, provides few examples of bulkheads built in salt and potash mines for control of water. Sealing experiences representing site-specific conditions often have little engineering design to back up the methods employed and even less quantitative evaluation of seal performance. Cases examined include successes and failures, and both contribute to a database of experiences. Mass salt-saturated concrete placement under ground was accomplished under several varied conditions. Information derived from this database has been used to assess the performance of concrete as a seal material. Concrete appears to be a robust material with successes in several case studies. 42 refs.

1546 (SAND–95-1148C) **WIPP panel simulations with gas generation.** DeVries, K.L. (RE/SPEC, Inc., Rapid City, SD (United States)); Callahan, G.D.; Munson, D.E. Sandia National Labs., Livermore, CA (United States). [1996]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9606115–1: 4. conference on the mechanical behavior of salt, Montreal (Canada), 17-18 Jun 1996). Order Number DE96007339. Source: OSTI; NTIS; INIS; GPO Dep.

An important issue in nuclear waste repository performance is the potential for fracture development resulting in pathways for release of radionuclides beyond the confines of the repository. A series of demonstration calculations using structural finite element analyses are presented here to examine the effect of internal gas generation on the response of a sealed repository. From the calculated stress fields, the most probable location for a fracture to develop was determined to be within the pillars interior to the repository for the range of parameter values considered. If a fracture interconnects the rooms and panels of the repository, fracture opening produces significant additional void volume to limit the excess gas pressure to less than 1.0 MPa above the overburden prêssure. Consequently, the potential for additional fracture development into the barrier pillar is greatly reduced, which provides further confidence that the waste will be contained within the repository.

1547 (SAND–95-1236) **Hanford coring bit temperature monitor development testing results report.** Rey, D. Sandia National Labs., Albuquerque, NM (United States). May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014532. Source: OSTI; NTIS; INIS; GPO Dep.

Instrumentation which directly monitors the temperature of a coring bit used to retrieve core samples of high level nuclear waste stored in tanks at Hanford was developed at Sandia National Laboratories. Monitoring the temperature of the coring bit is desired to enhance the safety of the coring operations. A unique application of mature technologies was used to accomplish the measurement. This report documents the results of development testing performed at Sandia to assure the instrumentation will withstand the severe environments present in the waste tanks.

1548 (SAND–95-1240) **Petrographic and X-ray diffraction analyses of selected samples from Marker Bed 139 at the Waste Isolation Pilot Plant.** Fredrich, J.T. (Sandia National Labs., Albuquerque, NM (United States). Geomechanics Dept.); Zeuch, D.H. Sandia National Labs., Albuquerque, NM (United States). Apr 1996. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010907. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) is located 660 m underground in the Salado Formation which consists of thick, horizontally bedded pure and impure salt and thin, laterally continuous clay and anhydrite interbeds. The Salado Two-Phase Flow Laboratory Program was established to provide site-specific-two-phase flow and other related rock properties to support performance assessment modeling of the WIPP repository. Owing to their potentially significant role in the hydrologic response of the repository, the program initially focused on the anhydrite interbeds, and in particular, on Marker Bed 139 (MB 139), which lies approximately 1 m below the planned waste storage rooms. This report synthesizes petrographic and X-ray powder diffraction studies performed to support the Salado Two-Phase Flow Laboratory Program. Experimental scoping activities in this area were performed in FY 1993 by three independent laboratories in order to: (1) quantify the mineral composition to support laboratory studies of hydrologic properties and facilitate correlation of transport properties with composition; (2) describe textures, including grain size; and (3) describe observed porosity. Samples from various depths were prepared from six 6-inch diameter cores which were obtained by drilling into the marker bed from the floor of two separate rooms. The petrographic analyses are augmented here with additional study of the original thin sections, and the pore structure observations are also examined in relation to an independent observational study of microcracks in Marker Bed 139 core samples performed in FY 1994 by the Geomechanics Department at Sandia National Laboratories.

1549 (SAND–95-1704C) **Brine release based on structural calculations of damage around an excavation at the Waste Isolation Pilot Plant (WIPP).** Munson, D.E. (Sandia National Labs., Albuquerque, NM (United States)); Jensen, A.L.; Webb, S.W.; DeVries, K.L. Sandia National Labs., Albuquerque, NM (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960619–3: 2. North American rock mechanics symposium: tools and techniques in rock mechanics, Montreal (Canada), 19-21 Jun 1996). Order Number DE96007344. Source: OSTI; NTIS; INIS; GPO Dep.

In a large in situ experimntal circular room, brine inflow was measured over 5 years. After correcting for evaporation losses into mine ventilation air, the measurements gave data for a period of nearly 3 years. Predicted brine accumulation based on a mechanical "snow plow" model of the volume swept by creep-induced damage as calculated with the Multimechanism Deformation Coupled Fracture model was found to agree with experiment. Calculation suggests the damage zone at 5 years effectively exends only some 0.7 m into the salt around the room. Also, because the mecahnical model of brine release gives an adequate explanation of the measured data, the hydrological process of brine flow appears to be rapid compared to the mechanical process of brine release.

1550 (SAND–95-1941) **Large-scale dynamic compaction demonstration using WIPP salt: Fielding and preliminary results.** Ahrens, E.H. (Sandia National Labs., Albuquerque, NM (United States). Nuclear Waste Technology Repository Isolation Systems); Hansen, F.D. Sandia National Labs., Albuquerque, NM (United States). Oct 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96005043. Source: OSTI; NTIS; INIS; GPO Dep.

Reconsolidation of crushed rock salt is a phenomenon of great interest to programs studying isolation of hazardous materials in natural salt geologic settings. Of particular interest is the potential for disaggregated salt to be restored to nearly an impermeable state. For example, reconsolidated crushed salt is proposed as a major shaft seal component for the Waste Isolation Pilot Plant (WIPP) Project. The concept for a permanent shaft seal component of the WIPP repository is to densely compact crushed salt in the four shafts; an effective seal will then be developed as the surrounding salt creeps into the shafts, further consolidating the crushed salt. Fundamental information on placement density and permeability is required to ensure attainment of the design function. The work reported here is the first large-scale compaction demonstration to provide information on initial salt properties applicable to design, construction, and performance expectations. The shaft seals must function for 10,000 years. Over this period a crushed salt mass will become less permeable as it is compressed by creep closure of salt surrounding the shaft. These facts preclude the possibility of conducting a full-scale, real-time field test. Because permanent seals taking advantage of salt reconsolidation have never been constructed, performance measurements have not been made on an appropriately large scale. An understanding of potential construction methods, achievable initial density and permeability, and performance of reconsolidated salt over time is required for seal design and performance assessment. This report discusses fielding and operations of a nearly full-scale dynamic compaction of mine-run WIPP salt, and presents preliminary density and in situ (in place) gas permeability results.

1551 (SAND–95-1998C) **Summary of the systems prioritization method (SPM) as a decision-aiding tool for the Waste Isolation Pilot Plant.** Boak, D.M. (Sandia National Labs., Albuquerque, NM (United States)); Prindle, N.H.; Lincoln, R.; Mendenhall, F.; Weiner, R.; Bills, R.A. Sandia National Labs., Albuquerque, NM (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212–59-Summ.: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96008256. Source: OSTI; NTIS; INIS; GPO Dep.

In March 1994, the Department of Energy Carlsbad Area Office (DOE/CAO) implemented a performance-based planning method to assist in programmatic prioritization within the Waste Isolation Pilot Plant (WIPP) project with respect to applicable Environmental Protection Agency (EPA) long-term performance requirements stated in 40 CFR 191.13(a) and 40 CFR 268.6. This method, the Systems Prioritization Method (SPM), was designed by Sandia National Laboratories (SNL) to: (1) identify programmatic options (activities) and their costs and durations; (2) analyze potential combinations of activities in terms of predicted contribution to long-term performance; and (3) analyze cost, duration, and performance tradeoffs. SPM results were the basis for recommendations to DOE/CAO in May 1995 for prioritization within the WIPP project. This paper presents a summary of the SPM implementation, key results, and lessons learned.

1552 (SAND–95-2005C) **Complexation study of NpO_2^+ and UO_2^{2+} ions with several organic ligands in aqueous solutions of high ionic strength.** Borkowski, M. (Florida State Univ., Tallahassee, FL (United States)); Lis, S.; Choppin, G.R. Sandia National Labs., Albuquerque, NM (United States). 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950946–7: 5. international conference on the chemistry and migration behaviour of actinides and fission products in the geosphere, Saint-Malo (France), 10-15 Sep 1995). Order Number DE95017641. Source: OSTI; NTIS; INIS; GPO Dep.

The acid dissociation constants, pK_a, and the stability constants for NpO_2^+ and UO_2^{2+} have been measured for certain organic ligands [acetate, α-hydroxyisobutyrate, lactate, ascorbate, oxalate, citrate, EDTA, 8-hydroxyquinoline, 1, 10-phenanthroline, and thenoyltrifluoroacetone] in 5 m (NaCl) ionic strength solution. The pK_a values were determined by potentiometry or spectrometry. These methods, as well as solvent extraction with ^{233}U and ^{237}Np radiotracers, were used to measure the stability constants of the 1:1 and 1:2 complexes of dioxo cations. These constants were used to estimate the concentrations required to result in 10 % competition with hydrolysis in the 5 m NaCl solution. Such estimates are of value in assessing the solubility from radioactive waste of AnO_2^+ and AnO_2^{2+} in brine solutions in contact with nuclear waste in a salt-bed repository.

1553 (SAND–95-2006C) **Variation of stability constants of thorium citrate complexes and of thorium hydrolysis constants with ionic strength.** Choppin, G.R. (Florida State Univ., Tallahassee, FL (United States)); Erten, H.N.; Xia, Y.X. Sandia National Labs., Albuquerque, NM (United States). 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Florida State University AH-5590. (CONF-950946–6: 5. international conference on the chemistry and migration behaviour of actinides and fission products in the geosphere, Saint-Malo (France), 10-15 Sep 1995). Order Number DE95017642. Source: OSTI; NTIS; INIS; GPO Dep.

Citrate is among the organic anions that are expected to be present in the wastes planned for deposition in the Waste Isolation Pilot Plant repository. In this study, a solvent extraction method has been used to measure the stability constants of Thorium(IV)[Th(IV)] with citrate anions in aqueous solutions with (a) $NaClO_4$ and (b) NaCl as the background electrolytes. The ionic strengths were varied up to 5 m (NaCl) and 14 m ($NaClO_4$). The data from the $NaClO_4$ solutions at varying pH values were used to calculate the hydrolysis constants for formation of $Th(OH)^{3+}$ at the different ionic strengths.

1554 (SAND–95-2007C) **Complexation of Am(III) by oxalate in $NaClO_4$ media.** Choppin, G.R. (Florida State Univ., Tallahassee, FL (United States)); Chen, J.F. Sandia National Labs., Albuquerque, NM (United States). 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Florida State University AH-5590. (CONF-950946–5: 5. international conference on the chemistry and migration behaviour of actinides and fission products in the geosphere, Saint-Malo (France), 10-15 Sep 1995). Order Number DE95017643. Source: OSTI; NTIS; INIS; GPO Dep.

The complexation of Am(III) by oxalate has been investigated in solutions of $NaClO_4$ up to 9.0 M ionic strength at 25°C. The dissociation constants of oxalic acid were determined by potentiometric titration, while the stability constants of the Am(III)-oxalate complexation were measured by the solvent extraction technique. A thermodynamic model was constructed to predict the apparent equilibrium constants at different ionic strengths by applying the Pitzer equation using parameters for the Na^+-HOx^-, Na^+-Ox^-, $AmOx^+$-ClO_4^-, and Na^+-$Am(Ox)_2^-$ interactions obtained by fitting the data.

1555 (SAND–95-2008C) **The experimental determination of the solubility product for NpO_2OH in NaCl solutions.** Roberts, K.E. (Lawrence Berkeley Lab., CA (United States)); Torretto, P.C.; Prussin, T. Sandia National Labs., Albuquerque, NM (United States). 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. NIH-Minority Biomedical Research Support; PRF Grant 26067-B3. (CONF-950946–4: 5. international conference on the chemistry and migration behaviour of actinides and fission products in the geosphere, Saint-Malo (France), 10-15 Sep 1995). Order Number DE95017644. Source: OSTI; NTIS; INIS; GPO Dep.

The solubility of Np(V) was measured in NaCl solutions ranging from 0.30 to 5.6 molal at room temperature (~21 ± 2°C). Experiments were conducted from undersaturation and allowed to equilibrate in a CO_2-free environment for 37 days. The apparent solubility products varied with NaCl concentration and were between 10^{-9} and 10^{-8} $mol^2 \bullet L^{-2}$. Using the specific ion interaction theory (SIT), the log of the solubility product of NpO_2OH(am) at infinite dilution was found to be - 8.79 ± 0.12. The interaction coefficient, $\epsilon(NpO_2^+ - Cl^-)$, was found to be (0.08 ± 0.05).

1556 (SAND–95-2009C) **Thermodynamic modeling of neptunium(V)-acetate complexation in concentrated NaCl media.** Novak, C.F.; Borkowski, M.; Choppin, G.R. Sandia National Labs., Albuquerque, NM (United States). 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950946–2: 5. international conference on the chemistry and migration behaviour of actinides and fission products in the geosphere, Saint-Malo (France), 10-15 Sep 1995). Order Number DE95017646. Source: OSTI; NTIS; INIS; GPO Dep.

The complexation of neptunium(V), Np(V), with the acetate anion, Ac^-, was measured in sodium chloride media to high concentration using an extraction technique. The data were interpreted using the thermodynamic formalism of Pitzer, which is valid to high electrolyte concentrations. A consistent model for the deprotonation constants of acetic acid in NaCl and $NaClO_4$ media was developed. For the concentrations of acetate expected in a waste repository, only the neutral complex NpO_2Ac(aq) was important in describing the interactions between the neptunyl ion and acetate. The thermodynamic stability constant log β^0_{101} for the reaction $NpO_2^+ + Ac^- \leftrightarrow NpO_2Ac$ was calculated to be 1.46±0.11. This weak complexing behavior between the neptunyl ion and acetate indicates that acetate will not significantly enhance dissolved Np(V) concentrations in ground waters associated with nuclear waste repositories that may contain acetate.

1557 (SAND–95-2015C) **The systems prioritization method (SPM) CD-ROM demonstration for Waste Management '96.** Harris, C.L. (Sandia National Labs., Albuquerque, NM (United States)); Boak, D.M.; Prindle, N.H.; Beyeler, W. Sandia National Labs., Albuquerque, NM (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212–60: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96008255. Source: OSTI; NTIS; INIS; GPO Dep.

In March 1994, the Department of Energy Carlsbad Area Office (DOE/CAO) implemented a performance-based planning method to assist in prioritization within the Waste Isolation Pilot Plant (WIPP). Probabilistic performance calculations were required for the Systems Prioritization Method (SPM) and roughly 46,700 combinations of activities were analyzed, generating a large volume of information to be documented, analyzed, and communicated. A self-contained information management system consisting of a relational database on a 600-megabyte CD-ROM was built to meet this need. The CD-ROM was used to store performance assessment results, data analysis and visualization tools, information about the activities, electronic copies of 40 ILFR 191 and 40 CFR 268, technical reference papers, and the final SPM report. Copies of the CD-ROM were distributed to interested members of the public, WIPP participants, and the Environmental Protection Agency (EPA).

1558 (SAND-95-2017/1) **The second iteration of the Systems Prioritization Method: A systems prioritization and decision-aiding tool for the Waste Isolation Pilot Plant: Volume 1, Synopsis of method and results.** Prindle, N.H. (and others); Mendenhall, F.T.; Boak, D.M. Sandia National Labs., Albuquerque, NM (United States). May 1996. 182p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96011056. Source: OSTI; NTIS; INIS; GPO Dep.

In March 1994, the US Department of Energy Carlsbad Area Office (DOE/CAO) embarked on an effort to design and implement a performance- based decision-aiding tool to provide an analytical basis for planning, prioritizing, and selecting programmatic options for the Waste Isolation Pilot Plant (WIPP). This tool, called Systems Prioritization Method (SPM) defines the most viable combinations of scientific investigations, engineered alternatives (EAs), and waste acceptance criteria (WAC) for supporting the final WIPP compliance application. The scope of SPM is restricted to selected portions of applicable Environmental Protection Agency (EPA) long-term performance regulations. SPM calculates the probabilities of certain sets of activities demonstrating compliance with various regulations. SPM provides results in the form of a decision matrix to identify cost-effective programmatic paths with a high probability of successfully demonstrating compliance.

1559 (SAND-95-2017/2) **The second iteration of the Systems Prioritization Method: A systems prioritization and decision-aiding tool for the Waste Isolation Pilot Plant: Volume 2, Summary of technical input and model implementation.** Prindle, N.H. (Sandia National Labs., Albuquerque, NM (United States)); Mendenhall, F.T.; Trauth, K.; Boak, D.M.; Beyeler, W.; Hora, S.; Rudeen, D. Sandia National Labs., Albuquerque, NM (United States). May 1996. 192p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96011199. Source: OSTI; NTIS; INIS; GPO Dep.

The Systems Prioritization Method (SPM) is a decision-aiding tool developed by Sandia National Laboratories (SNL). SPM provides an analytical basis for supporting programmatic decisions for the Waste Isolation Pilot Plant (WIPP) to meet selected portions of the applicable US EPA long-term performance regulations. The first iteration of SPM (SPM-1), the prototype for SPM< was completed in 1994. It served as a benchmark and a test bed for developing the tools needed for the second iteration of SPM (SPM-2). SPM-2, completed in 1995, is intended for programmatic decision making. This is Volume II of the three-volume final report of the second iteration of the SPM. It describes the technical input and model implementation for SPM-2, and presents the SPM-2 technical baseline and the activities, activity outcomes, outcome probabilities, and the input parameters for SPM-2 analysis.

1560 (SAND-95-2017/3) **The second iteration of the Systems Prioritization Method: A systems prioritization and decision-aiding tool for the Waste Isolation Pilot Plant: Volume 3, Analysis for final programmatic recommendations.** Prindle, N.H. (and others); Boak, D.M.; Weiner, R.F. Sandia National Labs., Albuquerque, NM (United States). May 1996. 108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96011013. Source: OSTI; NTIS; INIS; GPO Dep.

Systems Prioritization Method (SPM) is a decision-aiding tool developed by Sandia National Laboratories for the US DOE Carlsbad Area Office (DOE/CAO). This tool provides an analytical basis for programmatic decision making for the Waste Isolation Pilot Plant (WIPP). SPM integrates decision-analysis techniques, performance,a nd risk-assessment tools, and advanced information technology. Potential outcomes of proposed activities and combination of activities are used to calculate a probability of demonstrating compliance (PDC) with selected regulations. The results are presented in a decision matrix showing cost, duration, and maximum PDC for all activities in a given cost and duration category. This is the third and final volume in the series which presents the analysis for final programmatic recommendations.

1561 (SAND-95-2082C) **Field and laboratory testing of seal materials proposed for the Waste Isolation Pilot Plant.** Knowles, M.K. (Sandia National Labs., Albuquerque, NM (United States)); Howard, C.L. Sandia National Labs., Albuquerque, NM (United States). 5 Feb 1996. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212-49: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006478. Source: OSTI; NTIS; INIS; GPO Dep.

The Small Scale Seal Performance Tests (SSSPT) were a series of in situ tests designed to evaluate the feasibility of various materials for sealing purposes. Testing was initiated in 1985 and concluded in 1995. Materials selected for the SSSPT included salt-saturated concrete, a 50%/50% mixture of crushed salt and bentonite, bentonite, and crushed salt. This paper presents a summary of the SSSPT field program, results of the in situ testing, and a discussion of post-testing laboratory studies of salt-saturated concrete. Results of the SSSPT support the use of salt-saturated concrete, compacted bentonite clay, and compacted crushed salt as sealing materials for the WIPP.

1562 (SAND-95-2244C) **Using a multiphase flow code to model the coupled effects of repository consolidation and multiphase brine and gas flow at the Waste Isolation Pilot Plant.** Freeze, G.A. (INTERA Inc., Albuquerque, NM (United States)); Larson, K.W.; Davies, P.B.; Webb, S.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950828-22: 1995 National heat transfer conference, Portland, OR (United States), 5-9 Aug 1995). Order Number DE96000704. Source: OSTI; NTIS; INIS; GPO Dep.

Long-term repository assessment must consider the processes of (1) gas generation, (2) room closure and expansions due to salt creep, and (3) multiphase (brine and gas) fluid flow, as well as the complex coupling between these three processes. The mechanical creep closure code SANCHO was used to simulate the closure of a single, perfectly sealed disposal room filled with water and backfill. SANCHO uses constitutive models to describe salt creep, waste consolidation, and backfill consolidation, Five different gas-generation rate histories were simulated, differentiated by a rate multiplier, f, which ranged from 0.0 (no gas generation) to 1.0 (expected gas generation under brine-dominated conditions). The results of the SANCHO f-series simulations provide a relationship between gas generation, room closure, and room pressure for a perfectly sealed room. Several methods for coupling this relationship with multiphase fluid flow into and out of a room were examined. Two of the methods are described.

1563 (SAND–95-2571) **Probability, conditional probability and complementary cumulative distribution functions in performance assessment for radioactive waste disposal.** Helton, J.C. (Arizona State Univ., Tempe, AZ (United States)). Sandia National Labs., Albuquerque, NM (United States). Mar 1996. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010905. Source: OSTI; NTIS; INIS; GPO Dep.

A formal description of the structure of several recent performance assessments (PAs) for the Waste Isolation Pilot Plant (WIPP) is given in terms of the following three components: a probability space (S_{st}, S_{st}, p_{st}) for stochastic uncertainty, a probability space (S_{su}, S_{su}, p_{su}) for subjective uncertainty and a function (i.e., a random variable) defined on the product space associated with (S_{st}, S_{st}, p_{st}) and (S_{su}, S_{su}, p_{su}). The explicit recognition of the existence of these three components allows a careful description of the use of probability, conditional probability and complementary cumulative distribution functions within the WIPP PA. This usage is illustrated in the context of the U.S. Environmental Protection Agency's standard for the geologic disposal of radioactive waste (40 CFR 191, Subpart B). The paradigm described in this presentation can also be used to impose a logically consistent structure on PAs for other complex systems.

1564 (SAND–95-2660C) **Data qualification for the Waste Isolation Pilot Plant.** Brown, R.D. (Harbridge House, Inc., Washington, DC (United States)); Harper-Slaboszewicz, V.J. Sandia National Labs., Albuquerque, NM (United States). [1996]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960421–26: 7. annual international high-level radioactive waste management conference, Las Vegas, NV (United States), 29 Apr - 3 May 1996). Order Number DE96008254. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) site near Carlsbad, New Mexico, has been the subject of scientific and engineering investigations for more than twenty years. Data from these investigations are now being used as part of the process to certify compliance of the WIPP with the governing regulations. Some of these data were collected prior to the development and implementation of the quality assurance (QA) standards that are now being applied in the WIPP compliance certification process, and are considered "existing data" within the current QA program. This paper discusses the process for qualification of existing data (QED) defined for the WIPP project, the implementation of that process, and some of the results. This process incorporates many lessons learned, and should be useful to others in the radioactive waste management system who are dealing with "existing data."

1565 (SAND–95-2983C) **Computational implementation of the multi-mechanism deformation coupled fracture model for salt.** Koteras, J.R.; Munson, D.E. Sandia National Labs., Albuquerque, NM (United States). 1996. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960619–7: 2. North American rock mechanics symposium: tools and techniques in rock mechanics, Montreal (Canada), 19-21 Jun 1996). Order Number DE96010857. Source: OSTI; NTIS; INIS; GPO Dep.

The Multi-Mechanism Deformation (M-D) model for creep in rock salt has been used in three-dimensional computations for the Waste Isolation Pilot Plant (WIPP), a potential waste, repository. These computational studies are relied upon to make key predictions about long-term behavior of the repository. Recently, the M-D model was extended to include creep-induced damage. The extended model, the Multi-Mechanism Deformation Coupled Fracture (MDCF) model, is considerably more complicated than the M-D model and required a different technology from that of the M-D model for a computational implementation.

1566 (SAND–95-3056C) **Use of probabilistic methods for analysis of cost and duration uncertainties in a decision analysis framework.** Boak, D.M.; Painton, L. Sandia National Labs., Albuquerque, NM (United States). 8 Dec 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960421–2: 7. annual international high-level radioactive waste management conference, Las Vegas, NV (United States), 29 Apr - 3 May 1996). Order Number DE96004301. Source: OSTI; NTIS; INIS; GPO Dep.

Probabilistic forecasting techniques have been used in many risk assessment and performance assessment applications on radioactive waste disposal projects such as Yucca Mountain and the Waste Isolation Pilot Plant (WIPP). Probabilistic techniques such as Monte Carlo and Latin Hypercube sampling methods are routinely used to treat uncertainties in physical parameters important in simulating radionuclide transport in a coupled geohydrologic system and assessing the ability of that system to comply with regulatory release limits. However, the use of probabilistic techniques in the treatment of uncertainties in the cost and duration of programmatic alternatives on risk and performance assessment projects is less common. Where significant uncertainties exist and where programmatic decisions must be made despite existing uncertainties, probabilistic techniques may yield important insights into decision options, especially when used in a decision analysis framework and when properly balanced with deterministic analyses. For relatively simple evaluations, these types of probabilistic evaluations can be made using personal computer-based software.

1567 (SAND–96-0178C) **Effects of simulant Hanford tank waste on plastic packaging components.** Nigrey, P.J.; Dickens, T.G. Sandia National Labs., Albuquerque, NM (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960804–34: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96010548. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, the authors describe a chemical compatibility testing program for packaging components which might be used to transport mixed wastes. They mention the results of the screening phase of this program and then present the results of the second phase of this experimental program. This effort involved the comprehensive testing of five plastic liner materials in the aqueous mixed waste simulant. The testing protocol involved exposing the respective materials to ~ 140, 290, 570, and 3,670 krads of gamma radiation followed by 7, 14, 28, 180 day exposures to the waste simulant at 18, 50, and 60 C. From the data analysis performed to date in this study, they have identified the fluorocarbon Kel-F™ as having the greatest chemical compatibility after being exposed to gamma radiation followed by exposure to the Hanford Tank simulant mixed waste. The most striking observation from this study was the poor performance of Teflon under these conditions. The data obtained from this testing program will be available to packaging designers for the development of mixed waste packagings. The implications of the testing results on the selection of appropriate materials as packaging components are discussed.

1568 (SAND–96-0195C) **Ultrafine cement grout for sealing underground nuclear waste repositories.** Ahrens, E.H. (Sandia National Labs., Livermore, CA (United States)); Onofrei, M. Sandia National Labs., Livermore, CA (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960619–2: 2. North American rock mechanics symposium: tools and techniques in rock mechanics, Montreal (Canada), 19-21 Jun 1996). Order Number DE96007340. Source: OSTI; NTIS; INIS; GPO Dep.

Sealing fractures in nuclear waste repositories concerns all programs investigating deep burial as a means of disposal. Because the most likely mechanism for contaminant migration is by dissolution and movement through groundwater, sealing programs are seeking low-viscosity sealants that are chemically, mineralogically, and physically compatible with their host. This paper presents the results of collaborative work between Whitesell Laboratories, operated by Atomic Energy of Canada, Ltd., and Sandia National Laboratories; the work was undertaken in support of the Waste Isolation Pilot Plant (WIPP). This effort addresses the technology associated with long-term isolation of nuclear waste in a natural salt medium. The work presented is part of the plugging and sealing program, specifically the development and optimization of Ultrafine cementitious grout that can be injected to adequately lower excessive, strain-induced permeability in the Distributed Rock Zone (DRZ) surrounding underground excavations. Innovative equipment and procedures employed in the laboratory produced a usable cement-based grout whose particles are 90% smaller than 8 microns and average 4 microns. The process involved simultaneous wet pulverization and mixing. The grout was used for a successful in situ test underground at the WIPP. Injection of grout sealed microfractures as small as 8 microns and lowered the gas permeability of the DRZ by three orders of magnitude. Following the WIPP test, additional work produced an improved version of the grout containing particles 90% smaller than 6 microns and averaging 2 microns. This grout can be produced in the dry form at a competitive cost ready to mix.

1569 (SAND–96-0342C) **Using depleted uranium to shield vitrified high-level waste packages.** Yoshimura, H.R.; Gildea, P.D.; Bernard, E.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–60: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007424. Source: OSTI; NTIS; INIS; GPO Dep.

The underlying report for this paper evaluates options for using depleted uranium as shielding materials for transport systems for disposal of vitrified high-level waste (VHLW). In addition, economic analyses are presented to compare costs associated with these options to costs, associated with existing and proposed storage, transport, and diposal capabilities. A more detailed evaluation is provided elsewhere. (Yoshimura et al. 1995.)

1570 (SAND–96-0376C) **A constitutive model for representing coupled creep, fracture, and healing in rock salt.** Chan, K.S. (Southwest Research Inst., San Antonio, TX (United States)); Bodner, S.R.; Munson, D.E.; Fossum, A.F. Sandia National Labs., Albuquerque, NM (United States). [1996]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9606115–2: 4. conference on the mechanical behavior of salt, Montreal (Canada), 17-18 Jun 1996). Order Number DE96006991. Source: OSTI; NTIS; INIS; GPO Dep.

The development of a constitutive model for representing inelastic flow due to coupled creep, damage, and healing in rock salt is present in this paper. This model, referred to as Multimechanism Deformation Coupled Fracture model, has been formulated by considering individual mechanisms that include dislocation creep, shear damage, tensile damage, and damage healing. Applications of the model to representing the inelastic flow and fracture behavior of WIPP salt subjected to creep, quasi-static loading, and damage healing conditions are illustrated with comparisons of model calculations against experimental creep curves, stress-strain curves, strain recovery curves, time-to-rupture data, and fracture mechanism maps.

1571 (SAND–96-0435) **Hydraulic testing around Room Q: Evaluation of the effects of mining on the hydraulic properties of Salado Evaporites.** Domski, P.S. (INTERA, Inc., Albuquerque, NM (United States)); Upton, D.T.; Beauheim, R.L. Sandia National Labs., Albuquerque, NM (United States). Mar 1996. 141p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010653. Source: OSTI; NTIS; INIS; GPO Dep.

Room Q is a 109-m-long cylindrical excavation in the Salado Formation at the Waste Isolation Pilot Plant (WIPP) site. Fifteen boreholes were drilled and instrumented around Room Q so that tests could be conducted to determine the effects of room excavation on the hydraulic properties of the surrounding evaporate rocks. Pressure-buildup and pressure-pulse tests were conducted in all of the boreholes before Room Q was mined. The data sets from only eight of the boreholes are adequate for parameter estimation, and five of those are of poor quality. Constant-pressure flow tests and pressure-buildup tests were conducted after Room Q was mined, producing eleven interpretable data sets, including two of poor quality. Pre-mining transmissivities interpreted from the three good-quality data sets ranged from 1×10^{-15} to 5×10^{-14} m^2/s (permeability-thickness products of 2×10^{-22} to 9×10^{-21} m^3) for test intervals ranging in length from 0.85 to 1.37 m. Pre-mining average permeabilities, which can be considered representative of undisturbed, far-field conditions, were 6×10^{-20} and 8×10^{-20} m^2 for anhydrite, and 3×10^{-22} m^2 for halite. Post-mining transmissivities interpreted from the good-quality data sets ranged from 1×10^{-16} to 3×10^{-13} m^2/s (permeability-thickness products of 2×10^{-23} to 5×10^{-20} m^3). Post-mining average permeabilities for anhydrite ranged from 8×10^{-20} to 1×10^{-19} m^2. The changes in hydraulic properties and pore pressures that were observed can be attributed to one or a combination of three processes: stress reduction, changes in pore connectivity, and flow towards Room Q. The effects of the three processes cannot be individually quantified with the available data.

1572 (SAND–96-0791C) **Evaluation of constitutive models for crushed salt.** Callahan, G.D. (RE/SPEC, Inc., Rapid City, SD (United States)); Loken, M.C.; Hurtado, L.D.; Hansen, F.D. Sandia National Labs., Albuquerque, NM (United States). [1996]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9606115–3: 4. conference on the mechanical behavior of salt, Montreal (Canada), 17-18 Jun 1996). Order Number DE96009175. Source: OSTI; NTIS; INIS; GPO Dep.

Three constitutive models are recommended as candidates for describing the deformation of crushed salt. These models are generalized to three-dimensional states of stress to include the effects of mean and deviatoric stress and modified to include effects of temperature, grain size, and moisture content. A database including hydrostatic consolidation and shear consolidation tests conducted on Waste Isolation Pilot Plant (WIPP) and southeastern New Mexico salt is used to determine material parameters for the models. To evaluate the capability of the models, parameter values obtained from fitting the complete database are used to predict the individual tests. Finite element calculations of a WIPP shaft with emplaced crushed salt demonstrate the model predictions.

1573 (SAND–96-0792C) **Large-scale dynamic compaction of natural salt.** Hansen, F.D.; Ahrens, E.H. Sandia National Labs., Albuquerque, NM (United States). [1996]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9606115–4: 4. conference on the mechanical behavior of salt, Montreal (Canada), 17-18 Jun 1996). Order Number DE96010849. Source: OSTI; NTIS; INIS; GPO Dep.

A large-scale dynamic compaction demonstration of natural salt was successfully completed. About 40 m^3 of salt were compacted in three, 2-m lifts by dropping a 9,000-kg weight from a height of 15 m in a systematic pattern to achieve desired compaction energy. To enhance compaction, 1 wt% water was added to the relatively dry mine-run salt. The average compacted mass fractional density was 0.90 of natural intact salt, and in situ nitrogen permeabilities averaged $9X10^{-14}m^2$. This established viability of dynamic compacting for placing salt shaft seal components. The demonstration also provided compacted salt parameters needed for shaft seal system design and performance assessments of the Waste Isolation Pilot Plant.

1574 (SAND–96-0838C) **Properties of dynamically compacted WIPP salt.** Brodsky, N.S. (Sandia National Labs., Albuquerque, NM (United States)); Hansen, F.D.; Pfeifle, T.W. Sandia National Labs., Albuquerque, NM (United States). [1996]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9606115–6: 4. conference on the mechanical behavior of salt, Montreal (Canada), 17-18 Jun 1996). Order Number DE96011715. Source: OSTI; NTIS; INIS; GPO Dep.

Dynamic compaction of mine-run salt is being investigated for the Waste Isolation Pilot Plant (WIPP), where compacted salt is being considered for repository sealing applications. One large-scale and two intermediate-scale dynamic compaction demonstrations were conducted. Initial fractional densities of the compacted salt range form 0.85 to 0.90, and permeabilities vary. Dynamically-compacted specimens were further consolidated in the laboratory by application of hydrostatic pressure. Permeability as a function of density was determined, and consolidation microprocesses were studied. Experimental results, in conjunction with modeling results, indicate that the compacted salt will function as a viable seal material.

1575 (SAND–96-0866) **Consideration of critically when directly disposing highly enriched spent nuclear fuel in unsaturated tuff: Bounding estimates.** Rechard, R.P.; Tierney, M.S.; Sanchez, L.C.; Martell, M.-A. Sandia National Labs., Albuquerque, NM (United States). May 1996. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010373. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents one of 2 approaches (bounding calculations) which were used in a 1994 study to examine the possibility of a criticality in a repository. Bounding probabilities, although rough, point to the difficulty of creating conditions under which a critical mass could be assembled (container corrosion, separation of neutron absorbers from fissile material, collapse or precipitation of fissile material) and how significant the geochemical and hydrologic phenomena are. The study could not conceive of a mechanism consistent with conditions under which an atomic explosion could occur. Should a criticality occur in or near a container in the future, boundary consequence calculations showed that fissions from one critical event ($<10^{20}$ fissions, if similar to aqueous and metal accidents and experiments) are quite small compared to the amount of fissions represented by the spent fuel itself. If it is assumed that the containers necessary to hold the highly enriched spent fuel went critical once per day for 1 million years, creating an energy release of about 10^{20} fissions, the number of fissions equals about 10^{28}, which corresponds to only 1% of the fission inventory in a repository containing 70,000 metric tons of heavy metal, the expected size for the proposed repository at Yucca Mountain, Nevada.

1576 (SAND–96-0886) **Sandia WIPP calibration traceability.** Schuhen, M.D. (Sandia National Labs., Albuquerque, NM (United States)); Dean, T.A. Sandia National Labs., Albuquerque, NM (United States). May 1996. 214p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96011876. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the work performed to establish calibration traceability for the instrumentation used by Sandia National Laboratories at the Waste Isolation Pilot Plant (WIPP) during testing from 1980-1985. Identifying the calibration traceability is an important part of establishing a pedigree for the data and is part of the qualification of existing data. In general, the requirement states that the calibration of Measuring and Test equipment must have a valid relationship to nationally recognized standards or the basis for the calibration must be documented. Sandia recognized that just establishing calibration traceability would not necessarily mean that all QA requirements were met during the certification of test instrumentation. To address this concern, the assessment was expanded to include various activities.

1577 (SAND–96-1100C) **A shaft seal system for the Waste Isolation Pilot Plant.** Hansen, F.D. (Sandia National Labs., Albuquerque, NM (United States)); Ahrens, E.H.; Dennis, A.W.; Hurtado, L.D.; Knowles, M.K.; Tillerson, J.R.;

Thompson, T.W.; Galbraith, D. Sandia National Labs., Albuquerque, NM (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960804–35: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96011691. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the demonstration of compliance with federal regulations, a shaft seal system has been designed for the Waste Isolation Pilot Plant. The system completely fills the 650 m shafts with components consisting of the common engineering materials, each of which possesses low permeability, longevity, and can be constructed using available technology. Design investigations couple rock mechanics and fluid flow analysis and tests of these materials within the natural geological setting, and demonstrate the effectiveness of the design.

1578 (SAND–96-1921C) **Structural analysis in support of the waterborne transport of radioactive materials.** Ammerman, D.J. Sandia National Labs., Albuquerque, NM (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960706–30: American Society of Mechanical Engineers (ASME) pressure vessels and piping conference, Montreal (Canada), 21-26 Jul 1996). Order Number DE96013237. Source: OSTI; NTIS; INIS; GPO Dep.

The safety of the transportation of radioactive materials by road and rail has been well studied and documented. However, the safety of waterborne transportation has received much less attention. Recent highly visible waterborne transportation campaigns have led to DOE and IAEA to focus attention on the safety of this transportation mode. In response, Sandia National Laboratories is conducting a program to establish a method to determine the safety of these shipments. As part of that program the mechanics involved in ship-to-ship collisions are being evaluated to determine the loadings imparted to radioactive material transportation packages during these collisions. This paper will report on the results of these evaluations.

1579 (SAND–96-2011C) **Spent-fuel verification measurements using passive and active radiation techniques.** Ewing, R.I.; Seager, K.D. Sandia National Labs., Albuquerque, NM (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960767–22: 37. annual meeting of the Institute of Nuclear Materials Management, Naples, FL (United States), 28-31 Jul 1996). Order Number DE96013830. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes an evolutionary development process that will lead to spent fuel measurements that directly measure fissile reactivity. First, the Fork measurement system has been used to verify the burnup of pressurized water reactor (PWR) spent-fuel assemblies at U.S. nuclear utilities. Fork measurements have demonstrated the utility of the passive Fork system to verify reactor records with a single 100-second measurement on each assembly. Second, an Advanced Fork system incorporating collimated gamma-ray spectroscopy has been designed to permit advanced calibration techniques that are independent of reactor burnup records and to allow rapid axial scanning of spent fuel assemblies. Third, an Active Fork system incorporating a neutron source to interrogate spent fuel is proposed to provide the capability to measure fissile reactivity, when compared to measurements on fresh fuel assemblies of the same design. The Advanced and Active Fork systems have wide applicability to spent fuel verification for PWR, boiling water reactor (BWR), and U.S. Department of Energy (DOE) spent fuel.

1580 (UCRL-ID–118561) **Review of sensors for the in situ chemical characterization of the Hanford underground storage tanks.** Kyle, K.R.; Mayes, E.L. Lawrence Livermore National Lab., CA (United States). 29 Jul 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015026. Source: OSTI; NTIS; INIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL), in the Technical Task Plan (TTP) SF-2112-03 subtask 2, is responsible for the conceptual design of a Raman probe for inclusion in the in-tank cone penetrometer. As part of this task, LLNL is assigned the further responsibility of generating a report describing a review of sensor technologies other than Raman that can be incorporated in the in-tank cone penetrometer for the chemical analysis of the tank environment. These sensors would complement the capabilities of the Raman probe, and would give information on gaseous, liquid, and solid state species that are insensitive to Raman interrogation. This work is part of a joint effort involving several DOE laboratories for the design and development of in-tank cone penetrometer deployable systems for direct UST waste characterization at Westinghouse Hanford Company (WHC) under the auspices of the U.S. Department of Energy (DOE) Underground Storage Tank Integrated Demonstration (UST-ID).

1581 (UCRL-JC–122572) **Pitting corrosion of container materials in anticipated repository environments.** Roy, A.K.; McCright, R.D. Lawrence Livermore National Lab., CA (United States). Nov 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134 ; W-7405-ENG-48. (CONF-960421–8: 7. annual international high-level radioactive waste management conference, Las Vegas, NV (United States), 29 Apr - 3 May 1996). Order Number DE96006314. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. HIGH-LEVEL RADIOACTIVE WASTES/underground disposal; CONTAINERS/pitting corrosion; CONTAINERS/design; STAINLESS STEELS/materials testing; YUCCA MOUNTAIN; CONTAINERS; DESIGN; MOISTURE; GROUND WATER; ELECTROCHEMICAL CORROSION

1582 (UCRL-JC–122875) **Tank leak detection using electrical resistance methods.** Ramirez, A.; Daily, W.; Binley, A.; LaBrecque, D. Lawrence Livermore National Lab., CA (United States). Jan 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-960477–4: 9. annual symposium on the application of geophysics to engineering and environmental problems, Denver, CO (United States), 15 Apr - 1 May 1996). Order Number DE96010700. Source: OSTI; NTIS; GPO Dep.

Large volumes of hazardous liquids and high-level radioactive wastes are stored worldwide in surface and underground tanks. Frequently these tanks are found to leak, thereby resulting in not only a loss of stored inventory, but in contamination to soils and groundwater. It is important to develop a reliable method of detecting leaks before large quantities are emitted into the environment surround the tanks. Two field experiments were performed to evaluate the performance of electrical resistance tomography (ERT) as a leak detection method under metal underground storage tanks (UST). This paper provides a summary of the field experiments performed under a 15 m diameter steel tank mockup located at the Hanford Reservation.

1583 (WHC-EP–0474-16) **Quarterly report on the Ferrocyanide Safety Program for the period ending, March 31, 1995.** Cash, R.J.; Meacham, J.E.; Dukelow, G.T. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012969. Source: OSTI; NTIS; INIS; GPO Dep.

This quarterly report provides a status of the activities underway on the Ferrocyanide Safety Issue at the Hanford Site, including actions in response to Defense Nuclear Facilities Safety Board (DNFSB) Recommendation 90-7 (FR 1990). In March 1991, a DNFSB implementation plan (Cash 1991) responding to the six parts of Recommendation 90-7 was prepared and sent to the DNFSB. A Ferrocyanide Safety Program Plan addressing the total Ferrocyanide Safety Program, including the six parts of DNFSB Recommendation 90-7, was released in October 1994 (DOE 1994b). Activities in the program plan are underway or have been completed, and the status of each is described in Sections 2.0 and 3.0 of this report.

1584 (WHC-EP–0474-17) **Quarterly report on the Ferrocyanide Safety Program for the period ending June 30, 1995.** Meacham, J.E.; Cash, R.J.; Dukelow, G.T. Westinghouse Hanford Co., Richland, WA (United States). Jul 1995. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95017142. Source: OSTI; NTIS; INIS; GPO Dep.

This is the seventeenth quarterly report on the progress of activities addressing the Ferrocyanide Safety Issue associated with Hanford Site high-level radioactive waste tanks. Progress in the Ferrocyanide Safety Program is reviewed, including work addressing the six pans of Defense Nuclear Facilities Safety Board Recommendation 90-7 (FR 1990). All work activities are described in the revised program plan (DOE 1994b), and this report follows the same format presented there. A summary of the key events occurring this quarter is presented.

1585 (WHC-EP–0474-18) **Quarterly report on the Ferrocyanide Safety Program for the period ending September 30, 1995.** Meacham, J.E.; Cash, R.J.; Dukelow, G.T. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003339. Source: OSTI; NTIS; INIS; GPO Dep.

This is the eighteenth quarterly report on the progress of activities addressing the Ferrocyanide Safety Issue associated with Hanford Site high-level radioactive waste tanks. Progress in the Ferrocyanide Safety Program is reviewed, including work addressing the six parts of Defense Nuclear Facilities Safety Board Recommendation 90-7 (FR 1990). All work activities are described in the revised program plan (DOE 1994b), and this report follows the same format presented there. A summary of the key events occurring this quarter is presented in Section 1.2. More detailed discussions of progress are located in Sections 2.0 through 4.0.

1586 (WHC-EP–0474-19) **Quarterly report on the Ferrocyanide Safety Program for the period ending December 31, 1995.** Cash, R.J.; Meacham, J.E. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96009668. Source: OSTI; NTIS; GPO Dep.

This is the nineteenth quarterly report on the progress of activities addressing the Ferrocyanide Safety Issue associated with Hanford Site high-level radioactive waste tanks. Progress in the Ferrocyanide Safety Program is reviewed, including work addressing the six parts of Defense Nuclear Facilities Safety Board Recommendation 90-7 (FR 1990). All work activities are described in the revised program plan (DOE 1994b), and this report follows the same format presented there. A summary of the key events occurring this quarter is presented in Section 1.2. More detailed discussions of progress are located in Sections 2.0 through 4.0. 58 refs.

1587 (WHC-EP–0479-1) **Facility effluent monitoring plan for the tank farms facilities.** Bachand, D.D.; Crummel, G.M. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 159p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015658. Source: OSTI; NTIS; INIS; GPO Dep.

A facility effluent monitoring plan is required by the US Department of Energy for any operations that involve hazardous materials and radioactive substances that could impact employee or public safety or the environment. This document is prepared using specific guidelines. This facility effluent monitoring plan assesses effluent monitoring systems and evaluates whether they are adequate to ensure the public health and safety as specified in applicable federal, state, and local requirements. This facility effluent monitoring plan shall ensure long-range integrity of the effluent monitoring systems by requiring an update whenever a new process or operation introduces new hazardous materials or significant radioactive materials. This document must be reviewed annually even if there are no operational changes, and it must be updated as a minimum every three years.

1588 (WHC-EP–0600-Rev.1) **Status report on resolution of Waste Tank Safety Issues at the Hanford Site. Revision 1.** Dukelow, G.T. (Los Alamos Technical Associates, Inc., Kennewick, WA (United States)); Hanson, G.A. Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). May 1995. 207p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012985. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to provide and update the status of activities supporting the resolution of waste tank safety issues and system deficiencies at the Hanford Site. This report provides: (1) background information on safety issues and system deficiencies; (2) a description of the Tank Waste Remediation System and the process for managing safety issues and system deficiencies; (3) changes in safety issue description, prioritization, and schedules; and (4) a summary of the status, plans, order of magnitude, cost, and schedule for resolving safety issues and system deficiencies.

1589 (WHC-EP–0685) **Engineering evaluation of alternatives: Technologies for monitoring interstitial liquids in single-shell tanks.** Brevick, C.H. (ICF Kaiser Hanford Co., Richland, WA (United States)); Jenkins, C.E. Westinghouse Hanford Co., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). Feb 1996. 152p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC06-87RL10930. Order Number DE96006825. Source: OSTI; NTIS; INIS; GPO Dep.

A global search of mature, emerging, and conceptual tank liquid monitoring technologies, along with a historical review of Hanford tank farm waste monitoring instrumentation, was conducted to identify methods for gauging the quantity of interstitial waste liquids contained in Hanford SSTs. Upon completion of the search, an initial screening of alternatives was conducted to identify candidates which might be capable of monitoring interstitial tank liquids. The nine candidate technologies that were selected, evaluated, and ranked are summarized. Hydrostatic tank gauging (HTG) is the technology generally recommended for gauging the quantity of process materials contained in Hanford SSTs. HTG is a mass-based technique that has the capability for continuous remote monitoring. HTG has the advantages of no moving parts, intrinsic safety, and potentially gauging a one-million gal tank with a precision of approximately ±500 pounds (i.e., ±62 gal of water or ±0.02 in. of level in a 75 ft diameter tank). HTG is relatively inexpensive and probe design, construction, testing, installation, and operation should be straightforward. HTG should be configured as part of a hybrid tank gauging system. A hybrid system employs two or more independent measurement systems which function in concert to provide redundancy, improved accuracy, and maximum information at minimum cost. An excellent hybrid system choice for monitoring interstitial liquids in SSTs might be the combination of HTG with thermal differential technology.

1590 (WHC-EP–0817) **Alkaline chemistry of transuranium elements and technetium and the treatment of alkaline radioactive wastes.** Delegard, C.H. (Westinghouse Hanford Co., Richland, WA (United States)); Peretrukhin, V.F.; Shilov, V.P.; Pikaev, A.K. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015769. Source: OSTI; NTIS; INIS; GPO Dep.

Goal of this survey is to generalize the known data on fundamental physical-chemical properties of TRUs and Tc, methods for their isolation, and to provide recommendations that will be useful for partitioning them from alkaline high-level wastes.

1591 (WHC-EP–0818) **Calcination/dissolution residue treatment.** Knight, R.C. (Westinghouse Hanford Co., Richland, WA (United States)); Creed, R.F.; Patello, G.K.; Hollenberg, G.W.; Buehler, M.F.; O'Rourke, S.M.; Visnapuu, A.; McLaughlin, D.F. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013515. Source: OSTI; NTIS; INIS; GPO Dep.

Currently, high-level wastes are stored underground in steel-lined tanks at the Hanford site. Current plans call for the chemical pretreatment of these wastes before their immobilization in stable glass waste forms. One candidate pretreatment approach, calcination/dissolution, performs an alkaline fusion of the waste and creates a high-level/low-level partition based on the aqueous solubilities of the components of the product calcine. Literature and laboratory studies were conducted with the goal of finding a residue treatment technology that would decrease the quantity of high-level waste glass required following calcination/dissolution waste processing. Four elements, Fe, Ni, Bi, and U, postulated to be present in the high-level residue fraction were identified as being key to the quantity of high-level glass formed. Laboratory tests of the candidate technologies with simulant high-level residues showed reductive roasting followed by carbonyl volatilization to be successful in removing Fe, Ni, and Bi. Subsequent bench-scale tests on residues from calcination/dissolution processing of genuine Hanford Site tank waste showed Fe was separated with radioelement decontamination factors of 70 to 1,000 times with respect to total alpha activity. Thermodynamic analyses of the calcination of five typical Hanford Site tank waste compositions also were performed. The analyses showed sodium hydroxide to be the sole molten component in the waste calcine and emphasized the requirement for waste blending if fluid calcines are to be achieved. Other calcine phases identified in the thermodynamic analysis indicate the significant thermal reconstitution accomplished in calcination.

1592 (WHC-EP–0853-Rev.1-Vol.1) **DNFSB Recommendation 94-1 Hanford Site Integrated Stabilization Management Plan. Volume 1.** Gerber, E.W. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003261. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) has developed an Integrated Program Plan (IPP) to address concerns identified in Defense Nuclear Facilities Safety Board Recommendation 94-1. The IPP describes the actions that DOE plans to implement at its various sites to convert excess fissile materials to forms or conditions suitable for safe interim storage. The baseline IPP was issued as DOE's Defense Nuclear Facilities Safety Board (DNFSB) Recommendation 94-1 Implementation Plan (IP), which was transmitted to the DNFSB on February 28, 1995. The IPP is being further developed to include complex-wide requirements for research and development and a long-range facility requirements section. The planned additions to the baseline IPP are being developed based on a systems engineering approach that integrates facilities and capabilities at the various DOE sites and focuses on attaining safe interim storage with minimum safety risks and environmental impacts. Each affected DOE site has developed a Site Integrated Stabilization Management Plan (SISMP) to identify individual site plans to implement the DNFSB Recommendation 94-1 and to provide a basis for formulating planned additions to the IPP. The SISMPs were developed based on the objectives, requirements, and commitments identified in the baseline DNFSB Recommendation 94-1 IPP. The SISMPs will be periodically updated to reflect improved integration between DOE sites as identified during the IPP systems engineering evaluations.

1593 (WHC-EP–0853-Rev.1-Vol.2) **DNFSB Recommendation 94-1 Hanford Site Integrated Stabilization Management Plan. Volume 2.** Gerber, E.W. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003929. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site Integrated Stabilization Management Plan (SISMP) was developed in support of the US Department of Energy's (DOE) Defense Nuclear Facilities Safety Board (DNFSB) Recommendation 94-1 Integrated Program Plan (IPP). Volume 1 of the SISMP identifies the technical scope and costs associated with Hanford Site plans to resolve concerns identified in DNFSB Recommendation 94-1.

Volume 2 of the SISMP provides the Resource Loaded Integrated Schedules for Spent Nuclear Fuel Project and Plutonium Finishing Plant activities identified in Volume 1 of the SISMP. Appendix A provides the schedules and progress curves related to spent nuclear fuel management. Appendix B provides the schedules and progress curves related to plutonium-bearing material management. Appendix C provides programmatic logic diagrams that were referenced in Volume 1 of the SISMP.

1594 (WHC-EP–0853-Vol.1) **DNFSB Recommendation 94-1 Hanford Site Integrated Stabilization Management Plan. Volume 1.** McCormack, R.L. Westinghouse Hanford Co., Richland, WA (United States). Aug 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95017151. Source: OSTI; NTIS; GPO Dep.

This document describes the plans of the Hanford Site for the safe interim storage of fissile materials. Currently, spent nuclear fuels reside in storage basins that have leaked in the past and are projected to leak in the future. Other problems in the basins include; sludge from decomposition, degraded cladding of fuel elements, and construction defects which make the basins seismically unsafe. This management plan describes the time and cost that it will take to implement a safe interim storage plan for the fissile materials.

1595 (WHC-EP–0856) **Tank waste remediation system operational scenario.** Johnson, M.E. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013573. Source: OSTI; NTIS; INIS; GPO Dep.

The Tank Waste Remediation System (TWRS) mission is to store, treat, and immobilize highly radioactive Hanford waste (current and future tank waste and the strontium and cesium capsules) in an environmentally sound, safe, and cost-effective manner (DOE 1993). This operational scenario is a description of the facilities that are necessary to remediate the Hanford Site tank wastes. The TWRS Program is developing technologies, conducting engineering analyses, and preparing for design and construction of facilities necessary to remediate the Hanford Site tank wastes. An Environmental Impact Statement (EIS) is being prepared to evaluate proposed actions of the TWRS. This operational scenario is only one of many plausible scenarios that would result from the completion of TWRS technology development, engineering analyses, design and construction activities and the TWRS EIS. This operational scenario will be updated as the development of the TWRS proceeds and will be used as a benchmark by which to evaluate alternative scenarios.

1596 (WHC-EP–0861) **Status report for inactive miscellaneous underground storage tanks at Hanford Site 200 Areas.** Powers, T.B. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 115p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003336. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this status report is to summarize updated data and information from the FY 1994 strategy plan that is associated with inactive miscellaneous underground storage tanks (IMUSTs). Assumptions and processes to assess potential risks and operational concerns are documented in this report. Safety issue priorities are ranked based on a number of considerations. Sixty-three IMUSTs have been identified and placed on the official IMUST list. All the tanks are associated with past Hanford Site operations. Of the 63 tanks., 19 are catch tanks, 20 are vault tanks, 3 are neutralization tanks, 8 are settling tanks, 2 are solvent makeup tanks used to store hexone, 2 are flush tanks, 3 are decontamination tanks, 1 is a diverter station, 1 is a receiver tank, 1 is an experimental tank, and 3 are waste handling tanks. It is important to proactively deal with the risks Imposed by these 63 tanks, and at the same time not jeopardize the existing commitments and schedules for mitigating and resolving identified safety issues related to the 177 SSTs and DSTS. Access controls and signs have been placed on all but the three official IMUSTs added most recently. An accelerated effort to identify authorization documents and perform unreviewed safety question (USQ) screening has been completed. According to a set of criteria consistent with the safety screening data quality objective (DQO) process, 6 IMUSTs are ranked high related to the hydrogen generation potential safety Issue, 1 is ranked high related to the ferrocyanide potential safety issue, 6 are ranked high related to the flammability potential safety issue, and 25 are ranked high related to the vapor emissions potential safety issue.

1597 (WHC-EP–0862) **Recommended alternative for interim stabilization of Tank 241-C-103.** Dukelow, G.T. (Westinghouse Hanford Co., Richland, WA (United States)); Turner, D.A.; Grigsby, J.M. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011568. Source: OSTI; NTIS; INIS; GPO Dep.

The waste in tank 241-C-103 poses several health and safety risks and potential soil contamination caused by tank leaks. To minimize the risk of contaminating the soil beneath the tank, the pumpable waste liquids are planned to be removed by salt well pumping. In addition to aqueous liquids, this tank is unique because it also contains a layer of degraded PUREX solvent floating on the aqueous liquid. The following three options for removing and storing this separable phase organic solvent have been proposed and studied: transferring the organic solvent and pumpable aqueous liquids using existing salt well pumping equipment and procedures to a double-shell tank (DST) for storage; removing most of the organic solvent using a skimmer pump, then salt well pumping the remaining pumpable liquids to a different DST for storage; removing most of the organic solvent to an aboveground storage tank for eventual treatment or offsite transfer, and then salt well pumping the remaining pumpable liquids to a DST for interim storage. As a result of evaluating these three options and a no pumping option, the recommended action is to transfer both the organic solvent and pumpable aqueous liquid to a DST for storage using existing salt well pumping equipment. The evaluation considers the following criteria: public health and safety, worker safety, environmental compliance, engineering feasibility, and cost. The options compared these factors. Two key areas drove the selection of the recommended approach: the minimization of potential soil contamination from tank leaks caused the (interim stabilization by salt well pumping) options to be rated more highly than the no pumping option; and cost and implementation factors caused the transfer and storage to DST using existing tank farm salt well pumping equipment option to rate higher than the skimming options. Other factors have only a second order effect on the selection process. Evaluation results are described in this report.

1598 (WHC-EP–0870) **Acoustic imaging of underground storage tank wastes.** Mech, S.J. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96002791. Source: OSTI; NTIS; INIS; GPO Dep.

Acoustics is a potential tool to determine the properties of high level wastes stored in Underground Storage Tanks. Some acoustic properties were successfully measured by a limited demonstration conducted in 114-TX. This accomplishment provides the basis for expanded efforts to qualify techniques which depend on the acoustic properties of tank wastes. This work is being sponsored by the Department of Energy under the Office of Science and Technology. In FY-1994, limited Tank Waste Remediation Systems EM-30 support was available at Hanford and Los Alamos National Laboratory. The Massachusetts Institute of Technology (MIT) and Earth Resources Laboratory (ERL) were engaged for analysis support, and Elohi Geophysics, Inc. for seismic testing services. Westinghouse-Hanford Company provided the testing and training, supplied the special engineering and safety analysis equipment and procedures, and provided the trained operators for the actual tank operations. On 11/9/94, limited in-tank tests were successfully conducted in tank 114-TX. This stabilized Single Shell Tank was reported as containing 16.8 feet of waste, the lower 6.28 feet of which contained interstitial liquid. Testing was conducted over the lower 12 feet, between two Liquid Observation Wells thirty feet apart. The "quick-look" data was reviewed on-site by MIT and Elohi.

1599 (WHC-EP–0873) **Engineering evaluation of alternatives: Managing the assumed leak from single-shell Tank 241-T-101.** Brevick, C.H. (ICF Kaiser Hanford Co., Richland, WA (United States)); Jenkins, C. Westinghouse Hanford Co., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). Feb 1996. 240p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006826. Source: OSTI; NTIS; INIS; GPO Dep.

At mid-year 1992, the liquid level gage for Tank 241-T-101 indicated that 6,000 to 9,000 gal had leaked. Because of the liquid level anomaly, Tank 241-T-101 was declared an assumed leaker on October 4, 1992. SSTs liquid level gages have been historically unreliable. False readings can occur because of instrument failures, floating salt cake, and salt encrustation. Gages frequently self-correct and tanks show no indication of leak. Tank levels cannot be visually inspected and verified because of high radiation fields. The gage in Tank 241-T-101 has largely corrected itself since the mid-year 1992 reading. Therefore, doubt exists that a leak has occurred, or that the magnitude of the leak poses any immediate environmental threat. While reluctance exists to use valuable DST space unnecessarily, there is a large safety and economic incentive to prevent or mitigate release of tank liquid waste into the surrounding environment. During the assessment of the significance of the Tank 241-T-101 liquid level gage readings, Washington State Department of Ecology determined that Westinghouse Hanford Company was not in compliance with regulatory requirements, and directed transfer of the Tank 241-T-101 liquid contents into a DST. Meanwhile, DOE directed WHC to examine reasonable alternatives/options for safe interim management of Tank 241-T-101 wastes before taking action. The five alternatives that could be used to manage waste from a leaking SST are: (1) No-Action, (2) In-Tank Stabilization, (3) External Tank Stabilization, (4) Liquid Retrieval, and (5) Total Retrieval. The findings of these examinations are reported in this study.

1600 (WHC-EP–0876) **Ferrocyanide Safety Program: Analysis of postulated energetic reactions and resultant aerosol generation in Hanford Site Waste Tanks.** Postma, A.K. (G and P Consulting, Inc., Dallas, OR (United States)); Dickinson, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001606. Source: OSTI; NTIS; INIS; GPO Dep.

This report reviews work done to estimate the possible consequences of postulated energetic reactions in ferrocyanide waste stored in underground tanks at the Hanford Site. The issue of explosive reactions was raised in the 1987 Environmental Impact Statement (EIS), where a detonation-like explosion was postulated for the purpose of defining an upper bound on dose consequences for various disposal options. A review of the explosion scenario by the General Accounting Office (GAO) indicated that the aerosol generation and consequent radioactive doses projected for the explosion postulated in the EIS were understated by one to two orders of magnitude. The US DOE has sponsored an extensive study of the hazard posed by uncontrolled exothermic reactions in ferrocyanide waste, and results obtained during the past three years have allowed this hazard to be more realistically assessed. The objective of this report is to summarize the improved knowledge base that now indicates that explosive or vigorous chemical reactions are not credible in the ferrocyanide waste stored in underground tanks. This improved understanding supports the decision not to proceed with further analyses or predictions of the consequences of such an event or with aerosol tests in support of such predictions. 53 refs., 2 tabs.

1601 (WHC-EP–0882) **Calcination/dissolution chemistry development Fiscal year 1995.** Delegard, C.H. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001564. Source: OSTI; NTIS; INIS; GPO Dep.

The task "IPC Liaison and Chemistry of Thermal Reconstitution" is a $300,000 program that was conducted in Fiscal Year (FY) 1995 with U.S. Department of Energy (DOE) Office of Research and Development (EM-53) Efficient Separations and Processing Crosscutting Program supported under technical task plan (TTP) RL4-3-20-04. The principal investigator was Cal Delegard of the Westinghouse Hanford Company (WHC). The task encompassed the following two subtasks related to the chemistry of alkaline Hanford Site tank waste: (1) Technical Liaison with the Institute of Physical Chemistry of the Russian Academy of Science (IPC/RAS) and its research into the chemistry of transuranic elements (TRU) and technetium (Tc) in alkaline media. (2) Laboratory investigation of the chemistry of calcination/dissolution (C/D) (or thermal reconstitution) as an alternative to the present reference Hanford Site tank waste pretreatment flowsheet, Enhanced Sludge Washing (ESW). This report fulfills the milestone for the C/D subtask to "Provide End-of-Year Report on C/D Laboratory Test Results" due 30 September 1995. A companion report, fulfilling the milestone to provide an end-of-year report on the IPC/RAS liaison, also has been prepared.

1602 (WHC-EP–0893) **Hanford Site radioactive hazardous materials packaging directory.** McCarthy, T.L.

Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96005124. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site Radioactive Hazardous Materials Packaging Directory (RHMPD) provides information concerning packagings owned or routinely leased by Westinghouse Hanford Company (WHC) for offsite shipments or onsite transfers of hazardous materials. Specific information is provided for selected packagings including the following: general description; approval documents/specifications (Certificates of Compliance and Safety Analysis Reports for Packaging); technical information (drawing numbers and dimensions); approved contents; areas of operation; and general information. Packaging Operations & Development (PO&D) maintains the RHMPD and may be contacted for additional information or assistance in obtaining referenced documentation or assistance concerning packaging selection, availability, and usage.

1603 (WHC-MR-0506) **Glass science tutorial: Lecture No. 7, Waste glass technology for Hanford.** Kruger, A.A. Westinghouse Hanford Co., Richland, WA (United States). Jul 1995. 496p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015783. Source: OSTI; NTIS; INIS; GPO Dep.

Includes many view graphs.

This paper presents the details of the waste glass tutorial session that was held to promote knowledge of waste glass technology and how this can be used at the Hanford Reservation. Topics discussed include: glass properties; statistical approach to glass development; processing properties of nuclear waste glass; glass composition and the effects of composition on durability; model comparisons of free energy of hydration; LLW glass structure; glass crystallization; amorphous phase separation; corrosion of refractories and electrodes in waste glass melters; and glass formulation for maximum waste loading.

1604 (WHC-SA-2592) **Combustion and fuel loading characteristics of Hanford Site transuranic solid waste.** Greenhalgh, W.O.; Olson, W.W. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9506150-8: 2. annual Department of Energy defense programs packaging workshop, San Francisco, CA (United States), 12-15 Jun 1995). Order Number DE95017149. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site has been used for the storage of solid waste including transuranic and low-level mixed wastes. The storage and handling of solid waste presents some fire safety questions because most of the solid waste contains combustible components. This report addresses the composition, average fuel loading, and some general observations about performance of steel-drummed solid waste in fire situations.

1605 (WHC-SA-2616) **A parametric study of double-shell tank response to internal high-frequency pressure loading.** Baliga, R. (ADVENT Engineering Services, Inc., San Ramon, CA (United States)); Choi, K.; Shulman, J.S.; Strehlow, J.P.; Abatt, G. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950740-40: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95008787. Source: OSTI; NTIS; INIS; GPO Dep.

The double-shell waste tank 241SY101 (SY101) is a 3,785,400-liter tank used to store radioactive waste at the Hanford Site near Richland, Washington. The tank waste has formed two layers of sludge in the tank; a convective and a nonconvective layer. Ongoing reactions in the waste cause a buildup of hydrogen molecules that become trapped within the nonconvective layer of the waste. Various means of preventing the buildup of hydrogen molecules in the nonconvective layer have been investigated, including the use of a sonic probe that would transmit high-frequency acoustic pressure waves into the nonconvective layer of the waste. During the operation of the sonic probe, the pressure waves transmitted from the probe induce pressure time history loading on the inside surface of the primary tank. For low-frequency fluid-structure interaction loads, such as those associated with seismic events, the convective and impulsive effects of the waste-filled tank are well documented. However, for high-frequency loading, such as that associated with acoustic pressure waves, interactions between the waste and the primary tank are not understood. The pressure time history is represented by a harmonic function with a frequency range between 30 and 100 Hz. Structural analyses of the double-shell tank have been performed that address the tank's response to the sonic probe acoustic pressure loads. This paper addresses the variations in the tank response as a function of percent waste mass considered to be effective in the dynamic excitation of the tank. It also compares results predicted by analyses that discretely model the liquid waste and presents recommendations for the simplified effective mass approach. Also considered in the parametric study is the effect of damping on the tank response for the same pressure loading.

1606 (WHC-SA-2623) **Tank waste remediation system: An update.** Alumkal, W.T.; Babad, H.; Dunford, G.L.; Honeyman, J.O.; Wodrich, D.D. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950216-151: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95013487. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy's Hanford Site, located in southeastern Washington State, contains the largest amount and the most diverse collection of highly radioactive waste in the US. High-level radioactive waste has been stored at the Hanford Site in large, underground tanks since 1944. Approximately 217,000 M^3 (57 Mgal) of caustic liquids, slurries, saltcakes, and sludges have accumulated in 177 tanks. In addition, significant amounts of ^{90}Sr and ^{137}Cs were removed from the tank waste, converted to salts, doubly encapsulated in metal containers, and stored in water basins. The Tank Waste Remediation System Program was established by the US Department of Energy in 1991 to safely manage and immobilize these wastes in anticipation of permanent disposal of the high-level waste fraction in a geologic repository. Since 1991, significant progress has been made in resolving waste tank safety issues, upgrading Tank Farm facilities and operations, and developing a new strategy for retrieving, treating, and immobilizing the waste for disposal.

1607 (WHC-SA-2649) **External pressure limitations for 0-15 PSI storage tanks.** Dib, M.W. (ICF Kaiser Hanford

Co., Richland, WA (United States)); Shrivastava, H.P. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950740–103: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE96009110. Source: OSTI; NTIS; INIS; GPO Dep.

The US DOE plans to construct a number of underground high-level radioactive waste storage tanks at the Hanford Site near Richland, Washington. The underground tanks consist of two main concentric cylindrical structures. The primary carbon-steel tank contains the liquid waste, and the secondary concrete structure serves as a redundant barrier to confine the radioactive fluid in the event of failure of the primary tank. This paper evaluates the design adequacy of the cylindrical walls under the partial vacuum condition and determines the allowable negative pressure for the bottom plate. Failure by buckling is not the governing mode of failure for the dome because of its anchored configuration.

1608 (WHC-SA–2737) **Stress evaluation of the primary tank of a double-shell underground storage tank facility.** Atalay, M.B. (ICF Kaiser Engineers, Inc., Oakland, CA (United States)); Stine, M.D.; Farnworth, S.K. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950740–52: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95012565. Source: OSTI; NTIS; INIS; GPO Dep.

A facility called the Multi-Function Waste Tank Facility (MWTF) is being designed at the Department of Energy's Hanford site. The MWTF is expected to be completed in 1998 and will consist of six underground double-shell waste storage tanks and associated systems. These tanks will provide safe and environmentally acceptable storage capacity to handle waste generated during single-shell and double-shell tank safety mitigation and remediation activities. This paper summarizes the analysis and qualification of the primary tank structure of the MWTF, as performed by ICF Kaiser Hanford during the latter phase of Title 1 (Preliminary) design. Both computer finite element analysis (FEA) and hand calculations methods based on the so-called Tank Seismic Experts Panel (TSEP) Guidelines were used to perform the analysis and evaluation. Based on the evaluations summarized in this paper, it is concluded that the primary tank structure of the MWTF satisfies the project design requirements. In addition, the hand calculations performed using the methodologies provided in the TSEP Guidelines demonstrate that, except for slosh height, the capacities exceed the demand. The design accounts for the adverse effect of the excessive slosh height demand, i.e., inadequate freeboard, by increasing the hydrodynamic wall and roof pressures appropriately, and designing the tank for such increased pressures.

1609 (WHC-SA–2748) **Criticality safety of high-level tank waste.** Rogers, C.A. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9509100–16: 5. international conference on nuclear criticality safety, Albuquerque, NM (United States), 17-22 Sep 1995). Order Number DE95013721. Source: OSTI; NTIS; INIS; GPO Dep.

Radioactive waste containing low concentrations of fissile isotopes is stored in underground storage tanks on the Hanford Site in Washington State. The goal of criticality safety is to ensure that this waste remains subcritical into the indefinite future without supervision. A large ratio of solids to plutonium provides an effective way of ensuring a low plutonium concentration. Since the first waste discharge, a program of audits and appraisals has ensured that operations are conducted according to limits and controls applied to them. In addition, a program of surveillance and characterization maintains watch over waste after discharge.

1610 (WHC-SA–2758) **Nuclear waste management and criticality safety.** Vail, T.S. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950601–24: Annual meeting of the American Nuclear Society (ANS), Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95014315. Source: OSTI; NTIS; INIS; GPO Dep.

Since 1945 waste streams containing radioactive isotopes have been discharged to underground storage tanks on the Hanford Site in Washington State. At least 49 different waste streams containing low concentrations of ^{235}U and ^{239}Pu have been transferred to tank farm facilities. Optimizing tank space, combined with the variability of operations, results in a complex waste matrix that is difficult to characterize. Characterizing tank waste is difficult because of its relative inaccessibility inside the storage tanks and because of the large degree of uncertainty in the composition and distribution of components. Nuclear criticality safety controls are based on precise configurations that are conservative when used to represent the waste environment. However, the safety philosophy governing waste storage requires that the waste be controlled and monitored, and the margin of safety be quantified.

1611 (WHC-SA–2768) **Laboratory waste minimization during the operation startup phase.** Morrison, J.A. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9505111–2: 11. pollution prevention conference: shaping the future through pollution prevention involvement - commitment - progress, Knoxville, TN (United States), 16-18 May 1995). Order Number DE95013574. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Sampling and Characterization Facility (WSCF) Laboratory was opened for occupancy in October, 1994. It is the first of its kind on the Hanford Site, a low level lab located in an area of high level radiological material. The mission of the facility is to analyze process samples from two on-line effluent treatment plants. One of these plants is operating and the other is due to begin operations by the end of 1995. The VSCF also performs air sampling analysis for routine radiological surveillance filter papers drawn from around the Hanford Site. Because this type of laboratory had not been in operation before, there was only speculation about the types and amounts of waste that would be generated. The laboratory personnel assigned to WSCF were assembled from existing labs on the Hanford Site and from outside the Hanford Site community. For some, it was a first time experience working on a site where a twenty mile drive is sometimes required to visit another building. For others, it was a change in the way business is conducted using state-of-the-art equipment, a new building, and a chance to approach issues as a team from the beginning. It is how this team came together and the issues that were discussed, sometimes uncomfortably, that lead to the current success. The outcome of this process is discussed in this paper.

1612 (WHC-SA–2777) **Introduction to Radcalc: A computer program to calculate the radiolytic production of hydrogen gas from radioactive wastes in packages.** Green, J.R. (and others); Hillesland, K.E.; Field, J.G. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9506150–5: 2. annual Department of Energy defense programs packaging workshop, San Francisco, CA (United States), 12-15 Jun 1995). Order Number DE95012839. Source: OSTI; NTIS; INIS; GPO Dep.

A calculational technique for quantifying the concentration of hydrogen generated by radiolysis in sealed radioactive waste containers was developed in a U.S. Department of Energy (DOE) study conducted by EG&G Idaho, Inc., and the Electric Power Research Institute (EPRI) TMI-2 Technology Transfer Office. The study resulted in report GEND-041, entitled "A Calculational Technique to Predict Combustible Gas Generation in Sealed Radioactive Waste Containers". The study also resulted in a presentation to the U.S. Nuclear Regulatory Commission (NRC) which gained acceptance of the methodology for use in ensuring compliance with NRC IE Information Notice No. 84-72 (NRC 1984) concerning the generation of hydrogen within packages. NRC IE Information Notice No. 84-72: "Clarification of Conditions for Waste Shipments Subject to Hydrogen Gas Generation" applies to any package containing water and/or organic substances that could radiolytically generate combustible gases. EPRI developed a simple computer program in a spreadsheet format utilizing GEND-041 calculational methodology to predict hydrogen gas concentrations in low-level radioactive wastes containers termed Radcalc. The computer code was extensively benchmarked against TMI-2 (Three Mile Island) EPICOR II resin bed measurements. The benchmarking showed that the model developed predicted hydrogen gas concentrations within 20% of the measured concentrations. Radcalc for Windows was developed using the same calculational methodology. The code is written in Microsoft Visual C++ 2.0 and includes a Microsoft Windows compatible menu-driven front end. In addition to hydrogen gas concentration calculations, Radcalc for Windows also provides transportation and packaging information such as pressure buildup, total activity, decay heat, fissile activity, TRU activity, and transportation classifications.

1613 (WHC-SA–2794) **CRPE: Cesium Return Program Experience FY 1995.** Clements, E.P. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951203–39: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96005191. Source: OSTI; NTIS; INIS; GPO Dep.

Since 1945, the chemical reprocessing of irradiated nuclear fuels in the Hanford Chemical Separation areas has resulted in the generation of significant volumes of high-level, liquid, radioactive, by-product materials. However, because these materials were recognized to have beneficial uses, their disposal was delayed. To investigate the possibilities, the By-product Utilization Program (BUP) was initiated. The program mission was to develop a means for the application of radioactive-fission products for the benefit of society. Cs capsules were fabricated and distributed to private irradiation facilities for beneficial product sterilization. In June of 1988, a small leak developed in one of the Cs capsules at a private irradiator facility that is located in Decatur, Georgia. This leak prompted DOE to remove these capsules and to re-evaluate the BUP with the irradiator facilities that were currently using Cs capsules. As a result of this evaluation, a recall was issued to require that all remaining Cs capsules be returned to Hanford for safe management and storage pending final capsule disposition. The WHC completed the return of 309 capsules from a private irradiation facility, located in Northglenn, Colorado, to the Hanford Reservation. The DOE is also planning to remove 25 Cs capsules from a small, private irradiator facility located in Lynchburg, Virginia. This small irradiator facility is currently operational and uses the capsules for the underwater irradiation of wood-flooring products. This report discusses transportation-related activities that WHC has researched, developed, implemented, and is currently managing to ensure the safe and efficient movement of Cs-137 back to the Hanford Reservation.

1614 (WHC-SA–2795) **Radcalc: A computer program to calculate the radiolytic production of hydrogen gas from radioactive wastes in packages.** Green, J.R.; Schwarz, R.A.; Hillesland, K.E.; Roetman, V.E.; Field, J.G. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951203–40: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96005193. Source: OSTI; NTIS; INIS; GPO Dep.

Radcalc for Windows' is a menu-driven Microsoft2 Windows-compatible computer code that calculates the radiolytic production of hydrogen gas in high- and low-level radioactive waste. In addition, the code also determines US Department of Transportation (DOT) transportation classifications, calculates the activities of parent and daughter isotopes for a specified period of time, calculates decay heat, and calculates pressure buildup from the production of hydrogen gas in a given package geometry. Radcalc for Windows was developed by Packaging Engineering, Transportation and Packaging, Westinghouse Hanford Company, Richland, Washington, for the US Department of Energy (DOE). It is available from Packaging Engineering and is issued with a user's manual and a technical manual. The code has been verified and validated.

1615 (WHC-SA–2862) **Vitrification technology for Hanford Site tank waste.** Weber, E.T.; Calmus, R.B.; Wilson, C.N. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950401–35: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE96009909. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy's (DOE) Hanford Site has an inventory of 217,000 m^3 of nuclear waste stored in 177 underground tanks. The DOE, the US Environmental Protection Agency, and the Washington State Department of Ecology have agreed that most of the Hanford Site tank waste will be immobilized by vitrification before final disposal. This will be accomplished by separating the tank waste into high- and low-level fractions. Capabilities for high-capacity vitrification are being assessed and developed for each waste fraction. This paper provides an overview of the program for selecting preferred high-level waste melter and feed processing technologies for use in Hanford Site tank waste processing.

1616 (WHC-SA-2894) **FTIR fiber optic methods for the analysis of Hanford Site waste.** Rebagay, T.V. (and others); Cash, R.J.; Dodd, D.A. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9506234--1: 1995 Bio-Rad users meeting, Boston, MA (United States), 20-22 Jun 1995). Order Number DE95015739. Source: OSTI; NTIS; INIS; GPO Dep.

Sampling and chemical characterization of mixed high-level waste stored in underground tanks at the Hanford Site is currently in progress. Waste tank safety concerns have provided impetus to analyze this waste. A major safety issue is the possibility of significant concentrations of fuel (ferrocyanide and/or organic compounds) in contact with oxidizers (nitrates and nitrites). It is postulated that under dry conditions and elevated temperatures, ferrocyanide- and/or organic-bearing wastes could undergo rapid exothermic reactions. To maintain the tanks in a safe condition, data are needed on the moisture and fuel concentrations in the waste. Because of the highly radioactive nature of the waste, non-radioactive waste simulants mimicking actual waste are used to provide an initial basis for identifying realistic waste tank safety concerns. Emphasis has been placed on the use of new or existing Fourier transform infrared (FTIR)-based systems with potential for field or tank deployment to perform in situ remote waste characterization. Near-infrared diffuse reflectance and mid-infrared attenuated total reflectance fiber optic probes coupled to a Bio-Rad FTS 60A spectrometry system have been evaluated. The near-infrared diffuse reflectance fiber probe system has also been used for preliminary screening of the moisture content and chemical composition of actual Hanford Site waste tank waste core samples. The attributes of this method for analyzing actual radioactive waste are discussed.

1617 (WHC-SA-2933-FP) **Hot cell remote nuclear scanning of tank core samples.** Beck, M.A. (Westinghouse Hanford Co., Richland, WA (United States)); Blewett, G.R.; Troyer, G.L.; Keele, B.D.; Addleman, R.S. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960212--53: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006882. Source: OSTI; NTIS; INIS; GPO Dep.

A Westinghouse Hanford Company (WHC)-designed remote measurement system has been constructed for gamma and beta isotopic characterization of Hanford Site high-level waste tank core sample materials in a hot cell. A small, collimated, planar CdZnTe detector is used for gamma-ray spectroscopy. Spectral resolution of 2% full-width-at-maximum at 662 kiloelectronvolts (keV) has been obtained remotely using risetime compensation and limited pulse shape discrimination (PSD). Isotopic measurement of high-energy beta emitters was accomplished with a ruggedly made, deeply depleted, surface barrier silicon detector. The primary function of the remote nuclear screening system is to provide a fast, qualitative stratigraphic assessment (with isotopic information) of high-level radioactive material. Both gamma spectroscopy and beta measurements have been performed on actual core segments. Differences in radionuclide content, which correspond with color or texture variations, have been seen in constant cross section core samples, although for many samples the activity variation can be ascribed to geometry and/or mass factors. Discussion of the design, implementation, results and potential benefits will be presented.

1618 (WHC-SA-2942) **Soil structure interaction analysis of buried tank subjected to vertical excitations.** Wong, C.K. (ICF Kaiser Engineers, Inc., Oakland, CA (United States)); Stine, M.; Wagenblast, G.; Farnworth, S. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9511128--10: 5. Department of Energy (DOE) natural phenomena hazards mitigation symposium, Denver, CO (United States), 13-17 Nov 1995). Order Number DE96002795. Source: OSTI; NTIS; INIS; GPO Dep.

Underground High Level Waste Storage Tanks are subjected to strigent seismic requirements At some DOE sites, many existing waste storage tanks are of the double-shell tank design. In this configuration, the concrete outer structure acts as the vault and provides secondary confinement for the primary steel waste storage tank. To ensure the safety of the design and a good understanding of the seismic response of the concrete confinement structure, seismic analysis, including the effects of Soil-Structure Interaction (SSI), is generally performed with special purpose SSI computer analysis programs. Generally, the seismic SSI response due to vertical excitation is considered to be secondary to those of the horizontal excitation. In this paper, a detailed evaluation of the SSI response due to vertical excitation is presented and is shown to merit equal consideration relative to the horizontal excitation. The geometry and relative dimensions (i.e. flexibility) of the structure can have significant influence on the vertical seismic SSI response in local region(s) of the concrete structure.

1619 (WHC-SA-2952) **Characterization of Hanford N Reactor spent fuel and K Basin sludges.** Makenas, B.J.; Omberg, R.P.; Trimble, D.J.; Baker, R.B. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960212--81: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96009104. Source: OSTI; NTIS; INIS; GPO Dep.

Characterization is in progress for the N Reactor fuel stored in the Hanford K Basins. These activities' support the strategy for removal of fuel from the basins and storage of fuel in a dry condition at an area remote from the Columbia River. This strategy currently consists of placing fuel in a Multi-Canister Overpack (MCO), drying the fuel while it resides in the MCO and conditioning some portion of the fuel to reduce its chemical reactivity. Characterization includes the examination of fuel, canisters, and associated sludge. It consists firstly of in-basin activities such as visual examination, sludge depth measurements, and sampling of gas and liquid in canisters. Secondly characterization ecompasses the examination of samples of fuel and sludge which have been removed from the basins and shipped to laboratories. This paper presents observations made in the basins during the most recent attempts to ship samples from the basins and data obtained in the laboratory hotcells.

1620 (WHC-SA–2962-FP) **Organic reactivity analysis in Hanford single-shell tanks: Experimental and modeling basis for an expanded safety criterion.** Fauske, H. (Fauske and Associates, Inc. (United States)); Grigsby, J.M.; Turner, D.A.; Babad, H.; Meacham, J.E. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960212–61: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006378. Source: OSTI; NTIS; INIS; GPO Dep.

De-spite demonstrated safe storage in terms of chemical stability of the Hanford high level waste for many decades, including decreasing waste temperatures and continuing aging of chemicals to less energetic states, concerns continue relative to assurance of long-term safe storage. Review of potential chemical safety hazards has been of particular recent interest in response to serious incidents within the Nuclear Weapons Complexes in the former Soviet Union (the 1957 Kyshtym and the 1993 Tomsk-7 incidents). Based upon an evaluation of the extensive new information and understanding that have developed over the last few years, it is concluded that the Hanford waste is stored safely and that concerns related to potential chemical safety hazards are not warranted. Spontaneous bulk runaway reactions of the Kyshtym incident type and other potential condensed-phase propagating reactions can be ruled out by assuring appropriate tank operating controls are in place and by limiting tank intrusive activities. This paper summarizes the technical basis for this position.

1621 (WHC-SA–2966-FP) **Understanding waste phenomenology to reduce the amount of sampling and analysis required to resolve Hanford waste tank safety issues.** Meacham, J.E.; Babad, H. Westinghouse Hanford Co., Richland, WA (United States). Feb 1996. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960212–63: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006887. Source: OSTI; NTIS; INIS; GPO Dep.

Safety issues associated with Hanford Site waste tanks arose because of inadequate safety analyses and high levels of uncertainty over the release of radioactivity resulting from condensed phase exothermic chemical reactions (organic solvent fires, organic complexant-nitrate reactions, and ferrocyanide-nitrate reactions). The approach to resolving the Organic Complexant, Organic Solvent, and Ferrocyanide safety issues has changed considerably since 1990. The approach formerly utilized core sampling and extensive analysis of the samples with the expectation the data would provide insight into the hazard. This resulted in high costs and the generation of a large amount of data that was of limited value in resolving the safety issues. The new approach relies on an understanding of the hazard phenomenology to focus sampling and analysis on those analytes that are key to ensuring safe storage of the waste.

1622 (WHC-SA–2968-FP) **High-level core sample x-ray imaging at the Hanford Site.** Weber, J.R.; Keve, J.K. Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951091–2: 4. nondestructive assay and nondestructive examination waste characterization conference, Salt Lake City, UT (United States), 24-26 Oct 1995). Order Number DE96001856. Source: OSTI; NTIS; INIS; GPO Dep.

Waste tank sampling of radioactive high-level waste is required for continued operations, waste characterization, and site safety. Hanford Site tank farms consist of 28 double-shell and 149 single-shell underground storage tanks. The single shell tanks are out-of-service an no longer receive liquid waste. Core samples of salt cake and sludge waste are remotely obtained using truck-mounted, core drill platforms. Samples are recovered from tanks through a 2.25 inch (in.) drill pipe in 26-in. steel tubes, 1.5 in. diameter. Drilling parameters vary with different waste types. Because sample recovery has been marginal an inadequate at times, a system was needed to provide drill truck operators with "real-time feedback" about the physical condition of the sample and the percent recovery, prior to making nuclear assay measurements and characterizations at the analytical laboratory. The Westinghouse Hanford Company conducted proof-of-principal radiographic testing to verify the feasibility of a proposed imaging system. Tests were conducted using an iridium 192 radiography source to determine the effects of high radiation on image quality. The tests concluded that samplers with a dose rate in excess of 5000 R/hr could be imaged with only a slight loss of image quality and samples less than 1000 R/hr have virtually no effect on image quality. The Mobile Core Sample X-Ray Examination System, a portable vendor-engineered assembly, has components uniquely configured to produce a real-time radiographic system suitable for safely examining radioactive tank core segments collected at the Hanford Site. The radiographic region of interest extends from the bottom (valve) of the sampler upward 19 to 20 in. The purpose of the Mobile Core Sample X-Ray Examination System is to examine the physical contents of core samples after removal from the tank and prior to placement in an onsite transfer cask.

1623 (WHC-SA–2990-FP) **Selection of replacement material for the failed surface level gauge wire in Hanford waste tanks.** Anantatmula, R.P. (Westinghouse Hanford Co., Richland, WA (United States)); Pitman, S.G.; Lund, A.L. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960389–6: CORROSION '96: National Association of Corrosion Engineers (NACE) conference, Denver, CO (United States), 24-29 Mar 1996). Order Number DE96005228. Source: OSTI; NTIS; INIS; GPO Dep.

Surface level gauges fabricated from AISI Type 316 stainless steel (316) wire failed after only a few weeks of operation in underground storage tanks at the Hanford Site. The wire failure was determined to be due to chloride ion assisted corrosion of the 316 wire. Radiation-induced breakdown of the polyvinyl chloride (PVC) riser liners is suspected to be the primary source of the chloride ions. An extensive literature search followed by expert concurrence was undertaken to select a replacement material for the wire. Platinum (Pt)–20 % Iridium (Ir) alloy was selected as the replacement material from tile candidate materials, P-20% Ir, Pt-1O% Rhodium (Rh), Pt-20%Rh and Hastelloy

C-22. The selection was made on the basis of the alloy's immunity towards acidic and basic environments as well as its adequate tensile properties in the fully annealed state.

1624 (WHC-SA-3010-FP) **Hanford double shell tank corrosion monitoring instrument tree prototype.** Nelson, J.L.; Edgemon, G.L.; Ohl, P.C. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960389-3: CORROSION '96: National Association of Corrosion Engineers (NACE) conference, Denver, CO (United States), 24-29 Mar 1996). Order Number DE96005517. Source: OSTI; NTIS; INIS; GPO Dep.

High-level nuclear wastes at the Hanford site are stored underground in carbon steel double-shell and single-shell tanks (DSTs and SSTs). The installation of a prototype corrosion monitoring instrument tree into DST 241-A-101 was completed in December 1995. The instrument tree has the ability to detect and discriminate between uniform corrosion, pitting, and stress corrosion cracking (SCC) through the use of electrochemical noise measurements and a unique stressed element, three-electrode probe. The tree itself is constructed of AISI 304L stainless steel (UNS S30403), with probes in the vapor space, vapor/liquid interface and liquid. Successful development of these trees will allow their application to single shell tanks and the transfer of technology to other US Department of Energy (DOE) sites. Keywords: Hanford, radioactive waste, high-level waste tanks, electrochemical noise, probes, double-shell tanks, single-shell tanks, corrosion.

1625 (WHC-SA-3016) **Detection of localized and general corrosion of mild steel in simulated defense nuclear waste solutions using electrochemical noise analysis.** Edgemon, G.L. (Westinghouse Hanford Co., Richland, WA (United States)); Ohl, P.C.; Bell, G.E.C.; Wilson, D.F. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960389-2: CORROSION '96: National Association of Corrosion Engineers (NACE) conference, Denver, CO (United States), 24-29 Mar 1996). Order Number DE96005200. Source: OSTI; NTIS; INIS; GPO Dep.

Underground waste tanks fabricated from mild steel store more than 60 million gallons of radioactive waste from 50 years of weapons production. Leaks are suspected in a significant number of tanks. The probable modes of corrosion failures are reported to be localized corrosion (e.g. nitrate stress corrosion cracking and pitting). The use of electrochemical noise (EN) for the monitoring and detection of localized corrosion processes has received considerable attention and application over the last several years. Proof of principle laboratory tests were conducted to verify the capability of EN evaluation to detect localized corrosion and to compare the predictions of general corrosion obtained from EN with those derived from other sources. Simple, prefabricated flat and U-bend specimens of steel alloys A516-Grade 60 (UNS K02100) and A537-CL 1 (UNS K02400) were immersed in temperature controlled simulated waste solutions. The simulated waste solution was either 5M $NaNO_3$ with 0.3M NaOH at 90 C or 11M $NaNO_3$ with 0.15M NaOH at 95 C. The electrochemical noise activity from the specimens was monitored and recorded for periods ranging between 140 and 240 hours. At the end of each test period, the specimens were metallographically examined to correlated EN data with corrosion damage.

1626 (WHC-SA-3023-FP) **Hanford waste tank cone penetrometer.** Seda, R.Y. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960272-1: 8. annual Society of Hispanic Professional Engineers national technical and career conference, Seattle, WA (United States), 15-17 Feb 1996). Order Number DE96005516. Source: OSTI; NTIS; INIS; GPO Dep.

A new tool is being developed to characterize tank waste at the Hanford Reservation. This tool, known as the cone penetrometer, is capable of obtaining chemical and physical properties in situ. For the past 50 years, this tool has been used extensively in soil applications and now has been modified for usage in Hanford Underground Storage tanks. These modifications include development of new "waste" data models as well as hardware design changes to accommodate the hazardous and radioactive environment of the tanks. The modified cone penetrometer is scheduled to be deployed at Hanford by Fall 1996. At Hanford, the cone penetrometer will be used as an instrumented pipe which measures chemical and physical properties as it pushes through tank waste. Physical data, such as tank waste stratification and mechanical properties, is obtained through three sensors measuring tip pressure, sleeve friction and pore pressure. Chemical data, such as chemical speciation, is measured using a Raman spectroscopy sensor. The sensor package contains other instrumentation as well, including a tip and side temperature sensor, tank bottom detection and an inclinometer. Once the cone penetrometer has reached the bottom of the tank, a moisture probe will be inserted into the pipe. This probe is used to measure waste moisture content, water level, waste surface moisture and tank temperature. This paper discusses the development of this new measurement system. Data from the cone penetrometer will aid in the selection of sampling tools, waste tank retrieval process, and addressing various tank safety issues. This paper will explore various waste models as well as the challenges associated with tank environment.

1627 (WHC-SA-3025-FP) **Assuring safe interim storage of Hanford high-level tank wastes.** Bacon, R.F. (and others); Babad, H.; Lerch, R.E. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960212-64: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006888. Source: OSTI; NTIS; INIS; GPO Dep.

The federal government established the Hanford Site in South-Eastern Washington near the City of Richland in 1943 to produce plutonium for national defense purposes. The Hanford Site occupies approximately 1,450 square kilometers (560 square miles) of land North of the City of Richland. The production mission ended in 1988, transforming the Hanford Site mission to waste management, environmental restoration, and waste disposal. Thus the primary site mission has shifted from production to the management and disposal of radioactive, hazardous, and mixed waste that exist at the Hanford Site. This paper describes the focus and challenges facing the Tank Waste Remediation System (TWRS) Program related to the dual and parallel missions of interim safe storage and disposal of the tank associated waste. These wastes are presently stored in 2.08E+05 liters (55,000) to 4.16E+06 liters (1,100,000) gallon low-carbon steel tanks. There are 149 single- and 28 double-shell radioactive underground storage tanks, as well as approximately 40 inactive miscellaneous underground storage tanks. In addition, the TWRS mission includes the storage and disposal of the inventory of 1,929 cesium and strontium capsules created as part of waste management efforts. Tank waste was a by-product of producing plutonium and other defense related materials. From 1944 through 1990, four (4) different major chemical processing facilities at the Hanford Site processed irradiated (spent) fuel from defense reactors to separate and recover plutonium for weapons production. As new and improved processes were developed over the last 50 years, the processing efficiency improved and the waste compositions sent to the tanks for storage changed both chemically and radiologically. The earliest separation processes (e.g., bismuth phosphate coprecipitation) carried out in T Plant (1944-1956) and B Plant (1945-1952) recovered only plutonium.

1628 (WHC-SA-3029-FP) **Characterization of Hanford waste and the role of historic modeling.** Simpson, B.C. (Westinghouse Hanford Co., Richland, WA (United States)); Eberlein, S.J.; Brown, T.M.; Brevick, C.H.; Angew, S.F. Westinghouse Hanford Co., Richland, WA (United States). Feb 1996. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960212-55: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006881. Source: OSTI; NTIS; INIS; GPO Dep.

The tank waste characterization process is an integral part of the overall effort to identify, quantify and control the hazards associated with radioactive wastes stored in underground tanks at the Hanford Reservation. Characterization of the current waste tank contents through the use of waste sampling is only partly effective. The historic records must be exploited as much as possible. A model generates an estimate of the current contents of each tank, built up from the estimated volumes of each of the defined waste components. The model combines the best estimate of the waste stream composition for each of the major waste generating processes. All available waste transfer records were compiled and integrated to track waste tank fill history. The behavior of the waste materials in the tanks was modeled, based on general scientific principles augmented with specific measurement data. Sample analysis results were not used directly to generate any of the tank contents estimates, but were used to determine the values of variable parameters such as the solubility. By considering all available information first (including historical model estimates, surveillance data, and past sample analysis results), future sampling resources and other characterization efforts can best be spent on tanks that will provide the largest returns of information.

1629 (WHC-SA-3036-FP) **Progress on the Hanford K basins spent nuclear fuel project.** Culley, G.E. (and others); Fulton, J.C.; Gerber, E.W. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960212-62: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006889. Source: OSTI; NTIS; INIS; GPO Dep.

This paper highlights progress made during the last year toward removing the Department of Energy's (DOE) approximately, 2,100 metric tons of metallic spent nuclear fuel from the two outdated K Basins at the Hanford Site and placing it in safe, economical interim dry storage. In the past year, the Spent Nuclear Fuel (SNF) Project has engaged in an evolutionary process involving the customer, regulatory bodies, and the public that has resulted in a quicker, cheaper, and safer strategy for accomplishing that goal. Development and implementation of the Integrated Process Strategy for K Basins Fuel is as much a case study of modern project and business management within the regulatory system as it is a technical achievement. A year ago, the SNF Project developed the K Basins Path Forward that, beginning in December 1998, would move the spent nuclear fuel currently stored in the K Basins to a new Staging and Storage Facility by December 2000. The second stage of this $960 million two-stage plan would complete the project by conditioning the metallic fuel and placing it in interim dry storage by 2006. In accepting this plan, the DOE established goals that the fuel removal schedule be accelerated by a year, that fuel conditioning be closely coupled with fuel removal, and that the cost be reduced by at least $300 million. The SNF Project conducted coordinated engineering and technology studies over a three-month period that established the technical framework needed to design and construct facilities, and implement processes compatible with these goals. The result was the Integrated Process Strategy for K Basins Fuel. This strategy accomplishes the goals set forth by the DOE by beginning fuel removal a year earlier in December 1997, completing it by December 1999, beginning conditioning within six months of starting fuel removal, and accomplishes it for $340 million less than the previous Path Forward plan.

1630 (WHC-SA-3037-FP) **The regulatory approach for spent nuclear storage and conditioning facility: The Hanford example.** Sellers, E.D. (USDOE Richland Operations Office, WA (United States)); Mooers, G.C. III; Daschke, K.D.; Driggers, S.A.; Timmins, D.C. Westinghouse Hanford Co., Richland, WA (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960212-54: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006879. Source: OSTI; NTIS; INIS; GPO Dep.

Hearings held before the House Subcommittee on Energy and Mineral Resources in March 1994, requested that officials of federal agencies and other experts explore options for providing regulatory oversight of the US Department of Energy (DOE) facilities and operations. On January, 25, 1995, the DOE, supported by the White House Office of Environmental Quality and the Office of Management and Budget, formally initiated an Advisory Committee on External Regulation of DOE Nuclear Safety. In concert with this initiative and public opinion, the DOE Richland Operations Office has initiated the K Basin Spent Nuclear Fuel Project – Regulatory Policy. The DOE has established a program to move the spent nuclear fuel presently stored in the K Basins to a new storage facility located in the 200 East Area of the Hanford Site. New facilities will be designed and constructed for safe conditioning and interim storage of the fuel. In implementing this Policy, DOE endeavors to achieve in these new facilities "nuclear safety equivalency" to comparable US Nuclear Regulatory Commission (NRC)-licensed facilities. The DOE has established this Policy to take a proactive approach to better align its facilities to the requirements of the

NRC, anticipating the future possibility of external regulation. The Policy, supplemented by other DOE rules and directives, form the foundation of an enhanced regulatory, program that will be implemented through the DOE K Basin Spent Nuclear Fuel Project (the Project).

1631 (WHC-SA–3075) **Hydrogen gettering the overpressure gas from highly radioactive liquids.** Riley, D.L. (Walla Walla Coll., College Place, WA (United States). School of Engineering); McCoy, J.C.; Schicker, J.R. Westinghouse Hanford Co., Richland, WA (United States). Apr 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960706–8: American Society of Mechanical Engineers (ASME) pressure vessels and piping conference, Montreal (Canada), 21-26 Jul 1996). Order Number DE96009892. Source: OSTI; NTIS; INIS; GPO Dep.

Remediation of current inventories of high-activity radioactive liquid waste (HALW) requires transportation of Type-B quantities of radioactive material, possibly up to several hundred liters. However, the only currently certified packaging is limited to quantities of 50 ml (0.01 gal) quantities of Type-B radioactive liquid. Efforts are under way to recertify the existing packaging to allow the shipment of up to 4 L (1.1 gal) of Type-B quantities of HALW, but significantly larger packaging could be needed in the future. Scoping studies and preliminary designs have identified the feasibility of retrofitting an insert into existing casks, allowing the transport of up to 380 L (100 gal) of HALW. However, the insert design and ultimate certification strategy depend heavily on the gas-generating attributes of the HALW. A non-vented containment vessel filled with HALW, in the absence of any gas-mitigation technologies, poses a deflagration threat and, therefore, gas generation, specifically hydrogen generation, must be reliably controlled during all phases of transportation. Two techniques are available to mitigate hydrogen accumulation: recombiners and getters. Getters have an advantage over recombiners in that oxides are not required to react with the hydrogen. A test plan was developed to evaluate three forms of getter material in the presence of both simulated HALW and the gases that are produced by the HALW. These tests demonstrated that getters can react with hydrogen in the presence of simulated waste and in the presence of several other gases generated by the HALW, such as nitrogen, ammonia, nitrous oxide, and carbon monoxide. Although the use of such a gettering system has been shown to be technically feasible, only a preliminary design for its use has been completed. No further development is planned until the requirement for bulk transport of Type-B quantities of HALW is more thoroughly defined.

1632 (WHC-SD-534-CSWD–005-Rev.2) **242-A Control System device logic software documentation. Revision 2.** Berger, J.F. Westinghouse Hanford Co., Richland, WA (United States). 19 May 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013342. Source: OSTI; NTIS; INIS; GPO Dep.

A Distributive Process Control system was purchased by Project B-534. This computer-based control system, called the Monitor and Control System (MCS), was installed in the 242-A Evaporator located in the 200 East Area. The purpose of the MCS is to monitor and control the Evaporator and Monitor a number of alarms and other signals from various Tank Farm facilities. Applications software for the MCS was developed by the Waste Treatment System Engineering Group of Westinghouse. This document describes the Device Logic for this system.

1633 (WHC-SD-SNF-DP–001) **Data compilation report: Gas and liquid samples from K West Basin fuel storage canisters.** Trimble, D.J. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013329. Source: OSTI; NTIS; INIS; GPO Dep.

Forty-one gas and liquid samples were taken from spent fuel storage canisters in the K West Basin during a March 1995 sampling campaign. (Spent fuel from the N Reactor is stored in sealed canisters at the bottom of the K West Basin.) A description of the sampling process, gamma energy analysis data, and quantitative gas mass spectroscopy data are documented. This documentation does not include data analysis.

1634 (WHC-SD-SNF-SP–001) **Westinghouse Hanford Company recommended strategy for K Basin sludge disposition.** Alderman, C.J. Westinghouse Hanford Co., Richland, WA (United States). 1 May 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012570. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this document is to present the recommended strategy for removal of sludges from the K Basins. This document ties sludge removal activities to the plan for the K Basin spent nuclear fuel (SNF) described in WHC-EP-0830, Hanford Spent Nuclear Fuel Project Recommended Path Forward and is consistent with follow-on direction provided in February 1995. Solutions and processes for resolving sludge removal technical and management issues to meet accelerated K Basin deactivation objectives are described. The following outlines the major elements of the recommendation: (1) manage all sludges as SNF while in the K Basins; (2) once loose sludges are collected and removed from the facilities, manage them as radioactive or mixed waste consistent with the upcoming characterization results, the preferred sludge path forward alternative sends sludges to the Tank Waste Remediation System (TWRS) and/or the Hanford Solid Waste Disposal as appropriate; (3) continue to manage sludge within the fuel canisters at the time they are loaded into the multi-canister overpacks as SNF.

1635 (WHC-SD-SQA-CSA–20395) **Acceptability of Bettis Laboratories waste shipment to WHC solid waste.** McDonald, K.M. Westinghouse Hanford Co., Richland, WA (United States). 20 Apr 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011651. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to evaluate a potential discrepancy between the Solid Waste Management (SWM) Criticality Prevention Specifications and a proposed waste receipt from Bettis Laboratories. This analysis resolves an apparent discrepancy between two different requirements of the Central Waste Complex and 200 Area Low-Level Burial Grounds Criticality Prevention Specifications (CPS-SW-149-00002 and CPS-SW-149-00003 respectively). The analysis is being performed to enable Solid Waste Management to accept a specific package from Bettis Laboratories. This package meets the requirements of section 2.1.1 in that the total fissile content of the drum is less than 200g and the waste occupies greater than 20% of the container volume.

The package may not appear, however, to meet the requirements of section 2.1.5 for maximum enrichment of uranium bearing waste, as will be described below. Based on this analysis for this specific package, the waste is shown to be critically safe under all conditions for which the 55-gallon drums (17C, 17H, or UN1A2) specification applies. This package can be accepted under the 55-gallon drum limitations on fissile quantity. No change to the CPS is required.

1636 (WHC-SD-W030-ATP-001) **Acceptance test procedure for cathodic protection, rectifier 31.** Clifton, F.T. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011680. Source: OSTI; NTIS; INIS; GPO Dep.

Acceptance test procedure for Project W-030 Cathodic Protection Installation, 241-AY and 241-AZ Tank Farm Ventilation Upgrade.

1637 (WHC-SD-W030-ATP-002) **Acceptance test procedure for cathodic protection, rectifier 41.** Clifton, F.T. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011681. Source: OSTI; NTIS; INIS; GPO Dep.

Acceptance test procedure for Project W-030 Cathodic Protection Installation, 241-AY and 241-AZ Tank Farm Ventilation Upgrade.

1638 (WHC-SD-W030-ATP-003) **Acceptance Test Procedure for Cathodic Protection, Rectifier 11.** Clifton, F.T. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011634. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure for Project W-030 Cathodic Protection Installation, 241-AY and 241-AZ Tank Farm Ventilation Upgrade, has been prepared to demonstrate that the cathodic protection system functions as required by project criteria.

1639 (WHC-SD-W058-TA-001) **Replacement of the cross-site transfer system liquid waste transport alternatives evaluation, Project W-058.** Vo, D.V.; Epperson, E.M. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012951. Source: OSTI; NTIS; INIS; GPO Dep.

This document examines high-/low-level radioactive liquid waste transport alternatives. Radioactive liquid waste will be transported from the 200 West Area to the 200 East Area and within the 200 East Areas for safe storage and disposal. The radioactive waste transport alternatives are the Aboveground Transport System (French LR-56 Cask System [3,800 L (1,000 gal)]), 19,000-L (5,000-gal) trailer tanker system, 75,700-L (20,000-gal) rail tanker system and Underground Transport System (buried pipe [unlimited transfer volume capability]). The evaluation focused on the following areas: initial project cost, operational cost, secondary waste generation, radiation exposure, and final decommissioning. The evaluation was based on the near term (1995 to 2005) estimated volume of 49.509 million L (13.063 million gal) and long term (1995 to 2028) estimated volume of 757.1 million L (200 million gal). The conclusion showed that the buried pipe (Underground Transport System) resulted in the lowest overall total cost for near and long term, the trailer container resulted in the highest total cost for near and long term, and the French truck was operationally impractical and cost prohibitive.

1640 (WHC-SD-W079-ES-001-Rev.3) **Hot sample archiving. Revision 3.** McVey, C.B. Westinghouse Hanford Co., Richland, WA (United States). 26 May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013883. Source: OSTI; NTIS; INIS; GPO Dep.

This Engineering Study revision evaluated the alternatives to provide tank waste characterization analytical samples for a time period as recommended by the Tank Waste Remediation Systems Program. The recommendation of storing 40 ml segment samples for a period of approximately 18 months (6 months past the approval date of the Tank Characterization Report) and then composite the core segment material in 125 ml containers for a period of five years. The study considers storage at 222-S facility. It was determined that the critical storage problem was in the hot cell area. The 40 ml sample container has enough material for approximately 3 times the required amount for a complete laboratory re-analysis. The final result is that 222-S can meet the sample archive storage requirements. During the 100% capture rate the capacity is exceeded in the hot cell area, but quick, inexpensive options are available to meet the requirements.

1641 (WHC-SD-W164-ATP-001) **Fire alarm system acceptance test procedure for Project W-164, Sample Equipment Cleaning Facility.** McKenna, P.J. Westinghouse Hanford Co., Richland, WA (United States). 17 Apr 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010941. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure (ATP) has been prepared to demonstrate that the Fire Protection System functions as required by project criteria. The test results will be issued as an acceptance test report (ATR) after all testing is complete. Components that are covered by this procedure are the fire alarm control system, power transfer to battery backup, switching circuits, alarm input devices, and battery capacity and recharge capability. Bldg 6268 is part of the Effluent Treatment and Laboratory Project.

1642 (WHC-SD-W211-FDC-001-Rev.1) **Functional design criteria, Project W-211, Initial Tank Retrieval Systems. Revision 1.** Rieck, C.A. Westinghouse Hanford Co., Richland, WA (United States). 7 Feb 1995. 161p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007197. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the technical baseline for retrieval of waste from ten double-shell tanks in the SY, AN, AP, AW, AY, and AZ tank farms. In order to retrieve waste from these tanks, systems are needed to mix the sludge with the supernate and pump the waste mixture from the tank. For 101-SY, the existing mitigation pump will be used to mix the waste and Project W-211 will provide for waste removal. The retrieval scope for the other nine tanks includes both the waste mixing and removal functions.

1643 (WHC-SD-W236A-ER-013) **Concrete material characterization reinforced concrete tank structure Multi-Function Waste Tank Facility.** Winkel, B.V. Westinghouse Hanford Co., Richland, WA (United States). 3 Mar 1995. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008864. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to document the Multi-Function Waste Tank Facility (MWTF) Project position on the concrete mechanical properties needed to perform design/analysis calculations for the MWTF secondary concrete structure. This report provides a position on MWTF concrete properties for the Title 1 and Title 2 calculations. The scope of the report is limited to mechanical properties and does not include the thermophysical properties of concrete needed to perform heat transfer calculations. In the 1970's, a comprehensive series of tests were performed at Construction Technology Laboratories (CTL) on two different Hanford concrete mix designs. Statistical correlations of the CTL data were later generated by Pacific Northwest Laboratories (PNL). These test results and property correlations have been utilized in various design/analysis efforts of Hanford waste tanks. However, due to changes in the concrete design mix and the lower range of MWTF operating temperatures, plus uncertainties in the CTL data and PNL correlations, it was prudent to evaluate the CTL data base and PNL correlations, relative to the MWTF application, and develop a defendable position. The CTL test program for Hanford concrete involved two different mix designs: a 3 kip/in^2 mix and a 4.5 kip/in^2 mix. The proposed 28-day design strength for the MWTF tanks is 5 kip/in^2. In addition to this design strength difference, there are also differences between the CTL and MWTF mix design details. Also of interest, are the appropriate application of the MWTF concrete properties in performing calculations demonstrating ACI Code compliance. Mix design details and ACI Code issues are addressed in Sections 3.0 and 5.0, respectively. The CTL test program and PNL data correlations focused on a temperature range of 250 to 450 F. The temperature range of interest for the MWTF tank concrete application is 70 to 200 F.

1644 (WHC-SD-W236A-ER–018-Rev.1) **MWTF, material selection for insulating/supporting pad letter report. Revision 1.** Stine, M.D. Westinghouse Hanford Co., Richland, WA (United States). 25 Apr 1995. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010939. Source: OSTI; NTIS; INIS; GPO Dep.

The Multi-Function Waste Tank Facility (MWTF) consists of six 1.1 6 million on underground double-shell waste storage tanks and associated systems. Four of the tanks will be located approximately 2,000 feet west of the western boundary of the 200-East Area of the Hanford Site; two tanks will be located in the southeast corner of the 200-West Area. These tanks will provide storage of mixed hazardous waste. Revision 0 of this report was completed in July of 1993. Since that time, the design of the tanks has changed to using carbon steel for the primary tank and secondary liner in lieu of stainless steel. This means that the primary tank will require postweld heat treatment (PWHT) at a temperature of 1100°F. In addition, scoping calculations of the temperature distributions in the supporting pad indicate that pad insulating properties have a significant effect on the temperatures experienced by the piping embedded in the pad and the concrete foundation slab during PWHT. Each double-shell tank will be comprised of two main structures: an outer structure made of reinforced concrete and lined with a carbon steel secondary liner, and an inner primary storage tank that is a completely enclosed carbon steel ASME Section III vessel. An annular space will separate the carbon steel secondary liner from the primary storage tank. An insulating/supporting pad will be placed between the bottom of the secondary liner and the bottom of the primary storage tank. The existing double-shell tanks at the Hanford Site were constructed with an insulating castable refractory material at this location. This refractory material was used to protect the tank foundation from the high temperatures produced during the PWHT operation for the carbon steel primary storage tanks. This letter report provides the basis for material selection for the insulating/supporting pad to be used on this project.

1645 (WHC-SD-W236A-ER–021-Rev.1) **Multi-Function Waste Tank Facility phase out basis. Revision 1.** Awadalla, N.G. Westinghouse Hanford Co., Richland, WA (United States). 20 Apr 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011544. Source: OSTI; NTIS; INIS; GPO Dep.

Additional double-shell tank storage capacity is not needed until FY 2004 or later. The waste volume in the current baseline program can be managed within the existing tank capacity. However, this requires implementation of some risk management actions and significant investment in software and hardware to accomplish the actions necessary to maximize use of existing storage tank space."

1646 (WHC-SD-W236A-ER–022) **Using tank 107-AN caustic addition for confirmation of mixing scale relationship.** Chang, S.C. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012792. Source: OSTI; NTIS; INIS; GPO Dep.

A subscale jet mixing program was carried out in two scale tanks to extend the basis of previous subscale tests to include in-tank geometry associated with tank AN-107. The laboratory data will be correlated with the data to be collected in the upcoming tank AN-107 mixing and caustic addition test. The objective is to verify the scaling relationship used in the MWTF mixer design.

1647 (WHC-SD-W236A-ES–012) **Multi-function waste tank facility path forward engineering analysis technical task 3.3, single-shell tank liquid contents.** Brown, R.G.; Mattichak, R.W. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011639. Source: OSTI; NTIS; INIS; GPO Dep.

Results are reported on actions taken to determine the quantity of liquid wastes in the single shell tanks that still need stabilization, and to determine the amount of flush water needed to support the stabilization effort.

1648 (WHC-SD-W236A-ES–013) **Passive versus active mitigation cost analysis.** Parazin, R.J.; Galbraith, J.D. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011675. Source: OSTI; NTIS; INIS; GPO Dep.

The scope of this task is to assess the impact of mitigation alternatives for Tanks 241-SY-101 and 241-SY-103 on the Project W-236A Multi-Function Waste Tank Facility. This assessment and other related tasks are part of an Action Plan Path Forward prepared by the Tank Waste Remediation System (TWRS) Life Extension and Transition Program. Task 3.7 of the Action Plan for Project W-236A MWTF analyzed the comparative cost/risk of two hydrogen gas mitigation alternatives (active versus passive) to recommend the most appropriate course of action to resolve the hydrogen gas safety issue. The qualitative success of active mitigation has been demonstrated through Tank 241-SY-101 testing. Passive mitigation has not been demonstrated but will be validated by laboratory test work performed under Task 3.1 of the Action Plan. It is assumed for this assessment that the uncertainties associated with the performance of either alternative is comparable. Determining alternative specific performance measures beyond those noted are not in the scope of this effort.

1649 (WHC-SD-W236A-ES–014) **Multi-function Waste Tank Facility path forward engineering analysis – Technical Task 3.6, Estimate of operational risk in 200 West Area.** Coles, G.A. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012566. Source: OSTI; NTIS; INIS; GPO Dep.

Project W-0236A has been proposed to provide additional waste tank storage in the 200 East and 200 West Areas. This project would construct two new waste tanks in the 200 West Area and four new tanks in the 200 East Area, and a related project (Project W-058) would construct a new cross-site line. These projects are intended to ensure sufficient space and flexibility for continued tank farm operations, including tank waste remediation and management of unforeseen contingencies. The objective of this operational risk assessment is to support determination of the adequacy of the free-volume capacity provided by Projects W-036A and W-058 and to determine related impacts. The scope of the assessment is the 200 West Area only and covers the time period from the present to the year 2005. Two different time periods were analyzed because the new cross-site tie line will not be available until 1999. The following are key insights: success of 200 West Area tank farm operations is highly correlated to the success of the cross-site transfer line and the ability of the 200 East Area to receive waste from 200 West; there is a high likelihood of a leak on a complexed single-shell tank in the next 4 years (sampling pending); there is a strong likelihood, in the next 4 years, that some combination of tank leaks, facility upsets, and cross-site line failure will require more free tank space than is currently available in Tank 241-SY-102; in the next 4 to 10 years, there is a strong likelihood that a combination of a cross-site line failure and the need to accommodate some unscheduled waste volume will require more free tank space than is presently available in Tank 241-SY-102; the inherent uncertainty in volume projections is in the range of 3 million gallons; new million-gallon tanks increase the ability to manage contingencies and unplanned events.

1650 (WHC-SD-W236A-ES–015) **Waste segregation analysis for salt well pumping in the 200 W Area – Task 3.4.** Reynolds, D.A. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011676. Source: OSTI; NTIS; INIS; GPO Dep.

There is an estimated 7 million liters (1.9 million gallons) of potentially complexed waste that need to be pumped from single-shell tanks (SST) in the 200 West Area. This represents up to 40% of the salt well liquor that needs to be pumped in the 200 West Area. There are three double-shell (DST) tanks in the 241-SY tank farm in the 200 West Area. Tank 241-SY-101 is full and not usable. Tank 241-SY-102 has a transuranic (TRU) sludge in the bottom. Current rules prohibit mixing complexed waste with TRU waste. Tank 241-SY-103 has three major problems. First, 241-SY-103 is on the Flammable Watch list. Second, adding waste to tank 241-SY-103 has the potential for an episodic release of hydrogen gas. Third, 241-SY-103 will not hold all of the potentially complexed waste from the SSTs. This document looks at more details regarding the salt well pumping of the 200 West Area tank farm. Some options are considered but it is beyond the scope of this document to provide an in-depth study necessary to provide a defensible solution to the complexed waste problem.

1651 (WHC-SD-W236A-PHA–001-Rev.1) **Hazard and operability study of the multi-function Waste Tank Facility. Revision 1.** Hughes, M.E. Westinghouse Hanford Co., Richland, WA (United States). 15 May 1995. 134p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013335. Source: OSTI; NTIS; INIS; GPO Dep.

The Multi-Function Waste Tank Facility (MWTF) East site will be constructed on the west side of the 200E area and the MWTF West site will be constructed in the SW quadrant of the 200W site in the Hanford Area. This is a description of facility hazards that site personnel or the general public could potentially be exposed to during operation. A list of preliminary Design Basis Accidents was developed.

1652 (WHC-SD-W236A-QAPP–001-Rev.2) **Multi-Function Waste Tank Facility Quality Assurance Program Plan, Project W-236A. Revision 2.** Hall, L.R. Westinghouse Hanford Co., Richland, WA (United States). 30 May 1995. 96p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014424. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the Quality Assurance (QA) program for the Multi-Function Waste Tank Facility (MWTF) Project. The purpose of this QA program is to control project activities in such a manner as to achieve the mission of the MWTF Project in a safe and reliable manner. The QA program for the MWTF Project is founded on DOE Order 5700.6C, Quality Assurance, and implemented through the use of ASME NQA-1, Quality Assurance Program Requirements for Nuclear Facilities (ASME 1989 with addenda la-1989, lb-1991 and lc-1992). This document describes the program and planned actions which the Westinghouse Hanford Company (WHC) will implement to demonstrate and ensure that the project meets the requirements of DOE Order 5700.6C through the interpretive guidance of ASME NQA-1.

1653 (WHC-SD-W236A-RPT–010) **A human factors engineering evaluation of the Multi-Function Waste Tank Facility. Final report.** Donohoo, D.T. (Pacific Northwest Lab., Richland, WA (United States)); Sarver, T.L. Westinghouse Hanford Co., Richland, WA (United States). 5 Jun 1995. 191p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015787. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the methods and results of a human factors engineering (HFE) review conducted on the Multi-Function Waste Tank Facility (MWTF), Westinghouse Hanford Company (WHC) Project 236A, to be constructed at the U.S. Department of Energy (DOE) facility at Hanford, Washington. This HFE analysis of the MWTF was initiated by WHC to assess how well the current facility and equipment design satisfies the needs of its operations and maintenance staff and other potential occupants, and to identify areas of the design that could benefit from improving the human interfaces at the facility. Safe and effective operations, including maintenance, is a primary goal for the MWTF. Realization of this goal requires that the MWTF facility, equipment, and operations be designed in a manner that is consistent with the abilities and limitations of its operating personnel. As a consequence, HFE principles should be applied to the MWTF design, construction, its operating procedures, and its training. The HFE review was focused on the 200-West Area facility as the design is further along than that of the 200-East Area. The review captured, to the greatest extent feasible at this stage of design, all aspects of the facility activities and included the major topics generally associated with HFE (e.g., communication, working environment). Lessons learned from the review of the 200 West facility will be extrapolated to the 200-East Area, as well as generalized to the Hanford Site.

1654 (WHC-SD-W236A-TI–020) **Position paper: Seismic design criteria.** Farnworth, S.K. Westinghouse Hanford Co., Richland, WA (United States). 22 May 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013338. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to document the seismic design criteria to be used on the Title 11 design of the underground double-shell waste storage tanks and appurtenant facilities of the Multi-Function Waste Tank Facility (MWTF) project, and to provide the history and methodologies for determining the recommended Design Basis Earthquake (DBE) Peak Ground Acceleration (PGA) anchors for site-specific seismic response spectra curves. Response spectra curves for use in design are provided in Appendix A.

1655 (WHC-SD-W236A-TS–001) **Project W-236A multi-function waste tank facility waste feed projections.** Larrick, A.P. Westinghouse Hanford Co., Richland, WA (United States). 22 Dec 1994. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006597. Source: OSTI; NTIS; INIS; GPO Dep.

A review of Hanford Underground Waste Storage Tank Chemistry, coupled with planned remediation actions and retrieval sequences was conducted in order to predict the chemistry of the waste to be stored in the MWTF tanks. All projected waste solutions to be transferred to the MWTF tanks were found to be in compliance with current tank chemistry specifications; therefore, the waste and the tank materials of construction are expected to be compatible.

1656 (WHC-SD-W252-FHA–001) **WHC-SD-W252-FHA-001, Rev. 0: Preliminary fire hazard analysis for Phase II Liquid Effluent Treatment and Disposal Facility, Project W-252.** Barilo, N.F. Westinghouse Hanford Co., Richland, WA (United States). 11 May 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013889. Source: OSTI; NTIS; INIS; GPO Dep.

A Fire Hazards Analysis was performed to assess the risk from fire and other related perils and the capability of the facility to withstand these hazards. This analysis will be used to support design of the facility.

1657 (WHC-SD-W320-FHA–001) **Fire hazard analysis for Project W-320 Tank 241-C-106 waste retrieval.** Conner, J.C. Westinghouse Hanford Co., Richland, WA (United States). 12 Sep 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050097. Source: OSTI; NTIS; INIS; GPO Dep.

This Fire Hazards Analysis (FHA) for Project W-320, 'Tank 241-C-106 Waste Retrieval' addresses fire hazards or fire related concerns in accordance with DOE 5480.7A (DOE 1998), resulting from or related to the processes and equipment to be installed or modified under Project W-320 to ensure that there are no undue fire hazards to site personnel and the public; the potential for the occurrence of a fire is minimized, process control and safety systems are not damaged by fire or related perils; and property damage from fire and related perils does not exceed an acceptable level.

1658 (WHC-SD-W320-SUP–002) **Project W-320 ALARA Plan.** Harty, W.M. Westinghouse Hanford Co., Richland, WA (United States). 6 Jun 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014421. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting document establishes the As Low As Reasonable Achievable (ALARA) Plan to be followed during Sluicing Project W-320 design and construction activities to minimize personnel exposure to radiation and hazardous materials.

1659 (WHC-SD-W379-QAPP–001) **Quality Assurance Program Plan for Project W-379: Spent Nuclear Fuels Canister Storage Building Projec.** Duncan, D.W. Westinghouse Hanford Co., Richland, WA (United States). 22 Sep 1995. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050092. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the Quality Assurance Program Plan (QAPP) for the Spent Nuclear Fuels (SNF) Canister Storage Building (CSB) Project. The purpose of this QAPP is to control project activities ensuring achievement of the project mission in a safe, consistent and reliable manner.

1660 (WHC-SD-W430-FDC–001) **Functional design criteria SY tank farm cathodic protection, 95G-EWW-430.** Edgemon, G.L. Westinghouse Hanford Co., Richland, WA (United States). 13 Apr 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012794. Source: OSTI; NTIS; INIS; GPO Dep.

Functional Design Criteria (FDC) for Project W-430 describing cathodic protection system completion in 241-SY tank farm.

1661 (WHC-SD-WM-ANAL–020-Rev.2) **PUREX Plant waste analysis plan. Revision 2.** Villalobos, C.N. Westinghouse Hanford Co., Richland, WA (United States). 10 Apr 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011662. Source: OSTI; NTIS; INIS; GPO Dep.

A Washington Administrative Code 173-303-300 requires that a facility develop and follow a written waste analysis plan which describes the procedures that will be followed to ensure that its dangerous wastes are managed properly. This document covers the activities at the PUREX Plant to characterize the designate waste that is generated within the plant, stored in Tanks F18, U3/U4, and managed through elementary neutralization in Tank 31.

1662 (WHC-SD-WM-AP–036) **Acceptance criteria for non-destructive examination of double-shell tanks.** Jensen, C.E. Westinghouse Hanford Co., Richland, WA

(United States). Sep 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050098. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting document provides requirements for acceptance of relevant indications found during non-destructive examination of double-shell tanks (DSTs) at Hanford 200 areas. Requirements for evaluation of relevant indications are provided to determine acceptability of continued safe operation of the DSTs. Areas of the DSTs considered include the tank wall vapor space, liquid-vapor interface, wetted tank wall, sludge-liquid interface, and the knuckle region.

1663 (WHC-SD-WM-ATP–125) **241-SY-101 Pump Decon System Acceptance Test Procedure.** Talachy, S.A.; Cleveland, K.J. Westinghouse Hanford Co., Richland, WA (United States). 12 Apr 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010574. Source: OSTI; NTIS; INIS; GPO Dep.

The SY-101 Pump Decon System has components that consist of the water filter skid to assembly operation, the pump pit flooding system, and the system set up using air blow the water out of the decon hose. The Acceptance Test Procedure (ATP) consists of four parts. The first part will calibrate water and flow meters. The second part will determine the pressure loss on the water traveling through the filter skid at various flow rates. The third part will determine the length of time it takes to drain 1350 gallons of water out of a tank through 300 feet of discharge hose. The fourth part will verify that the calculated air volume and pressure in an air receiver is adequate to blow all the water out of a 2 inch diameter water hose.

1664 (WHC-SD-WM-ATP–128) **Operator coil monitoring Acceptance Test Procedure.** Erhart, M.F. Westinghouse Hanford Co., Richland, WA (United States). 16 May 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013362. Source: OSTI; NTIS; INIS; GPO Dep.

The readiness of the Data Acquisition and Control System (DACS) to provide monitoring and control of the Programmable Logic Controller (PLC) abort coils from the Master and RSS stations will be systematically tested during performance of this procedure. It should be noted that these are not physical abort coils but software coils controlled by the software's ladder logic. The readiness of the DACS to properly interface with the ENRAF wire level gauge installed in the SY-101 storage tank will also be tested. During this test, a verification of all abort coil indications will be conducted at the DACS Development Facility in the 306E Building by injecting an input signal for each DACS sensor that has an associated abort coil until the abort coil actuates, and then ensuring that the status of the abort coil indicated at the Master and RSS stations is correct. Each abort coil will also be tested to ensure that the "ENABLE" and "DISABLE" controls from the Master and RSS stations function correctly, and only with the use of proper passwords.

1665 (WHC-SD-WM-ATP–128-Rev.1) **Operator coil monitoring acceptance test procedure.** Erhart, M.F. Westinghouse Hanford Co., Richland, WA (United States). 5 Jun 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014423. Source: OSTI; NTIS; GPO Dep.

The readiness of the Data Acquisition and Control System (DACS) to provide monitoring and control of the Programmable Logic Controller (PLC) abort coils from the Master and RSS stations will be systematically tested during performance of this procedure. It should be noted that these are not physical abort coils but software coils controlled by the software's ladder logic. The readiness of the DACS to properly interface with the ENRAF wire level gauge installed in the SY101 storage tank will also be tested. During this test, a verification of all abort coil indications will be conducted at the DACS Development Facility in the 306E Building by injecting an input signal for each DACS sensor that has an associated abort coil until the abort coil actuates, and then ensuring that the status of the abort coil indicated at the Master and RSS stations correct. Each abort coil will also be tested to ensure that the "ENABLE" and "DISABLE" controls from the Master and RSS stations function correctly, and only with the use of proper passwords.

1666 (WHC-SD-WM-ATP–132) **In situ vapor sampling system test procedure.** Deford, D.K. Westinghouse Hanford Co., Richland, WA (United States). 19 Jun 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016327. Source: OSTI; NTIS; INIS; GPO Dep.

This test procedure verifies the adequacy of the improved in situ vapor sampling system designed for sampling of vapors in underground radioactive waste storage tanks.

1667 (WHC-SD-WM-ATP–134) **Acceptance Test Procedure: SY101 air pallet system.** Koons, B.M. Westinghouse Hanford Co., Richland, WA (United States). 30 May 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014318. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this test procedure is to verify that the system(s) procured to load the SY-101 Mitigation Test Pump package fulfills its functional requirements. It will also help determine the man dose expected due to handling of the package during the actual event. The scope of this procedure focuses on the ability of the air pallets and container saddles to carry the container package from the new 100 foot concrete pad into 2403-WD where it will be stored awaiting final disposition. This test attempts to simulate the actual event of depositing the SY-101 hydrogen mitigation test pump into the 2403-WD building. However, at the time of testing road modifications required to drive the 100 ton trailer into CWC were not performed. Therefore a flatbed trailer will be use to transport the container to CWC. The time required to off load the container from the 100 ton trailer will be recorded for man dose evaluation on location. The cranes used for this test will also be different than the actual event. This is not considered to be an issue due to minimal effects on man dose.

1668 (WHC-SD-WM-ATR–090) **Standard-B auto grab sampler hydrogen monitoring system, Acceptance Test Report.** Lott, D.T. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 799p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013364. Source: OSTI; NTIS; INIS; GPO Dep.

Project W-369, Watch List Tank Hydrogen Monitors, installed a Standard-C Hydrogen Monitoring System (SHMS) on the Flammable gas waste tank AN-104. General Support Projects (8K510) was support by Test Engineering (7CH30) in the performance of the Acceptance Test Procedures

(ATP) to qualify the SHMS cabinets on the waste tank. The ATP's performance was controlled by Tank Farm work package. This completed ATP is transmitted by EDT-601748 as an Acceptance Test Report (ATR) in accordance with WHC-6-1, EP 4.2 and EP 1.12.

1669 (WHC-SD-WM-ATR–096) **Standard-C hydrogen monitoring system. Acceptance test report.** Lott, D.T. Westinghouse Hanford Co., Richland, WA (United States). 17 May 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013332. Source: OSTI; NTIS; INIS; GPO Dep.

Project W-369, Watch List Tank Hydrogen Monitors, installed a Standard-C Hydrogen Monitoring System (SHMS) on Flammable Gas Watch List waste tank 104-AN. This document is the acceptance test report for the acceptance testing of the SHMS.

1670 (WHC-SD-WM-ATR–127) **Acceptance test report for the ultra high pressure bore head for use in the self-installing liquid observation well.** Hertelendy, N.A. Westinghouse Hanford Co., Richland, WA (United States). 14 Jun 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015777. Source: OSTI; NTIS; INIS; GPO Dep.

In order to monitor and characterize waste stored in single-shell tanks, liquid observation wells (LOWs) have been installed to permit periodic insertion of instrumentation probes to evaluate the waste's cross-sections characteristics.

1671 (WHC-SD-WM-ATR–129) **Void fraction instrument software, Version 1,2, Acceptance test report.** Gimera, M. Westinghouse Hanford Co., Richland, WA (United States). 9 May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013328. Source: OSTI; NTIS; INIS; GPO Dep.

This provides the report for the void fraction instrument acceptance test software Version 1.2. The void fraction will collect data that will be used to calculate the quantity of gas trapped in waste tanks.

1672 (WHC-SD-WM-ATR–130) **Viscometer software, Version 1.1, Acceptance test report.** Gimera, M. Westinghouse Hanford Co., Richland, WA (United States). 9 May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013327. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents results of the acceptance test for the software that was developed to operate the viscometer, which is the instrument that will collect ball rheometry data for Tank 101-SY.

1673 (WHC-SD-WM-ATR–135) **Test report - 241-AN-274 Caustic Pump Control Building.** Paintner, G.P. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050101. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Report documents the test results of test procedure WHC-SD-WM-ATP-135 'Acceptance Test Procedure for the 241-AN- 274 Caustic Pump Control Building.' The objective of the test was to verify that the 241-AN-274 Caustic Pump Control Building functions properly based on design specifications per applicable H-2-85573 drawings and associated ECN's. The objective of the test was met.

1674 (WHC-SD-WM-CSCM–028) **Computer software configuration management plan for the 241-AY and 241-AZ tank farm MICON automation system.** Teats, M.C. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011688. Source: OSTI; NTIS; INIS; GPO Dep.

Software configuration items pertaining to the process control systems, of the ventilation systems of the tank farms, are identified and configuration controls are defined.

1675 (WHC-SD-WM-CSCM–032) **Software Configuration Management Plan for sample trucks no. 2, 3, and 4 alarm & control logic.** Akers, J.C.; Dowell, J.L. Westinghouse Hanford Co., Richland, WA (United States). 26 Sep 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050102. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes the methods for configuration control of the sample truck alarm and control logic. Responsibility for documentation change control and custody are described.

1676 (WHC-SD-WM-CSRS–023-Rev.1) **Master equipment list – Phase 1. Revision 1.** Jech, J.B. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011667. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to define the system requirements for the Master Equipment List (MEL) Phase 1 project. The intended audience for this document includes Data Automation Engineering (DAE), Configuration Management Improvement and Control Engineering (CMI and CE), Data Administration Council (DAC), and Tank Waste Remedial System (TWRS) personnel. The intent of Phase 1 is to develop a user-friendly system to support the immediate needs of the TWRS labeling program. Phase 1 will provide CMI and CE the ability to administrate, distribute, and maintain key information generated by the labeling program. CMI and CE is assigning new Equipment Identification Numbers (EINs) to selected equipment in Tank Farms per the TWRS Data Standard "Tank Farm Equipment Identification Number". The MEL Phase 1 system will be a multi-user system available through the HLAN network. It will provide basic functions such as view, query, and report, edit, data entry, password access control, administration and change control. The scope of Phase 1 data will encompass all Tank Farm Equipment identified by the labeling program. The data will consist of fields from the labeling program's working database, relational key references and pointers, safety class information, and field verification data.

1677 (WHC-SD-WM-CSRS–025) **Process control computer software requirements and specifications for the 241-AY and 241-AZ tank farm MICON automation system.** Teats, M.C. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011687. Source: OSTI; NTIS; INIS; GPO Dep.

Software requirements and specifications for the AY/AZ MICON distributed control system for the tank farm ventilation systems are provided.

1678 (WHC-SD-WM-CSRS–026) **Solid Waste Information Tracking System (SWITS), Backlog Waste Modifications, Software Requirements Specification**

(SRS). Clark, R.E. (USDOE Richland Operations Office, WA (United States)). USDOE Richland Operations Office, WA (United States); Boeing Computer Services Co., Richland, WA (United States). 5 May 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012798. Source: OSTI; NTIS; INIS; GPO Dep.

Purpose of this document is to define the system requirements necessary to improve computer support for the WHC backlog waste business process through enhancements to the backlog waste function of the SWITS system. This SRS document covers enhancements to the SWITS system to support changes to the existing Backlog Waste screens including new data elements, label changes, and new pop-up screens. The pop-ups will allow the user to flag the processes that a waste container must have performed on it, and will provide history tracking of changes to data. A new screen will also be provided allowing Acceptable Services to perform mass updates to specific data in Backlog Waste table. The SWITS Backlog Waste enhancements in this document will support the project goals in WHC-SD-WM-003 and its Revision 1 (Radioactive Solid Waste Tracking System Conceptual Definition) for the control, tracing, and inventory management of waste as the packages are generated and moved through final disposal (cradle-to-grave).

1679 (WHC-SD-WM-DA–148) **Structural evaluation of mixer pump installed in Tank 241-AN-107 for caustic addition project.** Leshikar, G.A. Westinghouse Hanford Co., Richland, WA (United States). 16 Jun 1995. 131p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015790. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the structural analysis and evaluation of a mixer pump and caustic addition system to be used in Tank 107-AN. This pump will be installed in the central pump pit of this double- shell tank for the purpose of bringing the hydroxide ion concentration into compliance with Tank Farm operating specifications.

1680 (WHC-SD-WM-DA–189) **Design analysis supporting 101-SY Water Decon System.** Cleveland, K.J. Westinghouse Hanford Co., Richland, WA (United States). 5 Sep 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050105. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the results of stress analysis and component sizing for the 101-SY mitigation pump, Water Decon System. Calculations included are a stress analysis of the High Pressure Manifold, the threaded connection on the Yoke Water Connector and a sizing of an air receiver tank.

1681 (WHC-SD-WM-DA–196) **Structural analysis of 241C106 contingency chiller design.** Graves, C.E.; Coverdell, B.L.; Nawarynsky, D.A.; Rensink, G.E. Westinghouse Hanford Co., Richland, WA (United States). 26 May 1995. 152p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014422. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Tank 24lCl06 leak contingency plan, a chiller coil is to be installed on the existing HEPA-filtered air inlet unit. A natural phenomenon-hazard analysis per SDC 4.1, Standard Architectural-Civil Design Criteria, Design Loads for Facilities, Revision 12, was performed on several components of the design using both hand calculations and COSMOS/M computer models. The design meets SOC 4.1 requirements for safety class 3 equipment.

1682 (WHC-SD-WM-DP–081-Rev.1) **Aqueous sample from B-Plant, Tank 9-1. Revision 1.** Bell, K.E. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 263p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013333. Source: OSTI; NTIS; INIS; GPO Dep.

Eight liquid samples were received from B-Plant Tank 9-1 in four lots of two samples each, for inorganic and organic analysis. This is the final report for the sampling and analysis effort; included are summary tables of the analytical and quality control data as well as all raw data. The analyses include pH, OH, inductively coupled plasma spectrography, ion chromatograph, total organic carbon, total inorganic carbon, and differential scanning calorimetry. Included are copies of the chain of custody and request for special analysis forms.

1683 (WHC-SD-WM-DP–103) **60-day safety screen results for tank 241-BY-106, rotary mode, cores 64 and 65.** Bell, K.E. Westinghouse Hanford Co., Richland, WA (United States). 1 May 1995. 211p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011632. Source: OSTI; NTIS; INIS; GPO Dep.

Core samples 64 and 65 from tank BY-106, obtained by rotary-mode core sampling, were received by the 222-S Laboratories. Differential scanning calorimetry and thermogravimetric analysis were carried out.

1684 (WHC-SD-WM-DP–104) **45-Day safety screen results for Tank 241-BY-103, auger samples 95-AUG-012 and 95-AUG-013.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 21 Apr 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011448. Source: OSTI; NTIS; INIS; GPO Dep.

Two auger samples from tank 241-BY-103 (BY-103) were received by the 222-S Laboratories and underwent safety screening analysis, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity. Analytical results for the TGA analyses for both samples were less than the safety screening notification limit. Since notification is made if the sample is analyzed at less than 17% water, notification was made on April 20, 1995. Although the sample results were below this limit, no secondary analyses were required or performed. Included in this report are the primary safety screening results obtained from the analyses and copies of all DSC and TGA raw data scans as requested per the TCP. Photographs of the auger samples were taken during extrusion and, although not included in this report, are available. Tank BY-103 is on the ferrocyanide Watch List.

1685 (WHC-SD-WM-DP–105) **45-Day safety screen results for Tank 241-B-112, auger samples 95-AUG-014 and 95-AUG-015.** Conner, J.M. Westinghouse Hanford Co., Richland, WA (United States). 1 May 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011653. Source: OSTI; NTIS; INIS; GPO Dep.

Two auger samples from Tank 241-B-112 (B-112) were received in the 222-S Laboratories and underwent safety screening analyses, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity. All results for all analyses (DSC, TGA, and total alpha) were within the safety screening notification limits specified in the Tank Characterization Plan (TCP). No notification nor secondary analyses were required. Tank B-112 is not part of any of the four Watch Lists.

1686 (WHC-SD-WM-DP–106) **Fourty-five day safety screen results for Tank 241-C-107, push mode, cores 68 and 69.** Bell, K.E. Westinghouse Hanford Co., Richland, WA (United States). 8 May 1995. 168p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012800. Source: OSTI; NTIS; INIS; GPO Dep.

Reported are the safety-screening analytes required by the C-107 tank characterization plan. Also included are copies of the differential scanning calorimetry (DSC) and thermogravimetric analysis (TGA) scans. Two core samples from tank C-107, obtained by the push-mode core sampling method, were received, extruded, and analyzed by the 222-S Laboratories. Drainable liquid was analyzed at the segment level for a separable organic layer, energetics by DSC, and percent water by TGA. Sludge samples were analyzed at the half-segment level by DSC, TGA, and for total alpha activity. No safety-screening notification limits were exceeded on any samples.

1687 (WHC-SD-WM-DP–107) **45-Day safety screen results for Tank 241-U-201, push mode, cores 70, 73 and 74.** Sathyanarayana, P. Westinghouse Hanford Co., Richland, WA (United States). 4 May 1995. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012568. Source: OSTI; NTIS; INIS; GPO Dep.

Three core samples, each having two segments, from Tank 241-U-201 (U-201) were received by the 222-S Laboratories. Safety screening analysis, such as differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity were conducted on Core 70, Segment 1 and 2 and on Core 73, Segment 1 and 2. Core 74, Segment 1 and 2 were taken to test rotary bit in push mode sampling. No analysis was requested on Core 74, Segment 1 and 2. Analytical results for the TGA analyses for Core 70, Segment 1, Upper half solid sample was less than the safety screening notification limit of 17 percent water. Notification was made on April 27, 1995. No exotherm was associated with this sample. Analytical results are presented in Tables 1 to 4, with the applicable notification limits shaded.

1688 (WHC-SD-WM-DP–108) **45-Day safety screen results for tank 241-C-105, push mode, cores 72 and 76.** Sasaki, L.M. Westinghouse Hanford Co., Richland, WA (United States). 3 May 1995. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012834. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a report of the analytical results for samples collected between March 14 and March 22, 1995 from the radioactive wastes in Tank 241-C-105 at the Hanford Reservation. Core samples were collected from the solid wastes in the tank and underwent safety screening analyses including differential scanning calorimetry, thermogravimetric analysis, and total alpha analysis.

1689 (WHC-SD-WM-DP–109) **45-Day safety screen results for tank 241-U-203, push mode, cores 79 and 80.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012837. Source: OSTI; NTIS; INIS; GPO Dep.

Two one-segment core samples from tank 241-U-203 (U-203) were received by the 222-S Laboratories and underwent safety screening analysis, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity. In addition to the safety screening requirements, inductively coupled plasma (ICP) spectrographic analysis for lithium was performed to determine the extent of hydrostatic head fluid contamination during the sampling event. No notification limits were exceeded for these analyses.

1690 (WHC-SD-WM-DP–110) **45-Day safety screen results for tank 241-U-202, push mode, cores 75 and 78.** Jo, J. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012833. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a report of the analytical results for samples collected from the radioactive wastes in Tank 241-U-202 at the Hanford Reservation. Core samples were collected from the solid wastes in the tank and underwent safety screening analyses including differential scanning calorimetry, thermogravimetric analysis, and total alpha analysis. Results indicate that no safety screening notification limits were exceeded.

1691 (WHC-SD-WM-DP–111) **45-Day safety screen results for Tank 241-C-101, auger sample 95-AUG-019.** Sasaki, L.M. Westinghouse Hanford Co., Richland, WA (United States). 11 May 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012586. Source: OSTI; NTIS; INIS; GPO Dep.

One auger sample from Tank 241-C-101 was received by the 222-S Laboratory and underwent safety screening analyses–differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha analysis–in accordance with the tank characterization plan. Analytical results for the TGA on the crust sample (the uppermost portion of the auger sample) (sample number S95T000823) were less than the safety screening notification limit of 17 weight percent water. Verbal and written notifications were made on May 3, 1995. No exotherms were observed in the DSC analyses and the total alpha results were well below the safety screening notification limit. This report includes the primary safety screening results obtained from the analyses and copies of all DSC and TGA raw data scans as requested per the TCP. Although not included in this report, a photograph of the extruded sample was taken and is available. This report also includes bulk density measurements required by Characterization Plant Engineering. Additional analyses (pH, total organic carbon, and total inorganic carbon) are being performed on the drainable liquid at the request of Characterization Process Control; these analyses will be reported at a later date in a final report for this auger sample. Tank C-101 is not part of any of the four Watch Lists.

1692 (WHC-SD-WM-DP–112) **45-day safety screen results and final report for Tank 241-C-203, Auger samples 95 AUG-020 and 95-AUG-021.** Conner, J.M. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013365. Source: OSTI; NTIS; INIS; GPO Dep.

This document serves as the 45-day report deliverable for the tank C-203 auger samples collected on April 5, 1995 (samples 95-AUG-20 and 95-AUG-021). As no secondary analyses were required and no other analyses have been requested, this document also serves as the final report for C-203 auger sampling. Each sample was received, extruded, and analyzed by the 222-S Laboratories in accordance with the Tank Characterization Plan (TCP) referenced below. Included in this report are the primary safety screening results (DSC, TGA, and alpha) and density results. The worklists and raw data are included in this report. Photographs of the auger samples were taken during extrusion and, although not included in this report, are available.

1693 (WHC-SD-WM-DP-113) **45-day safety screen results for tank 241-U-204, push mode, cores 81 and 82.** Bell, K.E. Westinghouse Hanford Co., Richland, WA (United States). 17 May 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013346. Source: OSTI; NTIS; INIS; GPO Dep.

This is the 45-Day report for the fiscal year 1995 tank 241-U-204 (U-204) push-mode characterization effort. Included are a summary of analytical results and copies of the differential scanning calorimetry (DSC) and thermogravimetric analysis (TGA) scans. Core samples 81 and 82 from tank U-204, obtained by the push-mode core sampling method, were received by the 222-S Laboratories. Each core consisted of only one segment. Both core samples and the field blank were extruded, subsampled, and analyzed in accordance with Reference 1. Drainable liquids and the field blank were analyzed at the segment level for energetics by DSC, percent water by TGA, and total organic carbon (TOC) by furnace oxidation. In addition, the presence or absence of any separable, presumably organic, layer in drainable liquid samples was noted and none was observed. The solids were analyzed directly at the half segment level for energetics by DSC, percent water by TGA, and TOC by persulfate oxidation. Total alpha activity was determined on fusion digestions of the sludge subsamples. No immediate notifications were necessary on samples from cores 81 or 82.

1694 (WHC-SD-WM-DP-114) **60-day safety screen results and final report for tank 241-C-111, auger samples 95-Aug-002, 95-Aug-003, 95-Aug-016, and 95-Aug-017.** Rice, A.D. Westinghouse Hanford Co., Richland, WA (United States). 30 May 1995. 280p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014307. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the auger sampling events for underground waste tank C-111. The samples were shipped to the 222-S laboratories were they underwent safety screening analysis and primary ferricyanide analysis. The samples were analyzed for alpha total, total organic carbon, cyanide, Ni, moisture, and temperature differentials. The results of this analysis are presented in this document.

1695 (WHC-SD-WM-DP-115) **45-day safety screen results for tank 241-C-204, auger samples 95-Aug-022 and 95-Aug-023.** Conner, J.M. Westinghouse Hanford Co., Richland, WA (United States). 15 Aug 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016330. Source: OSTI; NTIS; INIS; GPO Dep.

Two auger samples from tank 241-C-204 (C-204) were received at the 222-S Laboratories and underwent safety screening analysis, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity. The three samples submitted to energetics determination by DSC exceeded the notification limit. As required by the Tank Characterization Plan, the appropriate notifications were made within 24 hours of official confirmation that the limit was exceeded. Secondary analyses have been initiated. Results from secondary analyses will be included in a revision to this report.

1696 (WHC-SD-WM-DP-116) **45-Day safety screen results for Tank 241-C-201, Auger samples 95-AUG-025 and 95-AUG-026.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 15 Jun 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015782. Source: OSTI; NTIS; INIS; GPO Dep.

Two auger samples from tank 241-C-201 (C-201) were received by the 222-S Laboratories and underwent safety screening analysis, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity. Analytical results for the DSC analyses of both samples exceeded the notification limit of 481 J/g (dry weight basis). As well, the TGA analyses for both samples were less than the safety screening notification limit (notification is made if the sample is analyzed at less than 17 percent water). Notification of both of these occurrences was made on May,15, 1995, and secondary analysis of total organic carbon (TOC) was initiated. These TOC analysis results are also included in this report.

1697 (WHC-SD-WM-DP-130) **Equipment sizing calculations for the Extensive Separations Alternative engineering data package.** Jansen, G. Jr. Westinghouse Hanford Co., Richland, WA (United States). 6 Apr 1995. 383p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010945. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains results of Raytheon/BNFL calculations for equipment selection and sizing for the Extensive Separations Alternative to be evaluated in the TWRS- (Tank Waste Remediation System) Environmental Impact Statement. This report contains: an equipment list for the extensive separations/HLW Facility; calculation of equipment sizing for HLW vitrification system; calculation for centrifuge selection; calculation of equipment sizing for fractionator, absorbers, reboiler, and condenser; calculation of equipment sizing for ion exchange columns; calculation of equipment sizing for tanks; calculation of equipment sizing for bulk, preparation, and feed cold chemical tanks; calculation of equipment sizing for evaporators, condensers, tanks, decanters, and filters; calculation of equipment sizing for organics destruction system; and calculation of LLW facility throughput and equipment sizes.

1698 (WHC-SD-WM-DP-132) **45-day safety screen results and final report for tank 241-C-202, auger samples 95-Aug-026 and 95-Aug-027.** Baldwin, J.H. Westinghouse Hanford Co., Richland, WA (United States). 19 Jun 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016329. Source: OSTI; NTIS; INIS; GPO Dep.

Two auger samples from tank 241-C-202 (C-202) were received at the 222-S Laboratories and underwent safety screening analysis, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity. Two samples were submitted for energetics determination by DSC. Within the triplicate analyses of each sample, one of the results for energetics exceeded the notification limit. The sample and duplicate analyses for both augers exceeded the notification limit for TGA. As required by the Tank Characterization Plan, the appropriate notifications were made within 24 hours of official confirmation that the limits were violated.

1699 (WHC-SD-WM-DP-133) **45-Day safety screen results and final report for Tank 241-SX-113, Auger samples 94-AUG-028 and 95-AUG-029.** Sasaki, L.M. Westinghouse Hanford Co., Richland, WA (United States). 22 Jun 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015779. Source: OSTI; NTIS; INIS; GPO Dep.

This document serves as the 45-day report deliverable for tank 241-SX-113 auger samples collected on May 9 and 10, 1995. The samples were extruded, and analyzed by the 222-S Laboratory. Laboratory procedures completed include: differential scanning calorimetry; thermogravimetric analysis; and total alpha analysis. This report incudes the primary safety screening results obtained from the analyses. As the final report, the following are also included: chains of custody; the extrusion logbook; sample preparation data; and total alpha analysis raw data.

1700 (WHC-SD-WM-DQO-001-Rev.1) **Data quality objectives for tank farms waste compatibility program. Revision 1.** Fowler, K.D. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010927. Source: OSTI; NTIS; INIS; GPO Dep.

Waste compatibility within the Tank Waste Remediation System (TWRS) double-shell tank farms at the Hanford Site is implemented via the Tank Farms Waste Transfer Compatibility Program, WHC-SD-WM-OCD-015. This DQO for waste compatibility includes a statement of the transfer problem(s), identification of safety and operations related decision elements relevant to waste transfers, a list of the data inputs to these decisions, a description of the transfers covered, and quantitative decision rules for the safety decisions.

1701 (WHC-SD-WM-DQO-002-Rev.1) **Data quality objectives for generic in-tank health and safety vapor issue resolution. Revision 1.** Osborne, J.W. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012797. Source: OSTI; NTIS; INIS; GPO Dep.

Data Quality Objectives (DQOs) for generic waste storage tank vapor and gas sampling were developed in facilitated meetings and a stakeholder review session, using the most recent US EPA DQO guidelines. These meetings elicited DQOs for two major vapor problem areas: flammability and toxicity. This is a summary of the outputs of the planning team for each of the 7 steps of the DQO process.

1702 (WHC-SD-WM-DQO-004-Rev.1) **Flammable gas tank safety program: Data requirements for core sample analysis developed through the Data Quality Objectives (DQO) process. Revision 1.** McDuffie, N.G.; LeClair, M.D. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011674. Source: OSTI; NTIS; INIS; GPO Dep.

This document represents the application of the Data Quality Objectives (DQO) process to the Flammable Gas Tank Safety Issue at the Hanford Site. The product of this effort is a list of data required from tank core sample analysis to support resolution of this issue.

1703 (WHC-SD-WM-DQO-006-Rev.1) **Data quality objective to support resolution of the organic fuel rich tank safety issue.** Buckley, L.L. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011633. Source: OSTI; NTIS; INIS; GPO Dep.

During years of Hanford process history, large quantities of complexants used in waste management operations as well as an unknown quantity of degradation products of the solvents used in fuel reprocessing and metal recovery were added to man of the 149 single-shell tanks. These waste tanks also contain a presumed stoichiometric excess of sodium nitrate/nitrite oxidizers, sufficient to exothermically oxidize the organic compounds if suitably initiated. This DQO identifies the questions that must be answered to appropriately disposition organic watchlist tanks, identifies a strategy to deal with false positive or negative judgements associated with analytical uncertainty, and list the analytes of concern to support dealing with organic watchlist concerns. Uncertainties associated with both assay limitations and matrix effects complicate selection of analytes. This results in requiring at least two independent measures of potential fuel reactivity.

1704 (WHC-SD-WM-DQO-007-Rev.1) **Data requirements for the Ferrocyanide Safety Issue developed through the data quality objectives process. Revision 1.** Meacham, J.E.; Cash, R.J. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012787. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the requirements for obtaining tank characterization information to support resolution of the Ferrocyanide Safety Issue at the Hanford Site by applying the data quality objectives (DQO) process. A strategy describing the overall approach to safe storage and disposal of the waste in the ferrocyanide tanks identifies the problems and decisions that require characterization data. The DQO process is applied to each decision or group of related decisions to specify data requirements.

1705 (WHC-SD-WM-DQO-018) **Historical model evaluation data requirements.** Simpson, B.C.; McCain, D.J. Westinghouse Hanford Co., Richland, WA (United States). 8 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012827. Source: OSTI; NTIS; INIS; GPO Dep.

Several studies about tank waste contents have been published using historical records of tank transactions and various analytical measurements. While these records offer a wealth of information, the results are questionable until error estimates associated with the results can be established. However, they do provide a direction for investigation. Two principal observations from the studies are: (1) Large quantities of individual waste types from the various separations processes were widely distributed throughout the tank farms, and (2) The compositions of many of these waste types are quite distinct from one another. A key assumption associated with these observations is that the effects of time and location on the tank wastes are either nominal or not discernable. Since each waste type has a distinct composition, it would benefit all programs to better quantify that composition, and establish an uncertainty for each element of that composition. Various process, disposal, or other decisions could then be made based on current information reducing the need for extended sampling and analysis.

1706 (WHC-SD-WM-DR-013) **Description of waste pretreatment and interfacing systems dynamic simulation model.** Garbrick, D.J.; Zimmerman, B.D. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 116p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016333. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Pretreatment and Interfacing Systems Dynamic Simulation Model was created to investigate the required pretreatment facility processing rates for both high level and low level waste so that the vitrification of tank waste can be completed according to the milestones defined in the Tri-Party Agreement (TPA). In order to achieve this objective, the processes upstream and downstream of the pretreatment facilities must also be included. The simulation model starts with retrieval of tank waste and ends with vitrification for both low level and high level wastes. This report describes the results of three simulation cases: one based on suggested average facility processing rates, one with facility rates determined so that approximately 6 new DSTs are required, and one with facility rates determined so that approximately no new DSTs are required. It appears, based on the simulation results, that reasonable facility processing rates can be selected so that no new DSTs are required by the TWRS program. However, this conclusion must be viewed with respect to the modeling assumptions, described in detail in the report. Also included in the report, in an appendix, are results of two sensitivity cases: one with glass plant water recycle steams recycled versus not recycled, and one employing the TPA SST retrieval schedule versus a more uniform SST retrieval schedule. Both recycling and retrieval schedule appear to have a significant impact on overall tank usage.

1707 (WHC-SD-WM-DTR-040) **Report of scouting study on precipitation of strontium, plutonium, and americium from Hanford complexant concentrate waste.** Herting, D.L. Westinghouse Hanford Co., Richland, WA (United States). 5 Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050111. Source: OSTI; NTIS; INIS; GPO Dep.

A laboratory scouting test was conducted of precipitation methods for reducing the solubility of radionuclides in complexant concentrate (CC) waste solution. The results show that addition of strontium nitrate solution is effective in reducing the liquid phase activity of 90Sr (Strontium) in CC waste from tank 107-AN by 94% when the total strontium concentration is adjusted to 0.1 M. Addition of ferric nitrate solution effective in reducing the 241Am (Americium) activity in CC waste by 96% under the conditions described in the report. Ferric nitrate was also marginally effective in reducing the solubility of 239/240Pu (Plutonium) in CC waste

1708 (WHC-SD-WM-ER-029-Rev.21) **Operational waste volume projection.** Koreski, G.M.; Strode, J.N. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050112. Source: OSTI; NTIS; INIS; GPO Dep.

Waste receipts to the double-shell tank system are analyzed and wastes through the year 2015 are projected based on generation trends of the past 12 months. A computer simulation of site operations is performed, which results in projections of tank fill schedules, tank transfers, evaporator operations, tank retrieval, and aging waste tank usage. This projection incorporates current budget planning and the clean-up schedule of the tri-party agreement. Assumptions are current as of June 1995.

1709 (WHC-SD-WM-ER-314) **Supporting document for the Southeast Quadrant historical tank content estimate report for AN-Tank Farm. Vols. I and II.** Brevick, C.H.; Gaddis, L.A.; Consort, S.D. Westinghouse Hanford Co., Richland, WA (United States). 15 Sep 1995. 1262p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050006. Source: OSTI; NTIS; INIS; GPO Dep.

Historical Tank Content Estimate of the Southeast Quadrant provides historical evaluations on a tank by tank basis of the radioactive mixed wastes stored in the underground double-shell tanks of the Hanford 200 East and West Areas. This report summarizes historical information such as waste history, temperature profiles, psychrometric data, tank integrity, inventory estimates and tank level history on a tank by tank basis. Tank Farm aerial photos and in- tank photos of each tank are provided. A brief description of instrumentation methods used for waste tank surveillance are included. Components of the data management effort, such as Waste Status and Transaction Record Summary, Tank Layer Model, Supernatant Mixing Model, Defined Waste Types, and Inventory Estimates which generate these tank content estimates, are also given in this report.

1710 (WHC-SD-WM-ER-315) **Supporting document for the Southeast quadrant historical tank content estimate report for AP-tank farm. Volume 1 and 2.** Brevick, C.H, Gaddis, L.A; Consort, S.D. Westinghouse Hanford Co., Richland, WA (United States). 14 Sep 1995. 1648p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050005. Source: OSTI; NTIS; INIS; GPO Dep.

1715 (WHC-SD-WM-ER-350) **Historical tank content estimate for the southeast quadrant of the Hanford 200 Areas.** ICF Kaiser Hanford Co., Richland, WA (United States). Jun 1995. 310p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015546. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides historical evaluations of the radioactive and mixed waste stored in the Hanford site underground double-shell tanks. A Historical Tank Content Estimate has been developed by reviewing the process histories, waste transfer data, and available physical and chemical characterization data from various Department of Energy and Department of Defense contractors. The historical data will supplement information that is currently being gathered from core sampling. Historical waste transfer and level data, tank physical information, temperature data, and sampling data have been compiled for this report and supporting documents.

1716 (WHC-SD-WM-ER-366) **Tank characterization report for Double-Shell Tank 241-SY-102.** DiCenso, A.T. (Los Alamos Technical Associates, Inc., NM (United States)); Amato, L.C.; Winters, W.I. Westinghouse Hanford Co., Richland, WA (United States). 9 Jun 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014306. Source: OSTI; NTIS; INIS; GPO Dep.

This tank characterization report presents an overview of Double-Shell Tank 241-SY-102 (hereafter, Tank 241-SY-102) and its waste contents. It provides estimated concentrations and inventories for the waste components based on the latest sampling and analysis activities and background tank information. This report describes the results of three sampling events. The first core sample was taken in October 1988. The tank supernate and sludge were next core sampled in February and March of 1990 (Tingey and Sasaki 1995). A grab sample of the supernate was taken in March of 1994. Tank 241-SY-102 is in active service and can be expected to have additional transfers to and from the tank that will alter the composition of the waste. The concentration and inventory estimates reported in this document no longer reflect the exact composition of the waste but represent the best estimates based on the most recent and available data. This report supports the requirements of the Hanford Federal Facility Agreement and Consent Order Milestone M-44-08 (Ecology, EPA, DOE 1994).

1717 (WHC-SD-WM-ER–400-Vol.1) **Tank waste source term inventory validation. Volume 1. Letter report.** Brevick, C.H.; Gaddis, L.A.; Johnson, E.D. ICF Kaiser Hanford Co., Richland, WA (United States). 28 Apr 1995. 505p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012488. Source: OSTI; NTIS; INIS; GPO Dep.

The sample data for selection of 11 radionuclides and 24 chemical analytes were extracted from six separate sample data sets, were arranged in a tabular format and were plotted on scatter plots for all of the 149 single-shell tanks, the 24 double-shell tanks and the four aging waste tanks. The solid and liquid sample data was placed in separate tables and plots. The sample data and plots were compiled from the following data sets: characterization raw sample data, recent core samples, D. Braun data base, Wastren (Van Vleet) data base, TRAC and HTCE inventories. This document is Volume I of the Letter Report entitled Tank Waste Source Term Inventory Validation.

1718 (WHC-SD-WM-ER–400-Vol.2) **Tank waste source term inventory validation. Volume II. Letter report.** ICF Kaiser Hanford Co., Richland, WA (United States). Apr 1995. 880p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012489. Source: OSTI; NTIS; INIS; GPO Dep.

This document comprises Volume II of the Letter Report entitled Tank Waste Source Term Inventory Validation. This volume contains Appendix C, Radionuclide Tables, and Appendix D, Chemical Analyte Tables. The sample data for selection of 11 radionuclides and 24 chemical analytes were extracted from six separate sample data sets, were arranged in a tabular format and were plotted on scatter plots for all of the 149 single-shell tanks, the 24 double-shell tanks and the four aging waste tanks. The solid and liquid sample data was placed in separate tables and plots. The sample data and plots were compiled from the following data sets: characterization raw sample data, recent core samples, D. Braun data base, Wastren (Van Vleet) data base, TRAC and HTCE inventories.

1719 (WHC-SD-WM-ER–418) **Tank 241-BY-104 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012592. Source: OSTI; NTIS; INIS; GPO Dep.

Tank BY-104 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Tank BY-104 using the vapor sampling system (VSS) on June 24, 1994 by WHC Sampling and Mobile Laboratories. Air from the tank BY-104 headspace was withdrawn via a heated sampling probe mounted in riser 10A, and transferred via heated tubing to the VSS sampling manifold. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, Pacific Northwest Laboratories, and Oregon Graduate Institute of Science and Technology through a contract with Sandia National Laboratories. The 46 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 10 trip blanks provided by the laboratories.

1720 (WHC-SD-WM-ER–418-Rev.1) **Tank 241-BY-104 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013567. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-104 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-104 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

1721 (WHC-SD-WM-ER–418-Rev.2) **Tank 241-BY-104 headspace gas and vapor characterization results for samples collected in April 1994 and June 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050116. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1722 (WHC-SD-WM-ER–419) **Tank 241-BY-105 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012591. Source: OSTI; NTIS; INIS; GPO Dep.

Tank BY-105 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Tank BY-105 is on the Ferrocyanide Watch List. Samples were collected from Tank BY-105 using the vapor sampling system (VSS) on July 7, 1994 by WHC Sampling and Mobile Laboratories. The tank headspace temperature was determined to be 26 C. Air from the Tank BY-105 headspace was withdrawn via a heated sampling probe mounted in riser 10A, and transferred via heated tubing to the VSS sampling manifold. All heated zones of the VSS were maintained at approximately 65 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, Pacific Northwest Laboratories, and Oregon Graduate Institute of Science and Technology through a contract with Sandia National Laboratories. The 46 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 10 trip blanks provided by the laboratories.

1723 (WHC-SD-WM-ER–419-Rev.1) **Tank 241-BY-105 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013566. Source: OSTI; NTIS; INIS; GPO Dep.

1730 (WHC-SD-WM-ER–421-Rev.2) **Tank 241-BY-107 headspace gas and vapor characterization results for samples collected in March 1994 and October 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050217. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1731 (WHC-SD-WM-ER–422) **Tank 241-BY-108 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012585. Source: OSTI; NTIS; INIS; GPO Dep.

Tank BY-108 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Tank BY-108 is on the Ferrocyanide Watch List. Samples were collected from Tank BY-108 using the vapor sampling system (VSS) on october 27, 1994 by WHC Sampling and Mobile Laboratories. The tank headspace temperature was determined to be 25.7 C. Air from the Tank BY-108 headspace was withdrawn via a 7.9 m-long heated sampling probe mounted in riser 1, and transferred via heated tubing to the VSS sampling manifold. All heated zones of the VSS were maintained at approximately 50 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, and Pacific Northwest Laboratories. The 40 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 14 trip blanks and 2 field blanks that accompanied the samples.

1732 (WHC-SD-WM-ER–422-Rev.1) **Tank 241-BY-108 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014304. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-108 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues" (Osborne and Huckaby 1994). Tank 241-BY-108 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution (Osborne et al., 1994).

1733 (WHC-SD-WM-ER–423) **Tank 241-C-108 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012832. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1739 (WHC-SD-WM-ER–425) **Tank 241-C-111 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012593. Source: OSTI; NTIS; INIS; GPO Dep.

Tank C-111 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Results presented here represent the best available data on the headspace constituents of Tank C-111. Almost all of the data in this report was obtained from samples collected on September 13, 1994.Data from 2 other sets of samples, collected on August 10, 1993 and June 20, 1994, are in generally good agreement with the more recent data. The tank headspace temperature was determined to be 27 C. Air from the Tank C-111 headspace was withdrawn via a 7.9 m-long heated sampling probe mounted in riser 6, and transferred via heated tubing to the VSS sampling manifold. All heated zones of the VSS were maintained at approximately 50 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, Pacific Northwest Laboratories, and Oregon Graduate Institute of Science and Technology through a contract with Sandia National Laboratories. The 39 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 14 trip blanks provided by the laboratories. Tank C-111 is a single shell tank which received first-cycle decontamination waste from B Plant and was later used as a settling tank.

1740 (WHC-SD-WM-ER–425-Rev.1) **Tank 241-C-111 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-C-112 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

1744 (WHC-SD-WM-ER–426-Rev.2) **Tank 241-C-112 headspace gas and vapor characterization results for samples collected in June 1994 and August 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050218. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1745 (WHC-SD-WM-ER–427) **Tank 241-C-106 process test report.** Bander, T.J. Westinghouse Hanford Co., Richland, WA (United States). 30 May 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014316. Source: OSTI; NTIS; INIS; GPO Dep.

This report evaluates the thermal hydraulic behavior of tank C-106 during and following the process test conducted from March 10, 1994 to June 15, 1994. During and following the process test the thermocouples on the thermocouple tree in riser No. 14 began to indicate significantly higher temperatures in the sludge than the low temperatures typically observed at this location. The thermocouples on the thermocouple tree in riser No. 8 during this same time period indicated temperature variations consistent with normal seasonal effects. This report summarizes the analyses conducted to understand the phenomena that caused the temperature history at riser No. 14.

1746 (WHC-SD-WM-ER–428) **Tank 241-BY-103 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012824. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-103 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-103 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

1747 (WHC-SD-WM-ER–428-Rev.2) **Tank 241-BY-103 headspace gas and vapor characterization results for samples collected in May 1994 and November 1994.** Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 26 Sep 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050123. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories

1748 (WHC-SD-WM-ER–429) **Tank 241-BY-110 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012595. Source: OSTI; NTIS; INIS; GPO Dep.

Tank BY-110 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Tank BY-110 is on the Ferrocyanide Watch List. Samples were collected from Tank BY-110 using the vapor sampling system (VSS) on November 11, 1994 by WHC Sampling and Mobile Laboratories. The tank headspace temperature was determined to be 27 C. Air from the Tank BY-110 headspace was withdrawn via a 7.9 m-long heated sampling probe mounted in riser 12B, and transferred via heated tubing to the VSS sampling manifold. All heated zones of the VSS were maintained at approximately 50 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, and Pacific Northwest Laboratories. The 40 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 14 trip blanks and 2 field blanks that accompanied the samples.

1749 (WHC-SD-WM-ER–429-Rev.1) **Tank 241-BY-110 vapor sampling and analysis tank characterization report. Revision 1.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013907. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-BY-110. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to the tank farm workers due to fugitive emissions from the tank.

1750 (WHC-SD-WM-ER–429-Rev.2) **Tank 241-BY-110 Headspace Gas and Vapor Characterization Results for Samples Collected in November 1994. Revision 2.** Huckaby, J.L. (Pacific Northwest Lab., Washington, DC (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050124. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1751 (WHC-SD-WM-ER–430) **Waste tank headspace gas and vapor characterization reference guide.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012823. Source: OSTI; NTIS; INIS; GPO Dep.

This document is to serve as a reference guide for gas and vapor sample results presented in tank characterization reports. It describes sampling equipment, devices, and protocols, and sample collection and analysis methods common to all vapor samples.

1752 (WHC-SD-WM-ER–432) **Evaluation of remaining life of the double-shell tank waste systems.** Schwenk, E.B. Westinghouse Hanford Co., Richland, WA (United States). 4 May 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012789. Source: OSTI; NTIS; INIS; GPO Dep.

A remaining life assessment of the DSTs (double-shell tanks) and their associated waste transfer lines, for continued operation over the next 10 years, was favorable. The DST assessment was based on definition of significant loads, evaluation of data for possible material degradation and geometric changes and evaluation of structural analyses. The piping assessment was based primarily on service experience.

1753 (WHC-SD-WM-ER-436) **Dropping of mixing pump in Tank 102-AP.** Jimenez, R.F. Westinghouse Hanford Co., Richland, WA (United States). 2 Jun 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016334. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study is to examine dropping of the mixing pump in Tank 102-AP during its removal poses the risk of causing a leak in the tank bottom with attendant potential for public exposure from the leak. The purpose of this investigation is to examine the potential for causing such a leak (i.e., estimated frequency of leak occurrence); to qualitatively estimate leak magnitude if its is a credible event; and, finally to compare the worker hazard, in the installation of an impact limiter (should it be required), to that which the public might incur if a leak is manifest in the tank bottom. The ultimate goal of the study is, of course, to assess the need for installation of an impact limiter.

1754 (WHC-SD-WM-ER-437) **Removal of mixing pump in tank 102-AP – pump drop onto central pit.** Jimenez, R.F. Westinghouse Hanford Co., Richland, WA (United States). 20 Jun 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015785. Source: OSTI; NTIS; INIS; GPO Dep.

The mixing pump, if dropped in the pump pit following its removal from the tank, is incapable of compromising the tank structure either locally or in a structural displacement mode to an extent which might allow dispersion of the contents. A drop from 10 ft above the pit floor (considered the maximum credible height) of a pump which is considered perfectly rigid does not approach the required perforation velocity. The velocity required to perforate requires a drop height which is physically impossible to attain with existing cranes. An analysis of the location of the deposition of the strain energy required to match the pump's impact kinetic energy, the results of which are shown in Table 2, verifies that there is no credible chance for compromise of the tank roof by such a drop.

1755 (WHC-SD-WM-ER-438) **Tank 241-B-103 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013896. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-B-103. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1756 (WHC-SD-WM-ER-438-Rev.1) **Tank 241-B-103 headspace gas and vapor characterization results for samples collected in February 1995.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 27 Sep 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050125. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories

1757 (WHC-SD-WM-ER-439) **Tank 241-BX-104 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013897. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-BX-104. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1758 (WHC-SD-WM-ER-439-Rev.1) **Tank 241-BX-104 headspace gas and vapor characterization results for samples collected in December 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050126. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories

1759 (WHC-SD-WM-ER-440) **Tank 241-BY-111 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013572. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-111 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-111 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

1760 (WHC-SD-WM-ER-440-Rev.1) **Tank 241-BY-111 headspace gas and vapor characterization results for samples collected in May 1994 and November 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050127. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories

1761 (WHC-SD-WM-ER–441) **Tank 241-BY-112 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013571. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-112 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-112 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

1762 (WHC-SD-WM-ER–441-Rev.1) **Tank 241-BY-112 headspace gas and vapor characterization results for samples collected in November 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050135. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories

1763 (WHC-SD-WM-ER–442) **Tank 241-C-104 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013597. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-C-104 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-C-104 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

1764 (WHC-SD-WM-ER–442-Rev.1) **Tank 241-C-104 headspace gas and vapor characterization results for samples collected in March 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1995. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050137. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories

1765 (WHC-SD-WM-ER–443) **Tank 241-C-105 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012136. Source: OSTI; INIS; NTIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-105. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1766 (WHC-SD-WM-ER–443-Rev.1) **Tank 241-C-105 headspace gas and vapor characterization results for samples collected in February 1994. Revision 1.** Huckaby, J.L. (Pacific Northwest Lab., Washington, DC (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050140. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1767 (WHC-SD-WM-ER–444) **Tank 241-C-106 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013230. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-106. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1768 (WHC-SD-WM-ER–444-Rev.1) **Tank 241-C-106 headspace gas and vapor characterization results for samples collected in February 1994.** Hackaby, J.L. (Pacific Northwest Lab., Washington, DC (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 26 Sep 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050141. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories

1769 (WHC-SD-WM-ER-445) **Tank 241-C-107 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015155. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-107. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1770 (WHC-SD-WM-ER-445-Rev.1) **Tank 241-C-107 headspace gas and vapor characterization results for samples collected in September 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050155. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories

1781 (WHC-SD-WM-ER–451) **Tank 241-U-107 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013578. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-U-107 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-U-107 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

1782 (WHC-SD-WM-ER–451-Rev.1) **Tank 241-U-107 headspace gas and vapor characterization results for samples collected in February 1995.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050158. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1783 (WHC-SD-WM-ER–452) **Tank 241-U-111 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013577. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-U-111 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-U-111 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

1784 (WHC-SD-WM-ER–452-Rev.1) **Tank 241-U-111 headspace gas and vapor characterization results for samples collected in February 1995.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050160. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1785 (WHC-SD-WM-ER–458) **Tank 241-C-101 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013881. Source: OSTI; NTIS; INIS; GPO Dep.

Tank C-101 headspace gas and vapor samples were collected and analyzed to help determine the potential risks of fugitive emissions to tank farm workers. Gas and vapor samples from the Tank C-101 headspace were collected on July 7, 1994 using the in situ sampling (ISS) method, and again on September 1, 1994 using the more robust vapor sampling system (VSS). Gas and vapor concentrations in

Tank C-101 are influenced by its connections to other tanks and its ventilation pathways. At issue is whether the organic vapors in Tank C-101 are from the waste in that tank, or from Tanks C-102 or C-103. Tank C-103 is on the Organic Watch List; the other two are not. Air from the Tank C-101 headspace was withdrawn via a 7.9-m long heated sampling probe mounted in riser 8, and transferred via heated tubing to the VSS sampling manifold. The tank headspace temperature was determined to be 34.0 C, and all heated zones of the VSS were maintained at approximately 50 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, Pacific Northwest Laboratories, and Oregon Graduate Institute of Science and Technology through a contract with Sandia National Laboratories. The 39 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 14 trip blanks and 2 field blanks provided by the laboratories.

1786 (WHC-SD-WM-ER–458-Rev.1) **Tank 241-C-101 headspace gas and vapor characterization results for samples collected in September 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050162. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1787 (WHC-SD-WM-ER–459) **Tank 241-C-102 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Douglas United Nuclear, Inc., Richland, WA (United States). 31 May 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013562. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-102. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1788 (WHC-SD-WM-ER–459-Rev.1) **Tank 241-C-102 headspace gas and vapor characterization results for samples collected in August 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050164. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1789 (WHC-SD-WM-ER–460) **Tank 241-SX-106 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013903. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-SX-106. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1790 (WHC-SD-WM-ER–460-Rev.1) **Tank 241-SX-106 headspace gas and vapor characterization results for samples collected in March 1995.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050166. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1791 (WHC-SD-WM-ER–461) **Tank 241-TY-101 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013902. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-TY-101. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1792 (WHC-SD-WM-ER–461-Rev.1) **Tank 241-TY-101 headspace gas and vapor characterization results for samples collected in August 1994 and April 1995.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 36p. Sponsored by USDOE, Washington, DC (United States). Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1793 (WHC-SD-WM-ER–462) **Tank 241-TY-103 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013898. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-TY-103. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1794 (WHC-SD-WM-ER–462-Rev.1) **Tank 241-TY-103 headspace gas and vapor characterization results for samples collected in August 1994 and April 1995.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050172. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1795 (WHC-SD-WM-ER–463) **Tank 241-TY-104 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013560. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-TY-104. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1796 (WHC-SD-WM-ER–463-Rev.1) **Tank 241-TY-104 headspace gas and vapor characterization results for samples collected in April 1995.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050174. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1797 (WHC-SD-WM-ER–464) **Tank 241-C-110 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013894. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-C-110. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedure that were presented in other reports. The vapor and headspace gas samples were collected and analyzed to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

1798 (WHC-SD-WM-ER–464-Rev.1) **Tank 241-C-110 headspace gas and vapor characterization results for samples collected in August 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050176. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1799 (WHC-SD-WM-ER–495) **Tank 241-C-106 thermal hydraulic analysis to establish the cooling liquid at a minimum level.** Bander, T.J. (Westinghouse Hanford Co., Richland, WA (United States)); Thurgood, M.J. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050179. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the computer simulations used to evaluate whether tank 241-C-106 can be operated at new lower operating liquid levels without significant reduction in th heat removal capability of the tank ventilation system. It is concluded that if the tank is operated with the liquid level between 72 and 74 in. the evaporation of the tank will be similar to what it is for the current operating level of 75 to 79 in. Analyses predict that for both operating limits voids will form during the summer months and disappear during the winter months. The waste temperatures for both operating limits will be close to the same. Installation of a chiller can maintain the highest waste temperatures below the saturation temperature (i.e., no voids will form) year round provided 67% of the original pool surface area is maintained for evaporation

1800 (WHC-SD-WM-ER–503) **Tank characterization report for single-shell tank 241-C-108.** Sederburg, J.P. Westinghouse Hanford Co., Richland, WA (United States). 29 Sep 1995. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050184. Source: OSTI; NTIS; INIS; GPO Dep.

This document summarizes the information on the historical uses, present status, and the sampling and analysis results of waste stored in tank 241-C-108.

1801 (WHC-SD-WM-ER–505) **Tank 241-A-101 headspace gas and vapor characterization results for samples collected in June 1995.** Huckaby, J.L. Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1809 (WHC-SD-WM-ER–514) **Headspace gas and vapor characterization summary for the 43 vapor program suspect tanks.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1995. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050128. Source: OSTI; NTIS; INIS; GPO Dep.

During the time period between February 1994 and September 1995, Westinghouse Hanford Company (WHC) sampled the waste tank headspace of 43 single-shell tanks for a variety of gaseous and/or volatile and semi-volatile compounds. This report summarizes the results of analyses of those sampling activities with respect to both the Priority 1 Safety Issues and relative to the detection in the headspace of significant concentrations of target analytes relating to worker breathing space consideration as recommended by the Pacific Northwest Laboratory (PNL) Toxicology Review Panel. The information contained in the data tables was abstracted from the vapor sampling and analysis tank characterization reports. Selected results are tabulated and summarized. Sampling equipment and methods, as well as sample analyses, are briefly described.

Vapor sampling of passively ventilated single-shell tanks (tanks C-105, C-106, and SX-106 were sampled and are actively ventilated) has served to highlight or confirm tank headspace conditions associated with both priority 1 safety issues and supports source term analysis associated with protecting worker health and safety from noxious vapors

1810 (WHC-SD-WM-ER–519) **Ferrocyanide safety program: Final report on adiabatic calorimetry and tube propagation tests with synthetic ferrocyanide materials.** Fauske, H.F. (Fauske and Associates, Inc. (United States)); Meacham, J.E.; Cash, R.J. Westinghouse Hanford Co., Richland, WA (United States). 29 Sep 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050203. Source: OSTI; NTIS; INIS; GPO Dep.

Based on Fauske and Associates, Inc. Reactive System Screening Tool tests, the onset or initiation temperature for a ferrocyanide-nitrate propagating reaction is about 250 degrees Celcius. This is at about 200 degrees Celcius higher than current waste temperatures in the highest temperature ferrocyanide tanks. Furthermore, for current ambient waste temperatures, the tube propagation tests show that a ferrocyanide concentration of 15.5 wt% or more is required to sustain a propagation reaction in the complete absence of free water. Ignoring the presence of free water, this finding rules out propagating reactions for all the Hanford flowsheet materials with the exception of the ferrocyanide waste produced by the original In Farm flowsheet

1811 (WHC-SD-WM-ES–317) **Identification of Radioactive Pilot-Plant test requirements.** Powell, W.J.; Riebling, E.F. Westinghouse Hanford Co., Richland, WA (United States). 9 May 1995. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015786. Source: OSTI; NTIS; INIS; GPO Dep.

Radioactive Pilot-Plant testing needs and alternatives are evaluated for enhanced Sludge Washing and High and Low-Level Vitrification efforts. Also investigated was instrument and equipment testing needs associated with the vitrification and retrieval process. The scope of this document is to record the existing March 1994 letter report for future use. A structured Kepner-Trego™ decision analysis process was used to assist analysis of the testing needs. This analysis provided various combinations of laboratory and radioactive (hot) and cold pilot testing options associated with the above need areas. Recommendations for testing requirements were made.

1812 (WHC-SD-WM-ES–321) **In-tank processes for destruction of organic complexants and removal of selected radionuclides.** Schulz, W.W.; Kupfer, M.J.; McKeon, M.M. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011673. Source: OSTI; NTIS; INIS; GPO Dep.

This report establishes the need and technical feasibility for using in-tank pretreatment processes for destruction of organic complexants and removal of ^{90}Sr, transuranic (TRU) elements, and ^{99}Tc from double-shell tank (DST) liquid wastes. Neither ^{90}Sr nor $^{99}T_c$have to be removed from any DST solution to obtain vitrified product containing less than the Nuclear Regulatory Commission (NRC) criteria for Class C commercial low-level waste (LLW). To meet the NRC criterion for Class C LLW, TRU elements must be removed from liquid wastes in three (possibly five) DSTs. No ^{90}Sr will have to be removed from any solution for the total vitrified waste from both DSTs and single-shell tanks to meet a goal of <7 MCi of radionuclides and a NRC ruling for Hanford Site Incidental Waste. Guidance from ALARA principles and the TWRS Environmental Impact Statement may dictate additional removal of radionuclides from DST supernatant liquids. Scavenging processes involving precipitation of strontium phosphate and/or hydrated iron oxide effectively remove ^{90}Sr and/or TRU elements from actual DST wastes including complexant concentrate (CC) wastes. Destruction of organic complexants is not required for these scavenging processes to reduce the ^{90}Sr and/or TRU element concentrations of DST waste solutions to or below the NRC criteria for Class C commercial LLW. However, substantially smaller amounts of scavenging agents would be required for removal of ^{90}Sr and TRU elements from CC waste if organic complexants were destroyed. Low concentrations of added $Sr(NO_3)_2$ and $Fe(NO_3)_3$ are desirable to minimize the volume of HLW glass.

1813 (WHC-SD-WM-ES–325) **Pre-1970 transuranic solid waste at the Hanford Site.** Greenhalgh, W.O. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015784. Source: OSTI; NTIS; INIS; GPO Dep.

The document is based on a search of pre-1970 Hanford Solid Waste Records. The available data indicates seven out of thirty-one solid waste burial sites used for pre-1970 waste appear to be Transuranic (TRU). A burial site defined to be TRU contains >100 nCi/gm Transuranic nuclides.

1814 (WHC-SD-WM-ES–331) **Identification of potential transuranic waste tanks at the Hanford Site.** Colburn, R.P. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012567. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to identify potential transuranic (TRU) material among the Hanford Site tank wastes for possible disposal at the Waste Isolation Pilot Plant (WIPP) as an alternative to disposal in the high-level waste (HLW) repository. Identification of such material is the initial task in a trade study suggested in WHC-EP-0786, Tank Waste Remediation System Decisions and Risk Assessment (Johnson 1994). The scope of this document is limited to the identification of those tanks that might be segregated from the HLW for disposal as TRU, and the bases for that selection. It is assumed that the tank waste will be washed to remove soluble inert material for disposal as low-level waste (LLW), and the washed residual solids will be vitrified for disposal. The actual recommendation of a disposal strategy for these materials will require a detailed cost/benefit analysis and is beyond the scope of this document.

1815 (WHC-SD-WM-ES–337) **Cost benefit and risk assessment for selected tank waste process testing alternatives.** Gasper, K.A. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Foster-Wheeler Environmental Corp., Richland, WA (United States). 22 May 1995. 644p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013837. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy has established the Tank Waste Remediation System (TWRS) program to safely manage wastes currently stored in underground tank at the Hanford Site. A TWRS testing and development strategy was recently developed to define long-range TWRS testing plans. The testing and development strategy considered four alternatives. The primary variable in the alternatives is the level of pilot-scale testing involving actual waste. This study evaluates the cost benefit and risks associated with the four alternatives. Four types of risk were evaluated: programmatic schedule risk, process mishap risk, worker risk, and public health risk. The structure of this report is as follows: Section 1 introduces the report subject; Section 2 describes the test strategy alternative evaluation; Section 3 describes the approach used in this study to assess risk and cost benefit; Section 4 describes the assessment methodologies for costs and risks; Section 5 describes the bases and assumptions used to estimate the costs and risks; Section 6 presents the detailed costs and risks; and Section 7 describes the results of the cost benefit analysis and presents conclusions.

1816 (WHC-SD-WM-ES–343) **Moisture monitoring and control system engineering study.** Carpenter, K.E.; Fadeff, J.G. Westinghouse Hanford Co., Richland, WA (United States). 16 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012588. Source: OSTI; NTIS; INIS; GPO Dep.

During the past 50 years, a wide variety of chemical compounds have been placed in the 149 single-shell tanks (SSTS) on the Hanford Site. A concern relating to chemical stability, chemical control, and safe storage of the waste is the potential for propagating reactions as a result of ferrocyanide-oxidizer and organic-oxidizer concentrations in the SSTS. Propagating reactions in fuel-nitrate mixtures are precluded if the amounts of fuel and moisture present in the waste are within specified limits. Because most credible ignition sources occur near the waste surface, the main emphasis of this study is toward monitoring and controlling moisture in the top 14 cm (5.5 in.) of waste. The purpose of this engineering study is to recommend a moisture monitoring and control system for use in SSTs containing sludge and saltcake. This study includes recommendations for: (1) monitoring and controlling moisture in SSTs; (2) the fundamental design criteria for a moisture monitoring and control system; and (3) criteria for the deployment of a moisture monitoring and control system in hanford Site SSTs. To support system recommendations, technical bases for selecting and using a moisture monitoring and control system are presented. Key functional requirements and a conceptual design are included to enhance system development and establish design criteria.

1817 (WHC-SD-WM-ES–345) **Development and determination of a single-shell tank interim stabilization pumping strategy.** Garvin, L.J.; Kujak, S.K. ICF Kaiser Hanford Co., Richland, WA (United States). 12 Jun 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015819. Source: OSTI; NTIS; INIS; GPO Dep.

This activity plan addresses the technique and steps involved in simulating a riser installation in the dome of a single-shell waste storage tank by the used of a rotary drill rig. This simulation will provide information to avoid potential inadequacies in planning and field efforts in a nonradiological environment. Personnel can be trained in a nonradiological environmental while perfecting techniques for drilling and installing risers. It is essential that field equipment and installation procedures be perfected before the installation of risers in SSTs occurs. Time spent installing the actual risers in the SSTs will be minimized, aiding in safety of personnel and conformance to ALARA principles.

1818 (WHC-SD-WM-ES–346) **Flammable gas tank safety program: Technical basis for gas analysis and monitoring.** Sherwood, D.J. Westinghouse Hanford Co., Richland, WA (United States). 8 Sep 1995. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050204. Source: OSTI; NTIS; INIS; GPO Dep.

Flammable gases generated in radioactive liquids. Twenty-five high level radioactive liquid waste storage tanks located underground at the Hanford Site are on a Flammable Gas Watch List because they contain waste which tends to retain the gases generated in it until rather large quantities are available for sudden release to the tank head space; if a tank is full it has little dome space, and a flammable concentration of gases could be produced–even if the tank is ventilated. If the waste has no tendency to retain gas generated in it then a continual flammable gas concentration in the tank dome space is established by the gas production rate and the tank ventilation rate (or breathing rate for unventilated tanks); this is also a potential problem for Flammable Gas Watch List tanks, and perhaps other Hanford tanks too. All Flammable Gas Watch List tanks will be fitted with Standard Hydorgen Monitoring Systems so that their behavior can be observed. In some cases, such as tank 241-SY-101, the data gathered from such observations will indicate that tank conditions need to be mitigated so that gas release events are either eliminated or rendered harmless. For example, a mixer pump was installed in tank 241-SY-101; operating the pump stirs the waste, replacing the large gas release events with small releases of gas that are kept below twenty-five percent of the lower flammability limit by the ventilation system. The concentration of hydrogen measured in Hanford waste tanks is greater than that of any other flammable gas. Hydrogen levels measured with a Standard Hydrogen Monitoring System in excess of 0.6 volume percent will cause Westinghouse Hanford Company to consider actions which will decrease the amount of flammable gas in the tank

1819 (WHC-SD-WM-ES–348) **Alternatives for high-level waste forms, containers, and container processing systems.** Crawford, T.W. Westinghouse Hanford Co., Richland, WA (United States). 22 Sep 1995. 166p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050205. Source: OSTI; NTIS; INIS; GPO Dep.

This study evaluates alternatives for high-level waste forms, containers, container processing systems, and onsite interim storage. Glass waste forms considered are cullet, marbles, gems, and monolithic glass. Small and large containers configured with several combinations of overpack confinement and shield casks are evaluated for these waste forms. Onsite interim storage concepts including canister storage building, bore holes, and storage pad were configured with various glass forms and canister alternatives. All favorable options include the monolithic glass production process as the waste form. Of the favorable options the unshielded 4- and 7-canister overpack options have the greatest technical assurance associated with their design concepts due to their process packaging and storage methods. These canisters are 0.68 m and 0.54 m in diameter respectively and 4.57 m tall. Life-cycle costs are not a discriminating factor in most cases, varying typically less than 15 percent.

1820 (WHC-SD-WM-ETP–109) **Pump strongback redesign, pump storage, PM procedures.** Leshikar, G.A.; Desantis, N. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010594. Source: OSTI; NTIS; INIS; GPO Dep.

This Engineering Task Plan describes the requirement for the fabrication of the safety latch, pump PM procedures and spare parts acquisitions.

1821 (WHC-SD-WM-ETP–152) **Engineering Task Plan for Tank 241-C-106 contingency chiller definitive design.** Rensink, G.E.; Kriskovich, J.R. Westinghouse Hanford Co., Richland, WA (United States). 22 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013363. Source: OSTI; NTIS; INIS; GPO Dep.

This document identifies the scope, cost, schedule and responsible organizations for completing a design of a contingency ventilation inlet air cooling system for Tank 241-C-106. The air cooling system, described in Rensink (1995), consists of a chiller, cooling coils, and supporting equipment that, when installed will be capable of assuring that the waste temperatures in Tank 241-C-106 are maintained within acceptable limits for safe storage. The effort described herein is scheduled for completion by May 31, 1995 to support Performance Based Incentive (PBI) Milestone SI-2x.

1822 (WHC-SD-WM-ETP–153) **Double-shell tank waste system assessment status and schedule.** Walter, E.J. Westinghouse Hanford Co., Richland, WA (United States). 14 Jun 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015776. Source: OSTI; NTIS; INIS; GPO Dep.

The integrated program for completing the integrity assessments of the dangerous waste tank systems managed by the Tank Waste Remediation System (TWRS) Division of Westinghouse Hanford Company is presented in the Tank Waste Remediation System Tank System Integrity Assessments Program Plan, WHC-SD-AP017, Rev. 1. The program plan identified the assessment requirements and the general scope to which these requirements applied. Some of these assessment requirements have been met and others are either in process of completion or scheduled to be worked. To define the boundary of the double-shell tank (DST) system and the boundaries of the DST system components (or system parts) for the purpose of performing integrity assessment activities; To identify the planned activities to meet the assessment requirements for each component; Provide the status of the assessment activities; and Project a five year assessment activity schedule.

1823 (WHC-SD-WM-EV–110) **Permitting plan for the high level waste vitrification plant.** Tollefson, K.S. Westinghouse Hanford Co., Richland, WA (United States). 27 Sep 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050208. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the regulatory requirements and describes alternative strategies for obtaining permits and approvals for the High Level Waste Vitrification Plant.

1824 (WHC-SD-WM-FHA–012) **Fire hazards analysis for the 241-AN-107 mixer pump installation and caustic addition.** Sepahpur, J.B. Westinghouse Hanford Co., Richland, WA (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010925. Source: OSTI; NTIS; INIS; GPO Dep.

This Fire Hazards Analysis (FHA) is intended to provide a comprehensive assessment of the risks from fire and fire related perils for the Tank 107AN mixer pump installation and caustic addition project at the Department of Energy (DOE) Hanford Site. The scope of this FHA is limited to a review of the hazards associated with the structures, systems and components for the caustic addition process. The fire hazards associated with the balance of tank farm "AN" are not within the scope of this FHA. This FHA addresses fire protection and life safety issues to demonstrate compliance with DOE Orders 5480.7A and 6430.1A to assure an acceptable level of protection for the facility occupants, the public and the environment are being provided.

1825 (WHC-SD-WM-FRD–018) **Functional design criteria for the retained gas sampler system.** Wootan, D.W. Westinghouse Hanford Co., Richland, WA (United States). 12 Apr 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011449. Source: OSTI; NTIS; INIS; GPO Dep.

A Retained Gas Sampler System (RGSS) is being developed to capture and analyze waste samples from Hanford Flammable Gas Watch List Tanks to determine both the quantity and composition of gases retained in the waste. The RGSS consists of three main components: the Sampler, Extractor, and Extruder. This report describes the functional criteria for the design of the RGSS components. The RGSS Sampler is based on the WHC Universal Sampler design with modifications to eliminate gas leakage. The primary function of the Sampler is to capture a representative waste sample from a tank and transport the sample with minimal loss of gas content from the tank to the laboratory. The function of the Extruder is to transfer the waste sample from the Sampler to the Extractor. The function of the Extractor is to separate the gases from the liquids and solids, measure the relative volume of gas to determine the void fraction, and remove and analyze the gas constituents.

1826 (WHC-SD-WM-FRD–021) **Functions and requirements for Hanford single-shell tank leakage detection and monitoring.** Cruse, J.M.; Ohl, P.C. Westinghouse Hanford Co., Richland, WA (United States). 19 Apr 1995. 176p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011506. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the initial functions and requirements for leakage detection and monitoring applicable to past and potential future leakage from the Hanford Site's 149 single-shell high-level waste tanks. This mission is a part of the overall mission of the Westinghouse Hanford Company Tank Waste Remediation System division to remediate the tank waste in a safe and acceptable manner. Systems engineering principles are being applied to this effort. This document reflects the an initial step in the systems engineering approach to decompose the mission into primary functions and requirements. The document is considered approximately 30% complete relative to the effort required to produce a final version that can be used to support demonstration and/or procurement of technologies. The functions and requirements in this document apply to detection and monitoring of below ground leaks from SST containment boundaries and the resulting soil contamination. Leakage detection and monitoring is invoked in the TWRS Program in three fourth level functions: (1) Store Waste, (2) Retrieve Waste, and (3) Disposition Excess Facilities (as identified in DOE/RL-92-60 Rev. 1, Tank Waste Remediation System Functions and Requirements).

1827 (WHC-SD-WM-OCD-015-Rev.1) **Tank Farm Waste Transfer Compatibility Program.** Fowler, K.D. Westinghouse Hanford Co., Richland, WA (United States). 24 Apr 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011504. Source: OSTI; NTIS; INIS; GPO Dep.

The compatibility program described in this document formalizes the process for determining waste compatibility. Goal is to ensure that sufficient controls are in place to prevent the formation of incompatible mixtures during future operations, could possibly result in an unreviewed safety question. Waste transfer decision rules are presented as a process for assessing compatibility of wastes or waste mixtures. The process involves characterizing the waste comparing waste characteristics with the criteria, resolving potential incompatibilities, and documenting the process.

1828 (WHC-SD-WM-OTP-174) **Operability test procedure for rotary mode core sampling system #3.** Farris, T.R.; Jarecki, T.D. Westinghouse Hanford Co., Richland, WA (United States). 26 Apr 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011664. Source: OSTI; NTIS; INIS; GPO Dep.

This document gives instructions for the Operability Testing of the Rotary Mode Core Sampling (RMCS) System No. 3. This document is based on the Operability Test Procedure for RMCS system No. 2 because the basic design is the same for all three systems. Modifications have been made from the original design only when exact duplication was not feasible or design improvements could be incorporated without affecting the operation of the system. Operability testing of the Rotary Mode Core Sampling System No. 3, will verify that functional and operational requirements have been met. Testing will be completed in two phases. The first phase of testing (section 7) will involve operating the truck equipment to demonstrate its capabilities. The second phase of testing (section 8) will take repeated samples in a simulated operation environment. These tests will be conducted at the "Rock Slinger" test site located just south of U-Plant in the 200 West Area. Tests will be done in a simulated tank farm environment. All testing will be non-radioactive and stand-in materials shall be used to simulate waste tank conditions. Systems will be assembled and arranged in a manner similar to that expected in the field.

1829 (WHC-SD-WM-OTP-175) **Operability test procedure for rotary mode core sampling system #4.** Farris, T.R.; Jarecki, T.D. Westinghouse Hanford Co., Richland, WA (United States). 26 Apr 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011666. Source: OSTI; NTIS; INIS; GPO Dep.

This document gives instructions for the Operability Testing of the Rotary Mode Core Sampling (RMCS) System No. 4. This document is based on the Operability Test Procedure for RMCS system No. 2 because the basic design is the same for all three systems. Modifications have been made from the original design only when exact duplication was not feasible or design improvements could be incorporated without affecting the operation of the system. Operability testing of the Rotary Mode Core Sampling System No. 4 will verify that functional and operational requirements have been met. Testing will be completed in two phases. The first phase of testing (section 7) will involve operating the truck equipment to demonstrate its capabilities. The second phase of testing (section 8) will take repeated samples in a simulated operation environment. These tests will be conducted at the "Rock Slinger" test site located just south of U-Plant in the 200 West Area. Tests will be done in a simulated tank farm environment. All testing will be non-radioactive and stand-in materials shall be used to simulate waste tank conditions. Systems will be assembled and arranged in a manner similar to that expected in the field.

1830 (WHC-SD-WM-OTP-176) **Operability test procedure for the Rotary Mode Core Sampling System Exhausters 3 and 4.** WSaldo, E.J. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013563. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a procedure for performing operability testing of the Rotary Mode Core Sampling System Exhausters 3 & 4. Upon completion of testing activities an operability testing report will be issued.

1831 (WHC-SD-WM-OTP-177) **Contaminated liquid drain system operability test.** Meloy, R.T. Westinghouse Hanford Co., Richland, WA (United States). 26 Apr 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011661. Source: OSTI; NTIS; INIS; GPO Dep.

This plan provides for starting and testing of the liquid waste storage, tanks with their associated instrumentation, load-out pump, piping, and newly installed remote sampling and recirculation pipe. Instrumentation and control circuits will be proven and samples will be taken to demonstrate adequate sampling. The system will be operated under direction of the test engineer to establish a more thorough understanding of its performance under various conditions.

1832 (WHC-SD-WM-OTP-181) **Acceptance/operational test procedure 103-AN tank camera purge system and 103-AN video camera system.** Castleberry, J.L. Westinghouse Hanford Co., Richland, WA (United States). 5 Sep 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050212. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance/Operational Test Procedure will document the satisfactory operation of the 103-AN Camera Purge Control System and 103-AN Video Camera System

1833 (WHC-SD-WM-OTP-182) **Acceptance/operational test procedure 104-AN tank camera purge System and 104-AN video camera system.** Castleberry, J.L. Westinghouse Hanford Co., Richland, WA (United States). Aug 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050129. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance/Operational Test Procedure will document the satisfactory operation of the 104-AN Camera Purge Control System and 104-AN Video Camera System

1834 (WHC-SD-WM-OTP–183) **Acceptance/operational test procedure 105-AN tank camera purge system and 105-AN video camera system.** Castleberry, J.L. Westinghouse Hanford Co., Richland, WA (United States). Aug 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050130. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance/Operational Test Procedure will document the satisfactory operation of the 105-AN Camera Purge Control System and 105-AN Video Camera System

1835 (WHC-SD-WM-OTP–189) **Operational test procedure for SY tank farm replacement exhauster unit.** McClees, J. Westinghouse Hanford Co., Richland, WA (United States). 26 Sep 1995. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050131. Source: OSTI; NTIS; INIS; GPO Dep.

This operational test procedure will verify that the remaining functions not tested per WHC-SD-WM-ATP-080, or components disturbed during final installation, as well as interfaces with other tank farm equipment and remote monitoring stations are operating correctly.

1836 (WHC-SD-WM-OTR–158) **ATR/OTR-SY Tank Camera Purge System and in Tank Color Video Imaging System.** Werry, S.M. Westinghouse Hanford Co., Richland, WA (United States). 6 Jun 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015778. Source: OSTI; NTIS; INIS; GPO Dep.

This procedure will document the satisfactory operation of the 101-SY tank Camera Purge System (CPS) and 101-SY in tank Color Camera Video Imaging System (CCVIS). Included in the CPRS is the nitrogen purging system safety interlock which shuts down all the color video imaging system electronics within the 101-SY tank vapor space during loss of nitrogen purge pressure.

1837 (WHC-SD-WM-PLN–100) **Waste shipment engineering data management plan.** Marquez, D.L. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012836. Source: OSTI; NTIS; INIS; GPO Dep.

This plan documents current data management practices and future data management improvements for TWRS Waste Shipment Engineering.

1838 (WHC-SD-WM-QAPP–009-Rev.2) **242-A Evaporator quality assurance plan. Revision 2.** Basra, T.S. Westinghouse Hanford Co., Richland, WA (United States). 4 May 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012575. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this quality assurance project plan (Plan) is to provide requirements for activities pertaining to sampling, shipping, and analyses associated with candidate feed tank samples for the 242-A Evaporator project. The purpose of the 242-A Evaporator project is to reduce the volume of aqueous waste in the Double Shell Tank (DST) System and will result in considerable savings to the disposal of mixed waste. The 242-A Evaporator feed stream originates from DSTs identified as candidate feed tanks. The 242-A Evaporator reduces the volume of aqueous waste contained in DSTs by boiling off water and sending the condensate (called process condensate) to the Liquid Effluent Retention Facility (LEPF) storage basin where it is stored prior to treatment in the Effluent Treatment Facility (ETF). The objective of this quality assurance project plan is to provide the planning, implementation, and assessment of sample collection and analysis, data issuance, and validation activities for the candidate feed tanks.

1839 (WHC-SD-WM-RPT–110) **Vapor and gas sampling of single-shell tank 241-C-108 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 25 Sep 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050132. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the August 5, 1994, sampling of SST 241-C-108 using the vapor sampling system.

1840 (WHC-SD-WM-RPT–111) **Vapor and gas sampling of single-shell tank 241-C-109 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 20 Sep 1995. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050133. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data from the August 10, 1994, sampling of SST 241-C-109 using the vapor sampling system.

1841 (WHC-SD-WM-RPT–112) **Vapor and gas sampling of single-shell tank 241-C-112 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 15 Sep 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050134. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the August 11, 1994, sampling of SST 241-C-112 using the vapor sampling system.

1842 (WHC-SD-WM-RPT–113) **Vapor and gas sampling of single-shell tank 241-BX-104 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 25 Sep 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050136. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the December 30, 1994, sampling of SST 241-BX-104 using the vapor sampling system.

1843 (WHC-SD-WM-RPT–114) **Vapor and gas sampling of single-shell tank 241-TX-118 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 15 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050138. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the December 16, 1994, sampling of SST 241-TX-118 using the vapor sampling system.

1844 (WHC-SD-WM-RPT–115) **Vapor and Gas Sampling of Single-Shell Tank 241-TX-105 Using the Vapor Sampling System.** Caprio, G.S. Westinghouse Hanford

Co., Richland, WA (United States). 20 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050139. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the December 20, 1994, sampling of SST 241-TX-105 using the vapor sampling system.

1845 (WHC-SD-WM-RPT–119) **Vapor and gas sampling of single-shell tank 241-C-111 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050142. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the September 21, 1995, sampling of SST 241-C-111 using the vapor sampling system.

1846 (WHC-SD-WM-RPT–120) **Vapor and gas sampling of single-shell tank 241-BY-107 using the Vapor Sampling System.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 15 Sep 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050144. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the October 26, 1994, sampling of SST 241-BY-107 using the Vapor Sampling System.

1847 (WHC-SD-WM-RPT–121) **Vapor and gas sampling of single-shell tank 241-BY-108 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 25 Sep 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050146. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the October 27, 1994, sampling of SST 241-BY-108 using the vapor sampling system.

1848 (WHC-SD-WM-RPT–122) **Vapor and gas sampling of single-shell tank 241-BY-103 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 25 Sep 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050147. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the November 1, 1994, sampling of SST 241-BY-103 using the vapor sampling system.

1849 (WHC-SD-WM-RPT–123) **Vapor and gas sampling of single-shell tank 241-BY-110 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 19 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050148. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the November 11, 1994, sampling of SST 241-BY-110 using the vapor sampling system.

1850 (WHC-SD-WM-RPT–124) **Vapor and gas sampling of single-shell tank 241-BY-111 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 7 Sep 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050150. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the November 16, 1994, sampling of SST 241-BY-111 Using the Vapor Sampling System.

1851 (WHC-SD-WM-RPT–125) **Vapor and gas sampling of single-shell tank 241-BY-112 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 20 Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050152. Westinghouse Hanford Co., Richland, WA (United States). 15 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050157. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the February 8, 1995, sampling of SST 241-B-103 using the vapor sampling system.

1855 (WHC-SD-WM-RPT–142) **Vapor and gas sampling of single-shell tank 241-S-102 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 7 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050159. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the March 14, 1995, sampling of SST 241-S-102 Using the Vapor Sampling System.

1856 (WHC-SD-WM-RPT–143) **Vapor and gas sampling of single-shell tank 241-S-111 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 15 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050161. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the March 21, 1995, sampling of SST 241-S-111 using the vapor sampling system.

1857 (WHC-SD-WM-RPT–144) **Vapor and gas sampling of single-shell tank 241-SX-103 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 22 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050163. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the March 23, 1995, sampling of SST 241-SX-103 using the vapor sampling system.

1858 (WHC-SD-WM-RPT–145) **Vapor and gas sampling of single-shell tank 241-SX-106 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 20 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050165. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the March 24, 1995, sampling of SST 241-SX-106 using the vapor sampling system.

1859 (WHC-SD-WM-RPT–146) **Vapor and gas sampling of single-shell tank 241-TY-101 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 20 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050167. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data from the April 6, 1995, sampling of SST 241-TY-101 using the vapor sampling system.

1860 (WHC-SD-WM-RPT–147) **Vapor and gas sampling of single-shell tank 241-TY-103 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). 20 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050169. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data from the April 11, 1995, sampling of SST 241-TY-103 using the vapor sampling system.

1861 (WHC-SD-WM-RPT–152) **Vapor and gas sampling of Single-Shell Tank 241-U-107 using the Vapor Sampling System.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050175. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the February 17, 1995, sampling of SST 241-U-107 using the Vapor Sampling System.

1862 (WHC-SD-WM-RPT–153) **Vapor and gas sampling of Single-Shell Tank 241-U-111 using the vapor sampling system.** Caprio, G.S. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050177. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents sampling data resulting from the February 28, 1995, sampling of SST 241-U-111 using the vapor sampling system.

1863 (WHC-SD-WM-RPT–190) **Tank waste remediation system heat stress control program report, 1995.** Carls, D.R. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1995. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050180. Source: OSTI; NTIS; INIS; GPO Dep.

Protecting employees from heat stress within tank farms during the summer months is challenging. Work constraints typically experienced in tank farms complicate the measures taken to protect employees from heat stress. TWRS-Industrial Hygiene (IH) has endeavored to control heat stress injuries by anticipating, recognizing, evaluating and controlling the factors which lead or contribute to heat stress in Tank Farms. The TWRS Heat Stress Control Program covers such areas as: employee and PIC training, communication of daily heat stress alerts to tank farm personnel, setting work/rest regimens, and the use of engineering and personal protective controls when applicable. The program has increased worker awareness of heat stress and prevention, established provisions for worker rest periods, increased drinking water availability to help ensure worker hydration, and allowed for the increased use of other protective controls to combat heat stress. The TWRS Heat Stress Control Program is the cornerstone for controlling heat stress among tank farm employees. The program has made great strides since it's inception during the summer of 1994. Some improvements can still be made to enhance the program for the summer of 1996, such as: (1) procurement and use of personal heat stress monitoring equipment to ensure appropriate application of administrative controls, (2) decrease the need for use of containment tents and anti-contamination clothing, and (3) providing a wider variety of engineering and personal protective controls for heat stress prevention

1864 (WHC-SD-WM-RPT–191) **Summary of FY-95 NIR moisture measurement development and implementation activities.** Reich, F.R.; Rebagay, T.V.; Dodd, D.A.; Lopez, T.; Watts, J.K. Westinghouse Hanford Co., Richland, WA (United States). 29 Sep 1995. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050181. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the work completed in FY-95 in preparing an NIR moisture probe for early hot cell deployment. This work was completed by a team from WHC's Process Analytical Labs and Tank Technology Projects organizations and was funded by EM-50 office of Technology Development and EM-30's Tank Waste Remediation Systems Programs.

1865 (WHC-SD-WM-SARR–031-Rev.1) **Safety analysis for push-mode and rotary-mode core sampling. Rev. 1.** Milliken, N.J.; Geschke, G.R. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015587. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the basis for core sampling operations that will be performed in hazardous and radioactive waste tanks at the Hanford site. The document covers both push- and rotary-mode core sampling. Hazards are identified and evaluated, consequences are calculated, and controls to mitigate or prevent accidents are developed.

1866 (WHC-SD-WM-SARR–032) **Accelerated safety analyses structural analyses Phase 2 ACI code evaluations of the maximum loads in the concrete dome, haunch & upper wall of double-shell waste storage tanks.** Scott, M.A. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 1314p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Source: OSTI.

Structural analysis of the double-shell tanks utilizing the Accelerated Safety Analysis-Phase 1 (WHC-SD-WM-DA-150) models was completed to verify the current double-shell tank analysis of record (WHC-SD-WM-ANAL-33, 34 and 35) for the maximum load combination. The stresses resulting from the maximum load combination determined from the Phase I sensitivity studies were compared to the stresses in the analysis of record and to the tanks' structural capacity. The maximum load combinations for the DSTs were comparable to those in the analysis of record and will not exceed American Concrete Institute Code allowable limits in the dome, haunch and upper wall for normal loading. The normal loading includes the soil overburden, uniform and concentrated live loads and elevated temperatures as limited by the Interim Operational Safety Requirements for standard and aging waste double-shell tanks. The generic accelerated safety analysis double shell tank model was used to evaluate the maximum loading determined from the Phase I load sensitivity study. The evaluation, as requested, concentrated on the structural capacity of the upper portions of the double-shell tank secondary concrete structure, which resists the overburden loads.

1867 (WHC-SD-WM-SD–020) **Tank Waste Remediation System High-Level Waste Melter Vitrification System Development and Testing Strategy.** Calmus, R.B. Westinghouse Hanford Co., Richland, WA (United States). 16 Feb 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008786. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the general strategy for developing and testing the performance of candidate high-level waste melter systems and establishing the basis for selecting the preferred melter system for the high-level waste vitrification plant.

1868 (WHC-SD-WM-SDP–010) **Software Development Plan for the 241-AY and 241-AZ Tank Farm MICON automation system.** Teats, M.C. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012796. Source: OSTI; NTIS; INIS; GPO Dep.

Project W-030 will install a new tank ventilation system for the aging 241-AY and 241-AZ tank farm facilities. Controls for this system will be provided by a MICON distributed control system. This document defines the plan, deliverables, and schedule to develop software for the control system.

1869 (WHC-SD-WM-SDS–005) **System design specification for rotary mode core sample trucks No. 2, 3, and 4 programmable logic controller.** Dowell, J.L.; Akers, J.C. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050183. Source: OSTI; NTIS; INIS; GPO Dep.

The system this document describes controls several functions of the Core Sample Truck(s) used to obtain nuclear waste samples from various underground storage tanks at Hanford. The system will monitor the sampling process and provide alarms and other feedback to insure the sampling process is performed within the prescribed operating envelope. The intended audience for this document is anyone associated with rotary or push mode core sampling. This document describes the Alarm and Control logic installed on Rotary Mode Core Sample Trucks (RMCST) #2, 3, and 4. It is intended to define the particular requirements of the RMCST alarm and control operation (not defined elsewhere) sufficiently for detailed design to implement on a Programmable Logic Controller (PLC).

1870 (WHC-SD-WM-SP–004-Rev.1) **Tank safety screening data quality objective. Revision 1.** Hunt, J.W. Westinghouse Hanford Co., Richland, WA (United States). 27 Apr 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011669. Source: OSTI; NTIS; INIS; GPO Dep.

The Tank Safety Screening Data Quality Objective (DQO) will be used to classify 149 single shell tanks and 28 double shell tanks containing high-level radioactive waste into safety categories for safety issues dealing with the presence of ferrocyanide, organics, flammable gases, and criticality. Decision rules used to classify a tank as "safe" or "not safe" are presented. Primary and secondary decision variables used for safety status classification are discussed. The number and type of samples required are presented. A tabular identification of each analyte to be measured to support the safety classification, the analytical method to be used, the type of sample, the decision threshold for each analyte that would, if violated, place the tank on the safety issue watch list, and the assumed (desired) analytical uncertainty are provided. This is a living document that should be evaluated for updates on a semiannual basis. Evaluation areas consist of: identification of tanks that have been added or deleted from the specific safety issue watch lists, changes in primary and secondary decision variables, changes in decision rules used for the safety status classification, and changes in analytical requirements. This document directly supports all safety issue specific DQOs and additional characterization DQO efforts associated with pretreatment and retrieval. Additionally, information obtained during implementation can assist in resolving assumptions for revised safety strategies, and in addition, obtaining information which will support the determination of error tolerances, confidence levels, and optimization schemes for later revised safety strategy documentation.

1871 (WHC-SD-WM-SP–006-Rev.1) **Testing and development strategy for the tank waste remediation system.** Reddick, G.W. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012829. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a strategy for performing radioactive (hot) and nonradioactive testing to support processing tank waste. It evaluates the need for hot pilot plant(s) to support pretreatment and other processing functions and presents a strategy for performing hot test work. A strategy also is provided for nonradioactive process and equipment testing. The testing strategy supports design, construction, startup, and operation of Tank Waste Remediation System (TWRS) facilities.

1872 (WHC-SD-WM-SP–009) **Evaluation of alternative chemical additives for high-level waste vitrification**

feed preparation processing. Seymour, R.G. Westinghouse Hanford Co., Richland, WA (United States). 7 Jun 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015818. Source: OSTI; NTIS; INIS; GPO Dep.

During the development of the feed processing flowsheet for the Defense Waste Processing Facility (DWPF) at the Savannah River Site (SRS), research had shown that use of formic acid (HCOOH) could accomplish several processing objectives with one chemical addition. These objectives included the decomposition of tetraphenylborate, chemical reduction of mercury, production of acceptable rheological properties in the feed slurry, and controlling the oxidation state of the glass melt pool. However, the DEPF research had not shown that some vitrification slurry feeds had a tendency to evolve hydrogen (H_2) and ammonia (NH_3) as the result of catalytic decomposition of CHOOH with noble metals (rhodium, ruthenium, palladium) in the feed. Testing conducted at Pacific Northwest Laboratory and later at the Savannah River Technical Center showed that the H_2 and NH_3 could evolve at appreciable rates and quantities. The explosive nature of H_2 and NH_3 (as ammonium nitrate) warranted significant mitigation control and redesign of both facilities. At the time the explosive gas evolution was discovered, the DWPF was already under construction and an immediate hardware fix in tandem with flowsheet changes was necessary. However, the Hanford Waste Vitrification Plant (HWVP) was in the design phase and could afford to take time to investigate flowsheet manipulations that could solve the problem, rather than a hardware fix. Thus, the HWVP began to investigate alternatives to using HCOOH in the vitrification process. This document describes the selection, evaluation criteria, and strategy used to evaluate the performance of the alternative chemical additives to CHOOH. The status of the evaluation is also discussed.

1873 (WHC-SD-WM-TA–162) **Double-Shell Tank Retrieval Allowable Heel Trade Analysis.** Grams, W.H. Westinghouse Hanford Co., Richland, WA (United States). 27 Sep 1995. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050185. Source: OSTI; NTIS; INIS; GPO Dep.

This Double-Shell Tank Retrieval Allowable Heel Trade Analysis evaluates the effects a remaining heel has on subsequent waste storage requirements after initial retrieval. The information contained in this analysis will be used as a basis to identify crucial double-shell tank (DST) retrieval system design and performance requirements for continued storage of waste in DSTs. The information presented in this analysis is summarized by the DST initial retrieval and reuse strategy. The strategy is based on the waste compatibility and consolidation requirements that are governed by the remaining heel after initial retrieval

1874 (WHC-SD-WM-TI–640) **Double shell tanks plutonium inventory assessment.** Tusler, L.A. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014319. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides an evaluation that establishes plutonium inventory estimates for all DSTs based on known tank history information, the DST plutonium inventory tracking system, tank characterization measurements, tank transfer records, and estimated average concentration values for the various types of waste. These estimates use data through December 31, 1994, and give plutonium estimates as of January 1, 1995. The plutonium inventory values for the DSTs are given in Section 31. The plutonium inventory estimate is 224 kg for the DSTs and 854 kg for the SSTs for a total of 1078 kg. This value compares favorably with the total plutonium inventory value of 981 kg obtained from the total plutonium production minus plutonium recovery analysis estimates.

1875 (WHC-SD-WM-TI–684) **Waste characterization of the 101-SY hydrogen mitigation mixing pump shipping container.** Gedeon, S.R. Westinghouse Hanford Co., Richland, WA (United States). 19 May 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013347. Source: OSTI; NTIS; INIS; GPO Dep.

The Hydrogen Mitigation Mixing Pump (HMMP) in Tank 241-SY-101 will need to be removed at some point. At that time, the HMMP will be placed in a shipping container and transferred to a designated onsite location depending on waste classification. This report shows how the radioactive material content of shipping container will be determined. Once the radioactive material loading is known, the waste classification of the container may be determined in accordance with established procedures.

1876 (WHC-SD-WM-TI–690) **Waste volume reduction factors for potential 242-A evaporator feed.** Sederburg, J.P. Westinghouse Hanford Co., Richland, WA (United States). 4 May 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012790. Source: OSTI; NTIS; INIS; GPO Dep.

Double-shell tank (DST) storage space requirements have been shown to be highly dependent on the end point of 242-A operations. Consequences to the DST of various waste volumes, and concentrations, are evaluated. Only waste streams that are currently planned to be stored in the DST system before the year 2004 are discussed. As of January 1, 1995, approximately 27-million L (7.2-million gal) of dilute wastes are stored in the DSTs available for evaporator processing. Waste streams planned to be transferred to the DSTs before December 31, 2004, are identified. The DST volume for storing slurry from these wastes is presented in this document. At a final slurry specific gravity of -1.35, 22.5-million L (5.93-million gal) of DST space would be needed on December 31, 2004, to store the product from evaporator processing of these feedstocks. The expected volume needed if the resultant slurry were concentrated to the traditional double-shell slurry feed (DSSF) phase boundary (a specific gravity of ~1.5) would be 17.7-million L (4.67-million gal). An additional 4.8-million L (1.26-million gal) is therefore needed if these wastes are concentrated to a specific gravity of 1.35 instead of the DSSF limit.

1877 (WHC-SD-WM-TI–691) **Strategy for resolution of the Flammable Gas Safety Issue.** Johnson, G.D. Westinghouse Hanford Co., Richland, WA (United States). 25 Apr 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011507. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to provide the general strategy for resolution of the flammable gas safety issue; it is not a detailed description of program activities. budgets and schedules. Details of the program activities have been issued (Johnson and Sherwood, 1994) and the information pertaining to budgets is provided in the FY 1995-1997 Multi-Year Work Plan for Tank Waste Remediation System

(TWRS) (Program Element 1.1.1.2.02.). The key element in this strategy is to provide an understanding of the behavior of each of the Flammable Gas Watch List tanks. While a review of historical information does provide some insight, it is necessary to gather current information about the gases, behavior and nature of the waste,. and about the control systems that maintain and monitor the waste. Analysis of this information will enable TWRS to determine the best approach to place any tank in a safe condition, if it is found to be in an unsafe state.

1878 (WHC-SD-WM-TI–696) **296-B-10 stack monitoring and sampling system annual system assessment report.** Ridge, T.M. Westinghouse Hanford Co., Richland, WA (United States). 26 Apr 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011665. Source: OSTI; NTIS; INIS; GPO Dep.

B Plant Administration Manual, requires an annual system assessment to evaluate and report the present condition of the sampling and monitoring system associated with stack 296-B-10 at B Plant. The ventilation system of WESF (Waste Encapsulation and Storage Facility) is designed to provide airflow patterns so that air movement throughout the building is from areas of lesser radioactivity to areas of greater radioactivity. All potentially contaminated areas are maintained at a negative pressure with respect to the atmosphere so that air flows into the building at all times. The exhaust discharging through the 296-B-10 stack is continuously monitored and sampled using a sampling and monitoring probe assembly located approximately 17.4 meters (57 feet) above the base of the stack. The probe assembly consists of 5 nozzles for the sampling probe and 2 nozzles to monitor the flow. The sampling and monitoring system associated with Stack 296-B-10 is functional and performing satisfactorily.

1879 (WHC-SD-WM-TI–702) **Chloride removal from vitrification offgas.** Slaathaug, E.J. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Fluor Daniel, Inc., Irvine, CA (United States). 1 Jun 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015585. Source: OSTI; NTIS; INIS; GPO Dep.

This study identified and investigated techniques of selectively purging chlorides from the low-level waste (LLW) vitrification process with the purge stream acceptable for burial on the Hanford Site. Chlorides will be present in high concentration in several individual feeds to the LLW Vitrification Plant. The chlorides are highly volatile in combustion type melters and are readily absorbed by wet scrubbing of the melter offgas. The Tank Waste Remediation System (TWRS) process flow sheets show that the resulting chloride rich scrub solution is recycled back to the melter. The chlorides must be purged from the recycle loop to prevent the buildup of excessively high chloride concentrations.

1880 (WHC-SD-WM-TI–705) **Solid waste handling.** Parazin, R.J. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014305. Source: OSTI; NTIS; INIS; GPO Dep.

This study presents estimates of the solid radioactive waste quantities that will be generated in the Separations, Low-Level Waste Vitrification and High-Level Waste Vitrification facilities, collectively called the Tank Waste Remediation System Treatment Complex, over the life of these facilities. This study then considers previous estimates from other 200 Area generators and compares alternative methods of handling (segregation, packaging, assaying, shipping, etc.).

1881 (WHC-SD-WM-TI–706) **Remote connector development study.** Parazin, R.J. Fluor Daniel, Inc., Irvine, CA (United States). May 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014317. Source: OSTI; NTIS; INIS; GPO Dep.

Plutonium-uranium extraction (PUREX) connectors, the most common connectors used at the Hanford site, offer a certain level of flexibility in pipe routing, process system configuration, and remote equipment/instrument replacement. However, these desirable features have inherent shortcomings like leakage, high pressure drop through the right angle bends, and a limited range of available pipe diameters that can be connect by them. Costs for construction, maintenance, and operation of PUREX connectors seem to be very high. The PUREX connector designs include a 90° bend in each connector. This increases the pressure drop and erosion effects. Thus, each jumper requires at least two 90° bends. PUREX connectors have not been practically used beyond 100 (4 in.) inner diameter. This study represents the results of a survey on the use of remote pipe-connection systems in US and foreign plants. This study also describes the interdependence between connectors, remote handling equipment, and the necessary skills of the operators.

1882 (WHC-SD-WM-TI–711) **Remediation and cleanout levels for Hanford site single-shell tanks.** Boothe, G.F. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050188. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement) (Ecology et al. 1994), requires the retrieval of 99 percent of the Hanford Site single-shell tank (SST) waste. Retrieval of the waste requires the completion of saltwell pumping and then the sluicing of all 149 tanks, at a cost of over $3 billion. The retrieved waste is to be processed and vitrified for ultimate disposal as glass. This document shows that the intent of the Tri-Party Agreement can be met by sluicing the waste from only 86 tanks, after the completion of saltwell pumping. This partial retrieval option will result in a cost savings of over $600 million in construction and operation alone, and will significantly reduce the volume of glass requiring disposal

1883 (WHC-SD-WM-TI–713) **Development of in-structure design spectra for dome mounted equipment on underground waste storage tanks at the Hanford Site.** Julyk, L.J. (ICF Kaiser Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050214. Source: OSTI; NTIS; INIS; GPO Dep.

In-structure response spectra for dome mounted equipment on underground waste storage tanks at the Hanford Site are developed on the basis of recent soil-structure-interaction analyses. Recommended design spectra are provided for various locations on the tank dome.

1884 (WHC-SD-WM-TI–719) **Preliminary engineering evaluation of heat and digest treatment for in-tank removal of radionuclides from complexed waste.** Klem, M.J. Westinghouse Hanford Co., Richland, WA (United States). 29 Sep 1995. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050215. Source: OSTI; NTIS; INIS; GPO Dep.

This report uses laboratory data from low temperature-ambient pressure digestion of actual complexed supernatant to evaluate digestion as a pretreatment method for waste in double-shell tanks 241-AN-102, 241-AN-107 and 241-AY-101. Digestion time requirements were developed at 100 degrees celsius to remove organic and meet NRC Class C criterion for TRU elements and NRC Class B criterion for 90Sr. The incidental waste ruling will establish the need for removal of 90Sr. Digestion pretreatment precipitates non radioactive metal ions and produces additional high-level waste solids and canisters of high level glass. This report estimates the amount of additional high-level waste produced and preliminary capital and operating costs for in-tank digestion of waste. An overview of alternative in-tank treatment methods is included

1885 (WHC-SD-WM-TP–325) **Tank 241-SX-115 tank characterization plan.** Sasaki, L.M. Westinghouse Hanford Co., Richland, WA (United States). 24 Apr 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012835. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Project, Sampling Operations, and WHC 222-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples for tank 241-SX-115.

1886 (WHC-SD-WM-TP–328) **Test plan for phase II of the Retained Gas Sampler system.** Hey, B.E. Westinghouse Hanford Co., Richland, WA (United States). 19 Jun 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015742. Source: OSTI; NTIS; INIS; GPO Dep.

The Retained Gas Sampler (RGS) system is being developed to permit characterization of the gas phase component of waste tank core samples. Several laboratory experiments have been conducted which have affirmed the proof-of-principle for separating the gas phase materials from waste tank material in a quantitative manner. However, experiments conducted thus far have dealt only with representative materials and simulated hardware mock-ups. This test plan deals with the operation and testing of actual devices in the hot cell environment. This test plan coves all aspects of the RGS system including: sampler load-in, extrusion, gas extraction, quantitative separation, sample collection, and quantitative analysis. Sample material used in this test plan will be waste tank simulants and will not be radioactive. The work environment, however, will be an operating hot cell facility and will have radioactive contaminated surfaces. Operation of the system will therefore require an official radiation work permit (RWP).

1887 (WHC-SD-WM-TP–339) **Tank 241-BX-103 tank characterization plan.** Bell, K.E. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 21 Apr 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011505. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, and WHC 222-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples for tank 241-BX-103.

1888 (WHC-SD-WM-TP–348) **Tank 241-S-107 tank characterization plan.** Jo, J. Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 6 Apr 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008950. Source: OSTI; NTIS; INIS; GPO Dep.

The Defense Nuclear Facilities Safety Board (DNFSB) has advised the Department of Energy (DOE) to concentrate the near-term sampling and analysis activities on identification and resolution of safety issues (Conway 1993). The data quality objective (DQO) process was chosen as a tool to be used to identify the sampling and analytical needs for the resolution of safety issues. As a result, a revision in the Federal Facility Agreement and Consent Order (Tri-Party Agreement) milestone M-44 has been made, which states that "A Tank Characterization Plan (TCP) will also be developed for each double-shell tank (DST) and single-shell tank (SST) using the DQO process". This document satisfies that requirement for tank 241-S-107 (S-107) sampling activities. The report gives a summary of descriptive information available on Tank S-107. Included are the present status and physical description of the tank, its age, process history, and expected tank contents from previous sampling and analytical data. The different types of waste, by layer, for Tank S-107 will also be discussed. As of December 1994, Tank S-107 has been categorized as sound and was partially isolated in December 1982. It is a low-heat load tank and is awaiting stabilization. Tank S-107 is expected to contain two primary layers of waste. The bottom layer should contain a mixture of REDOX waste and REDOX cladding waste. The second layer contains S1 saltcake (waste generated from the 242-S evaporator/crystallizer from 1973 until 1976), and S2 salt slurry (waste generated from the 242-S evaporator-crystallizer from 1977 until 1980).

1889 (WHC-SD-WM-TP–350) **Tank 241-B-101 tank characterization plan.** Schreiber, R.D. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 28 Apr 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011668. Source: OSTI; NTIS; INIS; GPO Dep.

The Defense Nuclear Facilities Safety Board (DNFSB) has advised the US Department of Energy (DOE) to concentrate the near-term sampling and analysis activities on identification and resolution of safety issues (Conway 1993). The data quality objective (DQO) process was chosen as a tool to be used to identify the sampling and analytical needs for the resolution of safety issues. As a result, a revision in the Federal Facility Agreement and Consent Order (Tri-Party Agreement or TPA) milestone M-44 has been made, which states that "A Tank Characterization Plan (TCP) will be developed for each double-shell tank (DST) and single-shell tank (SST) using the DQO process". This document satisfies that requirement for tank 241-B-101 (B-101) sampling activities. Tank B-101 is identified as a low-heat load non-Watch List tank, and is classified as an assumed leaker. The tank is passively ventilated, interim stabilized, and intrusion prevention measures have been completed. As of January 31, 1995, approximately 428,000 liters of non-complexed waste was contained in the tank. Tank B-101 is expected to have two primary layers. A layer of saltcake waste generated from the 242-B evaporator, followed by a top layer of sludge composed of B-Plant high-level, B-Plant low-level, and unknown waste.

1890 (WHC-SD-WM-TP-353) **Tank 241-B-106 Tank Characterization Plan.** Conner, J.M. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 15 Jun 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015780. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the tank characterization plan for waste tank 241-B-106. Topics discussed include: data quality objectives, historical information and tank status.

1891 (WHC-SD-WM-TP-354) **Tank 241-B-203 tank characterization plan.** Jo, J. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 16 May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013366. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the tank characterization plan for waste tank 241-B-203. Topics discussed include: data quality objectives, historical information, and tank status.

1892 (WHC-SD-WM-TP-357) **Test plan for auger sampler improvements.** Francis, P.M. Westinghouse Hanford Co., Richland, WA (United States). 27 Apr 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011510. Source: OSTI; NTIS; INIS; GPO Dep.

At Westinghouse Hanford Company (WHC), one of the functions of the Tank Waste Remediation System (TWRS) division is sampling waste tanks to characterize their contents. The recovery performance of the auger sampler has proven inadequate in certain materials. The current auger configuration relies on cohesion and adhesion (properties dependent on sample media) to retain the sample. The media must maintain its form and stick to the auger flights to recover the sample. Recovery has been satisfactory when sampling in wastes with adequate adhesion and shear strength to overcome the forces of gravity and vibrations associated with retrieval. Multiple variations to the auger design will be tested to determine their ability to increase sample recovery and broaden the sampling capabilities. The designs will be tested in two different media, with the recoveries compared to that of a standard auger sampler. Each design modification will be developed and tested using the method described in this test plan.

1893 (WHC-SD-WM-TP-358) **Tank 241-A-102 tank characterization plan.** Jo, J. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 16 May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013368. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the tank characterization plan for waste tank 241-A-102. Topic discussed include: data quality objectives for sampling, safety screening, tank configuration, historical information, and tank status.

1894 (WHC-SD-WM-TRP-224) **Ignitability testing for core drilling system. Final report.** Cashdollar, K.L. (Bureau of Mines, Pittsburgh, PA (United States). Pittsburgh Research Center); Furno, A.; Green, G.M.; Thomas, R.A.; Witwer, K.S. Westinghouse Hanford Co., Richland, WA (United States); Bureau of Mines, Pittsburgh, PA (United States). Pittsburgh Research Center. 15 Jun 1995. 207p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016332. Source: OSTI; NTIS; INIS; GPO Dep.

As part of a study of the hazards of the inspection of nuclear waste material stored at the Hanford, WA site, the Department of Energy (DOE) and Westinghouse Hanford Company (WHC) have developed a core drilling system to sample the material in large waste storage tanks. In support of this work, the US Bureau of Mines has studied the probability of ignition while core drilling into simulated salt cake that was permeated with a flammable gas mixture. No ignitions were observed while core drilling into the saltcake with or without a purge gas and no ignitions were observed while drilling into a steel plate.

1895 (WHC-SD-WM-TSAP-002) **Tank 241-B-106 push mode core sampling and analysis plan.** Conner, J.M. Westinghouse Hanford Co., Richland, WA (United States). 15 Jun 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015792. Source: OSTI; NTIS; INIS; GPO Dep.

This sampling and analysis plan identifies characterization objectives pertaining to sample collection, laboratory analytical evaluation, and reporting requirements in accordance with the Tank Safety Screening Data Quality Objective. This quality objective is part of the tank characterization plan for tank 241-B-106. This report also identifies procedures and requirements for collecting and characterizing samples form tank 241-B-106 by the push mode core sampling method.

1896 (WHC-SD-WM-TSAP-003) **Tank 241-B-203 Push Mode Core Sampling and Analysis Plan.** Jo, J. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 16 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013361. Source: OSTI; NTIS; INIS; GPO Dep.

This Sampling and Analysis Plan (SAP) will identify characterization objectives pertaining to sample collection, laboratory analytical evaluation, and reporting requirements in accordance with the Tank Safety Screening Data Quality Objective (Babad and Redus 1994). This Data Quality Objective (DQO) is described in the Tank Characterization Plan (Jo, 1995) for tank 241-B-203 (B-203). This SAP will also identify procedures and requirements for collecting and characterizing samples from tank B-203 by the core sampling method.

1897 (WHC-SD-WM-TSAP-004) **Tank 241-A-102 auger sampling and analysis plan.** Jo, J. Westinghouse Hanford Co., Richland, WA (United States). 16 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013367. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-A-102. The drivers and objectives of the auger sampling and analysis plan were in accordance with procedures that were presented in other reports.

1898 (WHC-SD-WM-TSAP–007) **Tank 241-SX-108 auger sampling and analysis plan.** Eggers, R.F. Westinghouse Hanford Co., Richland, WA (United States). 14 Sep 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050193. Source: OSTI; NTIS; INIS; GPO Dep.

This document outlines the plan for sampling and analysis of tank 241-SX-108.

1899 (WHC-SD-WM-TSAP–037-Rev.1) **Compatibility Grab Sampling and Analysis Plan.** Jones, J.M. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050194. Source: OSTI; NTIS; INIS; GPO Dep.

This document details the plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, and WHC 222-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples for waste compatibility purposes.

1900 (WHC-SD-WM-TSAP–040) **Tank 241-BY-104 rotary core sampling and analysis plan.** Benar, C.J. Westinghouse Hanford Co., Richland, WA (United States). 14 Sep 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050195. Source: OSTI; NTIS; INIS; GPO Dep.

This document summarizes the plan for sampling and analysis of tank 241-BY-104

1901 (WHC-SD-WM-WP–299) **Work plan for the identification of techniques for in-situ sensing of layering/interfaces of Hanford high level waste tanks.** Vargo, G.F. Jr. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010926. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan that describes the activities in a task to conduct an industry survey to determine the existence of currently available hardware and/or concepts for anticipating and/or identifying layering/interfaces within the materials contained in large tanks located on the Hanford Site in Washington State.

1902 (WHC-SD-WM-WP–299-Rev.1) **Work plan for the identification of techniques for in-situ sensing of layering/interfaces of Hanford high level waste tank.** Vargo, G.F. Jr. Westinghouse Hanford Co., Richland, WA (United States). 16 Jun 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016328. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this work scope is to identify a specific potential technology/device/instrument/ideas that would provide the tank waste data. A method is needed for identifying layering and physical state within the large waste tanks at the Hanford site in Washington State. These interfaces and state changes can adversely impact sampling and characterization activities.

1903 (WHC-SD-WM-WP–303) **Half-liter supernatant sampler system engineering work plan.** Ritter, G.A. Westinghouse Hanford Co., Richland, WA (United States). 6 Jun 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014406. Source: OSTI; NTIS; INIS; GPO Dep.

The Tank Waste Remediation System (TWRS) pretreatment facility project W-236B, known as the Initial Pretreatment Module (IPM), requires samples of supernatants and sludges from 200 Area tank farms for planned hot testing work in support of IPM design. The IPM project has proposed the development of several new sampler systems. These systems include a 0.5-l supernatant sampler, 3-l and 25-l supernatant and sludge samplers, and a 4,000-l sampler system. The 0.5-l sampler will support IPM sampling needs in the 1 to 3 l range starting in late fiscal year 1995. This sampler is intended to be used in conjunction with the existing 100 ml bottle-on-a-string. The 3-l and 25-l systems will be based on the Savannah River Site's sampler system and will support IPM sampling needs in the 3 to 100 liter range. Most of the hot testing required for design of the IPM must be accomplished in the next 3 years. This work plan defines the tasks associated with the development of a 0.5-l sampler system. This system will be referred to as the Half-Liter Supernatant Sampler System (HLSSS). Specifically, this work plan will define the scope of work, identify organizational responsibilities, identify major technical requirements, describe configuration control and verification requirements, and provide estimated costs and schedule. The sampler system will be fully operational, including trained staff and operating procedures, upon completion of this task.

1904 (WHC-SD-WM-WP–311) **Work plan for defining a standard inventory estimate for wastes stored in Hanford site underground tanks.** Kupfer, M.J. Westinghouse Hanford Co., Richland, WA (United States). 29 Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050199. Source: OSTI; NTIS; INIS; GPO Dep.

This work plan addresses the methodology for defining a tank waste database that will provide a best basis estimate of waste characteristics for each underground storage tank. The resulting database is expected to be in place in a network accessible electronic form by September 1996.

1905 (WHC-SP–0858-Rev.4) **Maintenance implementation plan for the B Plant/WESF. Revision 4.** Tritt, S.E.; Lueck, B.H. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006830. Source: OSTI; NTIS; INIS; GPO Dep.

This Maintenance Implementation Plan (MIP) has been developed for maintenance functions associated with the B Plant/WESF (Waste Encapsulation Storage Facility) complex. The objective of this plan is to provide baseline information for establishing and identifying WHC conformance programs and policies applicable to implementation of DOE order 4330.4B guidelines. In addition, this maintenance plan identifies the actions necessary to develop a cost-effective and efficient maintenance program at B Plant/WESF. The B Plant WESF facility complex consists of three main facilities and several support structures located in the 200 East Area of the Hanford site. B Plant is a transition facility that is required to ensure safe storage and management of WESF (operating facility) cesium and strontium capsules. B Plant/ WESF also contains substantial radiological inventory from previous campaigns. There are no production activities at B Plant, but several of its operating systems are required to accomplish the current B Plant/WESF mission. B Plant/WESF are each considered a nuclear facility due to the storage of cesium and strontium capsules at WESF and the large radiological inventory from past processing.

1906 (WHC-SP–1004) **Ozone destruction of Hanford Site tank waste organics.** Colby, S.A. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001784. Source: OSTI; NTIS; INIS; GPO Dep.

Ozone processing is one of several technologies being developed to meet the intent of the Secretary of the US Department of Energy, Decision on the Programmatic Approach and Near-Term Actions for Management and Disposal of Hanford Tank Waste Decision Statement, dated December 20, 1991, which emphasizes the need to resolve tank safety issues by destroying or modifying the constituents (e.g., organics) that cause safety concerns. As a result, the major tank treatment objectives on the Hanford Site are to resolve the tank safety issues regarding organic compounds (and accompanying flammable gas generation), which all potentially can react to evolve heat and gases. This report contains scoping test results of an alkaline ozone oxidation process to destroy organic compounds found in the Hanford Site's radioactive waste storage tanks.

1907 (WHC-SP–1101-Rev.1-App.A) **Tank Waste Remediation System fiscal year 1996 multi-year program plan WBS 1.1. Revision 1, Appendix A.** Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96002804. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a compilation of data relating to the Tank Waste Remediation System Multi-Year Program. Topics discussed include: management systems; waste volume, transfer and evaporation management; transition of 200 East and West areas; ferricyanide, volatile organic vapor, and flammable gas management; waste characterization; retrieval from SSTs and DSTs; heat management; interim storage; low-level and high-level radioactive waste management; and tank farm closure.

1908 (WHC-SP–1101-Rev.1-Vol.1) **Tank Waste Remediation System fiscal year 1996 multi-year program plan WBS 1.1. Revision 1, Volume 1.** Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 500p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96002803. Source: OSTI; NTIS; INIS; GPO Dep.

The 1995 Hanford Mission Plan specifically addresses the tank waste issue and clarifies the link with other initiatives, such as improving management practices and the Hanford Site Waste Minimization and Pollution Prevention Awareness Program Plan (DOE/RL-91-31). This document captures the results of decision making regarding the application of systems engineering at the Hanford Site, external involvement policy, and site end-state goals. Section 3.5 of the Hanford Mission Plan on Decisions and Directives provides an integrating discussion of the actions of the National Environmental Policy Act (NEPA), and DOE policy, guidance, and decisions associated with binding agreements such as the Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement). Two significant components of the Hanford Mission Plan 1994 planning basis are (1) the decisions regarding the disposition of onsite material inventory, and the key programs and interfaces to accomplish this; and (2) the Program Interface Issues section, which identified issues that stretch across program boundaries.

1909 (WHC-SP–1104-Rev.1) **Spent Nuclear Fuel Project FY 1996 Multi-Year Program Plan WBS No. 1.4.1, Revision 1.** Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 220p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001636. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the Spent Nuclear Fuel (SNF) Project portion of the Hanford Strategic Plan for the Hanford Reservation in Richland, Washington. The SNF Project was established to evaluate and integrate the urgent risks associated with N-reactor fuel currently stored at the Hanford site in the K Basins, and to manage the transfer and disposition of other spent nuclear fuels currently stored on the Hanford site. An evaluation of alternatives for the expedited removal of spent fuels from the K Basin area was performed. Based on this study, a Recommended Path Forward for the K Basins was developed and proposed to the U.S. DOE.

1910 (WHC-SP–1142-Rev.1) **Westinghouse Hanford Company plan for certifying newly generated contact – handled transuranic waste. Revision 1.** Lipinski, R.M.; Backlund, E.G. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96002800. Source: OSTI; NTIS; INIS; GPO Dep.

All transuranic (TRU) waste generators are required by US Department of Energy (DOE) Order 5820.2A to package their TRU waste in order to comply wit the Waste Isolation Pilot Plant (WIPP) – Waste Acceptance Criteria (WAC) or keep non-certifiable containers segregated. The Westinghouse Hanford Company (WHC) Transuranic Waste Certification Plan was developed to ensure that TRU newly generated waste at WHC meets the DOE Order 5820.2A and the WHC-WAC which includes the State of Washington Department of Ecology – Washington Administrative Code (DOE-WAC). The metho used at WHC to package TRU waste are described in sufficient detail to meet the regulations. This document is organized to provide a brief overview of waste generation operations at WHC. The methods used to implement this plan are discussed briefly along with the responsibilities and authorities of applicable organizations. This plan describes how WHC complies with all applicable regulations and requirements set forth in the latest approved revision of WHC-EP-0063-4.

1911 (WHC-SP–1155) **Maintenance implementation plan for fuel supply shutdown.** Stephenson, R.L. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016344. Source: OSTI; NTIS; INIS; GPO Dep.

This Maintenance Implementation Plan is written to satisfy the requirements of DOE Order 4330.4B, "MAINTENANCE MANAGEMENT PROGRAM", that specifies the general policy and objectives for the establishment of DOE controlled maintenance programs. These Programs provide for the management and performance of cost-effective maintenance and repair of Department of Energy (DOE) property, which includes facilities. A review of DOE Order 4330.4B, particularly Chapter II the nuclear portion, against existing WHC site programs and policies has provided assurance that most requirements of this order have already been implemented by existing WHC programs. Applicable requirements and guidelines of 4330.4B that are deficient or not implemented are presently being developed and implemented through WHC site policies and programs. Where no program is presently identified or being developed for 4330.4B requirements, responsibility for implementation has been assigned within this plan.

1912 (WHC-SP–1156) **Mid-year report: IPC liaison and chemistry of thermal reconstitution.** Delegard, C.H. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013513. Source: OSTI; NTIS; INIS; GPO Dep.

A program of investigation into the chemistry of alkaline Hanford Site tank waste is being conducted. The investigations have two main subtasks: liaison with the Institute of Physical Chemistry of the Russian Academy of Sciences and further laboratory testing of the chemistry of thermal reconstitution of Hanford Site tank waste. Progress to date includes: (1) a technical dialogue has been established with the Institute scientists; (2) editing of a technical literature review on the chemistry of the transuranic elements and technetium in alkaline media written by researchers at the Institute is complete; (3) four tasks from the Institute have been selected for support by the US Department of Energy; (4) technical information has been supplied to the Institute describing the composition of Hanford Site tank waste; (5) tests, using genuine waste from tank 104-S (a REDOX Process sludge), comparing the performance of thermal reconstitution with enhanced sludge washing show markedly improved dissolution of aluminum achieved by the thermal treatment; (6) a reduction/coprecipitation method was tested and shown to remove plutonium, solubilized by thermal treatment, rapidly and efficiently from solution; (7) technical chemistry support was provided to calciner kinetics tests at the University of Idaho; (8) tests to determine the speciation of plutonium and neptunium solubilized by thermal treatment show dissolved Pu(V) and Np(V) hydroxide complexes are produced, a Np(V) peroxide complex also was identified; (9) recently published data on Pu(IV) carbonate complexation in moderately alkaline (pH 12 to 13) solution led to reexamination of previous investigations of plutonium complexation in highly alkaline (3 to 5 molar NaOH) solutions.

1913 (WHC-SP–1177) **Westinghouse Hanford Company FY 1996 Materials Management Plan (MMP).** Higginson, M.C. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006822. Source: OSTI; NTIS; INIS; GPO Dep.

The safe and sound operation of facilities and the storage of nuclear material are top priorities within Hanford's environmental management, site restoration mission. The assumptions, plans and Special Nuclear Material (SNM) inventory summaries contained in this document were prepared for Department of Energy (DOE) use for interim and long- range planning. In accordance with Richland DOE field office (DOE-RL) direction, year-end inventory values were not projected over an 11 year period, as historically done in previous MMP documents. This decision was made since significant SNM movements to or from Hanford are not projected in the foreseeable future. Instead, the inventory summaries within this document reflect an "as of date" of June 30, 1995.

1914 (WHC-SP–1179) **Maintenance optimization plan for essential equipment reliability.** Steffen, D.H. Westinghouse Hanford Co., Richland, WA (United States). Feb 1996. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006836. Source: OSTI; NTIS; INIS; GPO Dep.

The Maintenance Optimization Plan (MOP) for Essential Equipment Reliability will furnish Tank Waste Remediation System (TWRS) management with a pro-active, forward-thinking process for maintaining essential structures, systems, and components (ESSC) at the Hanford Site tank farms in their designed condition, and to ensure optimum ESSC availability and reliability.

1915 (WSRC-MS–95-0294) **The effect of compositional parameters on the TCLP and PCT durability of environmental glasses.** Resce, J.L. (Clemson Univ., Clemson, SC (United States). Dept. of Environmental Systems Engineering); Overcamp, T.J.; Cicero, C.A.; Bickford, D.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9509266–1: Industrial and environmental chemistry special symposium, Atlanta, GA (United States), 17-20 Sep 1995). Order Number DE96003084. Source: OSTI; NTIS; INIS; GPO Dep.

The relationship between glass composition and the chemical durability of environmental waste glass is very important for both the development of glass formulations and the prediction of glass durability for process control. The development of such a model is extremely difficult for several reasons. Firstly, chemical durability is dependent upon the type of leach test employed; the leach tests themselves being only crude approximations of actual environmental conditions or long term behavior. Secondly, devitrification or crystallinity can also play a major role in durability, but is much more difficult to quantify. Lastly, the development of any one model for all glass types is impractical because of the wide variety of wastestreams, the heterogeneity of the wastestreams, and the large variety of components within each wastestream. Several ongoing efforts have been directed toward this goal, but as yet, no model has been proven acceptable.

1916 (WSRC-MS–95-0370) **Influence of particulates on crossflow filter performance with tetraphenylborate precipitate.** Peterson, R.A.; Nash, C.A.; McCabe, D.J. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9511193–1: Annual American Institute of Chemical Engineers (AIChE) meeting, Gatlinburg, TN (United States), 12-17 Nov 1995). Order Number DE96006499. Source: OSTI; NTIS; INIS; GPO Dep.

The pretreatment of High Level Waste at the Savannah River Site, prior to vitrification, includes tetraphenylborate precipitation of cesium. Also, strontium and actinides are removed from solution by sorption on monosodium titanate. The resulting slurry is concentrated and washed using 0.4 micron stainless steel Mott filters in a crossflow assembly. The rate of filtrate production is governed by a number of parameters including the concentration of both soluble and insoluble solids present in the process stream. The major insoluble constituents in the process stream are tetraphenylborate solids. However, the presence of small quantities of monosodium titanate as well as sludge particulates, typically less than 10% of the total solids concentration, produces up to a 50% decline in the rate of filtrate production. The cake that develops during filtration is the primary resistance to flow of filtrate. In addition, experimental data indicate the filter cake is enriched in the insoluble solids relative to the bulk of the solution. The presence of these insoluble solids in the filter cake influences not only the overall filtrate flow rate, but also the mechanisms by which the filter cake is formed.

1917 (WSRC-MS--95-0371) **Rheology of Savannah River site tank 42 and tank 51 HLW radioactive sludges.** Ha, B.C.; Bibler, N.E. Westinghouse Savannah River Co., Aiken, SC (United States). 19 Jan 1996. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960212--36: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96060036. Source: OSTI; NTIS; INIS; GPO Dep.

Knowledge of the rheology of the radioactive sludge slurries at the Savannah River Site (SRS) is necessary in order to ensure that they can be retrieved from waste tanks and processed for final disposal. The high activity radioactive wastes stored as caustic slurries at SRS result from the neutralization of acid waste generated from production of nuclear defense materials. During storage, the wastes separate into a supernate layer and a sludge layer. In the Defense Waste Processing Facility (DWPF) at SRS, the radionuclides from the sludge and supernate will be immobilized into borosilicate glass for long term storage and eventual disposal. Before transferring the waste from a storage tank to the DWPF, a portion of the aluminum in the waste sludge will be dissolved and the sludge will be extensively washed to remove sodium. Tank 51 and Tank 42 radioactive sludges represent the first batch of HLW sludge to be processed in the DWPF. This paper presents results of rheology measurements of Tank 51 and Tank 42 at various solids concentrations. The rheologies of Tank 51 and Tank 42 radioactive slurries were measured remotely in the Shielded Cells Operations (SCO) at the Savannah River Technology Center (SRTC) using a modified Haake Rotovisco RV-12 with an M150 measuring drive unit and TI sensor system. Rheological properties of the Tank 51 and Tank 42 radioactive sludges were measured as a function of weight percent solids. The weight percent solids of Tank 42 sludge was 27, as received. Tank 51 sludge had already been washed. The weight percent solids were adjusted by dilution with water or by concentration through drying. At 12, 15, and 18 weight percent solids, the yield stresses of Tank 51 sludge were 5, 11, and 14 dynes/cm2, respectively. The apparent viscosities were 6, 10, and 12 centipoises at 300 sec-1 shear rate, respectively.

1918 (WSRC-MS--95-0397) **Overview of the Savannah River Site high level waste storage tank structural qualification program.** Mertz, G.E.; Houston, T.W.; Flanders, H.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9511128--25: 5. Department of Energy (DOE) natural phenomena hazards mitigation symposium, Denver, CO (United States), 13-17 Nov 1995). Order Number DE96009653. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Site currently has fifty one waste storage tanks, with approximately thirty-four million gallons of high level waste. These structures were constructed from the mid 1950s to the early 1980s under a variety of design criteria. These tanks are being requalified for natural phenomena hazards (NPH) loads associated with the NPH analysis of waste storage tanks; fluid-structure-soil interaction of tanks contained in underground vaults; structure to structure interaction; seismically induced settlement; and impact loads from seismic or tornado induced collapse of secondary structures.

1919 (WSRC-MS--95-0400) **Impedance function study for cylindrical tanks surrounded by an earthen embankment.** Houston, T.W.; Mertz, G.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9511128--22: 5. Department of Energy (DOE) natural phenomena hazards mitigation symposium, Denver, CO (United States), 13-17 Nov 1995). Order Number DE96006493. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) operates many which are used to store radioactive waste material. The original design of the tanks was often based on criteria which did not meet current seismic codes. As a result DOE is undertaking a comprehensive review of the adequacy of these structures to meet current seismic standards. This comprehensive review includes an evaluation of soil-structure interaction. One method available for performing soil structure interaction analyses of structures couples a discrete model of the structure to a lumped parameter model of the soil. This method requires the knowledge of the expected dynamic stiffness and damping functions of the rigid, massless structure resting on the soil. These are commonly referred to as the impedance functions. Lumped parameter analysis is cost effective for the surface and embedded structure cases where impedance functions are available in the literature. For a complex case with the structure located on the surface surrounded by an embankment, the impedance functions must be established prior to using a lumped parameter model approach. The present paper describes the development of horizontal impedance functions for the structure surrounded by an embankment which are developed using a finite element approach as implemented by SASSI. Impedance functions for vertical, torsional, and rocking degrees of freedom can be developed in a similar manner. These functions are easily incorporated into simple models which provide conceptual and physical insight to the response of structures. These models provide both a check of more sophisticated methods, and, due to their simplicity, permit assessment of a wide range of site and structural parameters that my affect the dynamic response of structural systems.

1920 (WSRC-MS--95-0421) **Operation of a bushing melter system designed for actinide vitrification.** Ramsey, W.G. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960212--50: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006491. Source: OSTI; NTIS; INIS; GPO Dep.

The Westinghouse Savannah River Company is developing a melter system to vitrify actinide materials. The melter system will used to vitrify the americium and curium solution which is currently stored in one of the Savannah River Site's

(SRS) processing canyons. This solution is one of the materials designated by the Defense Nuclear Facilities Safety Board (DNFSB) to be dispositioned as part of the DNFSB recommendation 94-1. The Am/Cm solution contains an extremely large fraction (>2 kilograms of Cm and 10 kilograms of Am) of t he United States's total inventory of both elements. They have an estimated value on the order of one billion dollars - if they are processed through the DOE Isotope Sales program at the Oak Ridge National Laboratory. It is therefore deemed highly desirable to transfer the material to Oak Ridge in a form which can allow for recovery of the material. A commercial glass composition has been demonstrated to be compatible with up to 40 weight percent of the Am/Cm solution contents. This glass is also selectively attacked by nitric acid. This allows the actinide to be recovered by common separation processes.

1921 (WSRC-MS–95-0436) **CFD modeling of natural convection within dry spent nuclear fuel storage canisters.** Lee, S.Y. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960815–4: 31. national heat transfer conference, Houston, TX (United States), 3-6 Aug 1996). Order Number DE96009639. Source: OSTI; NTIS; INIS; GPO Dep.

One of the interim storage configurations being considered for aluminum-clad foreign research reactor fuel, such as the Material and Testing Reactor (MTR) design, is in a dry storage facility. To support design studies of storage options, a computational and experimental program was conducted at the Savannah River Site (SRS). The objective was to develop computational fluid dynamics (CFD) models which would be benchmarked using data obtained from a full scale heat transfer experiment conducted in the SRS Experimental Thermal Fluids Laboratory. The current work documents the CFD approach and presents comparison of results with experimental data. CFDS-FLOW3D (version 3.3) CFD code has been used to model the 3-dimensional convective velocity and temperature distributions within a single dry storage canister of MTR fuel elements. The analysis was made for the cases with $q''' = 100$ or 137 watts per MTR fuel element (equivalent to 25 or 35 kW/m^3) using different convective boundary conditions around the canister wall and different cooling gases (N_2 or He). For the present analysis, the Boussinesq approximation was used for the consideration of buoyancy-driven natural convection. Comparison of the CFD code can be used to predict reasonably accurate flow and thermal behavior of a typical foreign research reactor fuel stored in a dry storage facility.

1922 (WSRC-MS–95-0466) **Replacement inhibitors for high level waste tank cooling coils.** Wiersma, B.J.; Hsu, T.C. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960389–10: CORROSION '96: National Association of Corrosion Engineers (NACE) conference, Denver, CO (United States), 24-29 Mar 1996). Order Number DE96009617. Source: OSTI; NTIS; INIS; GPO Dep.

Sodium chromate has been an effective corrosion inhibitor for the cooling coil systems in Savannah river site (SRS) waste tanks for over 40 years. Due to age and operating history, cooling coils occasionally fail allowing chromated water to leak into the environment. The costs of reporting and cleaning up chromate spills became significant enough for SRS to consider alternate inhibitors. Confirmatory tests were performed to assess the effectiveness of three alternative corrosion inhibitor systems for the waste tank cooling water systems: (1) sodium molybdate (250 ppM as Mo)/sodium hydroxide (pH 10), (2) sodium molybdate (50 ppM as Mo)/sodium silicate (50 ppM as Si), and (3) sodium nitrite (500 ppM)/sodium hydroxide (0.01 M). The tests were conducted under stagnant conditions to simulate a worst-case scenario. The results showed that these inhibitors were as effective as chromate at minimizing general corrosion at solution temperatures between 30-70 °C. However, the initiation of localized attack in crevice regions, in solutions containing the alternative inhibitors at 70 °C, was observed. Also, for the nitrite and the molybdate systems to be effective, suitable biocide is needed. On the other hand, interval coupon tests showed that the molybdate inhibitor systems prevented significant propagation of the localized attack.

1923 (WSRC-MS–96-0119) **Heat transfer aspects of interim dry storage of aluminum-clad spent nuclear fuel.** Guerrero, H.N.; Eghbali, D.; Lee, S.Y.; Steeper, T.J. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9606116–49: Annual meeting of the American Nuclear Society (ANS), Reno, NV (United States), 16-20 Jun 1996). Order Number DE96011040. Source: OSTI; NTIS; INIS; GPO Dep.

The consequences of some special characteristics of aluminum-clad DOE spent nuclear fuel and special issues regarding DOE requirements on the heat transfer aspects of there interim dry storage are discussed. For the objective of future licensing of the dry storage facility, a spent fuel technology program is initiated to obtain prototypical data for benchmarking computer codes. This program consisted of separate effects tests on full scale mockup of a Materials Testing Reactor (MTR) spent fuel assembly and integral canister tests of a canister containing mockup fuel assembles in a wind tunnel. The effects of canister power, air flow velocity, type of fill gas, canister orientation and vacuum conditions were obtained. Comparisons of pretest predictions from candidate computational fluid dynamics codes with the test results were excellent.

1924 (WSRC-MS–96-0142) **Estimation of stresses near edges and corners in large spent fuel shipping containers.** Gupta, N.K. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960706–19: American Society of Mechanical Engineers (ASME) pressure vessels and piping conference, Montreal (Canada), 21-26 Jul 1996). Order Number DE96011039. Source: OSTI; NTIS; INIS; GPO Dep.

Spent fuel is transported in shipping containers which are lined with thick layers of lead to minimize radiation levels. The lead is poured in the space formed by the inner and outer steel walls of the container. This type of construction results in well defined edges and corners. Current regulations require detailed structural evaluation of these containers to meet the established guidelines. These regulations also require that any fatigue evaluation consider a stress concentration factor of 4 to 5 to determine the fatigue life of the shipping container. These containers develop large thermal stresses near edges and corners due to large differences in thermal coefficients of expansion between lead and steel. In this paper, the discontinuity formed by the welds in the edges and corners is treated as a groove and the existing formulations of deep grooves and notches are used to calculate a realistic value of the stress concentration factor.

1925 (WSRC-RP-94-1300) **Electrolytic Treatment of ICPP Sodium-Bearing Waste Simulant.** Hobbs, D.T. Westinghouse Savannah River Co., Aiken, SC (United States). 2 Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060112. Source: OSTI; NTIS; GPO Dep.

Two proof-of-principle tests were conducted to determine if nitrate can be destroyed electrochemically in a simulated Idaho Chemical Processing Plant (ICPP) Sodium-Bearing waste. Both tests demonstrated the destruction of nitrate as well as the removal of other metals in the simulant. Metals removal is believed to be due to precipitation as a result of a change in the pH of the waste solution from strongly acidic to highly alkaline and reduction to a metal or metal oxide. Although gas evolution at the cathode was visible during each test, there were no visible signs of NO_x formation in either test.

1926 (WSRC-RP-96-76) **Annual Status Report for the F/H Area High Level Waste Tank Farms.** Hayes, C.R. (Westinghouse Savannah River Company, AIKEN, SC (United States)). Westinghouse Savannah River Co., Aiken, SC (United States). 14 Mar 1996. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96060048. Source: OSTI; NTIS; INIS; GPO Dep.

Section 1X.E.3 of the SRS Federal Facility Agreement requires the DOE to submit to EPA and SCDHEC, an annual report on the status of tanks being removed from service. Tanks that are slated for removal from service either do not meet secondary containment standards or have leak sites. The attached document is intended to meet this annual report requirement. An undated status of relevant portions of the Waste Removal Plan and Schedule is also included.

1927 (WSRC-TR-95-0019) **HLW flowsheet material balance for DWPF rad operation with Tank 51 sludge and ITP Cycle 1 precipitate.** Choi, A.S. Westinghouse Savannah River Co., Aiken, SC (United States). 19 Apr 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96004065. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the details of the Savannah River Plant Flowsheet for the Rad Operation with Tank Sludge and ITP Cycle 1 Precipitate. Topics discussed include: material balance; radiolysis chemistry of tank precipitates; algorithm for ESP washing; chemistry of hydrogen and ammonia generation in CPC; batch sizes for processing feed; and total throughput of a streams during one cycle of operation.

1928 (WSRC-TR-95-0122) **Prevention for possible microbiologically influenced corrosion (MIC) in RHLWE flush water system.** Hsu, T.C.; Jenkins, C.F. Westinghouse Savannah River Co., Aiken, SC (United States). 10 Jul 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96002906. Source: OSTI; NTIS; INIS; GPO Dep.

This report is in response to the request to provide a recommendation for the prevention of possible microbiologically influenced corrosion (MIC) for the RHLWE (Replacement High-Level Waste Evaporator) flush water (FW) system. The recent occurrences of MIC at DWPF prompted HLWE to evaluate the possibility of MIC occurring in this 304L stainless steel RHLWE flush water system. Concern was heightened by the fact that the well water used and the other conditions at H-Tank Farm are similar to those at DWPF. However, only one known leak has occurred in the existing 304L evaporator flush water systems in either tank farm (in 1H system), and no MIC Corrosion has been confirmed in the tank farm area. The design of the RHLWE flush water system (completed long before the occurrence of MIC at DWPF) was modeled after the existing evaporator flush water systems and did not specifically include MIC prevention considerations. Therefore, MIC prevention was not specifically considered during the design phase of this flush water system. The system is presently being installed. After an extensive evaluation, a task team concluded that the best biocide to prevent the occurrence of MIC would be NaOH at fairly low concentration. Sodium hydroxide (NaOH) is optimal in this application, because of its effectiveness, low cost, and familiarity to the Operations personnel (see Appendix A). However, it is the opinion of the task group that application should be withheld until MIC corrosion is demonstrated in the system.

1929 (WSRC-TR-95-166) **Annual Radioactive Waste Tank Inspection Program 1994.** McNatt, F.G. Sr. Westinghouse Savannah River Co., Aiken, SC (United States). Apr 1995. 88p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95017483. Source: OSTI; NTIS; INIS; GPO Dep.

Aqueous radioactive wastes from Savannah River Site (SRS) separations processes are contained in large underground carbon steel tanks. Inspections made during 1994 to evaluate these vessels and evaluations based on data accrued by inspections made since the tanks were constructed are the subject of this report.

1930 (WSRC-TR-95-0170) **Validation Analysis for the Calculation of a Turbulent Free Jet in Water Using CFDS-FLOW 3-D and FLUENT.** Dimenna, R.A.; Lee, S.Y. Westinghouse Savannah River Co., Aiken, SC (United States). May 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96060018. Source: OSTI; NTIS; INIS; GPO Dep.

The application of computational fluid dynamics methods to the analysis of mixing in the high level waste tanks at the Savannah River Site requires a demonstration that the computer codes can properly represent the behavior of fluids in the tanks. The motive force for mixing the tanks is a set of jet pumps taking suction from the tank fluid and discharging turbulent jets near the bottom of the tank. The work described here focuses on the free turbulent jet in water as the simplest case of jet behavior for which data could be found in the open literature. Calculations performed with both CFDS-FLOW3D and FLUENT were compared with data as well as classical jet theory. Results showed both codes agreed reasonably well with each other and with the data, but that results were sensitive to the computational mesh and, to a lesser degree, the selection of turbulence models.

1931 (WSRC-TR-95-0178) **Limits on Annulus Air Outages in Types 1, 2, and 3 Waste Tanks.** Wiersma, B.J.; Sindelar, R. L. Westinghouse Savannah River Co., Aiken, SC (United States). 12 Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060142. Source: OSTI; NTIS; INIS; GPO Dep.

An evaluation was performed on the impact of abnormal air flow conditions on the structural integrity of Types 1, 2, and 3 waste tanks. Warm, dry air in the annular space is necessary to preclude low temperature embrittlement and corrosive conditions for the carbon steel materials. For Type

1 and 2 tanks the annulus air system should be repaired within a month to minimize the potential for low temperature embrittlement and corrosive conditions, for Tanks 29-34, which are Type 3 tanks, it is recommended that the system be repaired within two months to minimize the potential for low temperature embrittlement. For all other Type 3 tanks repair of the system within six months is adequate to minimize general corrosion.

1932 (WSRC-TR–95-0195) **Thermal analysis modeling and simulation of spent nuclear fuel canister using CFDS-FLOW3D.** Lee, S.Y. Westinghouse Savannah River Co., Aiken, SC (United States). Apr 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96003011. Source: OSTI; NTIS; INIS; GPO Dep.

The computational fluid dynamics (CFD) code CFDS-FLOW3D (version 3.3) has been utilized to model a three-dimensional thermal analysis of the spent nuclear fuel dry storage mockup test. The Experimental Thermal-Fluids (ETF) group obtained experimental data to benchmark computer codes for verifying the dry storage of aluminum-clad spent nu clear fuel. This report provides CFDS-FLOW3D detailed predictions and benchmark, against the test data. Close comparison of the computational results with the experimental data provide verification that the code can be used to predict reasonably accurate convective flow and thermal behavior of a typical foreign research reactor fuel, such as the Material and Testing Reactor (MTR) design tested, while stored in a dry storage facility.

1933 (WSRC-TR–95-0213) **Technical basis for a minimum hydroxide concentration in tanks containing dilute waste.** Zapp, P.E. Westinghouse Savannah River Co., Aiken, SC (United States). May 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96001692. Source: OSTI; NTIS; INIS; GPO Dep.

Laboratory tests were performed to address the protection of waste tank steel from corrosion in situations of elevated temperatures up to 75 C (hot spots) in the sludge layer of Extended Sludge Processing (ESP) tanks. Coupon immersion tests were conducted at 75 C in two ESP simulants at four hydroxide (or pH) levels. The nitrite concentrations of the simulants were calculated from the ESP technical standards based on a temperature of 40 C. The results showed that a hydroxide concentration of at least 0.01 M prevented significant corrosion of the steel at the elevated temperature. This conclusion provides the technical basis for the revised minimum hydroxide concentration of 0.01 M in the draft WSRC 241-82H Control Room Process Requirements, for the ESP tanks.

1934 (WSRC-TR–95-0242) **H-Area/ITP safety analysis summary report for subsurface liquid waste transport.** Flach, G.P.; Radder, J.A. Westinghouse Savannah River Co., Aiken, SC (United States). May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96001661. Source: OSTI; NTIS; INIS; GPO Dep.

The scope of analysis for this report is strictly limited to the subsurface release of liquid waste from the buried tanks in H-Area, following beyond Evaluation Basis Earthquake (EBE) events. Failure of these tanks is assumed and no assessments of tank structural integrity are made. The waste containment capability of the H-Area berms is examined, and the times for subsurface transport of liquid waste to the nearest surface water streams are determined. The H-Area tank farm berms are expected to remain intact following seismic events that do not produce liquefaction. The return frequency of an earthquake that produces onset of liquefaction is less than 1×10^{-5} per year. Berm damaging seismic events are defined to be earthquakes that are beyond the EBE, which has a return frequency of approximately 2×10^{-4} per year. As long as the berms remain intact, numerical analysis shows that any waste leaking from failed tanks will be contained by the berms with no liquid seeping out. Given a seismic event that causes waste to leak from the buried tanks but leaves the berms intact, the subsurface transport analysis shows that only a small fraction of waste will flow with the groundwater underlying H-Area. Best-estimate groundwater transit times between H-Area and surface water discharge points range from 45 to 85 years. Conservative estimates range from 10 to 15 years and also depend on location of the tank in question. Because the transport times are measured in tens of years, there is adequate time available to implement mitigation activities prior to any waste reaching the nearest surface water stream. Alternative mitigation planning is already underway to preclude this from becoming an issue.

1935 (WSRC-TR–95-0257) **Alternative inhibitors for the high level waste tank cooling water system.** Wiersma, B.J. Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96013312. Source: OSTI; NTIS; INIS; GPO Dep.

Leaks in cooling water feed and supply lines at SRS have resulted in spills of several gallons of chromated water on the ground. The costs of excavating and disposing of the soil and reporting the spill to state and federal agencies became significant enough for Waste Management Operations to consider replacing sodium chromate with an alternate inhibitor. Confirmatory tests were performed to assess the effectiveness of three alternative corrosion inhibitors for the cooling water system: (1) sodium molybdate (250 ppm as Mo)/sodium hydroxide (pH 10); (2) sodium molybdate (50 ppm as Mo)/sodium silicate (50 ppm as Si); and (3) sodium nitrite (500 ppm)/sodium hydroxide (0.01 M). The tests were conducted under stagnant conditions to simulate a worst-case scenario. The results showed that these inhibitors were as effective as chromate at minimizing general corrosion at solution temperatures between 30–70 C. However, the initiation of localized attack in crevice regions, in solutions containing the alternative inhibitors at 70 C, was observed. The following recommendations for operations were made: (1) maintain the pH of the molybdate inhibitor systems above 10 or the pH of the nitrite inhibitor system above 12; (2) add a biocide to the cooling water to eliminate the possibility of microbial activity; (3) maintain cooling water flow to a majority of the coils in tanks with wastes at temperatures greater than 60 C; and (4) purge the cooling coils with fresh inhibitor solution once every three months. Provided these recommendations are implemented, all three alternative inhibitors should be adequate for use in the cooling water system. Furthermore, it is recommended that the changeover should occur gradually, i.e., one pumphouse at a time.

1936 (WSRC-TR–95-0265) **Alternative dispositioning methods for HEU spent nuclear fuel at the Savannah River Site.** Krupa, J.F.; McKibben, J.M.; Parks, P.B.; DuPont, M.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9507119–5: Summer national meeting of the American Institute of Chemical Engineers, Boston, MA (United States), 30 Jul - 2 Aug 1995). Order Number DE96001845. Source: OSTI; NTIS; INIS; GPO Dep.

The United States has a strong policy on prevention of the international spread of nuclear weapons. This policy was announced in Presidential Directive PDD-13 and summarized in a White House press release September 27, 1993. Two cornerstones of this policy are: seek to eliminate where possible the accumulation of stockpiles of highly- enriched uranium or plutonium; propose···prohibiting the production of highly-enriched uranium (HEU) or plutonium for nuclear explosives purposes or outside international safeguards. The Department of Energy is currently struggling to devise techniques that safely and efficiently dispose of spent nuclear fuel (SNF) while satisfying national non-proliferation policies. SRS plans and proposals for disposing of their SNF are safe and cost effective, and fully satisfy non-proliferation objectives.

1937 (WSRC-TR–95-0288) **Thermal analysis of the failed equipment storage vault system.** Jerrell, J.; Lee, S.Y.; Shadday, A. Westinghouse Savannah River Co., Aiken, SC (United States). Jul 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96010050. Source: OSTI; NTIS; INIS; GPO Dep.

A storage facility for failed glass melters is required for radioactive operation of the Defense Waste Processing Facility (DWPF). It is currently proposed that the failed melters be stored in the Failed Equipment Storage Vaults (FESV's) in S area. The FESV's are underground reinforced concrete structures constructed in pairs, with adjacent vaults sharing a common wall. A failed melter is to be placed in a steel Melter Storage Box (MSB), sealed, and lowered into the vault. A concrete lid is then placed over the top of the FESV. Two melters will be placed within the FESV/MSB system, separated by the common wall. There is no forced ventilation within the vault so that the melter is passively cooled. Temperature profiles in the Failed Equipment Storage Vault Structures have been generated using the FLOW3D software to model heat conduction and convection within the FESV/MSB system. Due to complexities in modeling radiation with FLOW3D, P/THERMAL software has been used to model radiation using the conduction/convection temperature results from FLOW3D. The final conjugate model includes heat transfer by conduction, convection, and radiation to predict steady-state temperatures. Also, the FLOW3D software has been validated as required by the technical task request.

1938 (WSRC-TR–95-0306) **The long-term acceleration of waste glass corrosion: A preliminary review.** Kielpinski, A.L. Westinghouse Savannah River Co., Aiken, SC (United States). Jul 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96006497. Source: OSTI; NTIS; INIS; GPO Dep.

Whereas a prior conception of glass dissolution assumed a relatively rapid initial dissolution which then slowed to a smaller, fairly constant longer-term rate, some recent work suggests that these two stages are followed by a third phase of dissolution, in which the dissolution rate is accelerated with respect to what had previously been thought of as the final long-term rate. The goals of the present study are to compile experimental data which may have a bearing on this phenomena, and to provide an initial assessment of these data. The Savannah River Technology Center (SRTC) is contracted to develop glass formulation models for vitrification of Hanford low-level waste (LLW), in support of the Hanford Tank Waste Remediation System Technology Development Program. The phenomenon of an increase in corrosion rate, following a period characterized by a low corrosion rate, has been observed by a number of researchers on a number of waste glass compositions. Despite inherent ambiguities arising from SA/V (glass surface area to solution volume ratio) and other effects, valid comparisons can be made in which accelerated corrosion was observed in one test, but not in another. Some glass compositions do not appear to attain a plateau region; it may be that the observation of continued, non-negligible corrosion in these glasses represents a passage from the initial rate to the accelerated rate. The long-term corrosion is a function of the interaction between the glass and its environment, including the leaching solution and the surrounding materials. Reaction path modeling and stability field considerations have been used with some success to predict the changes in corrosion rate over time, due to these interactions. The accelerated corrosion phenomenon highlights the need for such integrated corrosion modeling and the scenario-specific nature of a particular glass composition's durability.

1939 (WSRC-TR–95-0337) **Evaluation and ranking of the tank focus area solid liquid separation needs.** McCadbe, D.J. Westinghouse Savannah River Co., Aiken, SC (United States). 17 Aug 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96003475. Source: OSTI; NTIS; INIS; GPO Dep.

The Tank Focus Area (TFA) of the Department of Energy (DOE) Office of Environmental Restoration and Waste Management (EM) addresses remediation of liquid waste currently stored in underground tanks. Several baseline technologies for treatment of tank waste can be categorized into three types of solid liquid separation: (a) removal of radioactive species that have been absorbed or precipitated, (b) pretreatment for ion exchange, and (c) volume reduction of sludge and wash water. The solids formed from precipitation or absorption of radioactive ions require separation from the liquid phase to permit treatment of the liquid as Low Level Waste. Prior to ion exchange of radioactive ions, removal of insoluble solids is needed to prevent bed fouling and downstream contamination. Volume reduction of washed sludge solids would reduce the tank space required for interim storage. The scope of this document is to evaluate the solid/liquid separations needed to permit treatment of tank wastes to accomplish these goals. The document summarizes previous alkaline waste testing, with an emphasis on crossflow filtration, to-obtain a general understanding of the behavior of radioactive wastes on available equipment. The document also provides general information about filtration and a path forward for testing.

1940 (WSRC-TR–95-0386) **Functional overview of the Production Planning Model (ProdMod).** Gregory, M.V.; Paul, P.K. Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1995. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96010049. Source: OSTI; NTIS; INIS; GPO Dep.

The Production Planning Model (ProdMod) has been developed by SRTC for use by High Level Waste Program Management and High Level Waste Engineering as a fast running, integrated, comprehensive model of the entire SRS high level waste (HLW) complex. ProdMod can simulate the response of the HLW complex from its current state to the end of tank clean-up or to any intermediate point. The present document describes the initial release of ProdMod at the end of FY95: a model version that contains all the significant elements from the High-level Waste System Plan Revision 5 and is capable of running the simulation all the way to the postulated completion of waste removal. For the scenario represented by this release, that simulates approximately 70 years of operation of the HLW complex (out to FY2065). This initial release of ProdMod will serve as the immediate starting point for the modeling of the High-Level Waste System Plan Revision 6. Thus ProdMod is expected to be in a state of continuous change and improvement.the initial goal has been to generate a simulation of the processes of interest, with the emphasis on mass and volume balances tracked throughout the HLW complex. That has been accomplished. Future development will add a set of cost equations to the process equations and extend the model for use as a linear programming (optimization) application. The goal of this later phase will be to free the ProdMod user to some extent from the need to set up detailed simulation scenarios: the model will automatically make operational choices which minimize or maximize a given objective function. Appendix A contains the source code.

1941 (WSRC-TR--95-0470) **Use of Savannah River Site facilities for glass and ceramics.** Kuehn, N.H.; Duane, J.B.; McKibben, J.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-951259--8: Plutonium stabilization and immobilization workshop, Washington, DC (United States), 12-14 Dec 1995). Order Number DE96009646. Source: OSTI; NTIS; INIS; GPO Dep.

Existing structures and processing facilities at the Savannah River Site are being considered for immobilization of plutonium. The Defense Waste Processing Facility (DWPF) which has completed cold testing and is scheduled to begin radioactive operation later this year to vitrify High Level Waste (HLW) has been considered for vitrification of plutonium and a means to provide a radiation barrier for plutonium glass. Introduction of plutonium into the DWPF processing stream and incorporating the plutonium in the (HLW) glass matrix would require significant modifications and upgrades to the facility. These would impact the schedule for its primary mission which is to vitrify HLW stored in tanks at the Savannah River Site. This paper discusses three options that utilize the DWPF with significantly less impact on its primary mission. Two of the options place small cans of plutonium glass or ceramic matrices containing plutonium into a DWPF canister and then pour HLW glass around the cans to provide proliferation resistance. The processing of HLW glass is not affected by the cans. The third option uses a portion of the DWPF feed process and a new facility in S Area where DWPF is located. All of these options use the existing 221F Separations Canyon building for processing the plutonium feed material and preparing the plutonium glass or ceramic containing plutonium.

1942 (WSRC-TR--96-0166) **Annual radioactive waste tank inspection program: 1995.** McNatt, F.G. Sr. Westinghouse Savannah River Co., Aiken, SC (United States). 1 Apr 1996. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96060063. Source: OSTI; NTIS; INIS; GPO Dep.

Aqueous radioactive wastes from Savannah River Site (SRS) separations processes are contained in large underground carbon steel tanks. Inspections made during 1995 to evaluate these vessels and evaluations based on data accrued by inspections performed since the tanks were constructed are the subject of this report

1943 (WSRC-TR--0400-Rev.1) **High level waste tank farm setpoint document. Revision 1.** Anthony, J.A. III. Westinghouse Savannah River Co., Aiken, SC (United States). 31 Jan 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95014726. Source: OSTI; NTIS; INIS; GPO Dep.

Revision 1 modifies Attachment I of this Technical Report as a result of a meeting which was held Friday, January 27, 1994 between Maintenance, Work Control, and Engineering to discuss report contents. Upon completion of the meeting, the Flow Chart was edited accordingly. Attachment 2 is modified for clerical reasons. Setpoints for nuclear safety-related instrumentation are required for actions determined by the design authorization basis. Minimum requirements need to be established for assuring that setpoints are established and held within specified limits. This document establishes the controlling methodology for changing setpoints of all classifications. The instrumentation under consideration involve the transfer, storage, and volume reduction of radioactive liquid waste in the F- and H-Area High-Level Radioactive Waste Tank Fanns. The setpoint document (Appendix 2) will encompass the PROCESS AREA listed in the Safety Analysis Report (SAR) (DSTSA-200-10 Sup 18) which includes the diversion box HDB-8 facility. In addition to the PROCESS AREAS listed in the SAR, Building 299-H and the Effluent Transfer Facility (ETF) are also included in the scope.

PLUTONIUM

1944 (ANL--95/31) **Treatment of plutonium-bearing solutions: A brief survey of the DOE complex.** Conner, C.; Chamberlain, D.B.; Chen, L.; Vandegrift, G.F. Argonne National Lab., IL (United States). Mar 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96005298. Source: OSTI; NTIS; INIS; GPO Dep.

With the abrupt shutdown of some DOE facilities, a significant volume of in-process material was left in place and still requires treatment for interim storage. Because the systems containing these process streams have deteriorated since shutdown, a portable system for treating the solutions may be useful. A brief survey was made of the DOE complex on the need for a portable treatment system to treat plutonium-bearing solutions. A survey was completed to determine (1) the compositions and volumes of solutions and heels present, (2) the methods that have been used to treat these solutions and heels in the past, and (3) the potential problems that exist in removing and treating these solutions. Based on the surveys and on the Defense Nuclear Facilities Safety Board Recommendation 94-1, design criteria for a portable treatment system were generated.

1945 (ANL/CMT/CP–84590). **Performance of high plutonium-containing glasses for the immobilization of surplus fissile materials.** Bates, J.K.; Emery, J.W.; Hoh, J.C.; Johnson, T.R. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950401–16: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE95013773. Source: OSTI; NTIS; INIS; GPO Dep.

Plutonium from dismantled weapons is being evaluated for geological disposal. While a final waste form has not been chosen, borosilicate glass will be one of the waste forms to be evaluated. The reactivity of the reference blend glass containing the standard amount of Pu (~0.01 wt %) to be produced by the Defense Waste Processing Facility (DWPF) is compared to that of glasses made from the same nominal frit composition but doped with 2 and 7 wt % Pu, and also equal mole percentages of Gd_2O_3. The Gd is added to act as a neutron poison to address criticality concerns. The four different glasses have been reacted using the PCT-B method with a SA/V of 20,000 m^{-1} and the Argonne Vapor Hydration Test (VHT) method. Both test methods accelerate the reaction of the glass. PCT-B is used to determine the reactivity of the glass by analyzing the solution and reacted test components, while the VHT is used to evaluate the long-term reactivity of the glass and the distribution of Pu to secondary phases that will control the long-term reaction of the glass. The results of the tests with high levels of Pu are compared to those with the nominal levels to be produced in the standard DWPF glass.

1946 (ANL/CMT/CP–86185) **A portable concentrator for processing plutonium containing solutions.** Chamberlain, D.B. (and others); Conner, C.; Chen, L. Argonne National Lab., IL (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9509139–4: 7. ACS special symposium: emerging technologies in hazardous waste management, Atlanta, GA (United States), 17-20 Sep 1995). Order Number DE96002563. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes a horizontal, compact agitated-film concentrator called a Rototherm, manufactured by Artisan Industries, Inc. which can be used to process aqueous solutions of radioactive wastes containing plutonium. The unit is designed to concentrate liquid streams to a high-solid content slurry.

1947 (ANL/CMT/CP–88453) **Application of spent fuel treatment technology to plutonium immobilization.** McPheeters, C.C; Ackerman, J.P.; Gay, E.C., Johnson, G.K. Argonne National Lab., IL (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9606116–19: Annual meeting of the American Nuclear Society (ANS), Reno, NV (United States), 16-20 Jun 1996). Order Number DE96009133. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the electrometallurgical treatment technology being developed at Argonne National Laboratory (ANL) is to convert certain spent nuclear fuels into waste forms that are suitable for disposal in a geological repository for nuclear waste. The spent fuels of interest are those that cannot be safely stored for a long time in their current condition, and those that cannot be qualified for repository disposal. This paper explores the possibility of applying this electrometallurgical treatment technology to immobilization of surplus fissile materials, primarily plutonium. Immobilization of surplus fissile materials by electrometallurgical treatment could be done in the same facilities, at the same time. and in the same equipment as the proposed treatment of the present inventory of spent nuclear fuel. The cost and schedule savings of this simultaneous treatment scheme would be significant.

1948 (CONF-951259–) **US Department of Energy Plutonium Stabilization and Immobilization Workshop, December 12-14, 1995: Final proceedings.** USDOE, Washington, DC (United States). May 1996. 474p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-93EW50512. From Plutonium stabilization and immobilization workshop; Washington, DC (United States); 12-14 Dec 1995. Order Number DE96011798. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the workshop was to foster communication within the technical community on issues surrounding stabilization and immobilization of the Department's surplus plutonium and plutonium- contaminated wastes. The workshop's objectives were to: build a common understanding of the performance, economics and maturity of stabilization and immobilization technologies; provide a system perspective on stabilization and immobilization technology options; and address the technical issues associated with technologies for stabilization and immobilization of surplus plutonium and plutonium- contaminated waste. The papers presented during this workshop have been indexed separately.

1949 (DOE/EA–1059) **Environmental Assessment Radioactive Source Recovery Program.** USDOE Los Alamos Area Office, NM (United States). 20 Dec 1995. 70p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96004641. Source: OSTI; NTIS; INIS; GPO Dep.

In a response to potential risks to public health and safety, the U.S. Department of Energy (DOE) is evaluating the recovery of sealed neutron sources under the Radioactive Source Recovery Program (RSRP). This proposed program would enhance the DOE's and the U.S. Nuclear Regulatory Commission's (NRC's) joint capabilities in the safe management of commercially held radioactive source materials. Currently there are no federal or commercial options for the recovery, storage, or disposal of sealed neutron sources. This Environmental Assessment (EA) analyzes the potential environmental impacts that would be expected to occur if the DOE were to implement a program for the receipt and recovery at the Los Alamos National Laboratory (LANL), Los Alamos, New Mexico, of unwanted and excess plutonium-beryllium (^{238}Pu-Be) and americium-beryllium (^{241}Am-Be) sealed neutron sources. About 1 kg (2.2 lb) plutonium and 3 kg (6.6 lb) americium would be recovered over a 15-year project. Personnel at LANL would receive neutron sources from companies, universities, source brokers, and government agencies across the country. These neutron sources would be temporarily stored in floor holes at the CMR Hot Cell Facility. Recovery reduces the neutron emissions from the source material and refers to a process by which: (1) the stainless steel cladding is removed from the neutron source material, (2) the mixture of the radioactive material (Pu-238 or Am-241) and beryllium that constitutes the neutron source material is chemically separated (recovered), and (3) the recovered Pu-238 or Am-241 is converted to an oxide form ($^{238}PuO_2$ or $^{241}AmO_2$). The proposed action would include placing the $^{238}PuO_2$ or $^{241}AmO_2$ in interim storage in a special nuclear material vault at the LANL Plutonium Facility.

1950 (DOE/EM–0279) **Plutonium focus area: Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Nuclear Materials Stabilization. Mar 1996. 46p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96008374. Source: OSTI; NTIS; INIS; GPO Dep.

To ensure research and development programs focus on the most pressing environmental restoration and waste management problems at the U.S. Department of Energy (DOE), the Assistant Secretary for the Office of Environmental Management (EM) established a working group in August 1993 to implement a new approach to research and technology development. As part of this approach, EM developed a management structure and principles that led to creation of specific focus areas. These organizations were designed to focus scientific and technical talent throughout DOE and the national scientific community on major environmental restoration and waste management problems facing DOE. The focus area approach provides the framework for inter-site cooperation and leveraging of resources on common problems. After the original establishment of five major focus areas within the Office of Technology Development (EM-50), the Nuclear Materials Stabilization Task Group (NMSTG, EM-66) followed EM-50's structure and chartered the Plutonium Focus Area (PFA). NMSTG's charter to the PFA, described in detail later in this book, plays a major role in meeting the EM-66 commitments to the Defense Nuclear Facilities Safety Board (DNFSB). The PFA is a new program for FY96 and as such, the primary focus of revision 0 of this Technology Summary is an introduction to the Focus Area; its history, development, and management structure, including summaries of selected technologies being developed. Revision 1 to the Plutonium Focus Area Technology Summary is slated to include details on all technologies being developed, and is currently planned for release in August 1996. The following report outlines the scope and mission of the Office of Environmental Management, EM-60, and EM-66 organizations as related to the PFA organizational structure.

1951 (DOE/EM–0297) **Plutonium focus area.** USDOE Office of Science and Technology, Washington, DC (United States). Office of Program Analysis. Aug 1996. 117p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013519. Source: OSTI; NTIS; INIS; GPO Dep.

To ensure research and development programs focus on the most pressing environmental restoration and waste management problems at the U.S. Department of Energy (DOE), the Assistant Secretary for the Office of Environmental Management (EM) established a working group in August 1993 to implement a new approach to research and technology development. As part of this new approach, EM developed a management structure and principles that led to the creation of specific Focus Areas. These organizations were designed to focus the scientific and technical talent throughout DOE and the national scientific community on the major environmental restoration and waste management problems facing DOE. The Focus Area approach provides the framework for intersite cooperation and leveraging of resources on common problems. After the original establishment of five major Focus Areas within the Office of Technology Development (EM-50, now called the Office of Science and Technology), the Nuclear Materials Stabilization Task Group (EM-66) followed the structure already in place in EM-50 and chartered the Plutonium Focus Area (PFA). The following information outlines the scope and mission of the EM, EM-60, and EM-66 organizations as related to the PFA organizational structure.

1952 (DOE/SF/20948–T1) **Plutonium stabilization and packaging system.** BNFL, Inc., Richland, WA (United States). [1996]. 175p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-96SF20948. Order Number DE96009306. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the functional design of the Plutonium Stabilization and Packaging System (Pu SPS). The objective of this system is to stabilize and package plutonium metals and oxides of greater than 50% wt, as well as other selected isotopes, in accordance with the requirements of the DOE standard for safe storage of these materials for 50 years. This system will support completion of stabilization and packaging campaigns of the inventory at a number of affected sites before the year 2002. The package will be standard for all sites and will provide a minimum of two uncontaminated, organics free confinement barriers for the packaged material.

1953 (DOE/SF/20948–T2) **System design document for the plutonium stabilization and packaging system.** BNFL, Inc., Richland, WA (United States). 8 May 1996. 192p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-96SF20948. Order Number DE96009307. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this system is to stabilize and package plutonium metals and oxides of greater than 50% wt, as well as other selected isotopes, in accordance with the requirements for DOE standards for safe storage of these materials for 50 years. This document describes the highest level design information and user characteristics from an operational perspective. It provides guidance for developing procurement and installation specifications, interface requirements, and test plans.

1954 (DOE/SF/20948–T4) **System specification/system design document comment review: Plutonium Stabilization and Packaging System. Notes of conference.** BNFL, Inc., Denver, CO (United States). [1996]. 158p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-96SF20948. Order Number DE96012349. Source: OSTI; NTIS; INIS; GPO Dep.

A meeting was held between DOE personnel and the BNFL team to review the proposed resolutions to DOE comments on the initial issue of the system specification and system design document for the Plutonium Stabilization and Packaging System. The objectives of this project are to design, fabricate, install, and start up a glovebox system for the safe repackaging of plutonium oxide and metal, with a requirement of a 50-year storage period. The areas discussed at the meeting were: nitrogen in can; moisture instrumentation; glovebox atmosphere; can marking-bar coding; weld quality; NFPA-101 references; inner can swabbing; ultimate storage environment; throughput; convenience can screw-top design; furnace/trays; authorization basis; compactor safety; schedule for DOE review actions; fire protection; criticality safety; applicable standards; approach to MC and A; homogeneous oxide; resistance welder power; and tray overfill. Revised resolutions were drafted and are presented.

1955 (DOE/SF/20948–T5) **Health and Safety Management Plan for the Plutonium Stabilization and Packaging System.** BNFL, Inc., Denver, CO (United States). 4 Jun 1996. 34p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC03-96SF20948. Order Number DE96012348. Source: OSTI; NTIS; INIS; GPO Dep.

This Health and Safety Management Plan (HSMP) presents safety and health policies and a project health and safety organizational structure designed to minimize potential risks of harm to personnel performing activities associated with Plutonium Stabilization and Packaging System (Pu SPS). The objectives of the Pu SPS are to design, fabricate, install, and startup of a glovebox system for the safe repackaging of plutonium oxides and metals, with a requirement of a 50-year storage period. This HSMP is intended as an initial project health and safety submittal as part of a three phase effort to address health and safety issues related to personnel working the Pu SPS project. Phase 1 includes this HSMP and sets up the basic approach to health and safety on the project and addresses health and safety issues related to the engineering and design effort. Phase 2 will include the Site Specific Construction health and Safety Plan (SSCHSP). Phase 3 will include an additional addendum to this HSMP and address health and safety issues associated with the start up and on-site test phase of the project. This initial submittal of the HSMP is intended to address those activities anticipated to be performed during phase 1 of the project. This HSMP is intended to be a living document which shall be modified as information regarding the individual tasks associated with the project becomes available. These modifications will be in the form of addenda to be submitted prior to the initiation of each phase of the project. For additional work authorized under this project this HSMP will be modified as described in section 1.4.

1956 (DOE/SF/20948–T6) **System specification for the plutonium stabilization and packaging system.** BNFL Engineering Ltd., Denver, CO (United States). 1996. 188p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-96SF20948. Order Number DE96012347. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes functional design requirements for the Plutonium Stabilization and Packaging System (Pu SPS), as required by DOE contract DE-AC03-96SF20948 through contract modification 9 for equipment in Building 707 at Rocky Flats Environmental Technology Site (RFETS).

1957 (DOE/SR/18035–T2) **XRF and leaching characterization of waste glasses derived from wastewater treatment sludges.** Ragsdale, R.G., Jr. Clemson Univ., SC (United States). Dept. of Environmental Systems Engineering. Dec 1994. 108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96011434. Source: OSTI; NTIS; INIS; GPO Dep.

Purpose of this study was to investigate use of XRF (x-ray fluorescence spectrometry) as a near real-time method to determine melter glass compositions. A range of glasses derived from wastewater treatment sludges associated with DOE sites was prepared. They were analyzed by XRF and wet chemistry digestion with atomic absorption/inductively coupled emission spectrometry. Results indicated good correlation between these two methods. A rapid sample preparation and analysis technique was developed and demonstrated by acquiring a sample from a pilot-scale simulated waste glass melter and analyzing it by XRF within one hour. From the results, XRF shows excellent potential as a process control tool for waste glass vitrification. Glasses prepared for this study were further analyzed for durability by toxicity characteristic leaching procedure and product consistency test and results are presented.

1958 (INEL–95/0038) **Non-fertile fuels development for plutonium and high-enriched uranium dispositioning in water cooled reactors.** Olsen, C.S. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Sep 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003537. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of dismantling the bomb, there is about 100 MT of excess weapons grade plutonium in the United States and about 150 MT in the Commonwealth of Independent States. In addition, there is another 1000 MT of plutonium in commercial spent fuel that may be used as degraded weapons material. This report discusses one means to disposition weapons grade plutonium is by irradiating the fuel in light water reactors (LWRs) using a non-fertile fuel based on plutonium dispersed in an oxide mixture of zirconia stabilized with calcia or yttria as a solid solution. Plutonium dispersed in a zirconia matrix offers the potential to achieve very high burnups while maintaining mechanical integrity.

1959 (INEL–95/0214) **Glass waste forms for the Na-bearing high activity waste fractions.** Vinjamuri, K. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001553. Source: OSTI; NTIS; INIS; GPO Dep.

Candidate experimental glasses for the Na-bearing high activity waste fractions were synthesized by crucible melting a mixture of reagent chemicals representative of the Na-bearing waste, the pilot plant alumina calcine, and frit additives at 1,200 or 1,600 C for 2–5 hours followed by air cooling of the melt. These glasses were characterized for density, elastic properties, viscosity, electrical resistivity, chemical durability, structural parameters, and glass phase separation. The results are discussed in this report.

1960 (INEL–95/0384) **Opportunities for mixed oxide fuel testing in the advanced test reactor to support plutonium disposition.** Terry, W.K. (and others); Ryskamp, J.M.; Sterbentz, J.W. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001187. Source: OSTI; NTIS; INIS; GPO Dep.

Numerous technical issues must be resolved before LWR operating licenses can be amended to allow the use of MOX fuel. These issues include the following: (1) MOX fuel fabrication process verification; (2) Whether and how to use burnable poisons to depress MOX fuel initial reactivity, which is higher than that of urania; (3) The effects of WGPu isotopic composition; (4) The feasibility of loading MOX fuel with plutonia content up to 7% by weight; (5) The effects of americium and gallium in WGPu; (6) Fission gas release from MOX fuel pellets made from WGPu; (7) Fuel/cladding gap closure; (8) The effects of power cycling and off-normal events on fuel integrity; (9) Development of radial distributions of burnup and fission products; (10) Power spiking near the interfaces of MOX and urania fuel assemblies; and (11) Fuel performance code validation. The Advanced Test Reactor (ATR) at the Idaho National Engineering Laboratory possesses many advantages for performing tests to resolve most of the issues identified above. We have performed calculations to show that the use of hafnium shrouds can produce spectrum adjustments that will bring the flux spectrum in ATR test loops into a good approximation to the spectrum anticipated in a commercial LWR containing MOX fuel while allowing operation of the test fuel assemblies near their optimum values of linear heat generation rate. The ATR would be a nearly ideal test bed for developing data needed to support applications to license LWRs for operation with MOX fuel made from weapons-grade plutonium. The requirements for planning and implementing a test program in the ATR have been identified. The facilities at Argonne National Laboratory-West can meet all potential needs for pre- and post-irradiation examination that might arise in a MOX fuel qualification program.

1961 (INEL–95/00458) **Stored Transuranic Waste Management Program at the Idaho National Engineering Laboratory.** Clements, T.L. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960212–76: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96009059. Source: OSTI; NTIS; INIS; GPO Dep.

Since 1970, INEL has provided interim storage capacity for transuranic (TRU)-contaminated wastes generated by activities supporting US national defense needs. About 60% of the nation's current inventory of TRU-contaminated waste is stored at INEL, awaiting opening of the Waste Isolation Pilot Plant (WIPP), the designated federal repository. A number of activities are currently underway for enhancing current management capabilities, conducting projects that support local and national TRU management activities, and preparing for production-level waste retrieval, characterization, examination, certification, and shipment of untreated TRU waste to WIPP in April 1998. Implementation of treatment capability is planned in 2003 to achieve disposal of all stored TRU-contaminated waste by a target date of December 31, 2015, but no later than December 31, 2018.

1962 (INEL–95/00459) **Assessment of gas flammability in transuranic waste container.** Connolly, M.J. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Loehr, C.A.; Djordjevic, S.M.; Spangler, L.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950216–160: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE96003509. Source: OSTI; NTIS; INIS; GPO Dep.

The Safety Analysis Report for the TRUPACT-II Shipping Package [Transuranic Package Transporter-II (TRUPACT-II) SARP] set limits for gas generation rates, wattage limits, and flammable volatile organic compound (VOC) concentrations in transuranic (TRU) waste containers that would be shipped to the Waste Isolation Pilot Plant (WIPP). Based on existing headspace gas data for drums stored at the Idaho National Engineering Laboratory (INEL) and the Rocky Flats Environmental Technology Site (RFETS), over 30 percent of the contact-handled TRU waste drums contain flammable VOC concentrations greater than the limit. Additional requirements may be imposed for emplacement of waste in the WIPP facility. The conditional no-migration determination (NMD) for the test phase of the facility required that flame tests be performed if significant levels of flammable VOCs were present in TRU waste containers. This paper describes an approach for investigating the potential flammability of TRU waste drums, which would increase the allowable concentrations of flammable VOCS. A flammability assessment methodology is presented that will allow more drums to be shipped to WIPP without treatment or repackaging and reduce the need for flame testing on drums. The approach includes experimental work to determine mixture lower explosive limits (MLEL) for the types of gas mixtures observed in TRU waste, a model for predicting the MLEL for mixtures of VOCS, hydrogen, and methane, and revised screening limits for total flammable VOCs concentrations and concentrations of hydrogen and methane using existing drum headspace gas data and the model predictions.

1963 (INEL–95/00461) **Position for determining gas phase volatile organic compound concentrations in transuranic waste containers.** Connolly, M.J. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Liekhus, K.J.; Djordjevic, S.M.; Loehr, C.A. Spangler, L.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960212–2: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96003511. Source: OSTI; NTIS; INIS; GPO Dep.

In the conditional no-migration determination (NMD) for the test phase of the Waste isolation Pilot Plant (WIPP), the US Environmental Protection Agency (EPA) imposed certain conditions on the US Department of Energy (DOE) regarding gas phase volatile organic compound (VOC) concentrations in the void space of transuranic (TRU) waste containers. The EPA required the DOE to ensure that each waste container has no layer of confinement that contains flammable mixtures of gases or mixtures of gases that could become flammable when mixed with air. The EPA also required that sampling of the headspace of waste containers outside inner layers of confinement be representative of the entire void space of the container. The EPA stated that all layers of confinement in a container would have to be sampled until DOE can demonstrate to the EPA that sampling of all layers is unnecessary. A test program was conducted to demonstrate that the gas phase VOC concentration in the void space of each layer of confinement in vented drums can be estimated from measured drum headspace using a theoretical transport model and that sampling of each layer of confinement is unnecessary. This report summarizes the studies performed in the INEL test program and extends them for the purpose of developing a methodology for determining gas phase VOC concentrations in both vented and unvented TRU waste containers. The methodology specifies conditions under which waste drum headspace gases can be said to be representative of drum gases as a whole and describes a method for predicting drum concentrations in situations where the headspace concentration is not representative.

1964 (INEL–95/0511) **Evaluation of Rocky Flats Plant stored plutonium inventory at the Idaho National Engineering Laboratory.** Clements, T.L. Jr.; Einerson, J.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Sep 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003534. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to evaluate reported inventories of plutonium contained in stored transuranic (TRU) waste generated by the Rocky Flats Plant (RFP). From 1970 to 1989, this waste was shipped to the Idaho National Engineering Laboratory (INEL) and placed in aboveground retrievable storage at the Radioactive Waste Management

Complex (RWMC)-Transuranic Storage Area (TSA). This evaluation was initiated to address potential uncertainty in quantities of stored plutonium reported in the Radioactive Waste Management Information System (RWMIS). The RWMIS includes radionuclide information from generators that shipped TRU waste to INEL for storage. Recent evaluations performed on buried TRU waste (1954-1970) resulted in significant revision to the original reported values of plutonium, americium, and enriched uranium. These evaluations were performed based on Rocky Flats Plant (RFP) Inventory Difference (ID) records. This evaluation for stored TRU waste was performed to: (1) identify if significant discrepancies exist between RWMIS reported values and RFP ID records, (2) describe the methodology used to perform the RWMIS evaluation, (3) determine a Best Estimate (BE) and 95% Upper Confidence Bound (UB) on the plutonium inventory, (4) provide conclusions based on this evaluation, and (5) identify recommendations and/or actions that might be needed.

1965 (LA–13011) **The radiological hazard of plutonium isotopes and specific plutonium mixtures.** Heindel, G.; Clow, J.; Inkret, W.; Miller, G. Los Alamos National Lab., NM (United States). Nov 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96001443. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy defines the hazard categories of its nuclear facilities based upon the potential for accidents to have significant effects on specific populations and the environment. In this report, the authors consider the time dependence of hazard category 2 (significant on-site effects) for facilities with inventories of plutonium isotopes and specific weapons-grade and heat-source mixtures of plutonium isotopes. The authors also define relative hazard as the reciprocal of the hazard category 2 threshold value and determine its time dependence. The time dependence of both hazard category 2 thresholds and relative hazards are determined and plotted for 10,000 years to provide useful information for planning long-term storage or disposal facilities.

1966 (LA–13058-MS) **Technology survey for real-time monitoring of plutonium in a vitrifier off-gas system.** Berg, J.M.; Veirs, D.K. Los Alamos National Lab., NM (United States). Jan 1996. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96007461. Source: OSTI; NTIS; INIS; GPO Dep.

We surveyed several promising measurement technologies for the real-time monitoring of plutonium in a vitrifier off-gas system. The vitrifier is being developed by Westinghouse Savannah River Corp. and will be used to demonstrate vitrification of plutonium dissolved in nitric acid for fissile material disposition. The risk of developing a criticality hazard in the off-gas processing equipment can be managed by using available measurement technologies. We identified several potential technologies and methods for detecting plutonium that are sensitive enough to detect the accumulation of a mass sufficient to form a criticality hazard. We recommend gross alpha-monitoring technologies as the most promising option for Westinghouse Savannah River Corp. to consider because that option appears to require the least additional development. We also recommend further consideration for several other technologies because they offer specific advantages and because gross alpha-monitoring could prove unsuitable when tested for this specific application.

1967 (LA-UR–96-2301) **Applying modular concepts to process and authorization basis issues for plutonium residue stabilization.** Hildner, R.A.; Zygmunt, S.J. Los Alamos National Lab., NM (United States). [1996]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9607134–3: 10. American Glovebox Society annual conference, San Diego, CA (United States), 22-25 Jul 1996). Order Number DE96012827. Source: OSTI; NTIS; INIS; GPO Dep.

A recent study completed for the Rocky Flats Environmental Technology Site proved that it is feasible to use modular, skid-mounted processes for disposition of Category 1 quantities of nuclear materials. This would allow personnel to assemble, test, and authorize the processes outside of the nuclear material management area. Besides having cost and schedule advantages, this technology reduces the uncertainty and risk in applications involving disposition of materials and facilities. This paper explains the previous research into modular skid-mounted processes and suggests various future applications of the technology.

1968 (PFC/RR–95-11) **Detection of plutonium with the microwave plasma continuous emissions monitor.** Rhee, D.Y. (Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center); Woskov, P.P.; Gervais, K.; Surma, J.E. Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center; Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96011009. Source: OSTI; NTIS; INIS; GPO Dep.

The first successful detection of plutonium with a continuous microwave plasma emissions monitor has been demonstrated. Seven plutonium emission peaks in the 362 - 366 nm and 449 - 454 nm ranges were clearly observed. The strongest peak was at 453.62 nm. This peak and five of the other plutonium peaks were easily distinguishable from possible interference from iron emission peaks with a spectrometer resolution of 0.1 nm. 2 refs., 3 figs.

1969 (PNL–10787) **Determination of the radioactive material and plutonium holdup in ducts and piping in the 327 Building.** Haggard, D.L.; Brackenbush, L.W. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000749. Source: OSTI; NTIS; INIS; GPO Dep.

The 327 Building Post Irradiation Testing Laboratory is used for temporary storage and for destructive and nondestructive examination of irradiated reactor fuels and structural materials. The facility contains 12 shielded hot cells, two water-filled basins, and dry storage. This report describes the measurements performed to determine the radionuclide content and mass of Pu in ducts, filters, and piping in the basement of the 327 Building at the Hanford Site in Washington State. This information is needed to characterize facility radiation levels, to verify compliance with criticality safety specifications, and to allow more accurate nuclear material control using nondestructive assay (NDA) methods. Gamma assay techniques typically employed for NDA analysis were used to determine the gamma-emitting isotopes in the ducts, filters, and piping. Passive neutron counting was selected to estimate the Pu content because high gamma levels from fission and activation products effectively mask any gamma emissions from Pu. A high-purity gamma-ray detector was used to measure the mixed fission and activation radionuclides. A slab neutron detector containing five ^{3}He proportional counters was used to determine the neutron emission rates and estimate the mass of Pu present. Estimated Pu mass in the basement ductwork and filters is 7.2 grams. The radioactive liquid waste system line has 4.2 grams and Special Environmental Radiometallurgy Facility cell recirculating system contains 8.7 grams in the lower filter housing and associated piping. Total Pu mass holdup estimates range from 20.1 grams, assuming that the Pu is weapons-grade Pu, to a best estimate of 11.0 grams Pu, assuming 11% ^{240}Pu.

1970 (WHC-SA–2781) **International shipment of plutonium by air.** Mercado, J.E.; McGrogan, J.P. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9506150–7: 2. annual Department of Energy defense programs packaging workshop, San Francisco, CA (United States), 12-15 Jun 1995). Order Number DE95016337. Source: OSTI; NTIS; INIS; GPO Dep.

In support of the United States (US) Government's decision to place excess plutonium oxide at the US Department of Energy's (DOE) Hanford Site under International Atomic Energy Agency (IAEA) safeguards, the Department of State notified the Congress that a plutonium storage vault at the Plutonium Finishing Plant at the Hanford Site would be added to the eligible facilities list. As part of the preparations to transfer the plutonium oxide under IAEA safeguards, samples of the powder were taken from the inventory to be shipped to the IAEA headquarters in Vienna, Austria, for laboratory analysis. The analysis of these samples was of high priority, and the IAEA requested that the material be shipped by aircraft, the most expeditious method.

1971 (WHC-SA–2833) **Comparison of NDA and DA measurement techniques for excess Pu powders at the Hanford Site: Operator and IAEA experience.** Welsh, T.L. (and others); McRae, L.P.; Delegard, C.H. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950787–27: 36. annual meeting of the Institute for Nuclear Materials Management, Palm Desert, CA (United States), 9-12 Jul 1995). Order Number DE95015740. Source: OSTI; NTIS; INIS; GPO Dep.

Quantitative physical measurements are necessary components of the International Atomic Energy Agency (IAEA) nuclear material safeguards verification regime. In December 1994, IAEA safeguards were initiated on an inventory of plutonium-bearing oxide and scrap items in Vault 3 of the 2736-Z Building of the Plutonium Finishing Plant on the United States Department of Energy's (USDOE) Hanford Site. The material originated in the United States nuclear weapons complex. The diversity of the chemical form and the heterogenous physical form of the plutonium in this inventory were expected to challenge the target precision and accuracy of methods employed by IAEA: quantitative destructive analytical techniques (which are susceptible to sampling error) and quantitative coincident neutron measurements (which rely on knowledge of the material's chemical form and purity). Because of the diverse and heterogenous nature of plutonium-bearing scrap, plant operations increasingly have adopted calorimetric techniques both for item inventory measurements and for verification purposes. During the recent advent of IAEA safeguards at Vault 3, a set of destructive and nondestructive methods were applied to a number of inventory items (cans of plutonium-bearing powders) with widely ranging chemical purities. Results of these measurements, gathered by the operator's and IAEA's laboratories and instruments as well as by instruments from Pacific Northwest Laboratory and USDOE's Los Alamos National Laboratory (LANL), are presented and statistically compared.

1972 (WHC-SA–2834) **Comparison of NDA and DA measurement techniques for excess plutonium powders at the Hanford Site: Statistical design and heterogeneity testing.** Welsh, T.L. (Westinghouse Hanford Co., Richland, WA (United States)); McRae, L.P.; Delegard, C.H.; Liebetrau, A.M.; Johnson, W.C.; Theis, W.; Lemaire, R.J.; Xiao, J. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950787–26: 36. annual meeting of the Institute for Nuclear Materials Management, Palm Desert, CA (United States), 9-12 Jul 1995). Order Number DE95015738. Source: OSTI; NTIS; INIS; GPO Dep.

Quantitative physical measurements are a n component of the International Atomic Energy Agency (IAEA) nuclear material m&guards verification regime. In December 1994, LA.FA safeguards were initiated on an inventory of excess plutonium powder items at the Plutonium Finishing Plant, Vault 3, on the US Department of Energy's Hanford Site. The material originl from the US nuclear weapons complex. The diversity of the chemical form and the heterogenous physical form of this inventory were anticipated to challenge the precision and accuracy of quantitative destructive analytical techniques. A sampling design was used to estimate the degree of heterogeneity of the plutonium content of a variety of inventory items. Plutonium concentration, the item net weight, and the ^{240}Pu content were among the variables considered in the design. Samples were obtained from randomly selected location within each item. Each sample was divided into aliquots and analyzed chemically. Operator measurements by calorimetry and IAEA measurements by coincident neutron nondestructive analysis also were performed for the initial physical inventory verification materials and similar items not yet under IAEA safeguards. The heterogeneity testing has confirmed that part of the material is indeed significantly heterogeneous; this means that precautionary measures must be taken to obtain representative samples for destructive analysis. In addition, the sampling variability due to material heterogeneity was found to be comparable with, or greater than, the variability of the operator's calorimetric measurements.

1973 (WHC-SA–3017-FP) **Plutonium storage phenomenology.** Szempruch, R. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951259–6: Plutonium stabilization and immobilization workshop, Washington, DC (United States), 12-14 Dec 1995). Order Number DE96009107. Source: OSTI; NTIS; INIS; GPO Dep.

Plutonium has been produced, handled, and stored at Department of Energy (DOE) facilities since the 1940s. Many changes have occurred during the last 40 years in the sources, production demands, and end uses of plutonium. These have resulted in corresponding changes in the isotopic composition as well as the chemical and physical forms of the processed and stored plutonium. Thousands of ordinary food pack tin cans have been used successfully for many years to handle and store plutonium. Other containers have been used with equal success. This paper addressees the exceptions to this satisfactory experience. To aid in understanding the challenges of handling plutonium for storage or immobilization the lessons learned from past storage experience and the necessary countermeasures to improve storage performance are discussed.

1974 (WHC-SD-CP-DRD-003) **Vault safety and inventory system conceptual baseline document.** Corrigan, N.B. Westinghouse Hanford Co., Richland, WA (United States). 5 Sep 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050001. Source: OSTI; NTIS; INIS; GPO Dep.

This document defines the baseline scope, schedule, and cost of the replacement computer system for the Vault Safety and Inventory System at the Plutonium Finishing Plant.

1975 (WHC-SD-CP-SA-026-Rev.1) **Seismic analyses of equipment in 2736-Z complex. Revision 1.** Ocoma, E.C. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 863p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012487. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the structural qualification for the existing equipment when subjected to seismic loading in the Plutonium Storage Complex. It replaces in entirety Revision 0 and reconciles the U.S. Department of Energy (DOE) comments on Revision 0. The Complex consists of 2736-Z Building (plutonium storage vault), 2736-ZA Building (vault ventilation equipment building), and 2736-ZB Building (shipping/receiving, repackaging activities). The existing equipment structurally qualified in this report are the metal storage racks for 7 inch and lard cans in room 2 of Building 2736-Z; the cubicles, can holders and pedestals in rooms 1, 3, and 4 of Building 2736-Z; the ventilation duct including exhaust fans/motors, emergency diesel generator, and HEPA filter housing in Building 2736-ZA; the repackaging glovebox in Building 2736-ZB; and the interface duct between Buildings 2736-Z and 2736-ZA.

1976 (WHC-SD-CP-TI-195) **Ash Stabilization Campaign Blend Plan.** Winstead, M.L. Westinghouse Hanford Co., Richland, WA (United States). 21 Jun 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015549. Source: OSTI; NTIS; INIS; GPO Dep.

This Stabilization Blend Plan documents the material to be processed and the processing order for the FY95 Ash Stabilization Campaign. The primary mission of this process is to reduce the inventory of unstable plutonium bearing ash. The source of the ash is from Rocky Flats and the 232-Z incinerator at the Plutonium Finishing Plant (PFP). The ash is currently being stored in Room 235B and Vault 174 in building 234-5Z. The sludge is to be thermally stabilized in a glovebox in room 230A of the 234-5Z building and material handling for the process will be done in room 230B of the same building. The campaign is scheduled for approximately 12–16 weeks. A total of roughly 4 kg of Pu will be processed.

1977 (WHC-SD-PRP-HA-002-Rev.2) **Plutonium finishing plant hazards assessment.** Sutton, L.N. Westinghouse Hanford Co., Richland, WA (United States). 8 Sep 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050018. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes the technical basis in support of Emergency Planning activities for the Plutonium Finishing Plant on the Hanford Site. Through this document, the technical basis for the development of facility speific Emergency Action Levels and the Emergency Planning Zone is demonstrated.

1978 (WHC-SD-SNF-TA-007) **Surveillance and prediction methods for the plutonium limit in the K-East Fuel Storage Basin Sandfilter Backwash Pit.** Harris, R.A. Westinghouse Hanford Co., Richland, WA (United States). 1 Jun 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014311. Source: OSTI; NTIS; INIS; GPO Dep.

Methods to predict and measure the amount of plutonium added to the 105-K East fuel storage basin sandfilter backwash pit have been developed. The bases for the methods and an evaluation of available data used in the methods are described.

1979 (WHC-SD-SQA-CSA-20397) **Addendum 6 to CSAR 79-038 out-of-hood plutonium storage (burial box).** Chiao, T. Westinghouse Hanford Co., Richland, WA (United States). 14 Jun 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015550. Source: OSTI; NTIS; INIS; GPO Dep.

The Addendum considered an increase in the limit of fissile material in a stacked container array to 500 grams. In other words, the sum of fissile material in an array of containers is limited to 500 grams, regardless of whether the containers are stacked or not. The results of this evaluation indicates that with the modification of the fissile limits described, the system of a container array will stay sub-critical.

1980 (WHC-SD-WM-ER-422-Rev.2) **Tank 241-BY-108 headspace gas and vapor characterization results for samples collected in March 1994 and October 1994.** Huckaby, J.L. (Pacific Northwest Lab., Richland, WA (United States)); Bratzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050119. Source: OSTI; NTIS; INIS; GPO Dep.

Significant changes have been made to all of the original vapor characterization reports. This report documents specific headspace gas and vapor characterization results for all vapor sampling events to date. In addition, changes have been made to the original vapor reports to qualify the data based on quality assurance issues associated with the performing laboratories.

1981 (WSRC-MS-95-0354) **Temperature and humidity effects on the corrosion of aluminum-base reactor fuel cladding materials during dry storage.** Peacock, H.B.; Sindelar, R.L.; Lam, P.S. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9509253-7: 18. international meeting on reduced enrichment for research and test reactors, Paris (France), 18-21 Sep 1995). Order Number DE96003361. Source: OSTI; NTIS; INIS; GPO Dep.

The effect of temperature and relative humidity on the high temperature (up to 200°C) corrosion of aluminum cladding alloys was investigated for dry storage of spent nuclear fuels. A dependency on alloy type and temperature was determined for saturated water vapor conditions. Models were developed and benchmarked to allow prediction of cladding behavior of 1100, 5052, and 6061 aluminum alloys for up to 50+ years at 100% relative humidity. Calculations show that for a closed system, corrosion stops after all moisture and oxygen is used up during corrosion reactions with aluminum alloys.

1982 (WSRC-TR-95-0468) **Vitrification of Rocky Flats ash followed by encapsulation in the Defense Waste Processing Facility.** McKibben, J.M. (Westinghouse Savannah River Co., Aiken, SC (United States)); Land, B.; Strachan, D.M.; Perez, J.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-951259-7: Plutonium stabilization and immobilization workshop, Washington, DC (United States), 12-14 Dec 1995). Order Number DE96009645. Source: OSTI; NTIS; INIS; GPO Dep.

Approximately 10 to 20 metric tons of plutonium in the US is in the form of scrap, residues, oxides, ash, metal, sludge, compounds, etc. This paper describes a relatively simple concept of stabilizing most of this type of plutonium by converting it into encapsulated glass. A full-scale hot demonstration of the concept is proposed, in which Rocky Flats ash would be vitrified and sealed in small cans, followed by encapsulation of the cans in Defense Waste Processing Facility (DWPF) canisters with high-level waste glass. The proposal described in this paper offers an integrated national approach for early stabilization and disposition of the nation's plutonium-bearing residues.

1983 (WSRC-TR-95-0472) **Glass and ceramic immobilization alternatives and the use of new facilities.** Kan, T. (Lawrence Livermore National Lab., CA (United States)); Sullivan, K. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-951259-9: Plutonium stabilization and immobilization workshop, Washington, DC (United States), 12-14 Dec 1995). Order Number DE96009647. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) is examining options for placing weapons-usable surplus nuclear materials (principally plutonium [Pu] and highly enriched uranium [U]) in a form or condition that is substantially and inherently more difficult to use in weapons either by the Host Country or by a subnational group. The two most promising alternatives for achieving these aims are: fabrication and use as fuel, without reprocessing, in existing or modified nuclear reactors; or vitrification in combination with high-level radioactive waste. The mission of the immobilization technologies and facilities considered in this paper and the paper "Use of Savannah River Site (SRS) Facilities for Glass and Ceramics," is to produce a waste form by incorporating plutonium in either an amorphous glass or a crystalline ceramic matrix and then disposal of it in a geologic repository. This paper summarizes all the glass and ceramic alternatives under consideration and presents the immobilization options using new facilities. The subsequent paper presents the immobilization options which use existing facilities at the Savannah River Site.

DECONTAMINATION & DECOMMISSIONING

1984 (AFIT/ENS-95-01) **Comparative life-cycle cost analysis for low-level mixed waste remediation alternatives.** Jackson, J.A.; White, T.P.; Kloeber, J.M.; Toland, R.J.; Cain, J.P.; Buitrago, D.Y. Air Force Inst. of Tech., Wright-Patterson AFB, OH (United States). Mar 1995. 302p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011131. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study is two-fold: (1) to develop a generic, life-cycle cost model for evaluating low-level, mixed waste remediation alternatives, and (2) to apply the model specifically, to estimate remediation costs for a site similar to the Fernald Environmental Management Project near Cincinnati, OH. Life-cycle costs for vitrification, cementation, and dry removal process technologies are estimated. Since vitrification is in a conceptual phase, computer simulation is used to help characterize the support infrastructure of a large scale vitrification plant. Cost estimating relationships obtained from the simulation data, previous cost estimates, available process data, engineering judgment, and expert opinion all provide input to an Excel based spreadsheet for generating cash flow streams. Crystal Ball, an Excel add-on, was used for discounting cash flows for net present value analysis. The resulting LCC data was then analyzed using multi-attribute decision analysis techniques with cost and remediation time as criteria. The analytical framework presented allows alternatives to be evaluated in the context of budgetary, social, and political considerations. In general, the longer the remediation takes, the lower the net present value of the process. This is true because of the time value of money and large percentage of the costs attributed to storage or disposal.

1985 (ANL-95-32) **Equipment decontamination: A brief survey of the DOE complex.** Conner, C.; Chamberlain, D.B; Chen, L.; Vandegrift, G.F. Argonne National Lab., IL (United States). Mar 1995. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96005816. Source: OSTI; NTIS; INIS; GPO Dep.

Deactivation at DOE facilities has left a tremendous amount of contaminated equipment behind. In-situ methods are needed to decontaminate the interiors of the equipment sufficiently to allow either free release or land disposal. A brief survey was completed of the DOE complex on their needs for equipment decontamination with in-situ technology to determine (1) the types of contamination problems within the DOE complex, (2) decontamination processes that are being used or are being developed within the DOE, and (3) the methods that are available to dispose of spent decontamination solutions. In addition, potential sites for testing decontamination methods were located. Based on the information obtained from these surveys, the Rocky Flats Plant and the Idaho National Engineering Laboratory appear to be best suited to complete the initial testing of the decontamination processes.

1986 (ANL/CMT/CP–87864) **A review of chemical decontamination systems for nuclear facilities.** Chen, L.; Chamberlain, D.B.; Conner, C.; Vandegrift, G.F. Argonne National Lab., IL (United States). Chemical Technology Div. [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960443–6: American Nuclear Society (ANS) topical meeting on decontamination and decommissioning, Chicago, IL (United States), 14-17 Apr 1996). Order Number DE96008403. Source: OSTI; NTIS; INIS; GPO Dep.

With the downsizing of the Department of Energy (DOE) complex, many of its buildings and facilities will be decommissioned and dismantled. As part of this decommissioning, some form of decontamination will be required. To develop an appropriate technology for in situ chemical decontamination of equipment interiors in the decommissioning of DOE nuclear facilities, knowledge of the existing chemical decontamination methods is needed. This paper attempts to give an up-to-date review of chemical decontamination methods. This survey revealed that aqueous systems are the most widely used for the decontamination and cleaning of metal surfaces. We have subdivided the aqueous systems by types of chemical solvent: acid, alkaline permanganate, highly oxidizing, peroxide, and proprietary. Two other systems, electropolishing and foams and gels, are also described in this paper.

1987 (ANL/CMT/CP–87865) **Decontamination of actinides and fission products from stainless steel surfaces.** Mertz, C. (Argonne National Lab., IL (United States)); Chamberlain, D.B.; Chen, L.; Conner, C.; Vandegrift, G.F.; Drockelman, D.; Kaminski, M.; Landsberger, S.; Stubbins, J. Argonne National Lab., IL (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960443–5: American Nuclear Society (ANS) topical meeting on decontamination and decommissioning, Chicago, IL (United States), 14-17 Apr 1996). Order Number DE96008402. Source: OSTI; NTIS; INIS; GPO Dep.

Seven in situ decontamination processes were evaluated as possible candidates to reduce radioactivity levels in nuclear facilities throughout the DOE complex. These processes were tested using stainless steel coupons (Type 304) contaminated with actinides (Pu and Am) or fission products (a mixture of Cs, Sr, and Gd). The seven processes were decontamination with nitric acid, nitric acid plus hydrofluoric acid, fluoboric acid, silver(II) persulfate, hydrogen peroxide plus oxalic acid plus hydrofluoric acid, alkaline persulfate followed by citric acid plus oxalic acid, and electropolishing using nitric acid electrolyte. Of the seven processes, the nitric acid plus hydrofluoric acid and fluoboric acid solutions gave the best results; the decontamination factors for 3- to 6-h contacts at 80°C were as high as 600 for plutonium, 5500 for americium, 700 for cesium, 15000 for strontium, and 1100 for gadolinium.

1988 (ANL/D-D/TM–95/1) **A survey of commercially available manipulators, end-effectors, and delivery systems for reactor decommissioning activities.** Henley, D.R. (Argonne National Lab., IL (United States)); Litka, T.J. Argonne National Lab., IL (United States). May 1996. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96013516. Source: OSTI; NTIS; INIS; GPO Dep.

Numerous nuclear facilities owned by the U.S. Department of Energy (DOE) are under consideration for decommissioning. Currently, there are no standardized, automated, remote systems designed to dismantle and thereby reduce the size of activated reactor components and vessels so that they can be packaged and shipped to disposal sites. Existing dismantling systems usually consist of customized, facility-specific tooling that has been developed to dismantle a specific reactor system. Such systems have a number of drawbacks. Generally, current systems cannot be disassembled, moved, and reused. Developing and deploying the tooling for current systems is expensive and time-consuming. In addition, the amount of manual work is significant because long-handled tools must be used; as a result, personnel are exposed to excessive radiation. A standardized, automated, remote system is therefore needed to deliver the tooling necessary to dismantle nuclear facilities at different locations. Because this system would be reusable, it would produce less waste. The system would also save money because of its universal design, and it would be more reliable than current systems.

1989 (ANL/D-D/TM–96/1) **Waste minimization handbook, Volume 1.** Boing, L.E.; Coffey, M.J. Argonne National Lab., IL (United States). Dec 1995. 168p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96009935. Source: OSTI; NTIS; INIS; GPO Dep.

This technical guide presents various methods used by industry to minimize low-level radioactive waste (LLW) generated during decommissioning and decontamination (D and D) activities. Such activities generate significant amounts of LLW during their operations. Waste minimization refers to any measure, procedure, or technique that reduces the amount of waste generated during a specific operation or project. Preventive waste minimization techniques implemented when a project is initiated can significantly reduce waste. Techniques implemented during decontamination activities reduce the cost of decommissioning. The application of waste minimization techniques is not limited to D and D activities; it is also useful during any phase of a facility's life cycle. This compendium will be supplemented with a second volume of abstracts of hundreds of papers related to minimizing low-level nuclear waste. This second volume is expected to be released in late 1996.

1990 (ANL/DIS/CP–87709) **Unit decontamination and dismantlement (D&D) costs.** Folga, S. (Argonne National Lab., IL (United States)); Swanston, R.; Davis, M.; Janke, R.J. Argonne National Lab., IL (United States). 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-960212–16: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006904. Source: OSTI; NTIS; INIS; GPO Dep.

A series of relationships have been developed for estimating unit decontamination and dismantlement (D&D) costs for a number of building types which may be applied in the absence of other data to obtain rough order-of-magnitude (ROM) cost estimates for D&D activities. The relationships were developed using unit D&D costs for a number of building structure types at the Department of Energy Fernald site. These unit costs into account the level of radioactive contamination as well as the, building size.

1991 (ANL/EA/CP--87182) **On-site disposal of decontaminated and dismantled (D and D) materials: A management approach.** Hall, J.S. (Dept. of Energy, Cincinnati, OH (United States). Fernald Area Office); Clark, T.R.; Davis, M.J.; Picel, K.C. Argonne National Lab., IL (United States). 19 Jul 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950868--31: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96002273. Source: OSTI; NTIS; INIS; GPO Dep.

The Fernald Environmental Management Project (FEMP) is a federal facility located near Cincinnati, Ohio that is being remediated. Operable Unit 3 (OU3) of the FEMP consists of 232 buildings and other structures that formerly housed various uranium and thorium metallurgical and chemical processes. The buildings are constructed primarily of steel and concrete, with transite siding. The structures are being decontaminated and dismantled using an interim remedial action approach. The disposition of the debris and other waste materials generated by the interim action is being addressed by the final remedial action for the operable unit. The preferred alternative is disposal of most of the material in an engineered disposal cell located on the FEMP property. This is complicated by the fact that the FEMP is located in an environmentally sensitive area and by the complex nature of the materials. The principal aquifer located beneath the site, the Great Miami Aquifer, is designated as a sole-source aquifer under the Safe Drinking Water Act. Disposal of any wastes at the FEMP must be protective of the aquifer. Dismantlement of OU3 structures will result in a very heterogeneous waste stream, both in terms of types of materials and levels of contamination. Wastes to be managed also include contaminated production equipment and drummed materials associated with former production activities, as well as structural materials. All of these factors complicate the management of OU3 materials. This paper discusses the approach proposed by the FEMP for the management of materials resulting from the interim remedial action. The components of the management approach being used to address disposal of the heterogeneous wastes from OU3 in an environmentally sensitive manner are discussed, followed by some conclusions.

1992 (ANL/EA/CP--88311) **Estimating D and D costs for structures at DOE facilities: Some considerations.** Davis, M.J. (Argonne National Lab., IL (United States)); Folga, S.; Swanston, R.; Janke, R.J. Argonne National Lab., IL (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960443--7: American Nuclear Society (ANS) topical meeting on decontamination and decommissioning, Chicago, IL (United States), 14-17 Apr 1996). Order Number DE96008445. Source: OSTI; NTIS; INIS; GPO Dep.

A number of issues are examined related to estimating decontamination and decommissioning costs for structures at US Department of Energy facilities. The ability to develop detailed estimates for such facilities is generally well established and the general range of costs for such activity is well understood. However, current ability to quickly develop credible planning estimates is more limited. A need exists for a continuing synthesis of experience to allow for an improved ability to develop both detailed and planning estimates.

1993 (ANL/EAD/TM--51) **Derivation of guidelines for uranium residual radioactive material in soil at the B&T Metals Company site, Columbus, Ohio.** Kamboj, S.; Nimmagadda, Mm.; Yu, C. Argonne National Lab., IL (United States). Environmental Assessment Div. Jan 1996. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96005808. Source: OSTI; NTIS; INIS; GPO Dep.

Guidelines for uranium residual radioactive material in soil were derived for the B&T Metals Company site in Columbus, Ohio. This site has been identified for remedial action under the US Department of Energy's (DOE's) Formerly Utilized Sites Remedial Action Program (FUSRAP). Single-nuclide and total-uranium guidelines were derived on the basis of the requirement that following remedial action, the 50-year committed effective dose equivalent to a hypothetical individual living or working in the immediate vicinity of the site should not exceed a dose constraint of 30 mrem/yr for the current use and likely future use scenarios or a dose limit of 100 n-mrem/yr for less likely future use scenarios. The DOE residual radioactive material guideline computer code, RESRAD, was used in this evaluation. RESRAD implements the methodology described in the DOE manual for establishing residual radioactive material guidelines. Three scenarios were considered; each assumed that for a period of 1,000 years following remedial action, the site would be used without radiological restrictions. The three scenarios varied with regard to the type of site use, time spent at the site by the exposed individual, and sources of food and water consumed. The evaluations indicate that the dose constraint of 30 mrem/yr would not be exceeded for uranium (including uranium-234, uranium-235, and uranium-238) within 1,000 years, provided that the soil concentration of total uranium (uranium-234, uranium-235, and uranium-238) at the B&T Metals site did not exceed 1, I 00 pCi/g for Scenario A (industrial worker, current use) or 300 pCi/g for Scenario B (resident with municipal water supply, a likely future use). The dose limit of 100 mrem/yr would not be exceeded at the site if the total uranium concentration of the soil did not exceed 880 pCi/g for Scenario C (resident with an on-site water well, a plausible but unlikely future use).

1994 (ANL/EAD/TM--55) **Postremediation dose assessment for the former Alba Craft Laboratory site, Oxford, Ohio.** Kamboj, S. (Argonne National Lab., IL (United States). Environmental Assessment Div.); Nimmagadda, M.; Yu, C. Argonne National Lab., IL (United States). Apr 1996. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96012031. Source: OSTI; NTIS; INIS; GPO Dep.

Potential maximum radiation dose rates were calculated for the former Alba Craft Laboratory site in Oxford, Ohio, which was involved in machining of uranium metal in the 1950s for the U.S. atomic energy program. The site is not currently being used. The residual radioactive material guidelines (RESRAD) computer code, which implements the methodology described in the US Department of Energy's (DOE's) manual for establishing residual radioactive material guidelines, was sued in this evaluation. Three potential land use scenarios were considered for the former Alba Craft site; the scenarios vary with regard to the type of site use, time spent at the site by the exposed individual, and sources of food consumed. Scenario A (a possible land use scenario) assumed industrial use of the site; Scenario B (a likely future land use scenario) assumed residential use of the site; and Scenario C (a possible but unlikely land use scenario) assumed the presence of a resident farmer. For scenario A, it was assumed that any water used for domestic or industrial activities would be from uncontaminated off-site municipal sources. The water used for drinking, household purposes, and irrigation was assumed to be from uncontaminated municipal sources in Scenario B; groundwater drawn from a well located at the downgradient edge of the contaminated zone would be the only source of water for drinking, irrigation, and raising livestock in Scenario C. The results of the evaluation indicated that the DOE dose limit of 100 mrem/yr would not be exceeded for any of the scenarios analyzed. The potential maximum dose rates for Scenarios A, B, and C are 0.64, 2.0, and 11 mrem/yr, respectively.

1995 (ANL/EMO/CP--90483) **Minimizing waste in environmental restoration.** Moos, L.; Thuot, J.R. Argonne National Lab., IL (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960741--11: Pollution prevention conference, Chicago, IL (United States), 9-11 Jul 1996). Order Number DE96012757. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental restoration, decontamination and decommissioning and facility dismantelment projects are not typically known for their waste minimization and pollution prevention efforts. Typical projects are driven by schedules and milestones with little attention given to cost or waste minimization. Conventional wisdom in these projects is that the waste already exists and cannot be reduced or minimized. In fact, however, there are three significant areas where waste and cost can be reduced. Waste reduction can occur in three ways: beneficial reuse or recycling; segregation of waste types; and reducing generation of secondary waste. This paper will discuss several examples of reuse, recycle, segregation, and secondary waste reduction at ANL restoration programs.

1996 (ANL/ESH-HP--96/01) **Radiological status report for the EBWR containment building. Volume 1: Summary and analysis.** Murdoch, B.T. Argonne National Lab., IL (United States). Feb 1996. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96008722. Source: OSTI; NTIS; INIS; GPO Dep.

At the conclusion of the EBWR D and D process, ANL Health Physics conducted a release survey to determine the radiological status of the facility. The primary goal of the survey was to verify that residual activities on building surfaces met DOE and ANL guidelines for downposting of a Radiologically Contaminated Area to a Radiologically Controlled Area. The resultant area was to bear no contamination designation, with no requirements for radiological personnel monitoring or protective clothing. ANL Health Physics designed a survey procedure, using a graded approach considering the building history, the D and D process, and the intended future use. The survey followed the general guidance of NRC NUREG/CR-5849, but simplified and reduced in scope to match the release goal. The building interior surfaces were divided into 15 principal survey units and one special survey unit. Each of the principal survey units had to meet the controlled release guidelines. The procedure consisted of dual full floor scans for beta/gamma activity, sampling measurements of total and removable alpha and beta/gamma activities, and background gamma exposure surveys. In the 15 principal survey units, surface activities were measured at a total of 444 locations. With the exception of certain excluded contaminated areas and mechanical equipment, the building interior meets the limited release guidelines.

1997 (ANL/ESH-HP--96/02) **Verification survey of buildings 200 hot cells.** Sholeen, C.M. Argonne National Lab., IL (United States). Mar 1996. 212p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96011918. Source: OSTI; NTIS; INIS; GPO Dep.

At the start of this D&D project, the decontamination goals were set at (1) reducing the stack emissions to 10% of the 1991 emissions; (2) reducing the exposure rate in each cell to < 1 mR/h; and (3) reducing the removable contamination to none detectable. Since the contamination can be fixed with paint, the other two goals were given priority. The estimate of the 1995 emissions from K-3 was 20% of the 1991 emissions estimate. However, the 1996 estimates are ~9% of the 1991 emissions estimate. Since in 1991 the K-3 emissions were only 1/2% of the emissions from M-1, even the 20% reduction has little effect on the project reduction. The total emissions have been reduce to ~2 1/4% of the 1991 emissions from the 5 hot cells that were decontaminated. The emissions and exposure rates are presented in Table I below. Cells A-1 and M-1 exceed the exposure rate criteria. For the other cells, the general exposure rate in the middle of the cell meets the criteria. However, near the prefilters, the exposure rates increase. Cell M-1 has extensive floor contamination that penetrated to a 6 inch depth. At 30 cm above the floor, the exposure rate through the lead blanket is 50 mR/h. A more detailed list of acceptance criteria were specified before the final verification survey. Table ii compares the maximum survey results on the wall or floor surface of each cell to these criteria. Cells M-1 and A-1 frequently fail to meet these criteria.

1998 (ANL/ES/RP--89091) **Mound-ACT*DE*CON^{SM} feasibility study. Phase 2: Final report.** Argonne National Lab., IL (United States). Dec 1994. 242p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96008777. Source: OSTI; NTIS; INIS; GPO Dep.

A portion of the abandoned Miami-Erie Canal paralleling the Greater Miami River receives the runoff and storm-water discharge from Mound Laboratory. In 1969, a low-level plutonium leak contaminated sediment as far away as 1.5 mi from the Mound site along the old canal system. An estimated one million cubic feet of sediment requires remediation. The technology being evaluated for the remediation of the low-level plutonium-238 contamination of the sediment involves two processes: washing the sediments with ACT*DE*CON^{SM} solution to dissolve the contaminant, followed by extraction of the solution and processing with the MAG*SEP^{SM} process to concentrate the contaminant and allow reuse of the ACT*DE*CON^{SM} solution. The processes are being optimized for pilot-scale and field demonstration. Phase 2 of the project primarily involved identification at the laboratory scale of the optimal ACT*DE*CON^{SM} formulation, identification of the ion-exchanger and MAG*SEP^{SM} particles, verification of the plutonium mobility in the treated soil, and evaluation of other process parameters according to a series of tasks.

1999 (ANL/EWM/CP--82616) **Preliminary investigation of the 317 Area, ANL-E.** Wescott, J. (Argonne National Lab., IL (United States)); Moos, L.; Remeikis, A. Argonne National Lab., IL (United States). [1995]. 13p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950225–2: Geoenvironment 2000 meeting, Baton Rouge, LA (United States), 22-24 Feb 1995). Order Number DE95012940. Source: OSTI; NTIS; INIS; GPO Dep.

The 317 Area at Argonne National Laboratory-East (ANL-E) is scheduled to undergo a Resource Conservation and Recovery Act (RCRA) Facility Investigation, Act or RFI. Prior to the formal RFI, a voluntary, preliminary characterization of the 317 Area was conducted by ANL-E. The characterization results were used to formulate the RFI work plan and provided a better focus for the formal investigation. This site presents a difficult engineering challenge. The nature of the waste disposed at this site in the past includes both liquid chemicals and radioactive waste. The 317 Area is classified as a radiologically controlled area because of operations currently performed there. Present Department of Energy policy stipulates that waste material from such an area must be considered radioactive. The possible presence of hazardous constituents in the soil and groundwater would require the investigation-derived waste generated at the site be disposed as radioactive mixed waste. Besides the nature of the waste possibly contaminating this site, the geology of the site poses an equally enigmatic situation. The ANL-E site is located in a region of recessional glacial moraine deposits.

2000 (ANL/TD/CP–85768) **Decontamination and decommissioning of the Experimental Boiling Water Reactor at Argonne National Laboratory.** Sears, L.F. (ALARON Corp. (United States)); Fellhauer, C. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950414–6: 57. annual American power conference, Chicago, IL (United States), 18-20 Apr 1995). Order Number DE95013787. Source: OSTI; NTIS; INIS; GPO Dep.

The Experimental Boiling Water Reactor (EBWR), located on the Argonne National Laboratory-East (ANL-E) site, started operations in 1957. The initial rating was 20 MW(t). The rating was eventually increased to 70 MW(t) in 1959 and 100 MW(t) in 1962. The reactor was shut down in 1967 and all of the fuel was removed from the facility. The facility was placed in dry lay-up until 1986. ANL-E personnel started the decontamination and decommissioning (D&D) effort in 1986. Supporting equipment such as the external steam system and some of the upper reactor components, the core riser and the top fuel shroud, were removed at that time. Characterization of the facility was also undertaken. The contract to complete the EBWR D&D Project was issued in December 1993. The initial schedule called for the final effort to be divided into five phases that were to be completed over a four year period. However, this schedule was subsequently consolidated, at the request of ANL-E, to a thirteen month period, with the on-site work to be completed by the end of 1994. The EBWR D&D Project is approximately 88% complete. A small quantity of reactor internals remains to be volume reduced along with the removal of the SFSP water treatment system. Upon completion of this work the facility will be decontaminated and a final survey completed. The planned completion of on-site work is scheduled for July 1995.

2001 (ANL/TD/CP–86095) **Low impact plutonium glovebox D&D.** Rose, R.W. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950868–37: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96005084. Source: OSTI; NTIS; INIS; GPO Dep.

A dilemma often encountered in decontamination and decommissioning operations is the lack of choice as to the location where the work is to be performed. Facility siting, laboratory location, and adjacent support areas were often determined based on criteria, which while appropriate at the time, are not always the most conducive to a D&D project. One must learn to adapt and cope with as found conditions. High priority research activities, which cannot be interrupted, may be occurring in adjacent non-radiological facilities in the immediate vicinity where highly contaminated materials must be handled in the course of a D&D operation. The execution of a project within such an environment involves a high level of coordination, cooperation, professionalism and flexibility among the project, the work force and the surrounding occupants. Simply moving occupants from the potentially affected area is not always an option and much consideration must be given in the selection of the D&D methodology to be employed and the processes to be implemented. Determining project boundaries and the ensuring that adjacent occupants are included in the planning/scheduling of specific operations which impact their work area are important in the development of the safety envelope. Such was the case in the recent D&D of 61 gloveboxes contaminated with plutonium and other transuranic nuclides at the Argonne National Laboratory-East site. The gloveboxes, which were used in Department of Energy research and development program activities over the past 30 years, were decontaminated to below transuranic waste criteria, size reduced, packaged and removed from Building 212 by Argonne National Laboratory personnel in conjunction with Nuclear Fuel Services, Inc. with essentially no impact to adjacent occupants.

2002 (ANL/TD/CP–88550) **Aerosol measurements from plasma torch cuts on stainless steel, carbon steel, and aluminum.** Novick, V.J.; Brodrick, C.J.; Crawford, S.; Nasiatka, J.; Pierucci, K.; Reyes, V.; Sambrook, J.; Wrobel, S.; Yeary, J. Argonne National Lab., IL (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-960443–1: American Nuclear Society (ANS) topical meeting on decontamination and decommissioning, Chicago, IL (United States), 14-17 Apr 1996). Order Number DE96004296. Source: OSTI; NTIS; INIS; GPO Dep.

The main purpose of this project is to quantify aerosol particle size and generation rates produced by a plasma torch whencutting stainless steel, carbon steel and aluminum. the plasma torch is a common cutting tool used in the dismantling of nuclear facilities. Eventually, other cutting tools will be characterized and the information will be compiled in a user guide to aid in theplanning of both D&D and other cutting operations. The data will be taken from controlled laboratory experiments on uncontaminated metals and field samples taken during D&D operations at ANL nuclear facilities. The plasma torch data was collected from laboratory cutting tests conducted inside of a closed, filtered chamber. The particle size distributions were determined by isokinetically sampling the exhaust duct using a cascade impactor. Cuts on different thicknesses showed there was no observable dependence of the aerosol quantity produced as a function of material thickness for carbon steel. However, data for both stainless steel and aluminum revealed that the aerosol mass produced for these materials appear to have some dependance on thickness, with thinner materials producing tmore aerosols. The results of the laboratory cutting tests show that most measured particle size distributions are bimodal with one mode at about 0.2 μm and the other at about 10 μm. The average Mass Median Aerodynamic Diameters (MMAD's) for these tests are 0.36 $\pm$0.08 μm for stainless steel, 0.48 $\pm$0.17μm for aluminum and 0.52$\pm$0.12 μm for carbon steel.

2003 (ANL/TD/CP--89321) **The D&D of the Experimental Boiling Water Reactor (EBWR).** Fellhauer, C.R.; Boling, L.E.; Yule, T.J.; Bhattacharyya, S.K. Argonne National Lab., IL (United States). [1996]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960306--8: ICONE 4: ASME/JSME international conference on nuclear engineering, New Orleans, LA (United States), 10-13 Mar 1996). Order Number DE96007055. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory has completed the D&D of the Experimental Boiling Water Reactor. The Project consisted of decontaminating and for packaging as radioactive waste the reactor vessel and internals, contaminated piping systems, miscellaneous tanks, pumps, and associated equipment. The D&D work involved dismantling process equipment and associated plumbing, ductwork drain lines, etc., performing size reduction of reactor vessel internals in the fuel pool, packaging and manifesting all radioactive and mixed waste, and performing a thorough survey of the facility after the removal of activated and contaminated material. Non-radioactive waste was disposed of in the ANL-E landfill or recycled. In January 1996 the EBWR facility was formally decommissioned and transferred from EM-40 to EM-30. This paper will discuss the details of this ten year effort.

2004 (ANL/TD/CP--89380) **Waste minimization and pollution prevention in D&D operations at the Argonne National Laboratory-East site.** Boing, L.E.; Coffey, M.J.; Ditch, R.W.; Fellhauer, C.R.; Rose, R.W. Argonne National Lab., IL (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960741--6: Pollution prevention conference, Chicago, IL (United States), 9-11 Jul 1996). Order Number DE96012690. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory (ANL) is implementing waste minimization and pollution prevention activities into its conduct of decontamination and decommissioning (D&D) projects. Many of these activities are rather straight forward and simple approaches, yet they are often overlooked and not implemented as often as they should or could be. Specific activities involving recycling and reuse of materials and structures, which have proven useful in lowering decommissioning and disposal costs on D&D projects at ANL are presented.

2005 (ANL/TD/SUMM--85849) **Experiences in the D&D of the EBWR reactor complex at Argonne National Laboratory.** Bhattacharyya, S.K.; Boing, L.E.; Fellhauer, C.R. Argonne National Lab., IL (United States). Feb 1995. 3p. Sponsored by USDOE, Washington, DC (United States). (CONF-950601--12: Annual meeting of the American Nuclear Society (ANS), Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95013713. Source: OSTI; NTIS; INIS; GPO Dep.

EBWR went critical in Dec 1957 at 20 MW(t), was upgraded to 100 MW(t) operation. EBWR was shut down July 1967 and placed in dry lay-up. In 1986, the D&D work was planned in 4 phases: final planning and preparations for D&D, removal of reactor systems, removal of reactor vessel complex, and final decontamination and project closeout. Despite precautions, there was an uptake of ^{241}Am by D&D workers following underwater plasma arc cutting within the pool; the cause was traced to an experimental ^{241}Pu foil (200 μg) that was lost in the mid-1960s in the reactor vessel. Several major lessons were learned from this episode, among which is the fact that research facilities often involve unusual experiments which may not be recorded. Safety analysis and review procedure for D&D operations need to be carefully considered since they represent considerably different situations than reactor operations. EBWR is one of the very few cases of a prototypic reactor facility designed, operated, tested and now D&D'd by one organization.

2006 (BCLDP--063095) **Site environmental report for Calendar Year 1994 on radiological and nonradiological parameters.** Battelle Columbus Labs., OH (United States). Decommissioning Project. 30 Jun 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-92. Order Number DE95017200. Source: OSTI; NTIS; INIS; GPO Dep.

Battelle Memorial Institute's nuclear research facilities are currently being maintained in a surveillance and maintenance (S&M) mode with continual decontamination and decommissioning (D&D) activities being conducted under Department of Energy (DOE) Contract W-7405-ENG-92. These activities are referred to under the Contract as the Battelle Columbus Laboratories Decommissioning Project (BCLDP). Operations referenced in this report are performed in support of S&M and D&D activities. Battelle's King Avenue facility is not considered in this report to the extent that the West Jefferson facility is. The source term at the King Avenue site is a small fraction of the source term at the West Jefferson site. Off site levels of radionuclides that could be attributed to the west Jefferson and King Avenue nuclear operations wereindistinguishable from background levels at specific locations where air, water, and direct radiation measurements were performed. Environmental monitoring continued to demonstrate compliance by Battelle with federal, state and local regulations. Routine, nonradiological activities performed include monitoring liquid effluents and monitoring the ground water system for the West Jefferson North site. Samples of various environmental media including air, water, grass, fish, field and garden crops, sediment and soil were collected from the region surrounding the two sites and analyzed.

2007 (BHI--00167-Rev.) **Final hazard classification for the 183-C D&D project.** Zimmer, J.J. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96006963. Source: OSTI; NTIS; INIS; GPO Dep.

The intent of this document is to provide a final Hazard Classification for the Decontamination and Decommissioning (D&D) activities associated with the 183-C Filter Plant/Pump Room facility. The Hazard Classification was determined based upon DOE-EM-STD-5502-94, "DOE Limited Standard, Hazard Baseline Documentation," issued by the US Department of Energy. The 183-C Filter Plant/Pump Room facility was constructed to support operations of the 105-B and 105-C Reactors at the Hanford Site. Since shutdown of the 105-C Reactor in April 1969, the 183-C facility has been kept in a safe storage condition.

2008 (BHI--00530) **309 plutonium recycle test reactor ion exchanger vault deactivitation report.** Griffin, P.W.

Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009902. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the deactivation of the ion exchanger vault at the 309 Plutonium Recycle Test Reactor (PRTR) Facility in the 300 Area. The vault deactivation began in May 1995 and was completed in June 1995. The final site restoration and shipment of the low-level waste for disposal was finished in September 1995. The ion exchanger vault deactivation project involved the removal and disposal of twelve ion exchangers and decontaminating and fixing of residual smearable contamination on the ion exchanger vault concrete surfaces.

2009 (BHI–00536-Rev.) **Final report for the dismantlement and interim stabilization of the 107-C, 107-KE, and 107-KW retention basins.** Smith, D.L. Bechtel Hanford, Inc., Richland, WA (United States). [1996]. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005930. Source: OSTI; NTIS; INIS; GPO Dep.

This final report provides a general description of the activities performed to dismantle and interim stabilize the 107-C, 107-KE, and 107-KW retention basins. These activities were performed as part of the Radiation Area Remedial Action Project. Dismantlement and interim stabilization were required to minimize wind and biotic transport vectors at these sites until final remediation occurs.

2010 (BHI–00606) **Final report for the 1304-N Emergency Dump Tank dose reduction.** Smith, D.S. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008015. Source: OSTI; NTIS; INIS; GPO Dep.

The 1304-N Emergency Dump Tank Decontamination Project began as an attempt to demonstrate a specific decontamination technology (chemical decontamination). The initial technical approach selected was to incorporate testing the effectiveness of Corpex™ chemicals on a radiologically contaminated steel surface painted with lead-based primer paint to achieve unrestricted release while at the same time perform useful decommissioning work. After discussions between the Department of Energy and Bechtel Hanford, Inc., the focus of the project shifted to the successful completion of Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement) Milestone M-16-12F, for dose reduction at the shoreline of the Columbia River. Chemical decontamination was included as part of the work scope, but was no longer the primary objective of the project. Dose reduction having become the goal, decontamination to releasable levels of contamination was no longer the prime consideration.

2011 (BHI–00745) **Technical basis and radiological release plan for trackhoe #H0-17-5669 at 100 BC-1.** Wesselman, M.A. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009926. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the development of a method for the radiological release of a tracked heavy equipment vehicle used in the excavation of the 116 C-1 crib at Hanford Reservation, including the technical bases for selection of release criteria and the instrumentation to be used for the surveys. The vehicle is a backhoe with an articulated arm extending from a tracked vehicle body and for ease is called a "trackhoe". The trackhoe was used at the 1301N crib to install the initial string of temporary casing. The trackhoe dug into the crib overburden to a depth of about 10 feet and in the process the bucket became contaminated with mixed fission/activation products and plutonium. An attempt was made to decontaminate the bucket, but was only partially successful as the facilities at the work site were not adequate to achieve a complete release. Surveys of the bucket indicated that direct readings for beta-gamma contamination were over 100 times higher than those for alpha contamination.

2012 (BHI–00748) **N-Springs Pump and Treat Database user guide.** Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012135. Source: OSTI; NTIS; INIS; GPO Dep.

The N-Springs Pump - and - treat Database is an access database system that contains information regarding daily operations, daily process analytical data, and performance monitoring analytical data. The purpose of the N-Springs Pump and Treat Database User Guide is to describe how to access the database. The system is part of an expedited response action at the 100-N Area located at the Hanford Site.

2013 (BHI–00758) **N basin stabilization project independent readiness evaluation plan for high exposure rate hardware removal.** Volkman, C.L.; Adamson, E.L. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009925. Source: OSTI; NTIS; INIS; GPO Dep.

Completion of the N Basin Stabilization Project will accomplish the following objectives: removing equipment, debris, and any suspect fuel pieces; removing water from N Basin and associated pits; and stabilizing N Basin surfaces to prevent the spread of radioactive contamination. N Basin stabilization includes the activities defined in BHI-00251, N Basin Stabilization Project Readiness Plan, Rev. 5. This plan is no longer required with the issuance of BHI-DE-01, EDPI 4.32-01 "Readiness Evaluations"; however, activities, will remain categorized as previously established. The high exposure rate hardware removal activity is one of several identified activities that will be performed to complete the N Basin Stabilization Project. The 100-N Basin Stabilization Project ALARA Plan proposed that the decision point between low-exposure rate hardware and high-exposure rate hardware should be $\geq$ 1R/hr on contact. The high exposure rate hardware removal activity waste consists primarily of irradiated N Reactor components. These components include process tube pieces, in-core instrumentation, fuel spacers, and other items. The waste may also include general basin hardware that did not meet the $\leq$ 1R/hr guideline for above water packaging. The high exposure rate hardware removal activity waste will be collected in stainless steel fuel baskets, moved to an underwater grouting location, and placed inside a specially fabricated steel pipe. The pipe and contents will be encased in high-slump grout, cured, removed from the basin, decontaminated, painted and placed inside an L3-181 overpack cask, and then transported to the disposal site. This IRE does not cover the disposal site.

2014 (BHI–00759) **Demonstration of radionuclides removal at the 105-N basin using the 3M system.** Hobart, S.A.; Hyman, M. Bechtel Hanford, Inc., Richland, WA

(United States). Mar 1996. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009920. Source: OSTI; NTIS; INIS; GPO Dep.

A field demonstration of the Minnesota Mining and Manufacturing Company (3M) innovative Cs- and Sr-removal technology was undertaken to support deactivation of the Hanford Site's N Reactor. The field demonstration and laboratory studies performed by Pacific Northwest National Laboratory are documented in this report. The deactivation of N Reactor includes an aggressive schedule for removing water from the reactor's original fuel storage pool, known as N Basin. The plan for treating N Basin water involves particulate filtration, followed by further treatment at the Hanford Site's Effluent Treatment Facility (ETF) before the water is discharged to a permitted soil column. Prudence calls for developing a backup treatment plan in the event that ETF is not available to support the N Basin critical path schedule. The 3M technique uses membrane filters that are impregnated with chemical species to remove specific ions from water by ion exchange or selective reaction. Sodium titanate is used to remove Sr by ion exchange, and potassium-cobalt hexacyanoferrate (COHEX) is used to remove Cs by formation of cesium-cobalt ferrocyanide. As a result of this field test, the following recommendations are made: 3M technology should not be considered for removing Sr from N Basin water, although the technology merits consideration for Sr removal in waters that have relatively low Cs content; application of 3M technology by recirculation of basin water through 3M adsorption cartridges for removal of Cs-137 should be considered since it efficiently removes Cs and may be cost effective; additional pilot-scale tests should be performed to determine the capacity of COHEX for Cs-137 removal, if full-scale application is desired.

2015 (BHI–00762) **N Area Project Maintenance Plan.** Little, N.C. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012124. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the 100-N Area site maintenance plan beginning with the planned deactivation and remediation process and the initiation of decontamination and decommissioning activities. A graded approach is used to address the applicable objectives provided by the U.S. DOE Order 4330.4B, 'Maintenance Management Program'.

2016 (BHI–00800) **Conceptual Plan for 105-N Basin high-exposure rate hardware.** Pisarcik, D.J. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005871. Source: OSTI; NTIS; INIS; GPO Dep.

This conceptual plan describes the selected approach for handling and packaging hardware waste with contact exposure rates greater than 1 R/hr. This plan is intended to guide the performance of detailed planning, and the development of work packages and procedures for this activity. This plan discusses; the grouting process for high-exposure rate hardware shall be performed underwater; removal of fuel fragments from the N Basin; and the grouting of irradiated hardware before removal from the 105-N Basin.

2017 (BHI–00802) **Decommissioning of the 216-B-3 Effluent Disposal Pond.** Smith, D.L. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008016. Source: OSTI; NTIS; INIS; GPO Dep.

The decommissioning of the 216-B-3 pond had to be compatible with future remediation activities at the pond. The 216-B-3 pond had received RCRA and Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA)-regulated waste. However, remediation of the site may not occur for many years because of an overall strategy to concentrate on other higher priority waste sites at the Hanford Site. Therefore, there would be an undetermined length of time between decommissioning and final remediation during which the pond would sit idle. The Hanford Site is in an arid area with only 18 cm of precipitation annually. The potential for waste to move downward in the soil column after the pond was decommissioned was small. However, once the bottom sediments have been exposed, mechanical and biotic transport of the waste would be possible. The main objective of the decommissioning was to place the pond in a configuration that would minimize biotic and wind-driven contamination from the site between the period of decommissioning and remediation. The second objective was to minimize the impacts to characterization and final remediation of the pond resulting from decommissioning of the site.

2018 (BHI–00803) **Field screening sampling and analysis strategy and methodology for the 183-H Solar Evaporation Basins: Phase 2, Soils.** Antipas, A.; Hopkins, A.M.; Wasemiller, M.A.; McCain, R.G. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1996. 157p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008195. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a sampling/analytical strategy and methodology for Resource Conservation and Recovery Act (RCRA) closure of the 183-H Solar Evaporation Basins within the boundaries and requirements identified in the initial Phase II Sampling and Analysis Plan for RCRA Closure of the 183-H Solar Evaporation Basins.

2019 (BHI–00808) **High exposure hardware removal activity readiness evaluation.** Plastino, J.C. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008209. Source: OSTI; NTIS; INIS; GPO Dep.

This document comprises the Readiness Evaluation Plan for the High Exposure Rate Hardware (HERH) Removal Activity planned for the N Basin area at the Hanford Reservation in Richland Washington. This activity will consist of collecting hardware, depositing hardware in stainless-steel fuel element storage baskets, placing baskets in specially fabricated steel grout pipe, and encasing the contents in a high-slump grout.

2020 (BHI–00812) **Conceptual plan for 100-N Emergency Dump Basin (EDB) deactivation.** Davis, C.M.; Day, R.S.; Smith, D.L. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012131. Source: OSTI; NTIS; INIS; GPO Dep.

The Emergency Dump Basin (EDB) is an outdoor concrete retention pond with a 3/16 in. thick carbon-steel liner underlain with fiberglass. The basin is approximately 9 ft south of the southwest corner of the 105-N Reactor Building transfer areas locate at the Hanford Site. As of February

1996, the EDB contained an estimated 260,000 gal of water and approximately 2,300 ft3 of sediment. The average sediment thickness is estimated at 2.5 ft and is covered with approximately 12 to 14 ft of water. The EDB was originally designed as a quenching pool for reactor blowdown in the event of a primary coolant leak. However, the EDB only received routine steam-generator blowdowns from 1963 to 1987. The steam-generator blow-down and leaking isolation valves allowed radioactively contaminated water from primary and secondary reactor coolant leaks to enter the EDB. Over the years, wind-blown sand and dust have settled in the EDB, resulting in the present layer of sediments.

2021 (BHI–00856) **Preliminary hazard classification for N-Basin intrusive activities.** Larson, A.R.; Smith, R.I. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012133. Source: OSTI; NTIS; INIS; GPO Dep.

This document defines the inventory of both radioactive and hazardous materials in the N Basin Segment to establish a preliminary hazard classification for the N Basin intrusive activities effort. This document uses the methodology as outlined in DOE-STD-1027-92, 'Hazard Categorization and Accident Analysis Techniques for Compliance with DOE Order 5480.23, Nuclear Safety Analysis Reports'. The preliminary hazard classification for the N Basin Segment intrusion activities is Category 3.

2022 (BNL–52486) **Corrosion analysis of decommissioned carbon steel waste water tanks at Brookhaven National Laboratory.** Soo, P.; Roberts, T.C. Brookhaven National Lab., Upton, NY (United States). Jul 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE96004059. Source: OSTI; NTIS; INIS; GPO Dep.

A corrosion analysis was carried out on available sections of carbon steels taken from two decommissioned radioactive waste water tanks at Brookhaven National Laboratory. One of the 100,000 gallon tanks suffered from a pinhole failure in the wall which was subsequently patched. From the analysis it was shown that this leak, and two adjacent leaks were initiated by a discarded copper heating coil that had been dropped into the tank during service. The failure mechanism is postulated to have been galvanic attack at points of contact between the tank structure and the coil. Other leaks in the two tanks are also described in this report.

2023 (CONF-940406–17) **Site characterization of ORNL D&D facilities.** Kelsey, A.P. (Bechtel Environmental, Inc., Oak Ridge, TN (United States)); Mandry, G.J.; Haghighi, M.H. Oak Ridge National Lab., TN (United States). 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International symposium on decontamination and decommissioning; Knoxville, TN (United States); 27-29 Apr 1994. Order Number DE96009994. Source: OSTI; NTIS; INIS; GPO Dep.

Site characterization for decontamination and decommissioning (D&D) planning purposes was done for two surplus facilities at Oak Ridge National Laboratory (ORNL) in late 1993 and early 1994. This site characterization includes measurements of radiological and chemical contaminants, assessment of general structural conditions, and investigation of unknown conditions within the buildings. It will serve as input to decisions on D&D engineering, D&D task sequences, radiological and contamination control, and waste management. This paper presents the methods used to investigate these facilities and discusses the preliminary results as they apply to D&D planning. Investigation methods include gross alpha, beta, and gamma surveys; directional gamma surveys; gamma spectroscopy; concrete coring; photography; and collection of soil and miscellaneous samples that are analyzed for radiological and chemical contaminants. Data will be analyzed using radiological models to sort sources and estimate exposure rates and waste volumes due to D&D. The former Waste Evaporator Facility (WEF), consisting of two concrete cells and an operating gallery, once contained a liquid radwaste evaporator. Subsequently it was used for an incinerator experiment and as a dressing area for remediation work on an adjacent tank farm. The building has been partially decontaminated. Figure 1 is a photograph of the WEF. The Fission Product Pilot Plant (FPPP) is a small concrete building containing two cells. It was used to extract isotopes of ruthenium, strontium, cesium, cerium, and other elements from liquid waste. This facility is highly contaminated. In 1960 all doors into FPPP were sealed with concrete block and mortar, and concrete block shielding was added to the external walls making them up to five feet thick. Prior to this study, almost nothing was known about the interior of this building.

2024 (CONF-940815–115) **Innovative technology for expedited site remediation of extensive surface and subsurface contamination.** Audibert, J.M.E.; Lew, L.R. Coleman Research Corp., Houston, TX (United States). 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-94MC31190. From SPECTRUM '94: international nuclear and hazardous waste management conference; Atlanta, GA (United States); 14-18 Aug 1994. Order Number DE96008767. Source: OSTI; NTIS; INIS; GPO Dep.

Large scale surface and subsurface contamination resulted from numerous releases of feed stock, process streams, waste streams, and final product at a major chemical plant. Soil and groundwater was contaminated by numerous compounds including lead, tetraethyl lead, ethylene dibromide, ethylene dichloride, and toluene. The state administrative order dictated that the site be investigated fully, that remedial alternative be evaluated, and that the site be remediated within a year period. Because of the acute toxicity and extreme volatility of tetraethyl lead and other organic compounds present at the site and the short time frame ordered by the regulators, innovative approaches were needed to carry out the remediation while protecting plant workers, remediation workers, and the public.

2025 (CONF-9508169–3) **The development and application of a risk-based prioritization model for the Oak Ridge Environmental Restoration Program.** Dail, J.L.; White, R.K. Oak Ridge National Lab., TN (United States). 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Energy Facilities Contractors Operating Group, Prioritization Working Group & Prioritization Methodology Users Group prioritization methodology workshop; Idaho Falls, ID (United States); 22-23 Aug 1995. Order Number DE96003756. Source: OSTI; NTIS; INIS; GPO Dep.

The Oak Ridge Environmental Restoration (ER) Program developed and implemented the Environmental Restoration Benefit Assessment Matrix (ERBAM) early in 1994 to provide a simple, efficient process for prioritizing and justifying fiscal budget decisions for a diverse set of activities. The decision to develop a methodology for prioritizing sites was necessitated by the large number of buildings and areas managed by the DOE Oak Ridge Field Office and the finite resources available to address these areas. The ERBAM was based on the Integrated Resource Management System prioritization methodology historically used by the United States Department of Energy (DOE) and Lockheed Martin Energy Systems, Inc., to rank compliance and operational activities. To develop the matrix, ER Program management, working with federal and state regulators, agreed on impact criteria that balance the major objectives within the ER Program: protection of public health, protection of the environment, protection of on-site workers, consideration of stakeholder/community preference, achievement of ER mission, and optimization of cost efficiency. Lessons learned from the initial application of the matrix were used to make refinements and improvements in the methodology. A standard set of assumptions (both overall and categoric) and a prioritization board, consisting of top level DOE and Lockheed Martin Energy Systems, Inc., managers along with federal and state regulatory representatives, were established to facilitate consistent application. Current and future improvements include a method to incorporate existing quantitative risk data and facilitate increased efficiency in applying baseline cost data and approved funding levels to the prioritized output. Application of the prioritization methodology yields a prioritized list of all work activities within the programs' work breakdown structure.

2026 (CONF-950917–9) **Risk-based cleanup and recycling of residuals from United States Department of Energy Decontamination and Decommissioning facilities in Oak Ridge, Tennessee, USA.** DeLozier, F. Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. international conference on radioactive waste management and environmental remediation; Berlin (Germany); 3-9 Sep 1995. Order Number DE95010222. Source: OSTI; NTIS; INIS; GPO Dep.

Decontamination and Decommissioning Program activities at United States Department of Energy facilities in Oak Ridge, Tennessee, involve a wide variety of buildings, building materials, and contaminants. There are approximately 100 buildings/structures included in the program, and they are primarily large gaseous diffusion plant buildings (one of which is 170,000 m^2 under roof), several research reactors, chemical and isotope processing facilities, and weapons component production facilities. The major contaminants at these facilities are uranium, mercury, solvents, cesium, strontium, asbestos, polychlorinated biphenyls, and other metals and radionuclides. Many of the buildings assigned to the Decontamination and Decommissioning Program are located on or near contaminated land units that are regulated under the Comprehensive Environmental Response, Compensation, and Liability Act, which prescribes risk-based cleanup. Original decontamination and decommissioning plans assumed free release standards similar to those proposed for power reactors by the United States Nuclear Regulatory Commission. However, now it is being proposed that decontamination and decommissioning work, like other remedial action work at the facilities, be governed by the Comprehensive Environmental Response, Compensation, and Liability Act-based regulatory agreement in place between the Department of Energy, the United States Environmental Protection Agency, and state regulators. It is also proposed that the facilities be cleaned up to a level dictated by the results of health and environmental-based risk assessments and consistent with the land beneath and around the buildings. The major emphasis, with all decontamination and decommissioning work, has been, and will continue to be, placed on recycling metal and other building materials when feasible.

2027 (CONF-9509100–11) **Verification of criticality accident alarm system for environmental restoration activities.** Broadhead, B.L.; Childs, R.L.; Hopper, C.M. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. international conference on nuclear criticality safety; Albuquerque, NM (United States); 17-22 Sep 1995. Order Number DE95017432. Source: OSTI; NTIS; INIS; GPO Dep.

This work analyzes the optimal placement of a criticality accident alarm system (CAAS) necessitated by an unexpected accumulation of fissile materials in the filtration system of an idled experimental nuclear reactor. Results using multidimensional deterministic and Monte Carlo methods confirmed the suitability of an existing CAAS placement located in the adjacent reactor building.

2028 (CONF-960271–2) **Disposition of the fluoride fuel and flush salts from the Molten Salt Reactor experiment at Oak Ridge National Laboratory.** Peretz, F.J. Oak Ridge National Lab., TN (United States). [1996]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From American Institute of Chemical Engineers (AIChE) spring meeting; New Orleans, LA (United States); 26-29 Feb 1996. Order Number DE96006708. Source: OSTI; NTIS; INIS; GPO Dep.

The Molten Salt Reactor Experiment (MSRE) is an 8 MW reactor that was operated at Oak Ridge National Laboratory (ORNL) from 1965 through 1969. The reactor used a unique liquid salt fuel, composed of a mixture of LIF, BeF_2, ZrF_4, and UF_4, and operated at temperatures above 600°C. The primary fuel salt circulation system consisted of the reactor vessel, a single fuel salt pump, and a single primary heat exchanger. Heat was transferred from the fuel salt to a coolant salt circuit in the primary heat exchanger. The coolant salt was similar to the fuel salt, except that it contains only LiF (66%) and BeF, (34%). The coolant salt passed from the primary heat exchanger to an air-cooled radiator and a coolant salt pump, and then returned to the primary heat exchanger. Each of the salt loops was provided with drain tanks, located such that the salt could be drained out of either circuit by gravity. A single drain tank was provided for the non-radioactive coolant salt. Two drain tanks were provided for the fuel salt. Since the fuel salt contained radioactive fuel, fission products, and activation products, and since the reactor was designed such that the fuel salt could be drained immediately into the drain tanks in the event of a problem in the fuel salt loop, the fuel salt drain tanks were provided with a system to remove the heat generated by radioactive decay. A third drain tank connected to the fuel salt loop was provided for a batch of flush salt. This batch of salt, similar in composition to the coolant salt, was used to condition the fuel salt loop after it had been exposed to air and to flush the fuel salt loop of residual fuel salt prior to accessing the reactor circuit for maintenance or experimental activities. This report discusses the disposition of the fluoride fuel and flush salt.

2029 (CONF-960804–13) **A concept of a nonfissile uranium hexafluoride overpack for storage, transport,**

and processing of corroded cylinders. Pope, R.B. (Oak Ridge National Lab., TN (United States)); Cash, J.M.; Singletary, B.H. Oak Ridge National Lab., TN (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From SPECTRUM '96: international conference on nuclear and hazardous waste management; Seattle, WA (United States); 18-23 Aug 1996. Order Number DE96009408. Source: OSTI; NTIS; INIS; GPO Dep.

There is a need to develop a means of safely transporting breached 48-in. cylinders containing depleted uranium hexafluoride (UF_6) from current storage locations to locations where the contents can be safely removed. There is also a need to provide a method of safely and easily transporting degraded cylinders that no longer meet the US Department of Transportation (DOT) and American National Standards Institute, Inc., (ANSI) requirements for shipments of depleted UF_6. A study has shown that an overpack can be designed and fabricated to satisfy these needs. The envisioned overpack will handle cylinder models 48G, 48X, and 48Y and will also comply with the ANSI N14.1 and the American Society of Mechanical Engineers (ASME) Sect. 8 requirements.

2030 (DOE/AL/62350–12) **Publications desktop survival guide.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 229p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95016207. Source: OSTI; NTIS; GPO Dep.

Purpose of this guide is to document and simplify the writing, reviewing, and production process for the Uranium Mill Tailings Remedial Action (UMTRA) Project Technical Assistance Contractor (TAC) staff and to provide specific answers concerning the content, style, and format of UMTRA Project documents. Goal of the UMTRA Project document preparation process is to deliver to the US DOE high-quality documents that meet requirements (meets expressed client needs; accurate and consistent technical content; clear writing; well organized document; consistent style). A document review process has been established to ensure that TAC documents are accurate, consistent, and well organized. The editing process applies standard rules for style and format, spelling, grammar, punctuation, and sentence structure to make the document consistent and easier to read. This guide sets forth the rules to be applied to UMTRA Project documents.

2031 (DOE/AL/62350–21F-Rev.1) **Remedial Action Plan and Site design for stabilization of the inactive Uranium Mill Tailings sites at Slick Rock, Colorado: Revision 1. Remedial action selection report, Attachment 2, geology report, Attachment 3, ground water hydrology report, Attachment 4, water resources protection strategy. Final.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Morrison-Knudsen Corp., San Francisco, CA (United States). Sep 1995. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000224. Source: OSTI; NTIS; INIS; GPO Dep.

The Slick Rock uranium mill tailings sites are located near the small community of Slick Rock, in San Miguel County, Colorado. There are two designated Uranium Mill Tailings Remedial Action (UMTRA) Project sites at Slick Rock: the Union Carbide site and the North Continent site. Both sites are adjacent to the Dolores River. The sites contain former mill building concrete foundations, tailings piles, demolition debris, and areas contaminated by windblown and waterborne radioactive materials. The total estimated volume of contaminated materials is approximately 621,000 cubic yards (475,000 cubic meters). In addition to the contamination at the two processing site areas, 13 vicinity properties were contaminated. Contamination associated with the UC and NC sites has leached into ground water. Pursuant to the requirements of the Uranium Mill Tailings Radiation Control Act (UMTRCA) (42 USC §7901 et seq.), the proposed remedial action plan (RAP) will satisfy the final US Environmental Protection Agency (EPA) standards in 40 CFR Part 192 (60 FR 2854) for cleanup, stabilization, and control of the residual radioactive material (RRM) (tailings and other contaminated materials) at the disposal site at Burro Canyon. The requirements for control of the RRM (Subpart A) will be satisfied by the construction of an engineered disposal cell. The proposed remedial action will consist of relocating the uranium mill tailings, contaminated vicinity property materials, demolition debris, and windblown/weaterborne materials to a permanent repository at the Burro Canyon disposal site. The site is approximately 5 road mi (8 km) northeast of the mill sites on land recently transferred to the DOE by the Bureau of Land Management.

2032 (DOE/AL/62350–21F-Rev.1-Attach.) **Uranium Mill Tailings Remedial Action Project (UMTRAP), Slick Rock, Colorado, Revision 1. Bid schedule, special conditions, specifications, and subcontract drawings.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Morrison-Knudsen Corp., San Francisco, CA (United States). [1995]. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000228. Source: OSTI; NTIS; INIS; GPO Dep.

This volume contains: bidding requirements; terms and conditions; specifications for Division 1 – general requirements; specifications for Division 2 – sitework; specifications for Divisions 5 – metals; subcontract drawings, (general, Union Carbide processing site, North Continent processing site, and Burro Canyon disposal site).

2033 (DOE/AL/62350–21F-Rev.1-Attach.3-App.B) **Remedial Action Plan and Site Design for Stabilization of the Inactive Uranium Mill Tailings Sites at Slick Rock, Colorado: Appendix B to Attachment 3, Lithologic logs and monitor well construction information. Final report.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000226. Source: OSTI; NTIS; INIS; GPO Dep.

This volume contains lithology logs and monitor well construction information for: NC processing site; UC processing site; and Burro Canyon disposal site. This information pertains to the ground water hydrology investigations which is attachment 3 of this series of reports.

2034 (DOE/AL/62350–21F-Rev.1-Attach.3-App.C) **Remedial Action Plan and Site Design for stabilization of the inactive Uranium Mill Tailings sites at Slick Rock, Colorado: Appendix C to Attachment 3, Calculations. Final.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Morrison-Knudsen Corp., San Francisco, CA (United States). Sep 1995. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000227. Source: OSTI; NTIS; INIS; GPO Dep.

This volume contains calculations for: Slick Rock processing sites background ground water quality; Slick Rock processing sites lysimeter water quality; Slick Rock processing sites on-site and downgradient ground water quality; Slick Rock disposal site background water quality; Burro Canyon disposal site, Slick Rock, Colorado, average hydraulic gradients and average liner ground water velocities in the upper, middle, and lower sandstone units of the Burro Canyon formation; Slick Rock–Burro Canyon disposal site, Burro Canyon pumping and slug tests–analyses; water balance and surface contours–Burro Canyon disposal cell; and analytical calculation of drawdown in a hypothetical well completed in the upper sandstone unit of the Burro Canyon formation.

2035 (DOE/AL/62350–21F-Rev.1-Vol.1) **Uranium Mill Tailings Remedial Action Project (UMTRAP), Slick Rock, Colorado, Revision 1. Volume 1, Calculations, Final design for construction.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Morrison-Knudsen Corp., San Francisco, CA (United States). Sep 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000229. Source: OSTI; NTIS; INIS; GPO Dep.

Volume one contains calculations for: embankment design–embankment material properties; Union Carbide site–bedrock contours; vicinity properties–origin of contamination; North Continent and Union Carbide sites contaminated materials–excavation quantities; and demolition debris–quantity estimate.

2036 (DOE/AL/62350–21F-Rev.1-Vol.2) **Uranium Mill Tailings Remedial Action Project (UMTRAP), Slick Rock, Colorado, Revision 1. Volume 2, Calculations, Final design for construction.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Morrison-Knudsen Corp., San Francisco, CA (United States). Sep 1995. 500p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000230. Source: OSTI; NTIS; INIS; GPO Dep.

Volume two contains calculations for: embankment design–slope stability analysis; embankment design–excavation stability; embankment design–settlement and cover cracking analysis; radon barrier design–statistical analysis of ra-226 concentrations for North Continent and Union Carbide sites; radon barrier design–RAECOM input data; radon barrier design–design thickness; and cover design–frost penetration depth.

2037 (DOE/AL/62350–21F-Rev.1-Vol.3) **Uranium Mill Tailings Remedial Action Project (UMTRAP), Slick Rock, Colorado, Revision 1, Volume 3. Calculations, Final design for construction.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Morrison-Knudsen Corp., San Francisco, CA (United States). Sep 1995. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000231. Source: OSTI; NTIS; INIS; GPO Dep.

Volume three contains calculations for: site hydrology–rainfall intensity, duration, and frequency relations; site hydrology– probable maximum precipitation; erosion protection–rock quality evaluation; erosion protection–embankment top and side slope; erosion protection–embankment toe apron; erosion protection–gradations and layer thicknesses; Union Carbide site–temporary drainage ditch design; Union Carbide site–retention basin sediment volume; Union Carbide site–retention basin sizing; Burro Canyon site temporary drainage–temporary drainage facilities; and Union Carbide site temporary drainage–water balance.

2038 (DOE/AL/62350–21F-Rev.1-Vol.4) **Uranium Mill Tailings Remedial Action Project (UMTRAP), Slick Rock, Colorado, Revision 1, Volume 4. Calculations, Final design for construction.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Morrison-Knudsen Corp., San Francisco, CA (United States). Sep 1995. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000232. Source: OSTI; NTIS; INIS; GPO Dep.

Volume four contains calculations for: Borrow areas–site evaluation; temporary facilities–material quantities; embankment quantities–excavation and cover materials; Burro Canyon site excavation quantities–rippable and unrippable materials; site restoration–earthwork quantities and seeding; and bid schedule quantities and material balance.

2039 (DOE/AL/62350–76-Rev.7) **ERD UMTRA Project quality assurance program plan, Revision 7.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96007512. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the revised Quality Assurance Program Plan (QAPP) dated September, 1995 for the Environmental Restoration Division (ERD) Uranium Mill Tailings Remedial Action Project (UMTRA). Quality Assurance requirements for the ERD UMTRA Project are based on the criteria outlined in DOE Order 5700.6C or applicable sections of 10 CFR 830.120. QA requirements contained in this QAPP shall apply to all personnel, processes, and activities, including planning, scheduling, and cost control, performed by the ERD UMTRA Project and its contractors.

2040 (DOE/AL/62350–77-Rev.1) **Long-term surveillance plan for the Bodo Canyon Disposal Site, Durango, Colorado. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Nov 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96003199. Source: OSTI; NTIS; INIS; GPO Dep.

This long-term surveillance plan (LTSP) for the Uranium Mill Tailings Remedial Act on (UMTRA) Project Bodo Canyon disposal site at Durango, Colorado, describes the surveillance activities for the disposal site. The US Department of Energy (DOE) will carry out these activities to ensure that the disposal call continues to function as designed This LTSP was prepared as a requirement for DOE acceptance under the US Nuclear Regulatory Commission (NRC) general license for custody and long-term care of residual radioactive materials (RRM) from processing uranium ore. This LTSP documents that the land and interests are owned by the United States and details how long-term care of the disposal site will be carried out. It is based on the DOE's Guidance for Implementing the UMTRA Project Long-term Surveillance Program (DOE, 1992a). Following the introduction, contents of this report include the following: site final condition; site drawings and photographs; permanent site surveillance features; ground water monitoring; annual site inspections; unscheduled inspections; custodial maintenance; corrective action; record keeping and reporting requirements; emergency notification and reporting;

quality assurance; personal health and safety; list of contributions; and references.

2041 (DOE/AL/62350–149-Rev.1) **Baseline risk assessment of ground water contamination at the uranium mill tailings site near Canonsburg, Pennsylvania. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Nov 1995. 125p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96005292. Source: OSTI; NTIS; INIS; GPO Dep.

For the UMTRA Project site located near Canonsburg, Pennsylvania (the Canonsburg site), the Surface Project cleanup occurred from 1983 to 1985, and involved removing the uranium processing mill tailings and radioactively contaminated soils and materials from their original locations and placing them in a disposal cell located on the former Canonsburg uranium mill site. This disposal cell is designed to minimize radiation emissions and further contamination of ground water beneath the site. The Ground Water Project will evaluate the nature and the extent of ground water contamination resulting from uranium processing at the former Canonsburg uranium mill site, and will determine a ground water strategy for complying with the US Environmental Protection Agency's (EPA) ground water standards established for the UMTRA Project. For the Canonsburg site, an evaluation was made to determine whether exposure to ground water contaminated by uranium processing could affect people's health. This risk assessment report is the first site-specific document prepared for the UMTRA Ground Water Project at the Canonsburg site. The results of this report and further site characterization of the Canonsburg site will be used to determine how to protect public health and the environment, and how to comply with the EPA standards.

2042 (DOE/AL/62350–151) **Integrated Project Management System description.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1994. 139p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95009832. Source: OSTI; NTIS; INIS; GPO Dep.

The Integrated Program Management System (IPMS) Description is a "working" document that describes the work processes of the Uranium Mill Tailings Remedial Action Project Office (UMTRA) and IPMS Group. This document has undergone many revisions since the UMTRA Project began; this revision not only updates the work processes but more clearly explains the relationships between the Project Office, contractors, and other participants. The work process flow style has been revised to better describe Project work and the relationships of participants. For each work process, more background and guidance on "why" and "what is expected" is given. For example, a description of activity data sheets has been added in the work organization and the Project performance and reporting processes, as well as additional detail about the federal budget process and funding management and improved flow charts and explanations of cost and schedule management. A chapter has been added describing the Cost Reduction/Productivity Improvement Program. The Change Control Board (CCB) procedures (Appendix A) have been updated. Project critical issues meeting (PCIM) procedures have been added as Appendix B. Budget risk assessment meeting procedures have been added as Appendix C. These appendices are written to act as stand-alone documentation for each process. As the procedures are improved and updated, the documentation can be updated separately.

2043 (DOE/AL/62350–155-Rev.1) **Technical Assistance Contractor management plan. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Aug 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96003970. Source: OSTI; NTIS; INIS; GPO Dep.

The Technical Assistance Contractor (TAC) for the Uranium Mill Tailings Remedial Action (UMTRA) Project comprises Jacobs Engineering Group Inc. (JEG) as the prime contractor and three teaming partner subcontractors: Roy F. Weston, Inc. (RFW), AGRA Earth and Environmental, Inc. (AGRA), and Geraghty and Miller, Inc. (G and M). The TAC contract's scope is to provide technical, analytical, environmental, engineering, design, inspection, and management support services to the US Department of Energy (DOE) for both Surface and Ground Water Projects. The TAC team supports the DOE in completing surface remedial action and initiating ground water remediation work for start-up, characterization, compliance planning, design, construction oversight, and remedial operations. The TAC provides the DOE UMTRA Project Team with a dedicated management, scientific, and technical resource base in Albuquerque, New Mexico, which is supplemented by corporate resources. A carefully developed and maintained staff of technical experts is available to assess, analyze, develop, and execute cost-effective solutions to the demanding technical and institutional problems presented by the UMTRA Project.

2044 (DOE/AL/62350–156-Rev.) **Site observational work plan for the UMTRA Project site at Spook, Wyoming.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). May 1995. 463p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95015442. Source: OSTI; NTIS; INIS; GPO Dep.

The Spook, Wyoming, site observational work plan proposes site-specific activities to achieve compliance with Subpart B of 40 CFR Part 192 (1994) of the final US Environmental Protection Agency (EPA) ground water protection standards 60 FR 2854 (1995) at this Uranium Mill Tailing Remedial Action (UMTRA) Project site. This draft SOWP presents a comprehensive summary of existing site characterization data, a conceptual site model of the nature and extent of ground water contamination, exposure pathways, and potential impact to human health and the environment. Section 2.0 describes the requirements for meeting ground water standards at UMTRA Project sites. Section 3.0 defines past and current conditions, describes potential environmental and human health risks, and provides site-specific data that supports the selection of a proposed ground water compliance strategy. Section 4.0 provides the justification for selecting the proposed ground water compliance strategy based on the framework defined in the ground water programmatic environmental impact statement (PEIS).

2045 (DOE/AL/62350–171) **UMTRA Project-Level Cost Reduction/Productivity Improvement Program manual.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95016204. Source: OSTI; NTIS; INIS; GPO Dep.

Mission of the Uranium Mill Tailings Remedial Action (UMTRA) Project Cost Reduction/Productivity Improvement Program (CR/PIP) is to contribute to the UMTRA Project's environmental restoration mission by providing the means to achieve and recognize continuous improvements and cost savings. This manual includes program definition, description of UMTRA project organizational responsibilities and interfaces with existing project functions, guidance to contractors, and definition of project-level functions.

2046 (DOE/AL/62350–182) **Long-term surveillance plan for the Tuba City, Arizona disposal site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1996. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96008304. Source: OSTI; NTIS; GPO Dep.

This long-term surveillance plan (LTSP) for the Uranium Mill Tailings Remedial Action (UMTRA) Project disposal site at Tuba City, Arizona, describes the site surveillance activities. The U.S. Department of Energy (DOE) will carry out these activities to ensure the disposal cell continues to function as designed. This final LTSP was prepared as a requirement for acceptance under the U.S. Nuclear Regulatory Commission (NRC) general license for custody and long-term care of residual radioactive materials (RRM) (10 CFR §40.27).

2047 (DOE/AL/62350–183) **Final audit report of remedial action construction at the UMTRA Project, Grand Junction, Colorado, processing site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95011231. Source: OSTI; NTIS; INIS; GPO Dep.

This final audit report (FAR) for remedial action at the Grand Junction, Colorado, Uranium Mill Tailings Remedial Action (UMTRA) Project processing site consists of a summary of the radiological surveillances/audits, the quality assurance (QA) in-process surveillances, and the QA final close-out inspection performed by the US Department of Energy (DOE) and Technical Assistance Contractor (TAC). The FAR also summarizes other surveillances performed by the US Nuclear Regulatory Commission (NRC). To summarize, a total of one finding and 127 observations were noted during DOE/TAC audit and surveillance activities. The NRC noted general site-related observations during the OSCRs. Follow-up to responses required from MK-Ferguson for the DOE/TAC finding and observations indicated that all issues related to the Grand Junction processing site were resolved and closed out to the DOE's satisfaction. The NRC OSCRs resulted in no issues related to the Grand Junction processing site requiring a response from MK-Ferguson.

2048 (DOE/AL/62350–184) **Uranium Mill Tailings Remedial Action Project 1994 environmental report.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); MK-Ferguson Co., Albuquerque, NM (United States). Aug 1995. 320p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96003200. Source: OSTI; NTIS; INIS; GPO Dep.

This annual report documents the Uranium Mill Tailings Remedial Action (UMTRA) Project environmental monitoring and protection program. The UMTRA Project routinely monitors radiation, radioactive residual materials, and hazardous constituents at associated former uranium tailings processing sites and disposal sites. At the end of 1994, surface remedial action was complete at 14 of the 24 designated UMTRA Project processing sites: Canonsburg, Pennsylvania; Durango, Colorado; Grand Junction, Colorado; Green River Utah, Lakeview, Oregon; Lowman, Idaho; Mexican Hat, Utah; Riverton, Wyoming; Salt Lake City, Utah; Falls City, Texas; Shiprock, New Mexico; Spook, Wyoming, Tuba City, Arizona; and Monument Valley, Arizona. Surface remedial action was ongoing at 5 sites: Ambrosia Lake, New Mexico; Naturita, Colorado; Gunnison, Colorado; and Rifle, Colorado (2 sites). Remedial action has not begun at the 5 remaining UMTRA Project sites that are in the planning stage. Belfield and Bowman, North Dakota; Maybell, Colorado; and Slick Rock, Colorado (2 sites). The ground water compliance phase of the UMTRA Project started in 1991. Because the UMTRA Project sites are.' different stages of remedial action, the breadth of the UMTRA environmental protection program differs from site to site. In general, sites actively undergoing surface remedial action have the most comprehensive environmental programs for sampling media. At sites where surface remedial action is complete and at sites where remedial action has not yet begun, the environmental program consists primarily of surface water and ground water monitoring to support site characterization, baseline risk assessments, or disposal site performance assessments.

2049 (DOE/AL/62350–185) **An assessment of potential hydrologic and ecologic impacts of constructing mitigation wetlands, Rifle, Colorado, UMTRA project sites.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Apr 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95016206. Source: OSTI; NTIS; INIS; GPO Dep.

This-assessment examines the consequences and risks that could result from the proposed construction of mitigation wetlands at the New and Old Rifle Uranium Mill Tailings Remedial Action (UMTRA) Project sites near Rifle, Colorado. Remediation of surface contamination at those sites is now under way. Preexisting wetlands at or near the Old and New Rifle sites have been cleaned up, resulting in the loss of 0.7 and 10.5 wetland acres (ac) (0.28 and 4.2 hectares [ha]) respectively. Another 9.9 ac (4.0 ha) of wetlands are in the area of windblown contamination west of the New Rifle site. The US Army Corps of Engineers (USACE) has jurisdiction over the remediated wetlands. Before remedial action began, and before any wetlands were eliminated, the USACE issued a Section 404 Permit that included a mitigation plan for the wetlands to be lost. The mitigation plan calls for 34.2 ac (1 3.8 ha) of wetlands to be constructed at the south end and to the west of the New Rifle site. The mitigation wetlands would be constructed over and in the contaminated alluvial aquifer at the New Rifle site. As a result of the hydrologic characteristics of this aquifer, contaminated ground water would be expected to enter the environment through the proposed wetlands. A preliminary assessment was therefore required to assess any potential ecological risks associated with constructing the mitigation wetlands at the proposed location.

2050 (DOE/AL/62350–187) **Long-term surveillance plan for the Falls City Disposal Site, Falls City, Texas.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States)..Jun 1995. 135p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95013796. Source: OSTI; NTIS; INIS; GPO Dep.

This long-term surveillance plan (LTSP) for the Uranium Mill Tailings Remedial Action (UMTRA) Project Falls City disposal site, Falls City, Texas, describes the surveillance activities for the disposal site. DOE will carry out these activities to ensure that the disposal cell continues to function as designed. This LTSP was prepared as a requirement for acceptance under the US Nuclear Regulatory Commission (NRC) general license for custody and long-term care of residual radioactive materials. This LTSP documents whether the land and interests are owned by the United States and details how long-term care of the disposal site will be carried out. It is based on the DOE's Guidance for Implementing the UMTRA Project Long-term Surveillance Program (DOE, 1992a).

2051 (DOE/AL/62350–187-Rev.1) **Long-term Surveillance Plan for the Falls City Disposal Site, Falls City, Texas. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Aug 1995. 134p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95016202. Source: OSTI; NTIS; INIS; GPO Dep.

This long-term surveillance plan (LTSP) for the Uranium Mill Tailings Remedial Action (UMTRA) Project Falls City disposal site, Falls City, Texas, describes the surveillance activities for the disposal site. The US Department of Energy (DOE) will carry out these activities to ensure that the disposal cell continues to function as designed. This LTSP was prepared as a requirement for acceptance under the US Nuclear Regulatory Commission (NRC) general license for custody and long-term care of residual radioactive materials. This LTSP documents whether the land and interests are owned by the United States and details how long-term care of the disposal site will be carried out. It is based on the DOE's Guidance for Implementing the UMTRA Project Long-term Surveillance Program (DOE, 1992a).

2052 (DOE/AL/62350–188) **Final audit report of remedial action construction at the UMTRA Project Falls City, Texas, site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). May 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95013502. Source: OSTI; NTIS; INIS; GPO Dep.

This final audit report for the Falls City, Texas, Uranium Mill Tailings Remedial Action Project site summarizes the radiological audits and the quality assurance (QA) in-process surveillances, audits, and final close-out inspection performed by the U.S. Department of Energy (DOE) and Technical Assistance Contractor (TAC). It also summarizes U.S. Nuclear Regulatory Commission (NRC) surveillances. One radiological audit and three radiological surveillances were performed at the Falls City site. These surveillances and audit, which resulted in 31 observations, focused primarily on processing site activities and were performed on the following dates: 3-6 August 1992, 29-30 October 1992, 22-26 March 1993, and 1-3 November 1993. All outstanding radiological issues were closed out at the completion of the construction activities. Six QA in-process surveillances, which resulted in 71 observations, were performed at the Falls City site on the following dates: 22-24 July 1992, 23-25 November 1992, 17-19 May 1993, 16-18 August 1993, 13-15 October 1993, and 2-4 February 1994. All outstanding issues were closed out with the February surveillance on 3 March 1994. The DOE/TAC remedial action close-out inspections of the Falls City site, which resulted in 56 observations, were conducted 9-10 June 1994 and 26 July 1994. The inspections were closed out on 26 January 1995. The NRC performed three on-site construction reviews (OSCR), resulting in seven observations of remedial action construction activities that occurred during site visits. The OSCRs were performed 9 December 1992, 12 May 1993, and 25 October 1993. Since all audit and surveillance observations and recommendations have been closed out, this final audit report segment of the site certification process is complete.

2053 (DOE/AL/62350–189) **Guidance for implementing the long-term surveillance program for UMTRA Project Title I Disposal Sites.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1996. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96006188. Source: OSTI; NTIS; INIS; GPO Dep.

This guidance document has two purposes: it provides guidance for writing site-specific long-term surveillance plans (LTSP) and it describes site surveillance, monitoring, and long-term care techniques for Title I disposal sites of the Uranium Mill Tailings Radiation Control Act (UMTRCA) (42 USC Section 7901 et seq.). Long-term care includes monitoring, maintenance, and emergency measures needed to protect public health and safety and the environment after remedial action is completed. This document applies to the UMTRCA-designated Title I disposal sites. The requirements for long-term care of the Title I sites and the contents of the LTSPs are provided in U.S. Nuclear Regulatory Commission (NRC) regulations (10 CFR Section 40.27) provided in Attachment 1.

2054 (DOE/AL/62350–197) **Comment and response document for the final remedial action plan site design for stabilization of the Inactive Uranium Mill Tailings Sites at Slick Rock, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000652. Source: OSTI; NTIS; INIS; GPO Dep.

This document consists of comments and responses; the reviewers are the U.S. Nuclear Regulatory Commission (NRC), Colorado Dept. of Public Health and Environment, and the remedial action contractor (RAC).

2055 (DOE/AL/62350–197-Rev.2) **Comment and response document for the final remedial action plan and site design for stabilization of the inactive uranium mill tailings sites at Slick Rock, Colorado. Revision 2.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). May 1996. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96011536. Source: OSTI; NTIS; INIS; GPO Dep.

This document for the final remedial action plan and site design has been prepared for US Department of Energy Environmental Restoration Division as part of the Uranium Mill Tailings Remedial Action plan. Comments and responses are included for the site design for stabilization of the inactive uranium mill tailings sites at Slick Rock, Colorado.

2056 (DOE/AL/62350–198) **Annual monitoring report for the Gunnison, Colorado, wetlands mitigation plan.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Oct 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96002054. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) administers the Uranium Mill Tailings Remedial Action (UMTRA) Project to clean up uranium mill tailings and other surface contamination at 24 abandoned uranium mill sites in 10 states. One of these abandoned mill sites is near the town of Gunnison, Colorado; surface remediation and the environmental impacts of remedial action are described in the Gunnison environmental assessment (EA) (DOE, 1992). Remedial action resulted in the elimination of 4.3 acres (ac) 1.7 hectares (ha) of wetlands and mitigation of this loss of wetlands is being accomplished through the enhance of 18.4 ac (7.5 ha) of riparian plant communities in six spring feed areas on Bureau of Land Management (BLM) land. The description of the impacted and mitigation wetlands is provided in the Mitigation and Monitoring Plan for Impacted Wetlands at the Gunnison UMTRA Project Site, Gunnison, Colorado (DOE, 1994), which is attached to the US Army corps of Engineers (USACE) Section 404 Permit. As part of the wetlands mitigation plan, the six mitigation wetlands were fenced in the fall of 1993 to exclude livestock grazing. Baseline of grazed conditions of the wetlands vegetation was determined during the summer of 1993 (DOE, 1994). A 5-year monitoring program of these six sites has been implemented to document the response of vegetation and wildlife to the exclusion of livestock. This annual monitoring report provides the results of the first year of the 5-year monitoring period.

2057 (DOE/AL/62350–200-Rev.1) **UMTRA project disposal cell cover biointrusion sensitivity assessment, Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Oct 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96003087. Source: OSTI; NTIS; INIS; GPO Dep.

This study provides an analysis of potential changes that may take place in a Uranium Mill Tailings Remedial Action (UMTRA) Project disposal cell cover system as a result of plant biointrusion. Potential changes are evaluated by performing a sensitivity analysis of the relative impact of root penetrations on radon flux out of the cell cover and/or water infiltration into the cell cover. Data used in this analysis consist of existing information on vegetation growth on selected cell cover systems and information available from published studies and/or other available project research. Consistent with the scope of this paper, no new site-specific data were collected from UMTRA Project sites. Further, this paper does not focus on the issue of plant transport of radon gas or other contaminants out of the disposal cell cover though it is acknowledged that such transport has the potential to be a significant pathway for contaminants to reach the environment during portions of the design life of a disposal cell where plant growth occurs. Rather, this study was performed to evaluate the effects of physical penetration and soil drying caused by plant roots that have and are expected to continue to grow in UMTRA Project disposal cell covers. An understanding of the biological and related physical processes that take place within the cover systems of the UMTRA Project disposal cells helps the U.S. Department of Energy (DOE) determine if the presence of a plant community on these cells is detrimental, beneficial, or of mixed value in terms of the cover system's designed function. Results of this investigation provide information relevant to the formulation of a vegetation control policy.

2058 (DOE/AL/62350–203) **Long-term surveillance plan for the Canonsburg, Pennsylvania, disposal site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Oct 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96002056. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes elements of the US Department of Energy's (DOE) Long-Term Surveillance Plan for the Canonsburg, Pennsylvania, disposal site. The US Nuclear Regulatory Commission (NRC) will use this plan in support of license issuance for the long-term surveillance of the Canonsburg site. The Canonsburg (CAN) site is located within the borough of Canonsburg, Washington County, in southwestern Pennsylvania. The Canonsburg site covers approximately 30 acres (74 hectares). The disposal cell contains approximately 226,000 tons (241,000 tons) of residual radioactive material (RRM). Area C is southeast of the Canonsburg site, between Strabane Avenue and Chartiers Creek. Contaminated soils were removed from Area C during the remedial action, and the area was restored with uncontaminated fill material.After this cleanup, residual quantities of thorium-230 were detected at several Area C locations. The remedial action plan did not consider the ingrowth of radium-226 from thorium-230 as part of the Area C cleanup, and only two locations contained sufficient thorium-230 concentrations to result in radium-226 concentrations slightly above the US Environmental Protection Agency (EPA) standards.

2059 (DOE/AL/62350–204) **Final audit report of remedial action construction at the UMTRA Project Ambrosia Lake, New Mexico, site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000216. Source: OSTI; NTIS; INIS; GPO Dep.

The final audit report for remedial action at the Ambrosia Lake, New Mexico, Uranium Mill Tailings Remedial Action (UMTRA) Project site consists of a summary of the radiological surveillances/audits, quality assurance (QA) in-process surveillances, and a QA final closeout inspection performed by the US Department of Energy (DOE) and the Technical Assistance Contractor (TAC). One radiological surveillance and three radiological audits were performed at the Ambrosia Lake site. The surveillance was performed on 12–16 April 1993 (DOE, 1993d). The audits were performed on 26–29 July 1993 (DOE, 1993b); 21–23 March 1994 (DOE, 1994d); and 1–2 August 1994 (DOE, 1994d). The surveillance and audits resulted in 47 observations. Twelve of the observations raised DOE concerns that were resolved on site or through subsequent corrective action. All outstanding issues were satisfactorily closed out on 28 December 1994. The radiological surveillance and audits are discussed in this report. A total of seven QA in-process surveillances were performed at the Ambrosia Lake UMTRA site are discussed. The DOE/TAC Ambrosia Lake final remedial action close-out inspection was conducted on 26 July 1995 (DOE, 1995a). To summarize, a total of 155 observations were noted during DOE/TAC audit and surveillance activities. Follow-up to responses required from the RAC for the DOE/TAC surveillance and audit observations indicated that all issues related to the Ambrosia Lake site were resolved and closed to the satisfaction of the DOE.

2060 (DOE/AL/62350–205) **Final audit report of remedial action construction at the UMTRA Project Mexican Hat, Utah – Monument Valley, Arizona, sites.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Oct 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96002055. Source: OSTI; NTIS; INIS; GPO Dep.

The final audit report for remedial action at the Mexican Hat, Utah, Monument Valley, Arizona, Uranium Mill Tailings Remedial Action (UMTRA) Project sites consists of a summary of the radiological surveillances/audits, quality assurance (QA) in-process surveillances, and QA remedial action close-out inspections performed by the US Department of Energy (DOE) and the Technical Assistance Contractor (TAC); on-site construction reviews (OSCR) performed by the US Nuclear Regulatory Commission (NRC); and a surveillance performed by the Navajo Nation. This report refers to remedial action activities performed at the Mexican Hat, Utah–Monument Valley, Arizona, Uranium Mill Tailings Remedial Action (UMTRA) Project sites.

2061 (DOE/AL/62350–207) **Long-term surveillance plan for the Mexican Hat disposal site, Mexican Hat, Utah.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jan 1996. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96004141. Source: OSTI; NTIS; INIS; GPO Dep.

This plan describes the long-term surveillance activities for the Uranium Mill Tailings Remedial Action (UMTRA) Project disposal site at Mexican Hat, Utah. The US Department of Energy (DOE) will carry out these activities to ensure that the disposal site continues to function as designed. This long-term surveillance plan (LTSP) was prepared as a requirement for acceptance under the US Nuclear Regulatory Commission (NRC) general license for custody and long-term care of residual radioactive material (RRM). This LTSPC documents the land ownership interests and details how the long-term care of the disposal site will be accomplished.

2062 (DOE/AL/62350–207-Rev.1) **Long-term surveillance plan for the Mexican Hat Disposal Site, Mexican Hat, Utah.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1996. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96008002. Source: OSTI; NTIS; INIS; GPO Dep.

This plan describes the long-term surveillance activities for the Uranium Mill Tailings Remedial Action (UMTRA) Project disposal site at Mexican Hat, Utah. The U.S. Department of Energy (DOE) will carry out these activities to ensure that the disposal site continues to function as designed. This long-term surveillance plan (LTSP) was prepared as a requirement for acceptance under the U.S. Nuclear Regulatory Commission (NRC) general license for custody and long-term care of residual radioactive material (RRM). This LTSP (based on the DOE's Guidance for Implementing the UMTRA Project Long-term Surveillance Program), documents the land ownership interests and details how the long-term care of the disposal site will be accomplished.

2063 (DOE/AL/62350–208) **Public affairs plan.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000233. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Uranium Mill Tailings Remedial Action (UMTRA) Project Public Affairs Plan is to establish goals for the fiscal year (FY) 1996 UMTRA Project public affairs program and to identify specific activities to be conducted during the year. It describes the roles of various agencies involved in the public affairs program and defines the functions of the UMTRA Project Technical Assistance Contractor (TAC) Public Affairs Department. It replaces the FY 1995 Public Affairs Plan (DOE/AL/62350-154). The plan also describes the US Department of Energy's (DOE) plans to keep stakeholders and other members of the public informed about UMTRA Project policies, plans, and activities, and provide opportunities for stakeholders and interested segments of the public to participate in UMTRA Project decision-making processes. The plan applies to the UMTRA Project Team; the DOE Grand Junction Projects Office (GJPO); the DOE Albuquerque Operations Office, Office of Public Affairs (OPA); the TAC; the UMTRA Project Remedial Action Contractor (RAC); and other cooperating agencies.

2064 (DOE/AL/62350–210) **Comment and response document for the long-term surveillance plan for the Bodo Canyon Disposal Site, Durango, Colorado, Revision 0.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Nov 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96003076. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the comment and response document for the Draft Long-Term Surveillance Plan of the Bodo Canyon Site in Durango, California. This is a part of the Uranium Mill Tailings Remedial Action (UMTRA) Project. Questions and comments regarding specific sections or statements in the report are described and then a response to each review comment or question is provided.

2065 (DOE/AL/62350–211) **Long-term surveillance plan for the Ambrosia Lake, New Mexico disposal site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Nov 1995. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96004149. Source: OSTI; NTIS; INIS; GPO Dep.

This long-term surveillance plan (LTSP) for the Uranium Mill Tailings Remedial Action (UMTRA) Project Ambrosia Lake disposal site in McKinley County, New Mexico, describes the US Department of Energy's (DOE) long-term care program for the disposal site. The DOE will carry out this program to ensure that the disposal cell continues to function as designed. This LTSP was prepared as a requirement for acceptance under the US Nuclear Regulatory Commission (NRC) general license for custody and long-term care of residual radioactive materials.

2066 (DOE/AL/62350–212) **Economic impact study of the Uranium Mill Tailings Remedial Action project in Colorado: Colorado state fiscal year 1995.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Dec 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96004147. Source: OSTI; NTIS; INIS; GPO Dep.

This Colorado economic impact study summarizes employment and economic benefits to the state from activities associated with the Uranium Mill Tailings Remedial Action (UMTRA) Project during Colorado state fiscal year (FY) 1995 (1 July 1994 through 30 June 1995). To capture employment information, a questionnaire was distributed to subcontractor employees at the active UMTRA Project sites of Grand Junction, Gunnison, Maybell, Naturita, Rifle, and Slick Rock, Colorado. Economic data were requested from the Remedial Action Contractor (RAC), the Technical Assistance Contractor (TAC) and the US Department of Energy (DOE). The most significant benefits associated with the UMTRA Project in Colorado are summarized.

2067 (DOE/AL/62350–212-Rev.1) **Economic impact study of the Uranium Mill Tailings Remedial Action project in Colorado: Colorado state fiscal year 1995. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Dec 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96004144. Source: OSTI; NTIS; INIS; GPO Dep.

As required by the Romer-Twining Agreement of 1990, the US Department of Energy (DOE) has prepared this annual economic impact study for the state of Colorado. This report assesses the economic impacts related to the DOE Uranium Mill Tailings Remedial Action (UMTRA) Project in Colorado during the state fiscal year (FY) between 1 July 1994 and 30 June 1995. To estimate net economic benefit, employment, salaries and wages, and other related economic benefits are discussed, quantified, and then compared to the state's 10 percent share of the remedial action costs. Actual data obtained from sites currently undergoing remedial action were used as the basis for analyses. If data were not available, estimates were used to derive economic indicators. This study describes the types of employment associated with the UMTRA Project and estimates of the numbers of people employed by UMTRA Project subcontractors in Colorado during state FY 1995. Employment totals are reported in estimated average annual jobs; however, the actual number of workers at the site fluctuates depending on weather and on the status of remedial action activities. In addition, the actual number of people employed on the Project during the year may be higher than the average annual employment reported due to the temporary nature of some of the jobs.

2068 (DOE/AL/62350–217) **Final audit report of remedial action construction at the UMTRA Project Site, Gunnison, Colorado. Revision 0.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jan 1996. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96007514. Source: OSTI; NTIS; INIS; GPO Dep.

The final audit report for remedial action at the Gunnison, Colorado Uranium Mill Tailings Remedial Action (UMTRA) Project site consists of a summary of the radiological surveillances/audits, quality assurance (QA) in-process surveillances, and QA remedial action close-out inspections performed by the U.S. Department of Energy (DOE) and the Technical Assistance Contractor (TAC); and on-site construction reviews (OSCR) performed by the U.S. Nuclear Regulatory Commission (NRC). Two radiological surveillances and four radiological audits were performed at the Gunnison site. The surveillances were performed on 16 to 19 September 1992 and 28 June to 1 July 1993. The radiological audits were performed on 4 to 7 October 1993; 13 to 16 June 1994; 19 to 22 September 1994 and 10 to 12 July 1995. The surveillances and audits resulted in 79 observations. Thirty-four of the observations raised DOE concerns that were resolved on the site or through subsequent corrective action. All outstanding issues were closed on 12 July 1995. The radiological surveillances and audits are discussed in Section 2.0 of this report. Ten QA in-process surveillances were performed at the Gunnison UMTRA Project site. The surveillances were performed on 24 to 25 September 1992, 7 to 9 July 1993, 29 October 1993, 27 to 28 June 1994, 31 October to 1 November 1994, 19 to 20 June 1 995, 20 to 21 July 1995, 17 to 18 August 1995, 20 September 1995, and 11 to 13 October 1995. The surveillances resulted in 100 observations. Six observations contained recommendations that required responses from the Remedial Action Contractor (RAC). Ninety-five observations contained a recommendation that required no response. All outstanding issues were closed on 8 January 1996. The QA in-process surveillances are discussed in Section 3.0 of this report.

2069 (DOE/AL/62350–221-Rev.1) **UMTRA Surface Project management action process document. Final report: Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Apr 1996. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96010980. Source: OSTI; NTIS; INIS; GPO Dep.

A critical mission of the US Department of Energy (DOE) is the planning, implementation, and completion of environmental restoration (ER) programs at facilities that were operated by or in support of the former Atomic Energy Commission (AEC) from the late 1940s into the 1970s. Among these facilities are the 24 former uranium mill sites designed in the Uranium Mill Tailings Radiation Control Act (UMTRCA) of 1978 (42 USC § 7901 et seq.) Title 1 of the UMTRCA authorized the DOE to undertake remedial actions at these designated sites and associated vicinity properties (VP), which contain uranium mill tailings and other residual radioactive materials (RRM) derived from the processing sites. Title 2 of the UMTRCA addresses uranium mill sites that were licensed at the time the UMTRCA was enacted. Cleanup of these Title 2 sites is the responsibility of the licensees. The cleanup of the Title 1 sites has been split into two separate projects: the Surface Project, which deals with the mill buildings, tailings, and contaminated soils at the sites and VPs; and the Ground Water Project, which is limited to the contaminated ground water at the sites. This management action process (MAP) document discusses the Uranium Mill Tailings Remedial Action (UMTRA) Surface Project only; a separate MAP document has been prepared for the UMTRA Ground Water Project.

2070 (DOE/AL/62350–221-Rev.2) **UMTRA Surface Project management action process document: Final. Revision 2.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1996. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96013528. Source: OSTI; NTIS; INIS; GPO Dep.

Title 1 of the UMTRCA authorized the DOE to undertake remedial actions at these designed sites and associated vicinity properties (VP), which contain uranium mill tailings and other residual radioactive materials (RRM) derived from the processing sites. Title 2 of the UMTRCA addresses uranium mill sites that were licensed at the time the UMTRCA was enacted. Cleanup of these Title 2 sites is the responsibility of the licensees. The cleanup of the Title 1 sites has been split into two separate projects: the Surface Project, which deals with the mill buildings, tailings, and contaminated soils at the sites and VPs; and the Ground Water Project, which is limited to the contaminated ground water at the sites. This management action process (MAP) document discusses the Uranium Mill Tailings Remedial Action (UMTRA) Surface Project. Since its inception through March 1996, the Surface Project (hereinafter called the Project) has cleaned up 16 of the 24 designated processing sites and approximately 5,000 VPs, reducing the risk to human health and the environment posed by the uranium mill tailings. Two of the 24 sites, Belfield and Bowman, North Dakota, will not be remediated at the request of the state, reducing the total number of sites to 22. By the start of FY1998, the remaining 6 processing sites and associated VPs will be cleaned up. The remedial action activities to be funded in FY1998 by the FY1998 budget request are remediation of the remaining Grand Junction, Colorado, VPs; closure of the Cheney disposal cell in Grand Junction, Colorado; and preparation of the completion reports for 4 completed sites.

2071 (DOE/AL/62350–222) **Long-term surveillance plan for the Gunnison, Colorado, disposal site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1996. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96008305. Source: OSTI; NTIS; GPO Dep.

This long-term surveillance plan (LTSP) describes the U.S. Department of Energy's (DOE) long-term care program for the Uranium Mill Tailings Remedial Action (UMTRA) Project Gunnison disposal site in Gunnison County, Colorado. The U.S. Nuclear Regulatory Commission (NRC) has developed regulations for the issuance of a general license for the custody and long-term care of UMTRA Project disposal sites in 10 CFR Part 40. The purpose of this general license is to ensure that the UMTRA Project disposal sites will be cared for in a manner that protects the public health and safety and the environment. For each disposal site to be licensed, the NRC requires the DOE to submit a site-specific LTSP. The DOE prepared this LTSP to meet this requirement for the Gunnison disposal site. The general license becomes effective when the NRC concurs with the DOE's determination of completion of remedial action for the Gunnison site and the NRC formally accepts this LTSP. This LTSP describes the long-term surveillance program the DOE will implement to ensure that the Gunnison disposal site performs as designed. The program is based on two distinct activities: (1) site inspections to identify threats to disposal cell integrity, and (2) ground water monitoring to demonstrate disposal cell performance. The LTSP is based on the UMTRA Project long-term surveillance program guidance and meets the requirements of 10 CFR §40.27(b) and 40 CFR §192.03.

2075 (DOE/AL/62350–225) **Biological assessment of remedial action at the abandoned uranium mill tailings site near Naturita, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96008306. Source: OSTI; NTIS; GPO Dep.

Pursuant to the Uranium Mill Tailings Radiation Control Act (UMTRCA) of 1978, the U.S. Department of Energy (DOE) is proposing to conduct remedial action to clean up the residual radioactive materials (RRM) at the Naturita uranium processing site in Colorado. The Naturita site is in

Montrose County, Colorado, and is approximately 2 miles (mi) (3 kilometer [km]) from the unincorporated town of Naturita. The proposed remedial action is to remove the RRM from the Naturita site to the Upper Burbank Quarry at the Uravan disposal site. To address the potential impacts of the remedial action on threatened and endangered species, the DOE prepared this biological assessment. Informal consultations with the U.S. Department of the Interior, Fish and Wildlife Service (FWS) were initiated in 1986, and the FWS provided a list of the threatened and endangered species that may occur in the Naturita study area. This list was updated by two FWS letters in 1988 and by verbal communication in 1990. A biological assessment was included in the environmental assessment (EA) of the proposed remedial action that was prepared in 1990. This EA addressed the impacts of moving the Naturita RRM to the Dry Flats disposal site. In 1993, the design for the Dry Flats disposal alternative was changed. The FWS was again consulted in 1993 and provided a new list of threatened and endangered species that may occur in the Naturita study area. The Naturita EA and the biological assessment were revised in response to these changes. In 1994, remedial action was delayed because an alternate disposal site was being considered. The DOE decided to move the FIRM at the Naturita site to the Upper Burbank Quarry at the Uravan site. Due to this delay, the FWS was consulted in 1995 and a list of threatened and endangered species was provided. This biological assessment is a revision of the assessment attached to the Naturita EA and addresses moving the Naturita RRM to the Upper Burbank Quarry disposal site.

2076 (DOE/AL/62350–228) **Long-term surveillance plan for the South Clive Disposal Site, Clive, Utah.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96011513. Source: OSTI; NTIS; INIS; GPO Dep.

This long-term surveillance plan (LTSP) describes the US Department of Energy's (DOE) long-term care program for the Uranium Mill Tailings Remedial Action (UMTRA) Project South Clive disposal site in Clive, Utah. The US Nuclear Regulatory Commission (NRC) has developed regulations for the issuance of a general license for the custody and long-term care of UMTRA Project disposal sites in 10 CRF Part 40. The purpose of this general license is to ensure that the UMTRA Project disposal sites will be cared for in a manner that protects the public health and safety and the environment. For each disposal site to be licensed, the NRC requires the DOE to submit a site-specific LTSP. The DOE prepared this LTSP to meet this requirement for the South Clive disposal site. The general license becomes effective when the NRC concurs with the DOE's determination of completion of remedial action for the South Clive site and the NRC formally accepts this LTSP. This LTSP describes the long-term surveillance program the DOE will implement to ensure that the South Clive disposal site performs as designed. The program's primary activity is site inspections to identify threats to disposal cell integrity.

2077 (DOE/AL/62350–231) **Geophysical surveys at the UMTRA project Shiprock, New Mexico site.** Wightman, E.; Smith, B.; Newlin, B. Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Geraghty and Miller, Inc., Denver, CO (United States). Mar 1996. 156p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96011835. Source: OSTI; NTIS; INIS; GPO Dep.

Geophysical surveys were performed at the Uranium Mill Tailings Remedial Action (UMTRA) Shiprock site in New Mexico during February 1996. The surveys were designed to locate areas of ground water contamination, consisting largely of sulfate and nitrate salts and uranium. Electrical geophysical methods were used to locate areas of sulfate and nitrate concentrations since these products, when present in ground water, increase its electrical conductivity. These contaminants also increase the density of water, making the water with the highest concentrations of these salts sink to the bottom of the water column. At the Shiprock site, where alluvium is underlain by the impervious Mancos Shale, the saline water will tend to rest in depressions on the shale surface. Seismic refraction surveys were conducted on the floodplain. The site comprises two areas, the terrace and the floodplain, separated by a steep scarp of some 70 feet (ft) (20 meters [m]). Measurements of electrical conductivity were taken over these two areas, searching for possible pockets of saline ground water resting on top of the bedrock. Conductivity surveys were also run to identify fractures within the bedrock that may act as conduits for ground water movement. Several areas of higher than normal conductivity were found on the terrace, including halos of higher conductivities on three sides of the tailings cell. The conductivity measurements searching for fractures found only a small number of minor fracture-like anomalies. These are not considered important. On the floodplain, both conductivity and seismic refraction measurements were taken. The conductivity measurements clearly show areas of high conductivity interpreted to result from ground water contamination. The seismic refraction measurements identified bedrock depressions that may contain denser, and more saline ground water lenses. Generally, the areas of high conductivity coincide with the bedrock depressions.

2078 (DOE/AL/62350–233) **Comment and response document for the long-term surveillance plan for the Bodo Canyon Disposal Site, Durango. Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jul 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96013530. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains comments made by the US Nuclear Regulatory Commission upon their review of the Long-Term Surveillance Plan for the Bodo Canyon Disposal Site, Durango, Colorado. Responses to the comments are also included in the document.

2079 (DOE/AL/62350–T7) **Remedial action plan and site conceptual design for stabilization of the inactive uranium mill tailings sites at Rifle, Colorado. Appendix D, Final report.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Colorado State Dept. of Public Health, Denver, CO (United States). Feb 1992. 595p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350 ; FC04-82AL16257. Order Number DE95015507. Source: OSTI; NTIS; INIS; GPO Dep.

This appendix assesses the present conditions and data gathered about the two designated inactive uranium mill tailings sites near Rifle, Colorado, and the proposed disposal site six miles north of Rifle in the area of Estes Gulch. It consolidates available engineering, radiological, geotechnical, hydrological, meteorological, and other information pertinent to the design of the Remedial Action Plan (RAP). The data characterize conditions at the mill, tailings, and disposal site so that the Remedial Action Contractor (RAC) may complete final designs for the remedial actions.

2080 (DOE/AL/62350–T8) **Scope of work-supplemental standards-related fieldwork - Salt Lake City UMTRA Project Site, Salt Lake City, Utah.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. 23 Jan 1996. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350 ; FG05-80ET53088. Order Number DE96005572. Source: OSTI; NTIS; INIS; GPO Dep.

This scope of work governs the field effort to conduct transient in situ (hereafter referred to by the trademark name HydroPunch®) investigative subsurface logging and ground water sampling, and perform well point installation services at the U.S. Department of Energy's (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project site near Salt Lake City, Utah. The HydroPunch® and well point services subcontractor (the Subcontractor) shall provide services as stated herein to be used to investigate the subsurface, collect and analyze ground water samples, and install shallow well points.

2081 (DOE/AL/62350–T9) **Uranium Mill Tailings Remedial Action Project, fiscal year 1995 annual report to stakeholders.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). 30 Sep 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96012683. Source: OSTI; NTIS; INIS; GPO Dep.

In 1978, Congress authorized the DOE to assess and clean up contamination at 24 designated former uranium processing sites. The DOE is also responsible for cleaning up properties in the vicinity of the sites where wind and water erosion deposited tailings or people removed them from the site for use in construction or landscaping projects. Cleanup is being undertaken in cooperation with state governments and Indian tribes within whose boundaries the sites are located. It is being conducted in two phases: the surface project and the ground water project. This report addresses specifics about both phases of the UMTRA Project. DOE's UMTRA Project is the world's largest materials management project ever undertaken to reduce or eliminate risk to the general public from exposure to potentially hazardous and radioactive materials. With an estimated cost at completion of nearly $2 billion for both phases of the UMTRA Project, and with the responsibility for encapsulating and isolating almost one-fourth of all the uranium mill tailings generated across the entire US (more than 44 million cubic yards), the UMTRA Project and its people have achieved a long record of safely and effectively completing its mission. It continually enhances its national reputation through its diligent process and cost efficiency as well as its international recognition for its technological innovation.

2082 (DOE/AL/62350–T10) **Remedial action plan for stabilization of the inactive uranium mill tailings site at Monument Valley, Arizona.** Jacobs Engineering Group, Inc., Washington, DC (United States). Feb 1986. 202p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96013585. Source: OSTI; NTIS; GPO Dep.

This Remedial Action Plan (RAP) has been developed to serve a two-fold purpose. It presents the series of activities which are proposed by the U.S. Department of Energy (DOE) to accomplish long-term stabilization and control of radioactive materials at the inactive uranium processing site located near Monument Valley, Arizona It also serves to document the concurrence of both the Navajo Nation and the U.S. Nuclear Regulatory Commission (NRC) in the remedial action. This agreement, upon execution by DOE and the Navajo Nation and concurrence by NRC, becomes Appendix B of the Cooperative Agreement.

2083 (DOE/EA–0988) **Transfer of Plutonium-Uranium Extraction Plant and N Reactor irradiated fuel for storage at the 105-KE and 105-KW fuel storage basins, Hanford Site, Richland Washington.** USDOE Richland Operations Office, WA (United States). Jul 1995. 72p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016112. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) needs to remove irradiated fuel from the Plutonium-Uranium Extraction (PUREX) Plant and N Reactor at the Hanford Site, Richland, Washington, to stabilize the facilities in preparation for decontamination and decommissioning (D&D) and to reduce the cost of maintaining the facilities prior to D&D. DOE is proposing to transfer approximately 3.9 metric tons (4.3 short tons) of unprocessed irradiated fuel, by rail, from the PUREX Plant in the 200 East Area and the 105 N Reactor (N Reactor) fuel storage basin in the 100 N Area, to the 105-KE and 105-KW fuel storage basins (K Basins) in the 100 K Area. The fuel would be placed in storage at the K Basins, along with fuel presently stored, and would be dispositioned in the same manner as the other existing irradiated fuel inventory stored in the K Basins. The fuel transfer to the K Basins would consolidate storage of fuels irradiated at N Reactor and the Single Pass Reactors. Approximately 2.9 metric tons (3.2 short tons) of single-pass production reactor, aluminum clad (AC) irradiated fuel in four fuel baskets have been placed into four overpack buckets and stored in the PUREX Plant canyon storage basin to await shipment. In addition, about 0.5 metric tons (0.6 short tons) of zircaloy clad (ZC) and a few AC irradiated fuel elements have been recovered from the PUREX dissolver cell floors, placed in wet fuel canisters, and stored on the canyon deck. A small quantity of ZC fuel, in the form of fuel fragments and chips, is suspected to be in the sludge at the bottom of N Reactor's fuel storage basin. As part of the required stabilization activities at N Reactor, this sludge would be removed from the basin and any identifiable pieces of fuel elements would be recovered, placed in open canisters, and stored in lead lined casks in the storage basin to await shipment. A maximum of 0.5 metric tons (0.6 short tons) of fuel pieces is expected to be recovered.

2084 (DOE/EA–1149-Draft) **Draft environmental assessment – Closure of the Waste Calcining Facility (CPP-633), Idaho National Engineering Laboratory.** Braun, J.B.; Irving, J.S.; Staley, C.S.; Stanley, N. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Apr 1996. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96010275. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE-Idaho Operations Office has prepared an environmental assessment (EA) to analyze the environmental impacts of closing the Waste Calcining Facility (WCF) at the Idaho National Engineering Laboratory (INEL). The purpose of the action is to reduce the risk of radioactive exposure and release of radioactive and hazardous constituents and eliminate the need for extensive long-term surveillance and maintenance. DOE has determined that the closure is needed to reduce these risks to human health and the environment and to comply with Resource Conservation and Recovery Act requirements. The WCF closure project is described in the DOE Programmatic Spent Nuclear Fuel

Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Final Environmental Impact Statement (Programmatic EIS). DOE determined in the Programmatic EIS Record of Decision (ROD) that certain actions would be implemented and other actions deferred. The EA examined the potential environmental impacts of the proposed action and evaluated reasonable alternatives, including the no action alternative in accordance with the Council on Environmental Quality Regulations. Based on the analysis in the EA, the action will not have a significant effect on the human environment.

2085 (DOE/EM–0234) **Cost quality management assessment report for the Kansas City Plant. Final report.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Engineering and Cost Management. Apr 1995. 104p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011865. Source: OSTI; NTIS; GPO Dep.

The Office of Engineering and Cost Evaluation (EM-24) conducted a Cost Quality Management Assessment (CQMA). at the Kansas City Plant (KCP) on March 16-27, 1992. The Round II CQMA at the KCP, conducted August 22-31, 1994, reviewed KCP's cost and cost-related management practices against POCs contained in the CQMA Site Handbook. Interviews of Department of Energy Kansas City Area Office (DOE-KCAO) and AlliedSignal personnel and a review of documents show that KCP has made measurable progress since the last CQMA. Of the 48 POCs, KCP meets 31 and partially meets 17. Among the key observations are the following: The DOE-KCAO and AlliedSignal are effectively managing the Environmental Restoration (ER) baseline, validated in FY 1992, through Baseline Change Control Procedures. KCP ER baseline performance is on schedule and under budget. Remedial Action at the KCP is expected to be completed by FY 2000. After FY 2000, only Waste Management (WM) operations in support of Defense Programs will be required. KCP has initiated a Baseline Change Proposal to combine five planned Corrective Measures Studies into one; the expected cost avoidance is $1M. AlliedSignal used the CQMA Handbook (Rev. 0) and the Action Plan developed in response to the Round I CQMA as a basis for improving cost-management systems, processes, and procedures. AlliedSignal is standardizing on Project 2/Series X software for baseline scheduling and cost and schedule performance reporting. For estimating environmental restoration and construction projects, AlliedSignal is converting to Composer Gold software, the commercial version Of MCACES Software developed by the U.S. Army Corps of Engineers. AlliedSignal is beginning to generate a site-specific database in Composer Gold for more accurately estimating constriction and remediation projects. The roles and responsibilities of DOE-KCAO and AlliedSignal managers and staff need to be clarified given the recent reorganization of AlliedSignal.

2086 (DOE/EM–0253) **Decontamination and decommissioning focus area. Technology summary.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. Jun 1995. 77p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016002. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents details of the facility deactivation, decommissioning, and material disposition research for development of new technologies sponsored by the Department of Energy. Topics discussed include; occupational safety, radiation protection, decontamination, remote operated equipment, mixed waste processing, recycling contaminated metals, and business opportunities.

2087 (DOE/EM–0265) **Uranium enrichment decontamination and decommissioning fund.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). 1994. 30p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96003569. Source: OSTI; NTIS; INIS; GPO Dep.

One of the most challenging issues facing the Department of Energy's Office of Environmental Management is the cleanup of the three gaseous diffusion plants. In October 1992, Congress passed the Energy Policy Act of 1992 and established the Uranium Enrichment Decontamination and Decommissioning Fund to accomplish this task. This mission is being undertaken in an environmentally and financially responsible way by: devising cost-effective technical solutions; producing realistic life-cycle cost estimates, based on practical assumptions and thorough analysis; generating coherent long-term plans which are based on risk assessments, land use, and input from stakeholders; and, showing near-term progress in the cleanup of the gaseous diffusion facilities at Oak Ridge.

2088 (DOE/EM–0300) **Decontamination & decommissioning focus area.** USDOE Office of Scientific and Technical Information (OSTI), Oak Ridge, TN (United States). Aug 1996. 201p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013521. Source: OSTI; NTIS; INIS; GPO Dep.

In January 1994, the US Department of Energy Office of Environmental Management (DOE EM) formally introduced its new approach to managing DOE's environmental research and technology development activities. The goal of the new approach is to conduct research and development in critical areas of interest to DOE, utilizing the best talent in the Department and in the national science community. To facilitate this solutions-oriented approach, the Office of Science and Technology (EM-50, formerly the Office of Technology Development) formed five Focus AReas to stimulate the required basic research, development, and demonstration efforts to seek new, innovative cleanup methods. In February 1995, EM-50 selected the DOE Morgantown Energy Technology Center (METC) to lead implementation of one of these Focus Areas: the Decontamination and Decommissioning (D & D) Focus Area.

2089 (DOE/FUSRAP–140-96-005) **Environmental surveillance results for 1995 for the Hazelwood Interim Storage Site.** McCague, J.C. USDOE Formerly Utilized Sites Remedial Action Program (FUSRAP), Washington, DC (United States). 1 Jun 1996. 68p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96011247. Source: OSTI; NTIS; INIS; GPO Dep.

This memorandum presents and interprets analytical results and measurements obtained as part of the 1995 environmental surveillance program for the Hazelwood Interim Storage Site (HISS) under the Formerly Utilized Sites Remedial Action Program (FUSRAP). The discussion provides a comparative analysis of average historical background conditions and applicable regulatory criteria to the 1995 results reported for external gamma radiation and for samples from the media investigated (air, surface water, sediment, groundwater, and stormwater). Results from the 1995 environmental surveillance program at HISS indicate that, with the exception of thorium-230 in streambed sediment, applicable US Department of Energy (DOE) guidelines were not exceeded for any measured parameter or for any dose calculated for potentially exposed members of the general public. In the absence of sediment guidelines, DOE soil guidelines serve as a standard of comparison for data obtained from stream bed sediment; two samples from downstream locations contained concentrations of thorium-230 that exceeded DOE soil guidelines. All stormwater sample results were in compliance with permit-specified limits. Other radioactive materials include radium 226 and natural uranium.

2090 (DOE/HWP–171) **Technology application analyses at five Department of Energy Sites.** Oak Ridge National Lab., TN (United States). HAZWRAP Support Contractor Office. May 1995. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016376. Source: OSTI; NTIS; INIS; GPO Dep.

The Hazardous Waste Remedial Actions Program (HAZWRAP), a division of Lockheed Martin Energy Systems, Inc., managing contractor for the Department of Energy (DOE) facilities in Oak Ridge, Tennessee, was tasked by the United States Air Force (USAF) through an Interagency Agreement between DOE and the USAF, to provide five Technology Application Analysis Reports to the USAF. These reports were to provide information about DOE sites that have volatile organic compounds contaminating soil or ground water and how the sites have been remediated. The sites were using either a pump-and-treat technology or an alternative to pump-and-treat. The USAF was looking at the DOE sites for lessons learned that could be applied to Department of Defense (DoD) problems in an effort to communicate throughout the government system. The five reports were part of a larger project undertaken by the USAF to look at over 30 sites. Many of the sites were DoD sites, but some were in the private sector. The five DOE projects selected to be reviewed came from three sites: the Savannah River Site (SRS), the Kansas City Site, and Lawrence Livermore National Laboratory (LLNL). SRS and LLNL provided two projects each. Both provided a standard pump-and-treat application as well as an innovative technology that is an alternative to pump-and-treat. The five reports on these sites have previously been published separately. This volume combines them to give the reader an overview of the whole project.

2091 (DOE/ID–10513) **FY-95 technology catalog. Technology development for buried waste remediation.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. [1995]. 137p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AD07-93ID10513. Order Number DE96001578. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy's (DOE) Buried Waste Integrated Demonstration (BWID) program, which is now part of the Landfill Stabilization Focus Area (LSFA), supports applied research, development, demonstration, and evaluation of a multitude of advanced technologies dealing with underground radioactive and hazardous waste remediation. These innovative technologies are being developed as part of integrated comprehensive remediation systems for the effective and efficient remediation of buried waste sites throughout the DOE complex. These efforts are identified and coordinated in support of Environmental Restoration (EM-40) and Waste Management (EM-30) needs and objectives. Sponsored by the DOE Office of Technology Development (EM-50), BWID and LSFA work with universities and private industry to develop technologies that are being transferred to the private sector for use nationally and internationally. This report contains the details of the purpose, logic, and methodology used to develop and demonstrate DOE buried waste remediation technologies. It also provides a catalog of technologies and capabilities with development status for potential users. Past FY-92 through FY-94 technology testing, field trials, and demonstrations are summarized. Continuing and new FY-95 technology demonstrations also are described.

2092 (DOE/ID/12584–271) **Radiological decontamination, survey, and statistical release method for vehicles.** Goodwill, M.E.; Lively, J.W.; Morris, R.L. Rust Geotech, Inc., Grand Junction, CO (United States). Jun 1996. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86ID12584. (GJPO-MRAP-27). Order Number DE96013690. Source: OSTI; NTIS; INIS; GPO Dep.

Earth-moving vehicles (e.g., dump trucks, belly dumps) commonly haul radiologically contaminated materials from a site being remediated to a disposal site. Traditionally, each vehicle must be surveyed before being released. The logistical difficulties of implementing the traditional approach on a large scale demand that an alternative be devised. A statistical method for assessing product quality from a continuous process was adapted to the vehicle decontamination process. This method produced a sampling scheme that automatically compensates and accommodates fluctuating batch sizes and changing conditions without the need to modify or rectify the sampling scheme in the field. Vehicles are randomly selected (sampled) upon completion of the decontamination process to be surveyed for residual radioactive surface contamination. The frequency of sampling is based on the expected number of vehicles passing through the decontamination process in a given period and the confidence level desired. This process has been successfully used for 1 year at the former uranium millsite in Monticello, Utah (a cleanup site regulated under the Comprehensive Environmental Response, Compensation, and Liability Act). The method forces improvement in the quality of the decontamination process and results in a lower likelihood that vehicles exceeding the surface contamination standards are offered for survey. Implementation of this statistical sampling method on Monticello projects has resulted in more efficient processing of vehicles through decontamination and radiological release, saved hundreds of hours of processing time, provided a high level of confidence that release limits are met, and improved the radiological cleanliness of vehicles leaving the controlled site.

2093 (DOE/MC/29103–96/CO565) **Field test of a post-closure radiation monitor.** Reed, S. (Babcock & Wilcox, Alliance, OH (United States)); Christy, C.E.; Heath, R.E. Babcock and Wilcox Co., Allison, OH (United States). 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29103. (CONF-9510108–25: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003434. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE is conducting remedial actions at many sites contaminated with radioactive materials. After closure of these sites, long-term subsurface monitoring is typically required by law. This monitoring is generally labor intensive and expensive using conventional sampling and analysis techniques. The U.S. Department of Energy's Morgantown Energy Technology Center (METC) has contracted with Babcock and Wilcox to develop a Long-Term Post-Closure Radiation Monitoring System (LPRMS) to reduce these monitoring costs. A prototype LPRMS probe was built, and B&W and FERMCO field tested this monitoring probe at the Fernald Environmental Management Project in the fall of 1994 with funding from the DOE's Office of Technology Development (EM-50) through METC. The system was used to measure soil and water with known uranium contamination levels, both in drums and in situ at depths up to 3 meters. For comparison purposes, measurements were also performed using a more conventional survey probe with a sodium iodide scintillator directly butt-coupled to detection electronics. This paper presents a description and the results of the field tests. The results were used to characterize the lower detection limits, precision and bias of the system, which allowed the DOE to judge the monitoring system's ability to meet its long-term post-closure radiation monitoring needs. Based on the test results, the monitoring system has been redesigned for fabrication and testing in a potential Phase III of this program. If the DOE feels that this system can meet its needs and chooses to continue into Phase III of this program, this redesigned full scale prototype system will be built and tested for a period of approximately a year. Such a system can be used at a variety of radioactively contaminated sites.

2094 (DOE/MC/29103–5100) **Development of a long-term post-closure radiation monitor: Phase 2, Topical report, March 1994–July 1995.** Reed, S.E. Babcock and Wilcox Co., Alliance, OH (United States). Jul 1995. 275p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29103. Order Number DE96000629. Source: OSTI; NTIS; INIS; GPO Dep.

The long-term monitoring of a hazardous waste site for migration of radionuclides requires installation of radiation sensors at a large number of subsurface locations. The concept under development employs a passive in-ground measurement probe which contains a scintillator coupled to an optical lightguide. The overall goal of the Long-Term Post-Closure Radiation Monitor System (LPRMS) development program is to configure a long-term radiation monitor using commercially available, demonstrated components to the largest extent possible. The development program is planned as a three phase program spanning a total time of 53 months. The problems to be solved during Phase 1 were primarily those associated with selection of the most appropriate components (scintillator, coupling optics, optical fiber, and opto-electronics) to maximize the signal reaching the detectors and thereby minimizing the integration time required to obtain a reliable measure of radiation. Phase 2 (the current Phase) encompassed the fabrication and testing of the prototype LPRMS probe at a contaminated DOE site, the Fernald Environmental Management Project, in southwestern Ohio. Uranium isotopes are the primary contaminants of concern at this site. The single probe and opto-electronic device were used to made measurements in-situ at relatively shallow subsurface depths. The end objective of Phase 2 was the design of a full-scale prototype system which incorporates all the features expected to be necessary on a commercial system, including 50 meter depth of measurement, multiplexing of multiple probes, and remote transmission of data. This full-scale prototype will be fabricated and field tested for 12 months during Phase 3, and a commercial design will be developed based upon the data gathered and experience gained during the entire program.

2095 (DOE/MC/29104–96/CO566) **Mobile worksystems for decontamination and dismantlement.** Osborn, J.; Bares, L.C.; Thompson, B.R. Carnegie-Mellon Univ., Pittsburgh, PA (United States). 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29104. (CONF-9510108–26: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003433. Source: OSTI; NTIS; INIS; GPO Dep.

Many DOE nuclear facilities have aged beyond their useful lifetimes. They need to be decommissioned in order to be safe for human presence in the short term, to eventually recover valuable materials they contain, and ultimately to be transitioned to alternative uses or green field conditions. Decontamination and dismantlement are broad classes of activities that will enable these changes to occur. Most of these facilities - uranium enrichment plants, weapons assembly plants, research and production reactors, and fuel recycling facilities - are dormant, though periodic inspection, surveillance and maintenance activities within them are ongoing. DOE estimates that there are over 5000 buildings that require deactivation to reduce the costs of performing such work with manual labor. In the long term, 1200 buildings will be decommissioned, and millions of metric tons of metal and concrete will have to be recycled or disposed of The magnitude of the problem calls for new approaches that are far more cost effective than currently available techniques. This paper describes two technologies that are viable solutions for facility D&D.

2096 (DOE/MC/29113–96/CO571) **Interactive computer-enhanced remote viewing system.** Tourtellott, J.A.; Wagner, J.F. Mechanical Technology, Inc., Latham, NY (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29113. (CONF-9510108–27: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003432. Source: OSTI; NTIS; INIS; GPO Dep.

Remediation activities such as decontamination and decommissioning (D&D) typically involve materials and activities hazardous to humans. Robots are an attractive way to conduct such remediation, but for efficiency they need a good three-dimensional (3-D) computer model of the task space where they are to function. This model can be created from engineering plans and architectural drawings and from empirical data gathered by various sensors at the site. The model is used to plan robotic tasks and verify that selected paths am clear of obstacles. This need for a task space model is most pronounced in the remediation of obsolete production facilities and underground storage tanks. Production facilities at many sites contain compact process machinery and systems that were used to produce weapons grade material. For many such systems, a complex maze of pipes (with potentially dangerous contents) must be removed, and this represents a significant D&D challenge. In an analogous way, the underground storage tanks at sites such as Hanford represent a challenge because of their limited entry and the tumbled profusion of in-tank hardware. In response to this need, the Interactive Computer-Enhanced Remote Viewing System (ICERVS) is being designed as a software system to: (1) Provide a reliable geometric description of a robotic task space, and (2) Enable robotic remediation to be conducted more effectively and more economically than with available techniques. A system such as ICERVS is needed because of the problems discussed below.

2097 (DOE/MC/29467–4080) **Decontamination systems information and research program. Quarterly report, January–March 1995.** National Research Center for Coal and Energy, Morgantown, WV (United States). Apr 1995. 360p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29467. Order Number DE95009726. Source: OSTI; NTIS; GPO Dep.

The projects reported during this period are categorized into the following three areas: 1.0 Site Remediation Technologies, 2.0 Advanced Product Applications Testing, and 3.0 Information Systems, Public Policy, Community Outreach, and Economics. Summaries of the significant accomplishments for the projects reported during this period, are presented.

2098 (DOE/MC/29467–4091) **Decontamination systems information and research program. Quarterly report, April–June 1995.** West Virginia Univ. Research Corp., Morgantown, WV (United States). Jul 1995. 344p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29467. Order Number DE96000580. Source: OSTI; NTIS; GPO Dep.

West Virginia University (WVU) and the US Department of Energy Morgantown Energy Technology Center (DOE/METC) entered into a Cooperative Agreement on August 29, 1992 titled 'Decontamination Systems Information and Research Programs'. Requirements stipulated by the Agreement require WVU to submit Technical Progress reports on a quarterly basis. This report contains the efforts of the fourteen research projects comprising the Agreement for the period April 1 to June 30, 1995. During this period three new projects have been funded by the Agreement. These projects are: (1) WERC National Design Contest, (2) Graduate Interns to the Interagency Environmental Technology Office under the National Science and Technology Council, and (3) WV High Tech Consortium.

2099 (DOE/MC/29467–5127) **Decontamination systems information and research program. Quarterly report, July–September 1995.** West Virginia Univ., Morgantown, WV (United States). Oct 1995. 461p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29467. Order Number DE96000647. Source: OSTI; NTIS; GPO Dep.

The projects reported for the WVU Cooperative Agreement are categorized into the following three areas: (1) in situ remediation process development; (2) advanced product applications testing; and (3) information systems, public policy, community outreach, and economics. Summaries of the significant accomplishments for the projects reported during the period 1 July 1995 through 30 September 1995 are presented.

2100 (DOE/MC/29467–5177) **Decontamination systems information and research program. Quarterly report, October 1995–December 1995.** West Virginia Univ., Morgantown, WV (United States). Dec 1995. 392p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29467. Order Number DE96004454. Source: OSTI; NTIS; GPO Dep.

West Virginia University (WVU) and the U.S. Department of Energy Morgantown Energy Technology Center (DOE/METC) entered into a Cooperative Agreement on August 29, 1992 titled "Decontamination Systems Information and Research programs" (DOE Instrument No. DE-FC21-92MC29467) This report contains the efforts of the research projects comprising the Agreement for the 4th calendar quarter of 1995, and is the final quarterly report deliverable required for the period ending 31 December 1995. The projects reported for the WVU Cooperative Agreement are categorized into the following three areas: 1.0 In Situ Remediation Process Development, 2.0 Advanced Product Applications Testing, and 3.0 Information Systems, Public Policy, Community Outreach, and Economics. Summaries of the significant accomplishments for the projects reported during the period 1 October 95 through 31 December 95 are presented in the following discussions.

2101 (DOE/MC/30162–96/C0576) **Electrokinetic decontamination of concrete.** Lomasney, H. Isotron Corp., New Orleans, LA (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30162. (CONF-9510108–53: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96007381. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy has assigned a priority to the advancement of technology for decontaminating concrete surfaces which have become contaminated with radionuclides, heavy metals, and toxic organics. This agency is responsible for decontamination and decommissioning of thousands of buildings. Electrokinetic extraction is one of the several innovative technologies which emerged in response to this initiative. This technique utilizes an electropotential gradient and the subsequent electrical transport mechanism to cause the controlled movement of ionics species, whereby the contaminants exit the recesses deep within the concrete. The primary objective was to demonstrate the feasibility of this approach as a means to achieve "release levels" which could be consistent with unrestricted use of a decontaminated building. The secondary objectives were: To establish process parameters; to quantify the economics; to ascertain the ALARA considerations; and to evaluate wasteform and waste volume. The work carried out to this point has achieved promising results to the extent that ISOTRON® has been authorized to expand the planned activity to include the fabrication of a prototype version of a commercial device.

2102 (DOE/MC/30164–96/CO577) **Concrete decontamination by electro-hydraulic scabbling.** Goldfarb, V.; Gannon, R. Textron, Inc., Everett, MA (United States). Textron Defense Systems. 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30164. (CONF-9510108–14: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003465. Source: OSTI; NTIS; INIS; GPO Dep.

Textron Defense Systems (TDS) is developing an electrohydraulic device that has the potential for faster, safer, and less expensive scabbling of contaminated concrete surfaces. In the device, shock waves and cavitating bubbles are produced in water by the electric pulses, and the direct and reflected shock waves impinging on the concrete surface result in the crushing and cracking of the concrete. Pulse energy, frequency, and traverse speed control the depth of the scabbling action. Performance thus far has demonstrated the capability of a prototype unit to process a swath 24 inches wide, up to 3/4 inches deep at a linear velocity of up to 6 feet per hour, i.e., at a scabbling rate of 12 sq. ft. per hour.

2103 (DOE/MC/30165–96/CO578) **Remote operated vehicle with carbon dioxide blasting (ROVCO$_2$).** Resnick, A.M. Oceaneering International, Inc., Marlboro, MD (United States). 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30165. (CONF-9510108–24: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003436. Source: OSTI; NTIS; INIS; GPO Dep.

The Remote Operated Vehicle with Carbon Dioxide Blasting (ROVCO$_2$), as shown in a front view, is a six-wheeled remote land vehicle used to decontaminate concrete floors. The remote vehicle has a high pressure Cryogenesis blasting subsystem, Oceaneering Technologies (OTECH) developed a CO_2 xY Orthogonal Translational End Effector (COYOTEE) subsystem, and a vacuum/filtration and containment subsystem. Figure 2 shows a block diagram with the various subsystems labeled.

2104 (DOE/MC/30168–96/CO579) **Decontamination of process equipment using recyclable chelating solvent.** Jevec, J.; Lenore, C.; Ulbricht, S. Babcock and Wilcox Co., Allison, OH (United States). 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30168. (CONF-9510108–22: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003437. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) is now faced with the task of meeting decontamination and decommissioning obligations at numerous facilities by the year 2019. Due to the tremendous volume of material involved, innovative decontamination technologies are being sought that can reduce the volumes of contaminated waste materials and secondary wastes requiring disposal. With sufficient decontamination, some of the material from DOE facilities could be released as scrap into the commercial sector for recycle, thereby reducing the volume of radioactive waste requiring disposal. Although recycling may initially prove to be more costly than current disposal practices, rapidly increasing disposal costs are expected to make recycling more and more cost effective. Additionally, recycling is now perceived as the ethical choice in a world where the consequences of replacing resources and throwing away reusable materials are impacting the well-being of the environment. Current approaches to the decontamination of metals most often involve one of four basic process types: (1) chemical, (2) manual and mechanical, (3) electrochemical, and (4) ultrasonic. "Hard" chemical decontamination solutions, capable of achieving decontamination factors (Df's) of 50 to 100, generally involve reagent concentrations in excess of 5%, tend to physically degrade the surface treated, and generate relatively large volumes of secondary waste. "Soft" chemical decontamination solutions, capable of achieving Df's of 5 to 10, normally consist of reagents at concentrations of 0.1 to 1%, generally leave treated surfaces in a usable condition, and generate relatively low secondary waste volumes. Under contract to the Department of Energy, the Babcock & Wilcox Company is developing a chemical decontamination process using chelating agents to remove uranium compounds and other actinide species from process equipment.

2105 (DOE/MC/30170–96/CO580) **Advanced technologies for decontamination and conversion of scrap metal.** Muth, T.R. (and others); Shasteen, K.E.; Liby, A.L. Manufacturing Sciences Corp., Oak Ridge, TN (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30170. (CONF-9510108–18: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003443. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) accumulated large quantities of radioactive scrap metal (RSM) through historic maintenance activities. The Decontamination and Decommissioning (D&D) of major sites formerly engaged in production of nuclear materials and manufacture of nuclear weapons will generate additional quantities of RSM, as much as 3 million tons of such metal according to a recent study. The recycling of RSM is quickly becoming appreciated as a key strategy in DOE's cleanup of contaminated sites and facilities.

2106 (DOE/MC/30178–96/CO590) **Advanced worker protection system.** Caldwell, B.; Duncan, P.; Myers, J. Oceaneering Space Systems, Houston, TX (United States). 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30178. (CONF-9510108–21: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003438. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) is in the process of defining the magnitude and diversity of Decontamination and Decommissioning (D&D) obligations at its numerous sites. The DOE believes that existing technologies are inadequate to solve many challenging problems such as how to decontaminate structures and equipment cost effectively, what to do with materials and wastes generated, and how to adequately protect workers and the environment. Preliminary estimates show a tremendous need for effective use of resources over a relatively long period (over 30 years). Several technologies are being investigated which can potentially reduce D&D costs while providing appropriate protection to DOE workers. The DOE recognizes that traditional methods used by the EPA in hazardous waste site clean up activities are insufficient to provide the needed protection and worker productivity demanded by DOE D&D programs. As a consequence, new clothing and equipment which can adequately protect workers while providing increases in worker productivity are being sought for implementation at DOE sites. This project will result in the development of an Advanced Worker Protection System (AWPS). The AWPS will be built around a life support backpack that uses liquid air to provide cooling as well as breathing gas to the worker. The backpack will be combined with advanced protective garments, advanced liquid cooling garment, respirator, communications, and support equipment to provide improved worker protection, simplified system maintenance, and dramatically improve worker productivity through longer duration work cycles. Phase I of the project has resulted in a full scale prototype Advanced Worker Protection Ensemble (AWPE, everything the worker will wear), with sub-scale support equipment, suitable for integrated testing and preliminary evaluation. Phase II will culminate in a full scale, certified, pre-production AWPS and a site demonstration.

2107 (DOE/MC/30178–5181) **Advanced worker protection system. Topical report, Phase I.** Myers, J.

Oceaneering Space Systems, Houston, TX (United States). Jul 1995. 278p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30178. Order Number DE96004458. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) is in the process of defining the magnitude and diversity of Decontamination and Decommissioning (D&D) obligations at its numerous sites. The DOE believes that existing technologies are inadequate to solve many challenging problems such as how to decontaminate structures and equipment cost effectively, what to do with materials and wastes generated, and how to adequately protect workers and the environment. Preliminary estimates show a tremendous need for effective use of resources over a relatively long period (over 30 years). The backpack will be combined with advanced protective garments, advanced liquid cooling garment, respirator, communications, and support equipment to provide improved worker protection, simplified system, maintenance, and dramatically improve worker productivity through longer duration work cycles.

2108 (DOE/MC/30179-96/CO591) **Protective clothing based on permselective membrane and carbon adsorption.** Gottschlich, D.; Baker, R. Membrane Technology and Research, Inc., Menlo Park, CA (United States). 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30179. (CONF-9510108-8: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003449. Source: OSTI; NTIS; INIS; GPO Dep.

This paper is a description of Phase I of the US DOE's program to develop improved protective clothing for use by workers engaged in decommissioning and decontamination of former DOE sites, including those used for atomic weapons research and production. Membrane Technology and Research has been developing the clothing with an innovative feature of an ultrathin, permselective outer membrane that is extremely permeable to water but impermeable to toxic organic compounds. Phase I (as described herein) includes fabric optimization, commercial-scale fabric production, and prototype suit evaluation. This phase is complete, with the results discussed in this document.

2109 (DOE/MC/30359-96/CO594) **Laser-based coatings removal.** Freiwald, J.G.; Freiwald, D. F2 Associates, Albuquerque, NM (United States). 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-94MC30359. (CONF-9510108-2: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003446. Source: OSTI; NTIS; INIS; GPO Dep.

Over the years as building and equipment surfaces became contaminated with low levels of uranium or plutonium dust, coats of paint were applied to stabilize the contaminants in place. Most of the earlier paint used was lead-based paint. More recently, various non-lead-based paints, such as two-part epoxy, are used. For D & D (decontamination and decommissioning), it is desirable to remove the paints or other coatings rather than having to tear down and dispose of the entire building.

2110 (DOE/METC-96/1022) **Record of the facility deactivation, decommissioning, and material disposition (D and D) workshop: A new focus for technology development, opportunities for industry/government collaboration.** Bedick, R.C.; Bossart, S.J.; Hart, P.W. USDOE Morgantown Energy Technology Center, WV (United States). Jul 1995. 116p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States);Environmental Protection Agency, Washington, DC (United States);International Society for Decontamination and Decommissioning Professionals. (CONF-9507185-Summ.: Record of the Facility deactivation, decommissioning, and material disposition (D&D) workshop: a new focus for technology development, opportunities for industry/government collaboration, Morgantown, WV (United States), 11-12 Jul 19 Order Number DE96000553. Source: OSTI; NTIS; INIS; GPO Dep.

This workshop was held at the Morgantown Energy Technology Center (METC) in Morgantown, West Virginia, on July 11–12, 1995. The workshop sought to establish a foundation for continued dialogue between industry and the DOE to ensure that industry's experiences, lessons learned, and recommendations are incorporated into D and D program policy, strategy, and plans. The mission of the D and D Focus Area is to develop improved technologies, processes and products, to characterize, deactivate, survey, maintain, decontaminate, dismantle, and dispose of DOE surplus structures, buildings, and contents. The target is a five-to-one return on investment through cost avoidance. The cornerstone of the D and D focus area activities is large-scale demonstration projects that actually decontaminate, decommission, and dispose of a building. The aim is to demonstrate innovative D and D technologies as part of an ongoing DOE D and D project. OTD would pay the incremental cost of demonstrating the innovative technologies. The goal is to have the first demonstration project completed within the next 2 years. The intent is to select projects, or a project, with visible impact so all of the stakeholders know that a building was removed, and demonstrate at a scale that is convincing to the customers in the EM program so they feel comfortable using it in subsequent D and D projects. The plan is to use a D and D integrating contractor who can then use the expertise in this project to use in jobs at other DOE sites.

2111 (DOE/METC/C-96/7220) **Technology demonstrations in the Decontamination and Decommissioning Focus Area.** Bossart, S.J. USDOE Morgantown Energy Technology Center, WV (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). (CONF-960487-1: ANS topical meeting on best of decontamination and decommissioning, Chicago, IL (United States), 14-17 Apr 1996). Order Number DE96005197. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes three large-scale demonstration projects sponsored jointly by the Decontamination and Decommissioning Focus Area (DDFA), and the three US Department of Energy (DOE) Operations Offices that successfully offered to deactivate or decommission (D&D) one of its facilities using a combination of innovative and commercial D&D technologies. The paper also includes discussions on recent technology demonstrations for an Advanced Worker Protection System, an Electrohydraulic Scabbling System, and a Pipe Explorer™. The references at the conclusion of this paper should be consulted for more detailed information about the large-scale demonstration projects and recent technology demonstrations sponsored by the DDFA.

2112 (DOE/NV/10833-34) **An arid zone lysimeter facility for performance assessment and closure investigations at the Nevada Test Site.** Levitt, D.G. (Bechtel Nevada Corp., Las Vegas, NV (United States)); Lohrstorfer, C.F.; Sully, M.J.; Ginanni, J.M. Bechtel Nevada Corp., Las Vegas, NV (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-91NV10833. (CONF-960212-94: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96012182. Source: OSTI; NTIS; INIS; GPO Dep.

Two precision weighing lysimeters were installed near the Area 5 Radioactive Waste Management Site (RWMS) on the Nevada Test Site to provide support for investigations of water, solute, and heat fluxes in the near-surface of the soil. The lysimeters consist of soil tanks with a volume of 16 cubic meters mounted on a sensitive scale. One lysimeter was revegetated with native shrubs whereas the other was kept bare to stimulate a non-vegetated waste cover. Data consisting of physical and hydrological properties of the lysimeter soils, thermal and moisture conditions in the lysimeters, and atmospheric boundary conditions are being collected for calibrating and verifying computer models for simulating the flow of water and heat in the near surface alluvium at the Area 5 RWMS. This effort will provide site-specific models for demonstration of "no migration" of constituents to the water table. Moisture and thermal conditions in the lysimeters are monitored daily using time domain reflectometry probes and thermocouple psychrometers. Daily evaporation and evapotranspiration are calculated from the lysimeter scales. Meteorological variables are monitored by sensors mounted on a 3 meter tower adjacent to the lysimeters. An array of soil-solution samplers to be installed through the side of the soil tank will allow studies of waste mobility under natural conditions. Conceptual designs for closure at the RWMS are focused on using an upper layer of repacked native alluvium, which can be tested with the lysimeters. In addition, performance of other components such as a capillary barrier can be tested by installing a scaled version in one of the lysimeter tanks.

2113 (DOE/OR/21548-592) **Weldon Spring Site Environmental Report for Calendar Year 1995.** MK-Ferguson Co., St. Charles, MO (United States); Jacobs Engineering Group, Inc., St. Charles, MO (United States). Jun 1996. 336p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-86OR21548. Order Number DE96012446. Source: OSTI; NTIS; INIS; GPO Dep.

This Weldon Spring Site Environmental Report for Calendar Year 1995 has been prepared to provide information about the public safety and environmental protection programs conducted by the Weldon Spring Site Remedial Action Project (WSSRAP). The Weldon Spring site is located in southern St. Charles County, Missouri, approximately 48 km (30 mi) west of St. Louis. The site consists of two main areas, the Weldon Spring Chemical Plant and raffinate pits and the Weldon Spring Quarry. The chemical plant, raffinate pits, and quarry are located on Missouri State Route 94, southwest of U.S. Route 40/61. The objectives of the Site Environmental Report are to present a summary of data from the environmental monitoring program, to characterize trends and environmental conditions at the site, and to confirm compliance with environmental and health protection standards and requirements. The report also presents the status of remedial activities and the results of monitoring these activities to assess their impacts on the public and environment. This report includes monitoring data from routine radiological and nonradiological sampling activities. These data include estimates of dose to the public from the Weldon Spring site, estimates of effluent releases, and trends in groundwater contaminant levels. Additionally, applicable compliance requirements, quality assurance programs, and special studies conducted in 1995 to support environmental protection programs are discussed. Dose estimates presented in this report are based on hypothetical exposure scenarios for public use of areas near the site. In addition, release estimates have been calculated on the basis of 1995 National Pollutant Discharge Elimination System (NPDES) and air monitoring data. Effluent discharges from the site under routine NPDES and National Emission Standards for Hazardous Air Pollutants (NESHAPs) monitoring were below permitted levels.

2114 (DOE/ORO-2032) **Pilot-scale treatability testing – Recycle, reuse, and disposal of materials from decontamination and decommissioning activities: Soda blasting demonstration.** Oak Ridge K-25 Site, TN (United States); O'Brien and Gere Engineers, Inc., Syracuse, NY (United States). Aug 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96001201. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is in the process of defining the nature and magnitude of decontamination and decommissioning (D and D) obligations at its sites. With disposal costs rising and available storage facilities decreasing, DOE is exploring and implementing new waste minimizing D and D techniques. Technology demonstrations are being conducted by LMES at a DOE gaseous diffusion processing plant, the K-25 Site, in Oak Ridge, Tennessee. The gaseous diffusion process employed at Oak Ridge separated uranium-235 from uranium ore for use in atomic weapons and commercial reactors. These activities contaminated concrete and other surfaces within the plant with uranium, technetium, and other constituents. The objective of current K-25 D and D research is to make available cost-effective and energy-efficient techniques to advance remediation and waste management methods at the K-25 Site and other DOE sites. To support this objective, O'Brien and Gere tested a decontamination system on K-25 Site concrete and steel surfaces contaminated with radioactive and hazardous waste. A scouring system has been developed that removes fixed hazardous and radioactive surface contamination and minimizes residual waste. This system utilizes an abrasive sodium bicarbonate medium that is projected at contaminated surfaces. It mechanically removes surface contamination while leaving the surface intact. Blasting residuals are captured and dissolved in water and treated using physical/chemical processes. Pilot-scale testing of this soda blasting system and bench and pilot-scale treatment of the generated residuals were conducted from December 1993 to September 1994.

2115 (DOE/ORO–2034) **Contaminated concrete: Occurrence and emerging technologies for DOE decontamination.** Dickerson, K.S. (Oak Ridge National Lab., Grand Junction, CO (United States)); Wilson-Nichols, M.J.; Morris, M.I. Oak Ridge National Lab., TN (United States). Aug 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96003221. Source: OSTI; NTIS; INIS; GPO Dep.

The goals of the Facility Deactivation, Decommissioning, and Material Disposition Focus Area, sponsored by the US Department of Energy (DOE) Office of Technology Development, are to select, demonstrate, test, and evaluate an integrated set of technologies tailored to provide a complete solution to specific problems posed by deactivation, decontamination, and decommissioning, (D&D). In response to these goals, technical task plan (TTP) OR152002, entitled Accelerated Testing of Concrete Decontamination Methods, was submitted by Oak Ridge National Laboratory. This report describes the results from the initial project tasks, which focused on the nature and extent of contaminated concrete, emerging candidate technologies, and matching of emerging technologies to concrete problems. Existing information was used to describe the nature and extent of contamination (technology logic diagrams, data bases, and the open literature). To supplement this information, personnel at various DOE sites were interviewed, providing a broad perspective of concrete contamination. Because characterization is in the initial stage at many sites, complete information is not available. Assimilation of available information into one location is helpful in identifying potential areas of concern in the future. The most frequently occurring radiological contaminants within the DOE complex are ^{137}Cs, ^{238}U (and it daughters), and ^{60}Co, followed closely by ^{90}Sr and tritium, which account for –30% of the total occurrence. Twenty-four percent of the contaminants were listed as unknown, indicating a lack of characterization information, and 24% were listed as other contaminants (over 100 isotopes) with less than 1% occurrence per isotope.

2116 (DOE/RL–90-11-Rev.1) **300 Area waste acid treatment system closure plan. Revision 1.** Department of Energy, Richland, WA (United States). Richland Operations Office. Mar 1996. 267p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96010174. Source: OSTI; NTIS; INIS; GPO Dep.

This section provides a description of the Hanford Site, identifies the proposed method of 300 Area Waste Acid Treatment System (WATS) closure, and briefly summarizes the contents of each chapter of this plan.

2117 (DOE/RL–93-54) **Risk evaluation of remedial alternatives for the Hanford Site.** USDOE Richland Operations Office, WA (United States). May 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017536. Source: OSTI; NTIS; INIS; GPO Dep.

The document identifies the points in the feasibility studies/corrective measures studies process in Hanford facilites under the Tri-Party Agreement, and the issues to address. This document also introduces semiquantitative and quantitative risk assessment techniques and guidance to ensure that a RERA (remedial alternative) provides an appropriate level of detail.

2118 (DOE/RL–93-64-Rev.3) **Sodium dichromate expedited response action assessment, Revision 3.** USDOE Richland Operations Office, WA (United States). Jun 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017352. Source: OSTI; NTIS; GPO Dep.

The U.S. Environmental Protection Agency (EPA) and the Washington State Department of Ecology (Ecology) recommended that the U.S. Department of Energy (DOE) perform an expedited response action (ERA) for the Sodium Dichromate Barrel Disposal Landfill. The ERA lead regulatory agency is Ecology and EPA is the support agency. The ERA was conducted in accordance with the applicable sections of Title 40, Code of Federal Regulations, the Hanford Federal Facility Agreement and Consent Order, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), the Resource Conservation and Recovery Act (RCRA), and the Washington Model Toxics Control Act (MTCA). The ERA was categorized as nontime-critical, which required preparation of an engineering evaluation and cost analysis (EE/CA). The EE/CA, which was included in the proposal, is a rapid, focused evaluation of available technologies using specific screening factors to assess feasibility, appropriateness, and cost. The ERA goal is to reduce the potential for any contaminant migration from the landfill to the soil column, groundwater, and the Columbia River. Because the Sodium Dichromate Barrel Disposal Landfill is the only waste site within the operable unit, the removal action is the final remediation of the 100-IU-4 Operable Unit. This ERA process started in March 1992. The ERA proposal went through a parallel review process with Westinghouse Hanford Company (WHC), DOE Richland Operations Office (RL), EPA, Ecology, and a 30-day public comment period. Ecology and EPA issued an Action Agreement Memorandum in March 1993. The memorandum directed excavation of all anomalies and disposal of the collected materials at the Hanford Site Central Landfill. Primary field activities were completed by the end of April 1993. Final disposal of a minor quantity of hazardous waste was completed in July 1993.

2119 (DOE/RL–93-82) **Limited field investigation report for the 100-FR-1 Operable Unit.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Sep 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96000282. Source: OSTI; NTIS; INIS; GPO Dep.

This limited field investigation (LFI) report summarizes the data collection and analysis activities conducted during the 100-FR-1 Source Operable Unit LFI and the associated qualitative risk assessment (QRA), and makes recommendations on the continued candidacy of high-priority sites for interim remedial measures (IRM). The results and recommendations presented in this report are generally independent of future land use scenarios. An LFI is required when existing data are insufficient to formulate a conceptual model and perform a QRA. The purpose of the report is to identify those sites that are recommended to remain as candidates for IRM, provide a preliminary summary of site characterization studies, refine the conceptual model as needed, identify contaminant- and location-specific applicable or relevant and appropriate requirements (ARAR), and provide a qualitative assessment of the risks associated with the sites. This assessment includes consideration of whether contaminant concentrations pose an unacceptable risk that warrants action through IRM. The final decision to conduct an IRM will rely on many factors including risk, ARAR, future land use, point of compliance, time of compliance, a bias-for-action, and the threat to human health and the environment.

2120 (DOE/RL--94-20) **Pickling Acid Cribs remedial investigation/feasibility study.** USDOE, Washington, DC (United States). Jun 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017535. Source: OSTI; NTIS; INIS; GPO Dep.

The White Bluffs Pickling Acid Cribs Site, south of the White Bluffs town site in the Hanford 600 Area, is the only site identified in the 100-IU-5 Operable Unit. The cribs are believed to have received waste streams (mostly nitric acid and HF etch solutions) from a pipe fabrication facility operated 1943-1959. Soil samples were collected at the surface basin adjacent to the crib site. The basin is not in the 100-IU-5 Operable Unit. This report includes risk assessment information and data on the surface basin. Based on characterization activities and Hanford Site background levels, there is no radiological contamination. Only one detected nonradioactive element (zinc) had readings above background; this is attributed to scrapping of a glavanized pipe. Since the max Zn concentration was 554 mg/kg, well below the most restricted Zn soil concentration (2,400 mg/kg) in the human health risk-based screening, Zn was eliminated from further analysis. The ecological risk assessment considered the max detected Zn to be relatively nontoxic. The RI/FS supports a no action alternative.

2121 (DOE/RL--94-30) **Riverland expedited response action assessment.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Jun 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017534. Source: OSTI; NTIS; INIS; GPO Dep.

The US Environmental Protection Agency (EPA) and Washington Department of Ecology (Ecology) recommended that the US Department of Energy (DOE) prepare an expedited response action (ERA) for the Riverland Railroad Car Wash Pit (located in the Riverland Rail Yard) and the 600 Area Army Munitions Burial Site (Munitions Cache). This assessment report details the actions taken to complete the Riverland ERA.

2122 (DOE/RL--94-48) **100-KR-4 Operable Unit focused feasibility study.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Aug 1995. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017528. Source: OSTI; NTIS; INIS; GPO Dep.

This focused feasibility study (FFS) presents a detailed analysis of alternatives for an interim remedial measure (IRM) in the 100-KR-4 Operable Unit. The FFS has been conducted as part of the remedial investigation/feasibility study (RI/FS) process included under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). The 100-KR-4 Operable Unit includes the groundwater beneath the 100-K Area, which contains the K-East and K-West reactors. These reactors are two of the nine retired production reactors located in the northern portion of the Hanford Site. All of the operable units associated with the retired reactor areas are collectively referred to as the 100 Areas, one of four groupings of waste sites at Hanford that are on the US Environmental Protection Agency (EPA) National Priorities List (NPL) under CERCLA. The 100-KR-4 Operable Unit includes the groundwater beneath waste sites in the 100-K Area. The Columbia River shoreline represents the downgradient boundary. Waste sites in the 100-K Area are grouped into source operable units 100-KR-1 and 100-KR-2. The scope of environmental restoration activities within the 100-KR-4 Operable Unit may be partially controlled by potential adverse impacts in adjacent areas or to receptors outside the Operable Unit. These include groundwater, river water, riverbed sediments, and aquatic biota that may be exposed to contaminants as the result of groundwater flow from the Operable Unit.

2123 (DOE/RL--94-67) **100-HR-3 Operable Unit focused feasibility study.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Aug 1995. 500p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017530. Source: OSTI; NTIS; INIS; GPO Dep.

This Focused Feasibility Study (FFS) report presents a detailed analysis of alternatives for an interim remedial measure (IRM). The IRM addresses groundwater contamination in the 100-HR-3 Operable Unit. The focus of the FFS is chromium, a waste constituent that is transported by groundwater flow from the 100 Areas into the Columbia River. Ecological receptors in the river ecosystem may be exposed to chromium concentrations that exceed criteria established for the protection of aquatic life. The 100-HR-3 Operable Unit includes the groundwater beneath the 100-D/DR and 100-H reactor areas, and the intervening area (600 Area), as bounded by the Columbia River shoreline and the southern extent of the two reactor areas. Environmental restoration activities within the operable unit may be influenced by potential adverse impacts in adjacent areas, including groundwater, river water, riverbed sediments, and aquatic biota that may be exposed to contaminants as the result of groundwater flow from the operable unit. The starting point for selecting remedial alternatives for detailed analysis in the FFS is the 100 Areas Feasibility Study, Phases 1 and 2 (DOE-RL 1994a). This study presents a generalized view of applicable and implementable remedial technologies for contaminants of potential concern that are typical of all 100 Areas operable units. The FFS refines the analysis of remedial technologies for groundwater by incorporating contaminant characteristics and hydrogeologic conditions that are specific to the 100-HR-3 Operable Unit.

2124 (DOE/RL--94-85) **Remedial investigation/feasibility study report for the 300-FF-5 Operable Unit.** Bechtel National, Inc., Richland, WA (United States). May 1995. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017542. Source: OSTI; NTIS; INIS; GPO Dep.

This report is the final remedial investigation (RI)/feasibility study (FS) report for the 300-FF-5 Operable Unit. The 300-FF-5 Operable Unit addresses the groundwater, contaminated saturated soils, river sediments, and river contamination associated with the 300 Area National Priorities List (NPL) site at the US Department of Energy (DOE) Hanford Site, located in Washington State. This RI/FS is being performed to characterize the nature and extent of contamination, assess risks to human health and the environment, and develop and evaluate alternatives for remediation of contamination in the 300-FF-5 Operable Unit that has resulted from 300 Area operations. Remediation goals for this operable unit do not include remediation of contaminants migrating into the operable unit from sources outside the 300 Area. These efforts are consistent with the statutory requirements of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA), the regulatory requirements of the National Oil and Hazardous Substances Contingency Plan (NCP) (40 CFR 300), and the Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement) (Ecology et al. 1994), which was negotiated and approved by the DOE, the US Environmental Protection Agency (EPA), and the Washington State Department of Ecology (Ecology). This RI/FS will be used by the Tri-Party Agreement signatories to make a risk management-based selection of remedies for the contamination exceeding the remedial action objectives in the groundwater aquifer, shoreline saturated sediments, and river within the boundaries of the operable unit.

2125 (DOE/RL–94-119) **Proposal plan for interim remedial measures at the 100-KR-1 operable unit, Revision 0.** USDOE Richland Operations Office, WA (United States). Aug 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017512. Source: OSTI; NTIS; INIS; GPO Dep.

This proposed plan identifies the preferred alternative for interim remedial measures for remedial action at the 100-KR-1 Operable Unit at the Hanford Site. The alternative presented in this plan is to remove, treat, and dispose of the contaminated soil and associated structures from five waste sites within the Unit. These actions will reduce potential human health and ecological risks, ensure that contaminants present will not adversely affect groundwater, and leave the site suitable for future use. This alternative is the initial recommendation of the EPA, Ecology, and the DOE. Public comment on this plan is solicited.

2126 (DOE/RL–94-119-Rev.1) **Proposed plan for interim remedial measures at the 100-KR-1 Operable Unit. Revision 1.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Sep 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96000283. Source: OSTI; NTIS; INIS; GPO Dep.

This proposed plan identifies the preferred alternative for interim remedial measures for remedial action of radioactive liquid waste disposal sites that include contaminated soils and structures at the 100-KR-1 Operable Unit, located at the Hanford Site. It also summarizes other remedial alternatives evaluated for interim remedial measures in this Operable Unit. The intent of interim remedial measures is to speed up actions to address contaminated areas that pose potential threats to human health and the environment. This proposed plan is being issued by the US Environmental Protection Agency (EPA), the lead regulatory agency; the Washington State Department of Ecology (Ecology), the support regulatory agency; and the US Department of Energy (DOE), the responsible agency. The EPA, Ecology, and the DOE are issuing this proposed plan as part of their public participation responsibilities under Section 117(a) of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), commonly known as the "Superfund Law." This proposed plan is intended to be a fact sheet for public review which briefly describes the remedial alternatives analyzed, identifies a preferred alternative, and summarizes the information relied upon to recommend the preferred alternative.

2127 (DOE/RL–95-44) **Radioactive air emissions notice of construction for the removal of spacers from the 1303-N fuel spacer silos.** Bechtel National, Inc., Richland, WA (United States). May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017513. Source: OSTI; NTIS; INIS; GPO Dep.

This Notice of Construction (NOC) presents the proposed plans to remove the spacers from the silos located at the 100-N Area. September 30, 1995 is the milestone established by the Washington State Department of Ecology, the US Environmental Protection Agency (EPA), and the US Department of Energy for the disposal of these spacers. Fuel spacers were used to correctly position fuel in the pressure tubes of N Reactor. Spacers were ejected along with spent fuel during reactor refueling and were stored as waste in three underground silos adjacent to the reactor building. Periodically, the silos were emptied and the spacers removed to the burial ground. About 70,000 radioactive 5 cm (2-in.) diameter by 57.15 cm (22.5-in.) long (average length) perforated-tube spacers remain in storage in Silos 2 and 3 (Silo 1 is empty). Potentially, radioactive air emissions will be generated during the removal process of the spacers. The NOC describes the removal process and the airborne contamination controls proposed for this project.

2128 (DOE/RL–95-56) **100-BC-1 Excavation Demonstration Project Plan.** Bechtel National, Inc., Richland, WA (United States). Jun 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017543. Source: OSTI; NTIS; INIS; GPO Dep.

The US Environmental Protection Agency (EPA) and the Washington State Department of Ecology (Ecology) have requested that the US Department of Energy (DOE), through the Environmental Restoration Contractor (ERC), perform removal actions at waste sites within the 100-BC-1 Operable Unit (OU) at the Hanford Site. To accelerate removal actions, the EPA (lead regulatory agency), Ecology (support regulatory agency), and DOE (responsible agency) have chosen an expedited response action (ERA) pathway for these removal actions. These removal actions will be non-time critical, and will follow the applicable sections of 40 CFR 300 Subpart E (EPA 1990), and the Comprehensive Environmental Response, Compensation, and Recovery Act of 1980 (CERCLA). The Resource Conservation and Recovery Act of 1976 and the Washington State Model Toxics Control Act (MTCA) are key sources of applicable or relevant and appropriate requirements (ARAR) for the removal actions. Section 7.0 of this plan details the ARARs. The 100-BC-1 Excavation Demonstration Project Plan provides information and guidance on the strategy planned to carry out the removal actions and meet all the project objectives. This document provides the objectives, site selection, subsystems, and phasing (Sections 2.0 through 5.0) of the project. Section 6.0 ties the previous sections together and details the strategy and data needs required to meet the project objectives while performing the removal actions. This strategy is applicable to all of the sites that will be addressed by this removal action project.

2129 (DOE/RL–95-60) **Proposed plan for the 100-IU-1, 100-IU-3, 100-IU-4, AND 100-IU-5 Operable Units.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Jun 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017497. Source: OSTI; NTIS; INIS; GPO Dep.

This proposed plan identifies the preferred alternative for the Riverland Rad Yard, the Wahluke Slope, the Sodium Dichromate Baffel Landfill, and the, White Bluffs Pickling

Acid Cribs, located at the Hanford Site. These areas are known respectively as the 100-IU-1, 100-IU-3, 100-IU-4, and 100-IU-5 Operable Units. Between 1992 and 1994, each of the four operable units was the subject of an expedited response action that addressed removal of site contaminants in soil. Waste sites in the 100-IU-2 (White Bluffs Townsite) and 100-IU-6 (Hanford Townsite) Operable Units will be addressed in future proposed plans. A proposed plan is intended to be a fact sheet for public review that summarizes the information relied upon to recommend the preferred alternative. As presented in this proposed plan, no further action is the preferred alternative for the final resolution of the 100-IU-1, 100-IU-3, 100-IU-4, and 100-IU-5 Operable Units. The preferred alternative is recommended because all suspect hazardous substances above cleanup levels have been removed from the waste sites, and the sites are unlikely to pose any significant risk to human health or the environment.

2130 (DOE/RL–96-09) **Richland Environmental Restoration Project management action process document.** USDOE Richland Operations Office, WA (United States). Apr 1996. 202p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96008985. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the prescribed means for providing direct input to the US Department of Energy Headquarters regarding the status, accomplishments, strategy, and issues of the Richland Environmental Restoration Project. The project mission, organizational interfaces, and operational history of the Hanford Site are provided. Remediation strategies are analyzed in detail. The document includes a status of Richland Environmental Restoration project activities and accomplishments, and it presents current cost summaries, schedules, and technical baselines.

2131 (EFR-TDD–950060) **Savannah River Site Surplus Facilities Available for Reuse.** Clarke, R.M.; Owens, M.B.; Lentz, D.W. Westinghouse Savannah River Co., Aiken, SC (United States). 14 Sep 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96060012. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to provide a current, centralized list of Savannah River Site facilities, which are surplus and available for reuse. These surplus facilities may be made available for other DOE site missions, commercial economic development reuse, or other governmental reuse. SRS procedures also require that before new construction can be approved, available surplus facilities are screened for possible reuse in lieu of the proposed new construction.

2132 (FEMP–2362B) **The CAMU Rule: A tool for implementing a protective, cost-effective remedy at the Fernald Environmental Management Project.** Dupuis-Nouille, E.M. (Fernald Environmental Management Project, Cincinnati, OH (United States)); Goidell, L.C.; Strimbu, M.J. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950868–16: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96000318. Source: OSTI; NTIS; INIS; GPO Dep.

The Fernald Environmental Management Project (FEMP) is a former uranium processing facility currently under remediation pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act as amended (CERCLA). Contamination at the FEMP consists of low-level radioactivity, hazardous substances, hazardous wastes and/or mixed wastes. Regulations promulgated under the Resource Conservation and Recovery Act as amended (RCRA) are evaluated as applicable or relevant and appropriate requirements (ARARs) for remediation of the FEMP. Historically, joint CERCLA-RCRA guidance dictated that hazardous waste could not be treated, or moved out of the designated area of contiguous contamination (AOC), without triggering land disposal restrictions (LDRs) or minimum technology requirements (MTRs). To avoid invoking these stringent requirements, in situ capping was chosen as the lower cost remedy at many sites, although on-site disposal and/or treatment of hazardous wastes would have been more protective. The Corrective Action Management Units (CAMUs) and Temporary Units (TUs) Final Rule [58 FR 8658, Vol. 58, No. 29, hereinafter the "CAMU Rule"], promulgated on February 16, 1993, provides facilities regulated under RCRA corrective action authority with greater flexibility to move, treat, and dispose of wastes on site without triggering LDRs or MTRs, thereby encouraging application of innovative technologies and more protective remedies. The waste acceptance criteria for the on-site disposal facility is based on site-specific considerations including the mobility of the contaminants through the underlying site geology and the protectiveness of the engineered liners. Application of the "CAMU Rule" allows for disposition in the on-site facility based on these technical considerations rather than on regulatory classifications.

2133 (FEMP/SUB–096) **Cost estimating for CERCLA remedial alternatives a unit cost methodology.** Brettin, R.W. (PARSONS Environmental Remedial Action Project, Fairfield, OH (United States)); Carr, D.J.; Janke, R.J. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. Jun 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950868–17: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96000319. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Environmental Protection Agency (EPA) Guidance for Conducting Remedial Investigations and Feasibility Studies Under CERCLA, Interim Final, dated October 1988 (EPA 1988) requires a detailed analysis be conducted of the most promising remedial alternatives against several evaluation criteria, including cost. To complete the detailed analysis, order-of-magnitude cost estimates (having an accuracy of +50 percent to -30 percent) must be developed for each remedial alternative. This paper presents a methodology for developing cost estimates of remedial alternatives comprised of various technology and process options with a wide range of estimated contaminated media quantities. In addition, the cost estimating methodology provides flexibility for incorporating revisions to remedial alternatives and achieves the desired range of accuracy. It is important to note that the cost estimating methodology presented here was developed as a concurrent path to the development of contaminated media quantity estimates. This methodology can be initiated before contaminated media quantities are estimated. As a result, this methodology is useful in developing cost estimates for use in screening and evaluating remedial technologies and process options. However, remedial alternative cost estimates cannot be prepared without the contaminated media quantity estimates. In the conduct of the feasibility study for Operable Unit 5 at the Fernald Environmental Management Project (FEMP), fourteen remedial alternatives were retained for detailed analysis. Each remedial alternative was composed of combinations of remedial technologies and processes which were earlier determined to be best suited for addressing the media-specific contaminants found at the FEMP site, and achieving desired remedial action objectives.

2134 (INEL–94/0134) **Testing and evaluation of light ablation decontamination.** Demmer, R.L.; Ferguson, R.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). Oct 1994. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002940. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

This report details the testing and evaluation of light ablation decontamination. It details WINCO contracted research and application of light ablation efforts by Ames Laboratory. Tests were conducted with SIMCON (simulated contamination) coupons and REALCON (actual radioactive metal coupons) under controlled conditions to compare cleaning effectiveness, speed and application to plant process type equipment.

2135 (INEL–94/0165-Rev.1) **Nuclear fuel reprocessing deactivation plan for the Idaho Chemical Processing Plant, Revision 1.** Patterson, M.W. EG and G Idaho, Inc., Idaho Falls, ID (United States). Oct 1994. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002861. Source: OSTI; NTIS; INIS; GPO Dep.

The decision was announced on April 28, 1992 to cease all United States Department of Energy (DOE) reprocessing of nuclear fuels. This decision leads to the deactivation of all fuels dissolution, solvent extraction, krypton gas recovery operations, and product denitration at the Idaho Chemical Processing Plant (ICPP). The reprocessing facilities will be converted to a safe and stable shutdown condition awaiting future alternate uses or decontamination and decommissioning (D&D). This ICPP Deactivation Plan includes the scope of work, schedule, costs, and associated staffing levels necessary to achieve a safe and orderly deactivation of reprocessing activities and the Waste Calcining Facility (WCF). Deactivation activities primarily involve shutdown of operating systems and buildings, fissile and hazardous material removal, and related activities. A minimum required level of continued surveillance and maintenance is planned for each facility/process system to ensure necessary environmental, health, and safety margins are maintained and to support ongoing operations for ICPP facilities that are not being deactivated. Management of the ICPP was transferred from Westinghouse Idaho Nuclear Company, Inc. (WINCO) to Lockheed Idaho Technologies Company (LITCO) on October 1, 1994 as part of the INEL consolidated contract. This revision of the deactivation plan (formerly the Nuclear Fuel Reprocessing Phaseout Plan for the ICPP) is being published during the consolidation of the INEL site-wide contract and the information presented here is current as of October 31, 1994. LITCO has adopted the existing plans for the deactivation of ICPP reprocessing facilities and the plans developed under WINCO are still being actively pursued, although the change in management may result in changes which have not yet been identified. Accordingly, the contents of this plan are subject to revision.

2136 (INEL–95/0022) **Concrete decontamination scoping tests.** Archibald, K.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002941. Source: OSTI; NTIS; INIS; GPO Dep.

This report details the research efforts and scoping tests performed at the Idaho Chemical Process Plant using scabbling, chemical, and electro-osmotic decontamination techniques on radiologically contaminated concrete.

2137 (INEL–95/00108) **Development of waste minimization and decontamination technologies at the Idaho Chemical Processing Plant.** Ferguson, R.L. (and others); Archibald, K.E.; Demmer, R.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9505111-6: 11. pollution prevention conference: shaping the future through pollution prevention involvement - commitment - progress, Knoxville, TN (United States), 16-18 May 1995). Order Number DE96001924. Source: OSTI; NTIS; INIS; GPO Dep.

Emphasis on the minimization of decontamination secondary waste has increased because of restrictions on the use of hazardous chemicals and Idaho Chemical Processing Plant (ICPP) waste handling issues. The Lockheed Idaho Technologies Co. (LITCO) Decontamination Development Subunit has worked to evaluate and introduce new performed testing, evaluations, development and on-site demonstrations for a number of novel decontamination techniques that have not yet previously been used at the ICPP. This report will include information on decontamination techniques that have recently been evaluated by the Decontamination Development Subunit.

2138 (INEL–95/0123) **Decontamination of metals by melt refining/slagging. An annotated bibliography: Update on stainless steel and steel.** Worchester, S.A. (Montana Tech of the Univ., of Montana (United States)); Twidwell, L.G.; Paolini, D.J.; Weldon, T.A.; Mizia, R.E. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jan 1995. 88p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96004068. Source: OSTI; NTIS; INIS; GPO Dep.

The following presentation is an update to a previous annotation, i.e., WINCO-1138. The literature search and annotated review covers all metals used in the nuclear industries but the emphasis of this update is directed toward work performed on mild steels. As the number of nuclear installations undergoing decontamination and decommissioning (D&D) increases, current radioactive waste storage space is consumed and establishment of new waste storage areas becomes increasingly difficult, the problem of handling and storing radioactive scrap metal (RSM) gains increasing importance in the DOE Environmental Restoration and Waste Management Program. To alleviate present and future waste problems, Lockheed Idaho Technologies Co (LITCO) is managing a program for the recycling of RSM for beneficial use within the DOE complex. As part of that effort, Montana Tech has been awarded a contract to help optimize melting and refining technology for the recycling of stainless steel RSM. The scope of the Montana Tech program includes a literature survey, a decontaminating slag design study, small wide melting studies to determine optimum slag compositions for removal of radioactive contaminant surrogates, analysis of preferred melting techniques, and coordination of large scale melting demonstrations (100–2,000 lbs) to be conducted at selected facilities. The program will support recycling and decontaminating stainless steel RSM for use in waste canisters for Idaho Waste Immobilization Facility densified high level waste and Pit 9/RWMC boxes. This report is the result of the literature search conducted to establish a basis for experimental melt/slag program development. The program plan will be jointly developed by Montana Tech and LITCO.

2139 (INEL–95/0218) **Small pipe characterization system (SPCS) conceptual design.** Anderson, M.O.; Ferrante, T.A.; McKay, M.D. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jan 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001370. Source: OSTI; NTIS; INIS; GPO Dep.

Throughout the Department of Energy (DOE) complex there are many facilities that have been identified for Decontamination and Decommissioning (D&D). As processes are terminated or brought off-line, facilities are placed on the inactive list, and facility managers and site contractors are required to assure a safe and reliable decommissioning and transition of these facilities to a clean final state. Decommissioning of facilities requires extensive reliable characterization, decontamination and in some cases dismantlement. Characterization of piping systems throughout the DOE complex is becoming more and more necessary. In addition to decommissioning activities, characterization activities are performed as part of surveillance and maintenance (S&M). Because of the extent of contamination, all inactive facilities require some type of S&M. These S&M activities include visual assessment, equipment and material accounting, and maintenance. The majority of the inactive facilities have piping systems 3 inches or smaller that are inaccessible because they are contaminated, imbedded in concrete, or run through hot cells. Many of these piping systems have been inactive for a number of years and there exists no current system condition information or the historical records are poor and/or missing altogether. Many of these piping systems are placed on the contaminated list, not because of known contamination, but because of the risk of internal contamination. Many of the piping systems placed on the contamination list may not have internal contamination. Because there is a potential however, they are treated as such. The cost of D&D can be greatly reduced by identifying and removing hot spot contamination, leaving clean piping to be removed using conventional methods. Accurate characterization of these piping systems is essential before, during and after all D&D activities.

2140 (INEL–95/00229) **Stationary low power reactor No. 1 (SL-1) accident site decontamination & dismantlement project.** Perry, E.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950868–29: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96004005. Source: OSTI; NTIS; INIS; GPO Dep.

The Army Reactor Area (ARA) II was constructed in the late 1950s as a test site for the Stationary Low Power Reactor No. 1 (SL-1). The SL-1 was a prototype power and heat source developed for use at remote military bases using a direct cycle, boiling water, natural circulation reactor designed to operate at a thermal power of 3,000 kW. The ARA II compound encompassed 3 acres and was comprised of (a) the SL-1 Reactor Building, (b) eight support facilities, (c) 50,000-gallon raw water storage tank, (d) electrical substation, (e) aboveground 1,400-gallon heating oil tank, (f) underground 1,000-gallon hazardous waste storage tank, and (g) belowground power, sewer, and water systems. The reactor building was a cylindrical, aboveground facility, 39 ft in diameter and 48 ft high. The lower portion of the building contained the reactor pressure vessel surrounded by gravel shielding. Above the pressure vessel, in the center portion of the building, was a turbine generator and plant support equipment. The upper section of the building contained an air cooled condenser and its circulation fan. The major support facilities included a 2,500 ft^2 two story, cinder block administrative building; two 4,000 ft^2 single story, steel frame office buildings; a 850 ft^2 steel framed, metal sided PL condenser building, and a 550 ft^2 steel framed decontamination and laydown building.

2141 (INEL–95/0287) **Pilot study dismantlement of 20 lead-lined shipping casks.** Thurmond, S.M. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Aug 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002300. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes a pilot study conducted at the INEL to dismantle lead-lined casks and shielding devices, separate the radiologically contaminated and hazardous materials, and recycle resultant scrap lead. The facility areas where the work was performed, dismantlement methods, and process equipment are described. Issues and results associated with recycling the lead as a free-released scrap metal are presented and discussed. Data and results from the pilot study are summarized and presented. The study concluded that cask dismantlement at the INEL can be performed as a legitimate recycling activity for scrap lead. Ninety-one percent of the lead recovered passed free-release criteria. The value of the 50,375 lb of recovered lead is approximately \$0.45/lb. Resultant waste streams can be satisfactorily treated and disposed. Only very low levels of bulk radiological contamination (47 picocuries/gram of 137 Cs and 3.2 picocuries/gram of ^{60}Co) were detected in the lead rejected for free release.

2142 (INEL–95/00403) **Selecting reasonable future land use scenarios.** Allred, W.E.; Smith, R.W. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951209–11: 17. low-level radioactive waste management conference, Phoenix, AZ (United States), 12-14 Dec 1995). Order Number DE96009023. Source: OSTI; NTIS; INIS; GPO Dep.

This paper examines a process to help select the most reasonable future land use scenario for hazardous waste and/or low-level radioactive waste disposal sites. The process involves evaluating future land use scenarios ab applying selected criteria currently used by commercial mortgage companies to determine the feasibility of obtaining a loan for purchasing such land. The basis for the process is that only land use activities for which a loan can be obtained well be considered. To examine the process, a low-level radioactive waste site, the Radioactive Waste Management Complex at the Idaho National Engineering Laboratory, is used as an example. The authors suggest that the process is a very precise, comprehensive, and systematic approach for determining reasonable future use of land. Implementing such a process will help enhance the planning, decision-making, safe management, and cleanup of present and future disposal facilities.

2143 (INEL–95/0419) **Use of MCNP for characterization of reactor vessel internals waste from decommissioned nuclear reactors.** Love, E.F.; Pauley, K.A.; Reid, B.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002206. Source: OSTI; NTIS; INIS; GPO Dep.

This study describes the use of the Monte Carlo Neutron-Photon (MCNP) code for determining activation levels of irradiated reactor vessel internals hardware. The purpose of the analysis is to produce data for the Department of Energy's Greater-Than-Class C Low-Level Radioactive Waste Program. An MCNP model was developed to analyze the Yankee Rowe reactor facility. The model incorporates reactor geometry, material compositions, and operating history data acquired from Yankee Atomic Electric Company. In addition to the base activation analysis, parametric studies were performed to determine the sensitivity of activation to specific parameters. A component sampling plan was also developed to validate the model results, although the plan was not implemented. The calculations for the Yankee Rowe reactor predict that only the core baffle and the core support plates will be activated to levels above the Class C limits. The parametric calculations show, however, that the large uncertainties in the material compositions could cause errors in the estimates that could also increase the estimated activation level of the core barrel to above the Class C limits. Extrapolation of the results to other reactor facilities indicates that in addition to the baffle and support plates, core barrels may also be activated to above Class C limits; however the classification will depend on the specific operating conditions of the reactor and the specific material compositions of the metal, as well as the use of allowable concentration averaging practices in packaging and classifying the waste.

2144 (INEL–95/0453) **INEL D&D long-range plan.** Buckland, R.J.; Kenoyer, D.J.; LaBuy, S.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002230. Source: OSTI; NTIS; INIS; GPO Dep.

This Long-Range Plan presents the Decontamination and Dismantlement (D&D) Program planning status for facilities at the Idaho National Engineering Laboratory (INEL). The plan provides a general description of the D&D Program objectives, management criteria, and policy; discusses current activities; and documents the INEL D&D Program cost and schedule estimate projections for the next 15 years. Appendices are included that provide INEL D&D project historical information, a comprehensive descriptive summary of each current D&D surplus facility, and a summary database of all INEL contaminated facilities awaiting or undergoing the facility transition process.

2145 (INEL–95/00559) **Decontamination technologies evaluations.** Tripp, J. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960804–28: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96010446. Source: OSTI; NTIS; INIS; GPO Dep.

Testing has been completed at the Idaho Chemical Processing Plant (ICPP) on in situ recyclable abrasives grit blasting, concrete cleaning (using scabbling, chemicals and electro-kinetics) and laser light ablation of metals. Several small scale tests have also been conducted with strippable coatings, CO_2 pellet blasting and various other techniques. The results of this testing is summarized in this paper.

2146 (INEL–96/0017) **Liquid abrasive pressure pot scoping tests report.** Archibald, K.E. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jan 1996. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96007524. Source: OSTI; NTIS; INIS; GPO Dep.

The primary initiatives of the LITCO Decontamination Development group at the Idaho Chemical Process Plant (ICPP) are the development of methods to eliminate the use of sodium bearing decontamination chemicals and minimization of the amount of secondary waste generated during decontamination activities. In July of 1994, a Commerce Business Daily (CBD) announcement was issued by the INEL to determine commercial interest in the development of an in-situ liquid abrasive grit blasting system. As a result of the CBD announcement, Klieber & Schulz issued an Expression of Interest letter which stated they would be interested in testing a prototype Liquid Abrasive Pressure Pot (LAPP). LITCO's Decontamination group and Kleiber & Schulz entered into a Cooperative Research and Development Agreement (CRADA) in which the Decontamination Development group tested the prototype LAPP in a non-radioactive hot cell mockup. Test results are provided.

2147 (K/TCD–1127) **Evaluation of gas-phase technetium decontamination and safety related experiments during FY 1994. A report of work in progress.** Simmons, D.W.; Munday, E.B. Oak Ridge K-25 Site, TN (United States). May 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012978. Source: OSTI; NTIS; INIS; GPO Dep.

Laboratory activities for FY94 included: evaluation of decontamination of Tc by gas-phase techniques, evaluation of diluted ClF_3 for removing U deposits, evaluation of potential hazard of wet air inlekage into a vessel containing ClF_3, planning and preparation for experiments to assess hazard of rapid reaction of ClF_3 and hydrated UO_2F_2 or powdered Al, and preliminary evaluation of compatibility of Tenic valve seat material.

2148 (LA–13060-MS) **Alpha contamination assessment for D&D activities: Monitoring inside glove boxes and vessels.** Rawool-Sullivan, M.W.; Bolton, R.D.; Conaway, J.G.; MacArthur, D.W. Los Alamos National Lab., NM (United States). Feb 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96007456. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed a new approach to glove box monitoring that involves drawing air out of one glove port through a detection grid that collects ions created in the air inside the glove box by ionizing radiation, especially alpha radiation. The charge deposited on the detection grid by the ions is measured with a sensitive electrometer. The air can be circulated back to the glove box through the other glove port, preventing contamination from leaving the glove box and detector system. Initial experiments using a mock-up constructed of sheet metal indicate that this technology provides the measurement technique needed to perform a defensible, non-invasive measurement of alpha contamination inside glove boxes destined for waste disposal. This can result in an enormous cost savings if a given glove box can be shown to fall into the catagory of Low-Level Waste rather than Trans-Uranic Waste. Considering that hundreds of glove boxes contaminated with plutonium will be taken out of service at various nuclear facilities over the next few years, the potential cost savings associated with disposal as LLW rather than TRU waste are substantial.

2149 (LA–13061-MS) **Alpha contamination assessment for D&D activities: Monitoring concrete surfaces.** Rawool-Sullivan, M.W.; Conaway, J.G.; MacArthur, D.W. Los Alamos National Lab., NM (United States). Feb 1996. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96007455. Source: OSTI; NTIS; INIS; GPO Dep.

The process of decontaminating and decomissioning former nuclear facilities sometimes requires that large areas of concrete and other materials be scanned to verify they are not contaminated. A specially developed concrete surface monitor (CSM) can greatly expedite that process. The CSM is basically an aluminum box, open on the bottom, that uses an electrostatic field to transport ions created by alpha particles interacting with ambient air to a collection grid or plate. A sensitive electrometer measures the resulting current, which is essentially proportional to surface alpha activity. The initial prototype CSM surveys a surface area of some 300 cm^2 at one time, while a second-generation prototype surveys 2500 cm^2 and is designed to compensate automatically for radon, which can cause substantial errors in estimating surface contamination in some cases. These monitors have been successfully demonstrated on a number of concrete surfaces in situ as well as on concrete pieces cut from former facilities.

2150 (LA–13062-MS) **Alpha contamination assessment for D&D activities: Technology overview.** Conaway, J.G.; Rawool-Sullivan, M.W.; MacArthur, D.W. Los Alamos National Lab., NM (United States). Feb 1996. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96007454. Source: OSTI; NTIS; INIS; GPO Dep.

Instruments based on the principle of Long-Range Alpha Detection (LRAD) detect the ions created in ambient air by ionizing radiation, particularly alpha radiation, interacting with air molecules. Using either an electrostatic field or forced convection, these ions can be transported to a detection grid where the ions produce a small current that is measured with a sensitive electrometer. LRAD-based instruments can give separate, simultaneous measurements of alpha-emitting solids and inert radioactive gases such as radon. LRAD-based instruments assess surface contamination on an entire object or large surface area in a single, rapid measurement, including relatively inaccessible areas such as interior surfaces of pipes and process equipment. The LRAD concept is well proven and has been developed into a range of different radiation detection devices. This paper presents an overview of the technology, while several associated papers explore specific applications in greater detail.

2151 (LA–13063-MS) **Alpha contamination assessment for D&D activities: Monitoring pipe interiors.** Rawool-Sullivan, M.W.; Conaway, J.G.; MacArthur, D.W.; Vaccarella, J. Los Alamos National Lab., NM (United States). Feb 1996. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96006237. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed a prototype instrument capable of assessing alpha-emitting contamination on interior surfaces of ducts, pipes, tanks, and other enclosed volumes without inserting a probe. Air is drawn through the potentially contaminated volume and then through a detection grid, where ions created in the air by alpha particles are collected and the resulting charge measured with a sensitive electrometer. A filter at the intake end of the contaminated volume excludes externally created ions, so only ions generated inside the volume are detected. We have studied the response of this prototype in initial experiments using calibrated alpha sources with various pipe diameters and configurations, air flows, and source locations in the pipes. The results of these experiments indicate that this method can be an effective approach to assessing internal contamination.

2152 (LA-SUB–95-99) **LANL environmental restoration site ranking system: System description. Final report.** Merkhofer, L. (Applied Decision Analysis, Inc., Menlo Park, CA (United States)); Kann, A.; Voth, M. Los Alamos National Lab., NM (United States); Applied Decision Analysis, Inc., Menlo Park, CA (United States). 13 Oct 1992. 160p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (ADA–92-2106). Order Number DE95017359. Source: OSTI; NTIS; INIS; GPO Dep.

The basic structure of the LANL Environmental Restoration (ER) Site Ranking System and its use are described in this document. A related document, Instructions for Generating Inputs for the LANL ER Site Ranking System, contains detailed descriptions of the methods by which necessary inputs for the system will be generated. LANL has long recognized the need to provide a consistent basis for comparing the risks and other adverse consequences associated with the various waste problems at the Lab. The LANL ER Site Ranking System is being developed to help address this need. The specific purpose of the system is to help improve, defend, and explain prioritization decisions at the Potential Release Site (PRS) and Operable Unit (OU) level. The precise relationship of the Site Ranking System to the planning and overall budget processes is yet to be determined, as the system is still evolving. Generally speaking, the Site Ranking System will be used as a decision aid. That is, the system will be used to aid in the planning and budgetary decision-making process. It will never be used alone to make decisions. Like all models, the system can provide only a partial and approximate accounting of the factors important to budget and planning decisions. Decision makers at LANL will have to consider factors outside of the formal system when making final choices. Some of these other factors are regulatory requirements, DOE policy, and public concern. The main value of the site ranking system, therefore, is not the precise numbers it generates, but rather the general insights it provides.

2153 (LA-UR–95-2277) **Alpha detection for decontamination and decommissioning: Results and possibilities.** MacArthur, D. Los Alamos National Lab., NM (United States). 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950868–4: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE95016792. Source: OSTI; NTIS; INIS; GPO Dep.

Alpha detectors based on the long-range alpha detection (LRAD) technology have numerous uses, both potential and demonstrated, in facility D&D. These monitors operate by detecting the ions created by alpha particles interacting with ambient air. Thus, detection is not limited by the short range of the alpha particle and no window is required between the contamination and the detection region. These properties make LRAD-based detectors ideal for operation in field environments where complex objects to be monitored are the norm and reliability is crucial. Three monitors of particular interest in D&D operations are the building surface monitor, the internal volume monitor for use on the inner surfaces of pipes, ducts, and tanks, and the conveyer belt monitor for concrete rubble and structural steel. Surface monitors have been used extensively, both in laboratory and field environments, internal volume monitors have been tested in the laboratory, and the conveyer system is still a conceptual design. These monitors and related applications demonstrate the utility of LRAD-based monitors for D&D operations as well as exploring some of the new ways that fieldable monitoring systems can be used for D&D. Ion collection sensing technology can be used to solve many of the alpha detection problems unique to the D&D field.

2154 (LA-UR–95-2435) **Preliminary assessments the shortcut to remediation (category III-surplus facility assessments).** Byars, L.L. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950868–9: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE95016323. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the preliminary assessments for the shortcut of decontamination of surplus nuclear facilities. Topics discussed include: environment, health and safety concerns; economic considerations; reduction of transition time; preliminary characterization reports; preliminary project plan; health and safety plan; quality assurance plan; surveillance and maintenance plan; and waste management plan.

2155 (LA-UR–95-2465) **Lessons learned from decommissioning projects at Los Alamos National Laboratory.** Salazar, M. Los Alamos National Lab., NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950868–10: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE95016910. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes lessons learned over the last 20 years from 12 decommissioning projects at Los Alamos National Laboratory. These lessons relate both to overall program management and to management of specific projects during the planning and operations phases. The issues include waste management; the National Environmental Policy Act (NEPA); the Resource Conservation and Recovery Act (RCRA); the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA); contracting; public involvement; client/customer interface; and funding. Key elements of our approach are to be proactive; follow the observation method; perform field activities concurrently; develop strategies to keep reportable incidents from delaying work; seek and use programs, methods, etc., in existence to shorten learning curves; network to help develop solutions; and avoid overstudying and overcharacterizing. This approach results in preliminary plans that require very little revision before implementation, reasonable costs and schedules, early acquisition of permits and NEPA documents, preliminary characterization reports, and contracting documents. Our track record is good – the last four projects (uranium and plutonium-processing facility and three research reactors) have been on budget and on schedule.

2156 (LA-UR–95-4294) **Waste minimization value engineering workshop for the Los Alamos National Laboratory Omega West Reactor Decommissioning Project.** Hartnett, S. (Benchmark Environmental Corp., Albuquerque, NM (United States)); Seguin, N.; Burns, M. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960212–5: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96005597. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory Pollution Prevention Program Office sponsored a Value Engineering (VE) Workshop to evaluate recycling options and other pollution prevention and waste minimization (PP/WMin) practices to incorporate into the decommissioning of the Omega West Reactor (OWR) at the laboratory. The VE process is an organized, systematic approach for evaluating a process or design to identify cost saving opportunities, or in this application, waste reduction opportunities. This VE Workshop was a facilitated process that included a team of specialists in the areas of decontamination, decommissioning, PP/WMin, cost estimating, construction, waste management, recycling, Department of Energy representatives, and others. The uniqueness of this VE Workshop was that it used an interdisciplinary approach to focus on PP/WMin practices that could be included in the OWR Decommissioning Project Plans and specifications to provide waste reduction. This report discusses the VE workshop objectives, summarizes the OWR decommissioning project, and describes the VE workshop activities, results, and lessons learned.

2157 (LA-UR–96-91) **Decontamination and demolition of a former plutonium processing facility's process exhaust system, firescreen, and filter plenum buildings.** LaFrate, P.J. Jr.; Stout, D.S.; Elliott, J.W. Los Alamos National Lab., NM (United States). [1996]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960443–2: American Nuclear Society (ANS) topical meeting on decontamination and decommissioning, Chicago, IL (United States), 14-17 Apr 1996). Order Number DE96007177. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory (LANL) Decommissioning Project has decontaminated, demolished, and decommissioned a process exhaust system, two filter plenum buildings, and a firescreen plenum structure at Technical Area 21 (TA-2 1). The project began in August 1995 and was completed in January 1996. These high-efficiency particulate air (HEPA) filter plenums and associated ventilation ductwork provided process exhaust to fume hoods and glove boxes in TA-21 Buildings 2 through 5 when these buildings were active plutonium and uranium processing and research facilities. This paper summarizes the history of TA-21 plutonium and uranium processing and research activities and provides a detailed discussion of integrated work process controls, characterize-as-you-go methodology, unique engineering controls, decontamination techniques, demolition methodology, waste minimization, and volume reduction. Also presented in detail are the challenges facing the LANL Decommissioning Project to safely and economically decontaminate and demolish surplus facilities and the unique solutions to tough problems. This paper also shows the effectiveness of the integrated work package concept to control work through all phases.

2158 (LA-UR-96-0421) **Decontamination and demolition of a former plutonium processing facility's process exhaust system, firescreen, and filter plenum buildings.** LaFrate, P.J. Jr.; Stout, D.S.; Elliott, J.W. Los Alamos National Lab., NM (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960212–68: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96008123. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory (LANL) Decommissioning Project has decontaminated, demolished, and decommissioned a process exhaust system, two filter plenum buildings, and a firescreen plenum structure at Technical Area 21 (TA-21). The project began in August 1995 and was completed in January 1996. These high-efficiency particulate air (HEPA) filter plenums and associated ventilation ductwork provided process exhaust to fume hoods and glove boxes in TA-21 Buildings 2 through 5 when these buildings were active plutonium and uranium processing and research facilities. This paper summarizes the history of TA-21 plutonium and uranium processing and research activities and provides a detailed discussion of integrated work process controls, characterize-as-you-go methodology, unique engineering controls, decontamination techniques, demolition methodology, waste minimization, and volume reduction. This paper also shows the effectiveness of the integrated work package concept to control work through all phases.

2159 (LA-UR–96-2051) **The Los Alamos National Laboratory Chemistry and Metallurgy Research Facility upgrades project - A model for waste minimization.** Burns, M.L.; Durrer, R.E.; Kennicott, M.A. Los Alamos National Lab., NM (United States). Jul 1996. 6p. Sponsored by USDOE, Washington, DC (United States). (CONF-960741–15: Pollution prevention conference, Chicago, IL (United States), 9-11 Jul 1996). Order Number DE96012638. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory (LANL) Chemistry and Metallurgy Research (CMR) Facility, constructed in 1952, is currently undergoing a major, multi-year construction project. Many of the operations required under this project (i.e., design, demolition, decontamination, construction, and waste management) mimic the processes required of a large scale decontamination and decommissioning (D&D) job and are identical to the requirements of any of several upgrades projects anticipated for LANL and other Department of Energy (DOE) sites. For these reasons the CMR Upgrades Project is seen as an ideal model facility - to test the application, and measure the success of - waste minimization techniques which could be brought to bear on any of the similar projects. The purpose of this paper will be to discuss the past, present, and anticipated waste minimization applications at the facility and will focus on the development and execution of the project's "Waste Minimization/Pollution Prevention Strategic Plan."

2160 (MMSC-EM–95011) **Pinellas Plant Annual Site Environmental Report for calendar year 1994.** Lockheed Martin Specialty Components, Inc., Largo, FL (United States). Jun 1995. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-92AL73000. Order Number DE95014021. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a comprehensive summary of the results of the Environmental Monitoring, Waste Management, and Environmental Restoration Programs at the Pinellas Plant, in Pinellas County, Florida for 1994. This report also includes the plant's performance in the areas of compliance with applicable regulatory requirements and standards and identifies major Environmental, Safety and Health Program initiatives and accomplishments for 1994. As a result of the end of Department of Energy Defense Programs mission production on September 30, 1994, considerable changes at the Pinellas Plant occurred. These changes, which included transitioning the plant toward alternate use in support of economic development and safe shutdown, both increased and heightened Environmental, Safety and Health responsibilities. In December 1994, the Department of Energy announced it had reached an agreement to sell the Pinellas Plant to the Pinellas County Industry Council in March 1995. The plant is being leased back by the Department of Energy through September 1997 to complete safe shutdown, reconfiguration, transfer of equipment to other Department of Energy production facilities, and transition to commercial ventures. Permit modifications and transfers will be completed during 1995 to reflect the new ownership by the Pinellas County Industry Council and to include new tenants as needed.

2161 (ORNL/ER–230) **Project management plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory. Environmental Restoration Program.** Oak Ridge National Lab., TN (United States). [1995]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008963. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Isotopes Facilities Deactivation Project (IFDP) is to place nineteen former isotopes production facilities at the Oak Ridge National Laboratory in a safe, stable, and environmentally sound condition suitable for an extended period of minimum surveillance and maintenance (S&M) and as quickly and economically as possible. Implementation and completion of the deactivation project win further reduce the already small risks to the environment and to public safety and health. Furthermore, the project should result in significant S&M cost savings in the future. The IFDP management plan has been prepared to document the project objectives, define organizational relationships and responsibilities, and outline the management control systems to be employed in the management of the project. The project has adopted a strategy to deactivate the simple facilities first, to reduce the scope of the project, and to gain experience before addressing more difficult facilities. A decision support system is being developed to identify those activities that best promote the project mission and result in largest cost savings. The Work Plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory

(Energy Systems 1994) defines the project schedule, the cost estimate, and the technical approach for the project.

2162 (ORNL/ER–230/R1) **Project Management Plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory.** Oak Ridge National Lab., TN (United States). Apr 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016168. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration Program.

The purpose of the Isotopes Facilities Deactivation Project (IFDP) is to place former isotopes production facilities at the Oak Ridge National Laboratory in a safe, stable, and environmentally sound condition suitable for an extended period of minimum surveillance and maintenance (S&M) and as quickly and economically as possible. Implementation and completion of the deactivation project will further reduce the already small risks to the environment and to public safety and health. Furthermore, the project should result in significant S&M cost savings in the future. The IFDP management plan has been prepared to document the project objectives, define organizational relationships and responsibilities, and outline the management control systems to be employed in the management of the project. The project has adopted a strategy to deactivate the simple facilities first, to reduce the scope of the project, and to gain experience before addressing more difficult facilities. A decision support system is being developed to identify those activities, that best promote the project mission and result in largest cost savings. The Work Plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory (Energy Systems 1994) defines the project schedule, the cost estimate, and the technical approach for the project.

2163 (ORNL/ER–249/R1) **Work plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory.** Oak Ridge National Lab., TN (United States). May 1995. 186p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014995. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Isotopes Facilities Deactivation Project (IFDP) is to place former isotopes production facilities at the Oak Ridge National Laboratory in a safe, stable, and environmentally sound condition; suitable for an extended period of minimum surveillance and maintenance (S&M) and as quickly and economical as possible. Implementation and completion of the deactivation project will further reduce the risks to the environment and to public safety and health. Furthermore, completion of the project will result in significant S&M cost savings in future years. The IFDP work plan defines the project schedule, the cost estimate, and the technical approach for the project. A companion document, the IFDP management plan, has been prepared to document the project objectives, define organizational relationships and responsibilities, and outline the management control systems to be employed in the management of the project. The project has adopted the strategy of deactivating the simple facilities first, to reduce the scope of the project and to gain experience before addressing more difficult facilities. A decision support system is being developed to identify the activities that best promote the project mission and result in the largest cost savings. This work plan will be reviewed and revised annually. Deactivation of IFDP facilities was initiated in FY 1994 and will be completed in FY 1999. The schedule for deactivation of facilities is shown. The total cost of the project is estimated to be $36M. The costs are summarized. Upon completion of deactivation, annual S&M costs of these facilities will be reduced from the current level of $5M per year to less than $1M per year.

2164 (ORNL/ER–249/R2) **Work plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Aug 1995. 181p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016574. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Isotopes Facilities Deactivation Project (IFDP) is to place former isotopes production facilities at the Oak Ridge National Laboratory in a safe, stable, and environmentally sound condition; suitable for an extended period of minimum surveillance and maintenance (S and M) and as quickly and economical as possible. Implementation and completion of the deactivation project will further reduce the risks to the environment and to public safety and health. Furthermore, completion of the project will result in significant S and M cost savings in future years. The IFDP work plan defines the project schedule, the cost estimate, and the technical approach for the project. A companion document, the EFDP management plan, has been prepared to document the project objectives, define organizational relationships and responsibilities, and outline the management control systems to be employed in the management of the project. The project has adopted the strategy of deactivating the simple facilities first, to reduce the scope of the project and to gain experience before addressing more difficult facilities. A decision support system is being developed to identify the activities that best promote the project mission and result in the largest cost savings. This work plan will be reviewed and revised annually. Deactivation of EFDP Facilities was initiated in FY 1994 and will be completed in FY 2000. The schedule for deactivation of facilities is shown. The total cost of the project is estimated to be $51M. The costs are summarized. Upon completion of deactivation, annual S and M costs of these facilities will be reduced from the current level of $5M per year to less than $1M per year.

2165 (ORNL/ER–311) **Level 3 Baseline Risk Assessment for Building 3515 at Oak Ridge National Lab., Oak Ridge, TN.** Wollert, D.A. (Univ. of Tennessee, Knoxville, TN (United States)); Cretella, F.M.; Golden, K.M. Oak Ridge National Lab., TN (United States). Aug 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017406. Source: OSTI; NTIS; INIS; GPO Dep.

The baseline risk assessment for the Fission Product Pilot Plant (Building 3515) at the Oak Ridge National laboratory (ORNL) provides the Decontamination and Decommissioning (D&D) Program at ORNL and Building 3515 project managers with information concerning the results of the Level 3 baseline risk assessment performed for this building. The document was prepared under Work Breakdown Structure 1.4.12.6.2.01 (Activity Data Sheet 3701, Facilities D&D) and includes information on the potential long-term impacts to human health and the environment if no action is taken to remediate Building 3515. Information provided in this document forms the basis for the development of remedial alternatives and the no-action risk portion of the Engineering Evaluation/Cost Analysis report.

2166 (ORNL/ER–325) **Lifecycle baseline summary for ADS 6504IS isotopes facilities Deactivation Project**

at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Oak Ridge National Lab., TN (United States). Aug 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017060. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration Program.

The scope of this Activity Data Sheet (ADS) is to provide a detailed plan for the Isotopes Facilities Deactivation Project (IFDP) at the Oak Ridge National Laboratory (ORNL). This project places the former isotopes production facilities in a safe, stable, and environmentally sound condition suitable for an extended period of minimum surveillance and maintenance (S&M) until the facilities are included in the Decontamination and Decommissioning (D&D) Program. The facilities included within this deactivation project are Buildings 3026-C, 3026-D, 3028, 3029, 3038-AHF, 3038-E, 3038-M, 3047, 3517, 7025, and the Center Circle Facilities (Buildings 3030, 3031, 3032, 3033, 3033-A, 3034, and 3118). The scope of deactivation identified in this Baseline Report include surveillance and maintenance activities for each facility, engineering, contamination control and structural stabilization of each facility, radioluminescent (RL) light removal in Building 3026, re-roofing Buildings 3030, 3118, and 3031, Hot Cells Cleanup in Buildings 3047 and 3517, Yttrium (Y) Cell and Barricades Cleanup in Building 3038, Glove Boxes & Hoods Removal in Buildings 3038 and 3047, and Inventory Transfer in Building 3517. For a detailed description of activities within this Work Breakdown Structure (WBS) element, see the Level 6 and Level 7 Element Definitions in Section 3.2 of this report.

2167 (ORNL/ER–326) **Health and safety plan for the Molten Salt Reactor Experiment remediation project at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Burman, S.N.; Uziel, M.S. Oak Ridge National Lab., TN (United States). Dec 1995. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96009986. Source: OSTI; NTIS; INIS; GPO Dep.

The Lockheed Martin Energy Systems, Inc., (Energy Systems) policy is to provide a safe and healthful workplace for all employees and subcontractors. The accomplishment of the policy requires that operations at the Molten Salt Reactor Experiment (MSRE) facility at the Department of Energy (DOE) Oak Ridge National Laboratory (ORNL) are guided by an overall plan and consistent proactive approach to safety and health (S and H) issues. The policy and procedures in this plan apply to all MSRE operations. The provisions of this plan are to be carried out whenever activities are initiated at the MSRE that could be a threat to human health or the environment. This plan implements a policy and establishes criteria for the development of procedures for day-to-day operations to prevent or minimize any adverse impact to the environment and personnel safety and health and to meet standards that define acceptable management of hazardous and radioactive materials and wastes. The plan is written to utilize past experience and the best management practices to minimize hazards to human health or the environment from events such as fires, explosions, falls, mechanical hazards, or any unplanned release of hazardous or radioactive materials to the air.

2168 (ORNL/ER–334) **D and D alternatives risk assessment for Building 3515 at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Robers, S.K. (DASKR Ltd. (United States)); Golden, K.M. Oak Ridge National Lab., TN (United States). Sep 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96007657. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the Level 3 Decontamination and Decommissioning (D and D) Alternatives Risk Assessment (DARA) performed on Building 3515 located at the Oak Ridge National Laboratory (ORNL). The goal of the risk evaluation process is to provide risk information necessary to assist decision making for Environmental Restoration (ER) Program D and D facilities. This risk information is developed in the baseline risk assessment (BRA) and in the DARA. The BRA provides risk information necessary for determining whether or not a facility represents an unacceptable risk and requires remediation. In addition, the BRA also provides an estimation of the risks associated with the no-action alternative for use in the DARA. The objective of this Level 3 DARA is to evaluate and document the potential risks to human health, human safety, and the environment associated with the proposed remedial action at Building 3515. A Level 3 assessment is the least rigorous type of DARA. The decision to conduct a Level 3 DARA was based on the fact that characterization data from the facility are limited, and currently only one remedial alternative (complete dismantlement) is being evaluated in addition to the no-action alternative. The results of the DARA along with cost and engineering information may be used by project managers in making decisions regarding the final disposition of Building 3515. This Level 3 assessment meets the requirements of the streamlined risk assessment necessary for an Engineering Evaluation/Cost Analysis (EE/CA).

2169 (ORNL/ER–336) **Quality assurance plan for the Molten Salt Reactor Experiment Remediation Project at the Oak Ridge National Laboratory. Phase 1 – Interim corrective measures and Phase 2 – Purge and trap reactive gases.** Oak Ridge National Lab., TN (United States). Nov 1995. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006664. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Plan (QAP) identifies and describes the systems utilized by the Molten Salt Reactor Experiment Remediation Project (MSRERP) personnel to implement the requirements and associated applicable guidance contained in the Quality Program Description Y/QD-15 Rev. 2 (Energy Systems 1995f). This QAP defines the quality assurance (QA) requirements applicable to all activities and operations in and directly pertinent to the MSRERP Phase 1–Interim Corrective Measures and Phase 2–Purge and Trap objectives. This QAP will be reviewed, revised, and approved as necessary for Phase 3 and Phase 4 activities. This QAP identifies and describes the QA activities and procedures implemented by the various Oak Ridge National Laboratory support organizations and personnel to provide confidence that these activities meet the requirements of this project. Specific support organization (Division) quality requirements, including the degree of implementation of each, are contained in the appendixes of this plan.

2170 (ORNL/ER–343) **Completion report for the Inactive Liquid Low-Level Waste Tank Remediation Project at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Feb 1996. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96011792. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the results of the Inactive Liquid Low-Level Waste Tank Remediation Project at Oak Ridge National Laboratory (ORNL). The work performed is compared with that proposed in the statement of work and the service contract specification for the maintenance action to remediate tanks 3013, 3004-B, T-30, and 3001-B. The Federal Facility Agreement (FFA) among the U.S. Environmental Protection Agency (EPA), the Tennessee Department of Environment and Conservation (TDEC), and the U.S. Department of Energy (DOE) requires that all tanks, which have been removed from service and are designated in the FFA as Category D, must be remediated in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) requirements. The Environmental Restoration Program's inactive tank removal program strategy and plans for remediating the inactive LLLW tanks were documented in a report issued in January 1995 (Inactive Tanks Remediation Program Strategy and Plans for Oak Ridge National Laboratory, Oak Ridge, Tennessee, ORNL/ER-297). The inactive (Category D) tanks were initially screened for remediation according to risk, remediation technology required, level of instrumentation available, interferences with other piping and equipment, location, and available sludge removal techniques and storage requirements. On the basis of this preliminary screening, the tanks were assigned to one of five batches (I through V) for consideration of remedial action alternatives, and these batches were tentatively scheduled for remedial actions. The eight links tentatively assigned to Batch I were divided into two groups (Series I and Series II).

2171 (ORNL/ER–345) **Annual summary report on the surveillance and maintenance activities for the Oak Rige National Laboratory Environmental Restoration Program for fiscal year 1995.** Oak Ridge National Lab., TN (United States); Stoller (S.M.) Corp., Oak Ridge, TN (United States). Nov 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006669. Source: OSTI; NTIS; INIS; GPO Dep.

This Annual Summary Report on the Surveillance and Maintenance Activities for the Oak Ridge National Laboratory Environmental Restoration Program for Fiscal Year 1995 was prepared to communicate the accomplishments of the Program during fiscal year 1995. This work was performed under work breakdown structure element 1.4.12.6.1.14.20 (activity data sheet 3314, "Remedial Action Surveillance and Maintenance"). Publication of this document meets the Life Cycle Baseline milestone date of November 30, 1995. This document provides the accomplishments for both the Remedial Action and Decontamination and Decommissioning Surveillance and Maintenance programs.

2172 (ORNL/ER–347) **HAZWOPER project documents for demolition of the Waste Evaporator Facility, Building 3506, at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); Allied Technology Group, Inc., Oak Ridge, TN (United States). Mar 1996. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96009987. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

This document, in support of the Waste Evaporator Facility (WEF) demolition project and contains the Project Work Plan and the Project Health and Safety Plan for demolition and partial remediation actions by ATG at the Waste Evaporator Facility, Building 3506. Various activities will be conducted during the course of demolition, and this plan provides details on the work steps involved, the identification of hazards, and the health and safety practices necessary to mitigate these hazards. The objective of this document is to develop an approach for implementing demolition activities at the WEF. This approach is based on prior site characterization information and takes into account all of the known hazards at this facility. The Project Work Plan provides instructions and requirements for identified work steps that will be utilized during the performance of demolition, while the Health and Safety Plan addresses the radiological, hazardous material exposure, and industrial safety concerns that will be encountered.

2173 (ORNL/ER–355) **Molten Salt Reactor Experiment Facility (Building 7503) standards/requirements identification document adherence assessment plan at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Feb 1996. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006674. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration Program.

This is the Phase 2 (adherence) assessment plan for the Building 7503 Molten Salt Reactor Experiment (MSRE) Facility standards/requirements identification document (S/RID). This document outlines the activities to be conducted from FY 1996 through FY 1998 to ensure that the standards and requirements identified in the MSRE S/RID are being implemented properly. This plan is required in accordance with the Department of Energy Implementation Plan for Defense Nuclear Facilities Safety Board Recommendation 90-2, November 9, 1994, Attachment 1A. This plan addresses the major aspects of the adherence assessment and will be consistent with Energy Systems procedure QA-2. 7 "Surveillances."

2174 (ORNL/ER–370/R1) **Health and safety plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Aug 1996. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96013409. Source: OSTI; NTIS; INIS; GPO Dep.

This HASP describes the process for identifying the requirements, written safety documentation, and procedures for protecting personnel involved in the Isotopes Facilities Deactivation Project. Objective of this project is to place 19 former isotope production facilities at ORNL in a safe condition in anticipation of an extended period of minimum surveillance and maintenance.

2175 (ORNL/ER–376) **Project management plan for the isotopes facilities deactivation project at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Aug 1996. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96012622. Source: OSTI; NTIS; INIS; GPO Dep.

Purpose of the deactivation project is to place former isotopes production facilities at ORNL in a safe, stable, and environmentally sound condition suitable for an extended period of minimum surveillance and maintenance. This management plan was prepared to document project objectives, define organizational relationships and responsibilities, and outline the management control systems. The project has adopted the strategy of deactivating the simple facilities first. The plan provides a road map for the quality assurance program and identifies other documents supporting the Isotopes Facilities Deactivation Project.

2176 (ORNL/RASA–94/3) **Results of the supplementary radiological survey at the former C. H. Schnoor and Company site, 644 Garfield Street, Springdale, Pennsylvania (CVP001).** Coleman, R.L.; Murray, M.E.; Brown, K.S. Oak Ridge National Lab., TN (United States). Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012542. Source: OSTI; NTIS; INIS; GPO Dep.

At the request of the U.S. Department of Energy (DOE), a team from Oak Ridge National Laboratory conducted radiological surveys at the former C. H. Schnoor and Company site, 644 Garfield Street, Springdale, Pennsylvania. The surveys were performed on October 11-13 and November 14-17, 1993, in order to provide a complete characterization prior to site remediation. The surveys included a gamma scan and a scan for surface contamination from alpha and beta-gamma emitters; measurement of direct and removable alpha and beta-gamma levels; systematic FIDLER measurements at the surface of the concrete; and the collection of samples from boreholes for radionuclide analysis. Results of the surveys revealed radionuclide concentrations and surface contamination levels in excess of applicable DOE guidelines for ^{238}U. Radionuclide distributions were higher than typical background levels for ^{238}U in the Springdale, Pennsylvania area.

2177 (ORNL/RASA–95/1) **Results of the independent radiological verification survey at the former C.H. Schnoor and Company Site, 644 Garfield Street, Springdale, Pennsylvania (CPV001).** Murray, M.E. (and others); Brown, K.S.; Foley, R.D. Oak Ridge National Lab., TN (United States). Sep 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96000836. Source: OSTI; NTIS; INIS; GPO Dep.

At the request of the U.S. Department of Energy (DOE), a team from Oak Ridge National Laboratory (ORNL) conducted an independent radiological verification survey at the former C. H. Schnoor and Company Site in Springdale, Pennsylvania. The survey was performed from August to October of 1994. The purpose of the survey was to verify that the site was remediated to levels below DOE guidelines from FUSRAP sites. Results of the independent radiological verification survey at the former C. H. Schnoor and Company Site confirm that the residual uranium contamination at the site is below DOE FUSRAP guidelines for unrestricted use.

2178 (ORNL/RASA–95/2) **Results of the independent radiological verification survey of the remedial action performed at 525 S. Main Street, Oxford, Ohio, (OXO002).** Kleinhans, K.R.; Rice, D.E.; Murray, M.E.; Carrier, R.F. Oak Ridge National Lab., TN (United States). Apr 1996. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96010626. Source: OSTI; NTIS; INIS; GPO Dep.

Between October 1952 and February 1957, National Lead of Ohio (NLO), a primary contractor for the Atomic Energy Commission (AEC), subcontracted certain uranium machining operations to Alba Craft Laboratory, Incorporated, located at 10-14 West Rose Avenue, Oxford, Ohio. In 1992, personnel from Oak Ridge National Laboratory (ORNL) confirmed the presence of residual radioactive materials from the AEC-related operations in and around the facility in amounts exceeding the applicable Department of Energy (DOE) guidelines. Above-guideline radiation levels were also found both indoors and outdoors at 525 S. Main Street, a private residential property in the immediate vicinity of the Alba Craft site. This document reports the findings at this private residence. Although the amount of uranium found on the properties posed little health hazard if left undisturbed, the levels were sufficient to require remediation to bring radiological conditions into compliance with current guidelines, thus ensuring that the public and the environment are protected. A team from ORNL conducted a radiological verification survey of the property at 525 S. Main Street, between November 1993 and December 1994. The survey was conducted at the request of DOE and included directly measured radiation levels, the collection and analysis of soil samples to determine concentrations of uranium and certain other radionuclides, and comparison of these data to the guidelines.

2179 (ORNL/RASA–95/13) **Radiological survey results at 1 Shady Lane, Lodi, New Jersey (LJ095).** Foley, R.D.; Johnson, C.A. Oak Ridge National Lab., TN (United States). Jul 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016566. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) conducted remedial action at the Stepan property in Maywood, New Jersey and several vicinity properties in Lodi, New Jersey as part of the Formerly Utilized Sites Remedial Action Program (FUSRAP). These properties are in the vicinity of the DOE-owned Maywood Interim Storage Site (MISS), adjacent to the former Maywood Chemical Works facility. The property at One Shady Lane, Lodi, New Jersey was not one of these vicinity properties but was surveyed by DOE at the request of the owner. At the request of DOE, a team from Oak Ridge National Laboratory conducted a radiological survey at this property. The purpose of the survey, conducted in November 1994, was to confirm whether remedial actions were to be performed on the property in order to be in compliance with the identified Guidelines. The radiological survey included surface gamma scans and gamma readings at 1 meter, and the collection of soil samples for radionuclide analysis. Results of the survey demonstrated that all radiological measurements on the property at One Shady Lane, Lodi, New Jersey, were comparable to background levels in the area, and well within the limits prescribed by DOE radiological guidelines. Based on the results of the radiological survey data, this property does not meet guidelines for inclusion under FUSRAP.

2180 (ORNL/RASA–95/14) **Results of the radiological verification survey at the former Herring-Hall-Marvin Safe Company, 1550 Grand Boulevard, Hamilton Ohio (HO001V).** Murray, M.E.; allred, J.F.; Johnson, C.A. Oak Ridge National Lab., TN (United States). Nov 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96003584. Source: OSTI; NTIS; INIS; GPO Dep.

During the period between the 1940s and early 1950s, the Herring-Hall-Marvin Safe Company, 1550 Grand Boulevard, Hamilton, Ohio, was one company under subcontract to the Manhattan Engineer District (MED), and the Atomic Energy Commission (AEC), the lead agencies in the development of nuclear energy for defense-related projects. The US Department of Energy (DOE) conducted radiological surveys of these sites to evaluate current radiological conditions as part of the Formerly Utilized Sites Remedial Action Program

(FUSRAP). In 1988, a radiological survey of the Herring-Hall-Marvin Safe Company facility was conducted, and after small fragments of uranium metal were removed, no beta or gamma radiation above background was detected and the building was dismissed from any additional DOE restrictions. In 1993, it was discovered that a portion of the actual machining work was conducted on the third floor of the facility, located in the southeastern comer of the building. At the request of DOE, this part of the facility was radiologically surveyed by an ORNL survey team to determine whether fixed surface contamination could be found that might exceed the DOE guidelines. Results of this radiological survey indicated ^{238}U contamination in excess of the DOE criteria for surface contamination, and the site was recommended for remediation. In February and March of 1995, a verification survey of the third floor of the former Herring-Hall-Marvin Safe Company facility by an ORNL survey team was performed in conjunction with decontamination operations conducted under the supervision of Bechtel National Incorporated. The verification survey included gamma scans at the surface and at one meter, alpha and beta-gamma scans for fixed contamination, and smears for transferable contamination.

2181 (ORNL/RASA–95/15) **Results of the independent radiological verification survey at the former Associate Aircraft Tool and Manufacturing Company site, Fairfield, Ohio (FOH001).** Rice, D.E.; Murray, M.E.; Brown, K.S. Oak Ridge National Lab., TN (United States). Jan 1996. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006026. Source: OSTI; NTIS; INIS; GPO Dep.

The former Associate Aircraft Tool and Manufacturing Company site is located at 3550 Dixie Highway, Fairfield, Ohio. Associate Aircraft Tool and Manufacturing Company produced hollow uranium slugs in a machine shop at the site in 1956. The work was performed for National Lead of Ohio in a contract with the Atomic Energy Commission to augment the capacity of the Feed Materials Production Center at Fernald in the development of nuclear energy for defense-related projects. The current occupant of the building, Force Control, operates a multipurpose machine shop. At the request of the US Department of Energy (DOE), a team from Oak Ridge National Laboratory conducted an independent radiological verification survey at the former Associate Aircraft Tool and Manufacturing Company Site, Fairfield, Ohio. The survey was performed from February to May of 1995. The purpose of the survey was to verify that radioactivity from residues of ^{238}U was remediated to a level below acceptable DOE guidelines levels.

2182 (ORNL/RASA–95/16) **Results of the independent radiological verification survey at 4400 Piehl Road, Ottawa Lake, Michigan (BTO002).** Murray, M.E.; Brown, K.S. Oak Ridge National Lab., TN (United States). Apr 1996. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96011220. Source: OSTI; NTIS; INIS; GPO Dep.

At the request of the US Department of Energy (DOE), a team from Oak Ridge National Laboratory (ORNL) conducted an independent radiological verification survey at Ottawa Lake, Michigan. The survey was performed in November and December of 1994. The purpose of the survey was to verify that the site was remediated to levels below the DOE guidelines for FUSRAP sites. Results of the independent radiological verification survey at Ottawa Lake, Michigan confirm that the residual uranium contamination at the site is below DOE FUSRAP guidelines for unrestricted use.

2183 (ORNL/TM–12968) **Results of the independent radiological verification survey of the remedial action performed at the former Alba Craft Laboratory site, Oxford, Ohio, (OXO001).** Kleinhans, K.R.; Murray, M.E.; Carrier, R.F. Oak Ridge National Lab., TN (United States). Apr 1996. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96010625. Source: OSTI; NTIS; INIS; GPO Dep.

Between October 1952 and February 1957, National Lead of Ohio (NLO), a primary contractor for the Atomic Energy Commission (AEC), subcontracted certain uranium machining operations to Alba Craft Laboratory, Incorporated, located at 10-14 West Rose Avenue, Oxford, Ohio. In 1992, personnel from Oak Ridge National Laboratory (ORNL) confirmed the presence of residual radioactive materials from the AEC-related operations in and around the facility in amounts exceeding the applicable Department of Energy (DOE) guidelines. Although the amount of uranium found on the property posed little health hazard if left undisturbed, the levels were sufficient to require remediation to bring radiological conditions into compliance with current guidelines, thus ensuring that the public and the environment are protected. A team from ORNL conducted a radiological verification survey of the former Alba Craft Laboratory property between December 1994 and February 1995. The survey was conducted at the request of DOE and included directly measured radiation levels, the collection and analysis of soil samples to determine concentrations of uranium and certain other radionuclides, and comparison of these data to the guidelines. This document reports the findings of this survey. The results of the independent verification survey of the former Alba Craft Laboratory property demonstrate that all contaminated areas have been remediated to radionuclide concentrations and activity levels below the applicable guideline limits set by DOE.

2184 (ORNL/TM–13026) **Thermal analysis to support decommissioning of the molten salt reactor experiment.** Sulfredge, C.D.; Morris, D.G.; Park, J.E.; Williams, P.T. Oak Ridge National Lab., TN (United States). Jun 1996. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96011585. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the decommissioning process for the Molten Salt Reactor Experiment (MSRE) at Oak Ridge National Laboratory, several thermal-sciences issues were addressed. Apparently a mixture of UF_6 and F_2 had diffused into the upper portion of one charcoal column in the MSRE auxiliary charcoal bed (ACB), leading to radiative decay heating and possible chemical reaction sources. A proposed interim corrective action was planned to remove the water from the ACB cell to reduce criticality and reactivity concerns and then fill the ACB cell with an inert material. This report describes design of a thermocouple probe to obtain temperature measurements for mapping the uranium deposit, as well as development of steady-state and transient numerical models for the heat transfer inside the charcoal column. Additional numerical modeling was done to support filling of the ACB cell. Results from this work were used to develop procedures for meeting the goals of the MSRE Remediation Project without exceeding appropriate thermal limits.

2185 (ORNL/TM–13098) **Demonstration recommendations for accelerated testing of concrete**

decontamination methods. Dickerson, K.S.; Ally, M.R.; Brown, C.H.; Morris, M.I.; Wilson-Nichols, M.J. Oak Ridge National Lab., TN (United States). Dec 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006024. Source: OSTI; NTIS; INIS; GPO Dep.

A large number of aging US Department of Energy (DOE) surplus facilities located throughout the US require deactivation, decontamination, and decommissioning. Although several technologies are available commercially for concrete decontamination, emerging technologies with potential to reduce secondary waste and minimize the impact and risk to workers and the environment are needed. In response to these needs, the Accelerated Testing of Concrete Decontamination Methods project team described the nature and extent of contaminated concrete within the DOE complex and identified applicable emerging technologies. Existing information used to describe the nature and extent of contaminated concrete indicates that the most frequently occurring radiological contaminants are ^{137}Cs, ^{238}U (and its daughters), ^{60}Co, ^{90}Sr, and tritium. The total area of radionuclide-contaminated concrete within the DOE complex is estimated to be in the range of 7.9×10^8 ft^2or approximately 18,000 acres. Concrete decontamination problems were matched with emerging technologies to recommend demonstrations considered to provide the most benefit to decontamination of concrete within the DOE complex. Emerging technologies with the most potential benefit were biological decontamination, electro-hydraulic scabbling, electrokinetics, and microwave scabbling.

2186 (ORNL/TM–13142) **A descriptive model of the molten salt reactor experiment after shutdown: Review of FY 1995 progress.** Williams, D.F.; Del Cul, G.D.; Toth, L.M. Oak Ridge National Lab., TN (United States). Jan 1996. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96008017. Source: OSTI; NTIS; INIS; GPO Dep.

During FY 1995 considerable progress was made toward gaining a better understanding of the chemistry and transport processes that continue to govern the behavior of the Molten Salt Reactor Experiment (MSRE). As measurements in the MSRE proceed, laboratory studies continue, and better analyses are available, our understanding of the state of the MSRE and the best path toward remediation improves. Because of the immediate concern about the deposit in the auxiliary charcoal bed (ACB), laboratory studies in the past year focused on carbon-fluorine chemistry. Secondary efforts were directed toward investigation of gas generation from MSRE salts by both radiolytic and nonradiolytic pathways. In addition to the laboratory studies, field measurements at the MSRE provided the basis for estimating the inventory of uranium and fluorine in the ACB. Analysis of both temperature and radiation measurements provided independent and consistent estimates of about 2.6 kg of uranium deposited in the top of the ACB. Further analysis efforts included a refinement in the estimates of the fuel- salt source term, the deposited decay energy, and the projected rate of radiolytic gas generation. This report also provides the background material necessary to explain new developments and to review areas of particular interest. The detailed history of the MSRE is extensively documented and is cited where appropriate. This work is also intended to update and complement the more recent MSRE assessment reports.

2187 (PNL–10615) **Cost update technology, safety, and costs of decommissioning a reference uranium hexafluoride conversion plant.** Miles, T.L.; Liu, Y. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95017599. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study is to update the cost estimates developed in a previous report, NUREG/CR-1757 (Elder 1980) for decommissioning a reference uranium hexafluoride conversion plant from the original mid-1981 dollars to values representative of January 1993. The cost updates were performed by using escalation factors derived from cost index trends over the past 11.5 years. Contemporary price quotes wee used for costs that have increased drastically or for which is is difficult to find a cost trend. No changes were made in the decommissioning procedures or cost element requirements assumed in NUREG/CR-1757. This report includes only information that was changed from NUREG/CR-1757. Thus, for those interested in detailed descriptions and associated information for the reference uranium hexafluoride conversion plant, a copy of NUREG/CR-1757 will be needed.

2188 (PNL–10651) **Development of a risk-based approach to Hanford Site cleanup.** Hesser, W.A. (Pacific Northwest Lab., Richland, WA (United States)); Daling, P.M.; Baynes, P.A. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 350p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001420. Source: OSTI; NTIS; INIS; GPO Dep.

In response to a request from Mr. Thomas Grumbly, Assistant Secretary of Energy for Environmental Management, the Hanford Site contractors developed a conceptual set of risk-based cleanup strategies that (1) protect the public, workers, and environment from unacceptable risks; (2) are executable technically; and (3) fit within an expected annual funding profile of 1.05 billion dollars. These strategies were developed because (1) the US Department of Energy and Hanford Site budgets are being reduced, (2) stakeholders are dissatisfied with the perceived rate of cleanup, (3) the US Congress and the US Department of Energy are increasingly focusing on risk and riskreduction activities, (4) the present strategy is not integrated across the Site and is inconsistent in its treatment of similar hazards, (5) the present cleanup strategy is not cost-effective from a risk-reduction or future land use perspective, and (6) the milestones and activities in the Tri-Party Agreement cannot be achieved with an anticipated funding of 1.05 billion dollars annually. The risk-based strategies described herein were developed through a systems analysis approach that (1) analyzed the cleanup mission; (2) identified cleanup objectives, including risk reduction, land use, and mortgage reduction; (3) analyzed the existing baseline cleanup strategy from a cost and risk perspective; (4) developed alternatives for accomplishing the cleanup mission; (5) compared those alternatives against cleanup objectives; and (6) produced conclusions and recommendations regarding the current strategy and potential risk-based strategies.

2189 (PNL–10855) **Assessment of unabated facility emission potentials for evaluating airborne radionuclide monitoring requirements at Pacific Northwest National Laboratory - 1995.** Ballinger, M.Y.; Jette, S.J.; Sula, M.J. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002887. Source: OSTI; NTIS; INIS; GPO Dep.

Assessments were performed to evaluate compliance with the airborne radionuclide emission monitoring requirements in the National Emission Standards for Hazardous Air Pollutants. In these assessments, potential unabated offsite doses were evaluated for 31 emission locations at the US DOE's Pacific Northwest National Laboratory on the Hanford Site. Four buildings met Sate and Federal critical for continuous sampling of airborne radionuclide emissions. The assessments were performed using building radionuclide inventory data obtained in 1995.

2190 (SAND–94-0686) **Determination of kinetic coefficients for the simultaneous reduction of sulfate and uranium by Desulfovibrio desulfuricans bacteria.** Tucker, M.D. Sandia National Labs., Albuquerque, NM (United States). May 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011839. Source: OSTI; NTIS; INIS; GPO Dep.

Uranium contamination of groundwaters and surface waters near abandoned mill tailings piles is a serious concern in many areas of the western United States. Uranium usually exists in either the U(IV) or the U(VI) oxidation state. U(VI) is soluble in water and, as a result, is very mobile in the environment. U(IV), however, is generally insoluble in water and, therefore, is not subject to aqueous transport. In recent years, researchers have discovered that certain anaerobic microorganisms, such as the sulfate-reducing bacteria Desulfovibrio desulfuricans, can mediate the reduction of U(VI) to U(IV). Although the ability of this microorganism to reduce U(VI) has been studied in some detail by previous researchers, the kinetics of the reactions have not been characterized. The purpose of this research was to perform kinetic studies on Desulfovibrio desulficans bacteria during simultaneous reduction of sulfate and uranium and to determine the phase in which uranium exists after it has been reduced and precipitated from solution. The studies were conducted in a laboratory-scale chemostat under substrate-limited growth conditions with pyruvate as the substrate. Kinetic coefficients for substrate utilization and cell growth were calculated using the Monod equation. The maximum rate of substrate utilization (k) was determined to be 4.70 $days^{-1}$ while the half-velocity constant (K_s) was 140 mg/l COD. The yield coefficient (Y) was determined to be 0.17 mg cells/mg COD while the endogenous decay coefficient (k_d) was calculated as 0.072 $days^{-1}$. After reduction, U(IV) Precipitated from solution in the uraninite (UO_2) phase. Uranium removal efficiency as high as 90% was achieved in the chemostat.

2191 (SAND–94-3100C) **Geostatistics and cost-effective environmental remediation.** Rautman, C.A. Sandia National Labs., Albuquerque, NM (United States). 12 Apr 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9609131–1: 5. international geostatistics congress, Wollongong (Australia), 22-27 Sep 1996). Order Number DE96010863. Source: OSTI; NTIS; INIS; GPO Dep.

Numerous sites within the U.S. Department of Energy (DOE) complex have been contaminated with various radioactive and hazardous materials by defense-related activities during the post-World War II era. The perception is that characterization and remediation of these contaminated sites will be too costly using currently available technology. Consequently, the DOE Office of Technology Development has funded development of a number of alternative processes for characterizing and remediating these sites. The former Feed-Materials Processing Center near Fernald, Ohio (USA), was selected for demonstrating several innovative technologies. Contamination at the Fernald site consists principally of particulate uranium and derivative compounds in surficial soil. A field-characterization demonstration program was conducted during the summer of 1994 specifically to demonstrate the relative economic performance of seven proposed advanced-characterization tools for measuring uranium activity of in-situ soils. These innovative measurement technologies are principally radiation detectors of varied designs. Four industry-standard measurement technologies, including conventional, regulatory-agency-accepted soil sampling followed by laboratory geochemical analysis, were also demonstrated during the program for comparative purposes. A risk-based economic-decision model has been used to evaluate the performance of these alternative characterization tools. The decision model computes the dollar value of an objective function for each of the different characterization approaches. The methodology not only can assist site operators to choose among engineering alternatives for site characterization and/or remediation, but also can provide an objective and quantitative basis for decisions with respect to the completeness of site characterization.

2192 (SAND–95-1689) **VAMOS: The verification and monitoring options study: Current research options for in-situ monitoring and verification of contaminant remediation and containment within the vadose zone.** Betsill, J.D. (Sandia National Labs., Albuquerque, NM (United States)); Gruebel, R.D. Sandia National Labs., Albuquerque, NM (United States). Sep 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96001761. Source: OSTI; NTIS; INIS; GPO Dep.

The Verification and Monitoring Options Study Project (VAMOS) was established to identify high-priority options for future vadose-zone environmental research in the areas of in-situ remediation monitoring, post-closure monitoring, and containment emplacement and verification monitoring. VAMOS examined projected needs not currently being met with applied technology in order to develop viable monitoring and verification research options. The study emphasized a compatible systems approach to reinforce the need for utilizing compatible components to provide user friendly site monitoring systems. To identify the needs and research options related to vadose-zone environmental monitoring and verification, a literature search and expert panel forums were conducted. The search included present drivers for environmental monitoring technology, technology applications, and research efforts. The forums included scientific, academic, industry, and regulatory environmental professionals as well as end users of environmental technology. The experts evaluated current and future monitoring and verification needs, methods for meeting these needs, and viable research options and directions. A variety of high-priority technology development, user facility, and technology guidance research options were developed and presented as an outcome of the literature search and expert panel forums.

2193 (WHC-SA–2746) **Deactivation and cleanout of the 308 Fuels Laboratory and the 232-Z Incinerator at the Hanford site.** Gerber, M.S.; Bliss, R.J. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950216–138: Waste management '95, Tucson, AZ (United States), 26

Feb - 2 Mar 1995). Order Number DE95008788. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the deactivation and source term reduction activities conducted over the recent past in two plutonium-contaminated Hanford Site buildings: the 308 Fuels Development Laboratory and the 232-Z Incinerator. Both of these facilities belong to the U.S. Department of Energy, and the projects are unique success stories carried out in direct support of EM-60 functions and requirements. In both cases the buildings, for different reasons, contained unacceptable amounts of plutonium, and were stabilized and placed in a safe, pre-D&D (decontamination and decommissioning) mode. The concept of deactivation as the last step in the operating life of a facility will be discussed. The need for and requirements of EM-60 transition between operations and D&D, the costs savings, techniques, regulations and lessons learned also will be discussed. This paper describes the strategies that led to successful source term reduction: accurate characterization, cooperation among different divisions within DOE and the Hanford Site, attention to regulations (especially unique in this case since the 232-Z Incinerator has been nominated as a Historic Structure to the National Register of Historic Places), and stakeholder concerns involving the proximity of the 308 Building to the Columbia River. The paper also weaves in the history, missions, and plutonium accumulation of the two buildings. The lessons learned are cogent to many other present and future deactivation activities across the DOE complex and indeed across the world.

2194 (WHC-SA–2761) **Educational understanding of pollution prevention in decontamination and decommissioning/environmental restoration activities.** Betsch, M.D. (Westinghouse Hanford Co., Richland, WA (United States)); Lewis, R.A. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9505111–3: 11. pollution prevention conference: shaping the future through pollution prevention involvement - commitment - progress, Knoxville, TN (United States), 16-18 May 1995). Order Number DE95012573. Source: OSTI; NTIS; INIS; GPO Dep.

Demolishing outdated structures from the US Department of Energy Hanford Site in Washington, generates large quantities of waste which can be minimized. The Hanford cleanup is one of the world's largest and most complex environmental restoration efforts. Approximately 280 square miles of ground water and soil are contaminated; there are more than 80 surplus facilities, including nine shut-down nuclear reactors in various stages of decay; and there are 177 underground waste storage tanks containing highly radioactive waste. In all, 1,500 cleanup sites have been identified and the Environmental Restoration Contractor (ERC) is currently responsible for surveillance and maintenance of 170 structures. A two hour orientation training in pollution prevention was developed by the Westinghouse Hanford Company to provide all Decontamination and Decommissioning/Environmental Restoration (D&D/ER) personnel with the knowledge to apply waste minimization principles during their cleanup activities. The ERC Team Pollution Prevention Workshop serves to communicate pollution prevention philosophies and influences the way D&D/ER projects are conducted at the Hanford Site.

2195 (WHC-SA–2786) **Production reactor disposal on the Hanford site.** Romano, T. (Westinghouse Hanford Co., Richland, WA (United States)); Miller, R.L. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951203–41: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96005194. Source: OSTI; NTIS; INIS; GPO Dep.

One of the many restoration challenges for the Hanford Site is the disposal of eight plutonium production reactors inactive since 1971. In order to minimize environmental and public health and safety impacts disposal alternatives were evaluated in an Environmental Impact Statement (EIS). Alternatives considered were no action, immediate one-piece removal, safe storage followed by deferred one- piece removal, safe storage followed by deferred dismantlement, and in-situ decommissioning. Evaluation of the EIS by the US Department of Energy resulted in the selection of the safe storage followed by one-piece removal alternative, which is discussed in this report.

2196 (WHC-SA–2807-FP) **Resolution of USQ regarding source term in the 232-Z Waste Incinerator Building.** Westsik, G.A. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950923–15: 5. international conference on facility-safeguards interface, Jackson Hole, WY (United States), 24-30 Sep 1995). Order Number DE96001599. Source: OSTI; NTIS; INIS; GPO Dep.

The 232-Z Waste Incinerator at the Hanford Plutonium Finishing Plant (PFP) was used to incinerate plutonium-bearing combustible materials generated during normal plant operations. Nondestructive (NDA) measurements performed after the incinerator ceased operations indicated high plutonium loadings in exhaust ductwork near the incinerator glovebox, while the incinerator was found to have only low quantities. Measurements, following a campaign to remove some of the ductwork, resulted in markedly higher assay value for the incinerator glovebox itself. Subsequent assays confirmed the most recent results and pointed to a potential further underestimation of the holdup, in part because of attenuation due to fire brick, which could not be seen easily and which had been reported to not be present. NaI detector based measurements were used to map the deposits. Extended count times, using high resolution Ge detectors helped estimate the isotopic composition of the plutonium and quantify the deposits. Experiments were performed using a Ge detector to obtain adequate corrections for the high attenuation of the incinerator glovebox. Several neutron detectors and detector configurations were employed to understand and quantify the neutron flux. Due to the disparity that was anticipated to occur between the gamma ray and neutron assay results, radiation modeling was used to try to reconcile the divergent results. This was a third aspect of the team's effort, utilizing computer modeling to resolve discrepancies between measurement methods.

2197 (WHC-SA–3035-FP) **Electrical resistivity tomography at the DOE Hanford site.** Narbutovskih, S.M. (Westinghouse Hanford Co., Richland, WA (United States)); Halter, T.D.; Sweeney, M.D.; Daily, W.; Ramirez, A.L. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960477–3: 9. annual symposium on the application of geophysics to engineering and environmental problems, Denver, CO

(United States), 15 Apr - 1 May 1996). Order Number DE96009908. Source: OSTI; NTIS; INIS; GPO Dep.

Recent work at the DOE Hanford site has established the potential of applying Electrical Resistivity Tomography (ERT) for early leak detection under hazardous waste storage facilities. Several studies have been concluded to test the capabilities and limitations of ERT for two different applications. First, field experiments have been conducted to determine the utility of ERT to detect and map leaks from underground storage tanks during waste removal processes. Second, the use of ERT for long term vadose zone monitoring has been tested under different field conditions of depth, installation design, acquisition mode/equipment and infiltration chemistry. This work involves transferring the technology from Lawrence Livermore National Laboratory (LLNL) to the Resource Conservation and Recovery Act (RCRA) program at the DOE Hanford Site. This paper covers field training studies relevant to the second application for long term vadose zone monitoring.

2198 (WHC-SD-C018H-ATP–004) **Project C-018H, 242-A evaporator/PUREX Plant Process Condensate Treatment Facility Instrumentation and Control (I&C).** Dupuis, A. Westinghouse Hanford Co., Richland, WA (United States). 26 May 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014433. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure (ATP) has been prepared to demonstrate that the Collection System Instrumentation & Control System for Project C-018H performs according to design. Specifically, this ATP is designed to verify the following overall system requirements: The input and outputs properly connected to the LCU terminal strips. The control system software conforms to the configuration specified by the logic diagrams, piping and instrumentation diagrams (P&ID), and the LERF operating philosophy. Testing will be performed using actual signals. If actual signals are not available, then simulated signals will be used to complete the tests.

2199 (WHC-SD-C018H-ATR–002) **Electrical/instrumentation acceptance test report for Project C-018H, 242-A Evaporator/PUREX Plant condensate treatment facility.** Compau, R.A. Jr. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Kaiser Engineers Hanford Co., Richland, WA (United States). 1 Jun 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014425. Source: OSTI; NTIS; INIS; GPO Dep.

This project is part of the 200 Area Effluent Treatment Facility. The acceptance test procedure describes test methods for leak detection units, pump flow switches, pump level control valves, room air temperature monitor, leachate pump status contacts, basin pump status contacts, catch basin leak detector, leachate level monitors, and basin level monitors. These are all components of the C-018H Collection System.

2200 (WHC-SD-C018H-FDC–001-Rev.3) **Project C-018H, 242-A Evaporator/PUREX Plant Process Condensate Treatment Facility, functional design criteria. Revision 3.** Sullivan, N. Westinghouse Hanford Co., Richland, WA (United States). 2 May 1995. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015749. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the Functional Design Criteria (FDC) for Project C-018H, the 242-A Evaporator and Plutonium-Uranium Extraction (PUREX) Plant Condensate Treatment Facility (Also referred to as the 200 Area Effluent Treatment Facility [ETF]). The project will provide the facilities to treat and dispose of the 242-A Evaporator process condensate (PC), the Plutonium-Uranium Extraction (PUREX) Plant process condensate (PDD), and the PUREX Plant ammonia scrubber distillate (ASD).

2201 (WHC-SD-CP-CR–036) **PFP supply fan motor starters.** Keck, R.D. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014309. Source: OSTI; NTIS; INIS; GPO Dep.

The Plutonium Finishing Plant (PFP) is currently stabilizing about 25 kg of Pu sludge; upon completion of this task, PFP will be maintained in a safe standby condition to await decision from the PFP NEPA review. It can take about 10 years to initiate and complete terminal cleanout after this; the facility will then be decommissioned and decontaminated. The 234-5Z ventilation system must continue to operate until terminal cleanout. Part of the ventilation system is the seismic fan shutdown system which shuts down the ventilation supply fans in case of strong earthquake. This document presents criteria for installing solid state, reduced voltage motor starters and isolation contactors for the 8 main ventilation supply fans. The isolation contactors will shutdown the supply fans in event of earthquake.

2202 (WHC-SD-CP-MAR–002) **PUREX Plant deactivation mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013878. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the PUREX Deactivation Project mission analysis is to define the problem to be addressed by the PUREX mission, and to lay the ground work for further system definition. The mission analysis is an important first step in the System Engineering (SE) process. This report presents the results of the PUREX Deactivation Project mission analysis. The purpose of the PUREX Deactivation Project is to prepare PUREX for Decontamination and Decommissioning within a five year time frame. This will be accomplished by establishing a passively safe and environmentally secure configuration of the PUREX Plant, that can be preserved for a 10-year horizon. During deactivation, appropriate portions of the safety envelop will be maintained to ensure deactivation takes place in a safe and regulatory compliant manner.

2203 (WHC-SD-CP-OCD–040-Rev.1) **Basis document for sludge stabilization. Revision 1.** Dayley, L. Westinghouse Hanford Co., Richland, WA (United States). 5 Apr 1995. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010701. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the technical basis for the operating specifications to be used in the Sludge Stabilization Process at the Plutonium Finishing Plant.

2204 (WHC-SD-CP-OTR–152) **Closed loop cooling operation with MICON.** Navarro, G.E. Westinghouse Hanford Co., Richland, WA (United States). 11 May 1995.

48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012580. Source: OSTI; NTIS; INIS; GPO Dep.

This Operability Test Procedure (OTP) provides instructions for testing the Closed Loop Cooling System interface with the MICON Terminal at the Plutonium Finishing Plant located at the 200 West Area of the Hanford Site. The Closed Loop Cooling System consists of several primary loops and a single secondary cooling loop. The test objectives are to functionally prove the interlocks and instruments of the closed loop cooling system with the MICON and to show operability of the system from the MICON Terminal. Any out of tolerance readings during the test will be adjusted immediately or with a new calibration package at a later time per cognizant engineers direction.

2205 (WHC-SD-CP-OTR–153) **PFP Wastewater Sampling Facility.** Hirzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 11 May 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012578. Source: OSTI; NTIS; INIS; GPO Dep.

This test report documents the results obtained while conducting operational testing of the sampling equipment in the 225-WC building, the PFP Wastewater Sampling Facility. The Wastewater Sampling Facility houses equipment to sample and monitor the PFP's liquid effluents before discharging the stream to the 200 Area Treated Effluent Disposal Facility (TEDF). The majority of the streams are not radioactive and discharges from the PFP Heating, Ventilation, and Air Conditioning (HVAC). The streams that might be contaminated are processed through the Low Level Waste Treatment Facility (LLWTF) before discharging to TEDF. The sampling equipment consists of two flow-proportional composite samplers, an ultrasonic flowmeter, pH and conductivity monitors, chart recorder, and associated relays and current isolators to interconnect the equipment to allow proper operation. Data signals from the monitors are received in the 234-5Z Shift Office which contains a chart recorder and alarm annunciator panel. The data signals are also duplicated and sent to the TEDF control room through the Local Control Unit (LCU). Performing the OTP has verified the operability of the PFP wastewater sampling system. This Operability Test Report documents the acceptance of the sampling system for use.

2206 (WHC-SD-CP-SDD–004-Rev.2) **Definition and means of maintaining the supply ventilation system seismic shutdown portion of the PFP safety envelope. Revision 2.** Keck, R.D. Westinghouse Hanford Co., Richland, WA (United States). 27 Jun 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015547. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the modifications to the ventilation system for the Plutonium Finishing Plant. Topics discussed in this report include; system functional requirements, evaluations of equipment, a list of drawings showing the safety envelope boundaries; list of safety envelope equipment, functional requirements for individual safety envelope equipment, and a list of the operational, maintenance and surveillance procedures necessary to operate and maintain the system equipment.

2207 (WHC-SD-EN-AP–186) **105-DR Large Sodium Fire Facility decontamination, sampling, and analysis plan.** Knaus, Z.C. Westinghouse Hanford Co., Richland, WA (United States). 12 Jun 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015654. Source: OSTI; NTIS; INIS; GPO Dep.

This is the decontamination, sampling, and analysis plan for the closure activities at the 105-DR Large Sodium Fire Facility at Hanford Reservation. This document supports the 105-DR Large Sodium Fire Facility Closure Plan, DOE-RL-90-25. The 105-DR LSFF, which operated from about 1972 to 1986, was a research laboratory that occupied the former ventilation supply room on the southwest side of the 105-DR Reactor facility in the 100-D Area of the Hanford Site. The LSFF was established to investigate fire fighting and safety associated with alkali metal fires in the liquid metal fast breeder reactor facilities. The decontamination, sampling, and analysis plan identifies the decontamination procedures, sampling locations, any special handling requirements, quality control samples, required chemical analysis, and data validation needed to meet the requirements of the 105-DR Large Sodium Fire Facility Closure Plan in compliance with the Resource Conservation and Recovery Act.

2208 (WHC-SD-EN-TI–300) **218 E-8 Borrow Pit Demolition Site clean closure soil evaluation report.** Korematsu-Olund, D.M. Westinghouse Hanford Co., Richland, WA (United States). 12 Jun 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015653. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the sampling activities undertaken and the analytical results obtained in a soil sampling and analyses study performed for the 218 E-8 Borrow Pit Demolition Site (218 E-8 Demolition Site). The 218 E-8 Demolition Site is identified as a Resource Conservation and Recovery Act (RCRA) treatment unit that will be closed in accordance with the applicable laws and regulations. The site was used for the thermal treatment of discarded explosive chemical products. No constituents of concern were found in concentrations indicating contamination of the soil by 218 E-8 Demolition Site activities.

2209 (WHC-SD-FF-CSER–004) **Criticality safety evaluation for long term storage of FFTF fuel in interim storage casks.** Richard, R.F. Westinghouse Hanford Co., Richland, WA (United States). 11 May 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012576. Source: OSTI; NTIS; INIS; GPO Dep.

It has been postulated that a degradation phenomenon, referred to as "hot cell rot", may affect irradiated FFTF mixed plutonium-uranium oxide (MOX) fuel during dry interim storage. "Hot cell rot" refers to a variety of phenomena that degrade fuel pin cladding during exposure to air and inert gas environments. It is thought to be a form of caustic stress corrosion cracking or environmentally assisted cracking. Here, a criticality safety analysis was performed to address the effect of the "hot cell rot" phenomenon on the long term storage of irradiated FFTF fuel in core component containers. The results show that seven FFTF fuel assemblies or six Ident-69 pin containers stored in core component containers within interim storage casks will remain safely subcritical.

2210 (WHC-SD-FF-HC–002-Rev.1) **Hazard categorization and baseline documentation for the Sodium Storage Facility. Revision 1.** Bowman, B.R. Westinghouse Hanford Co., Richland, WA (United States). 16 Jun 1995. 8p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC06-87RL10930. Order Number DE95016341. Source: OSTI; NTIS; INIS; GPO Dep.

Hazard Categorization evaluation has been performed in accordance with DOE-STD-1027 for the Sodium Storage Facility at FFTF and a determination of less than Category 3 or non-nuclear has been made. Hazard Baseline Documentation has been performed in accordance with DOE-EM-STD-5502 and a determination of "Radiological Facility" has been made.

2211 (WHC-SD-FF-MAR–001) **FFTF Plant transition mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 25 May 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013564. Source: OSTI; NTIS; INIS; GPO Dep.

FFTF (Fast Flux Test Facility) is a 400-MW(t) sodium-cooled, fast flux test reactor at Hanford, designed to test fuels and materials for advanced nuclear power plants; it has no capability for generating electric power. Since a long-term mission could not be found for FFTF, it was placed in standby, and a recommendation was made that it be shut down. Purpose of the FFTF Transition Project is to prepare it for Decontamination and Decommissioning; this will be accomplished by establishing a passively safe and environmentally secure configuration, that can be preserved for several decades. This report presents the results of the mission analysis, which is required by Hanford systems engineering procedures.

2212 (WHC-SD-FF-TRP–019) **Effect of long-term thermal aging on the fracture toughness of austenitic stainless steel base and weld metals.** Huang, F.F. Westinghouse Hanford Co., Richland, WA (United States). 27 Sep 1995. 128p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050016. Source: OSTI; NTIS; INIS; GPO Dep.

Compact tension specimens taken from FFTF primary piping materials (Type 316 stainless steel (SS) and 16-8-2 SS weld metal) and from reactor vessel materials (304 SS and 308 SS weld metal) were heated in laboratory furnaces from 100,000 hours. Fracture toughness testing was performed on these specimens, which are 7.62- and 25.4-mm thick, respectively at the aging temperature (482 and 427 degrees). Results were analyzed with the multiple-specimen method. Thermal aging continues to reduce the fracture toughness of FFTF component materials. Results show that thermal aging has a strong effect on the toughness degradation of weld metals, particularly for 16-8-2 SS weld whose aged/unaged Jc ratio is only 0.31 after 100,000-hour aging. The fracture toughness of the 308 and 16-8-2 SS weld metals fluctuated during 20,000 to 50,000-hour aging but deteriorated as the aging time increased to 100,000 hours; the toughness degradation is significant. Fracture control based on a fracture mechanics approach should be considered

2213 (WHC-SD-FL-MAR–001) **308 Building deactivation mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013900. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the 308 Building (Fuels Development Laboratory) Deactivation Project mission analysis. Hanford systems engineering (SE) procedures call for a mission analysis. The mission analysis is an important first step in the SE process. The functions and requirements to successfully accomplish this mission, the selected alternatives and products will later be defined using the SE process.

2214 (WHC-SD-FL-MAR–002) **300 Area fuel supply facilities deactivation mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013882. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the 300 Area fuel supply facilities (formerly call "N reactor fuel fabrication facilities") Deactivation Project mission analysis. Hanford systems engineering (SE) procedures call for a mission analysis. The mission analysis is an important first step in the SE process.

2215 (WHC-SD-NR-ISB–001) **Interim safety basis for fuel supply shutdown facility.** Brehm, J.R.; Deobald, T.L.; Benecke, M.W.; Remaize, J.A. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013349. Source: OSTI; NTIS; INIS; GPO Dep.

This ISB in conjunction with the new TSRs, will provide the required basis for interim operation or restrictions on interim operations and administrative controls for the Facility until a SAR is prepared in accordance with the new requirements. It is concluded that the risk associated with the current operational mode of the Facility, uranium closure, clean up, and transition activities required for permanent closure, are within Risk Acceptance Guidelines. The Facility is classified as a Moderate Hazard Facility because of the potential for an unmitigated fire associated with the uranium storage buildings.

2216 (WHC-SD-SNF-CM–001) **Spent Nuclear Fuel Project Configuration Management Plan.** Reilly, M.A. Westinghouse Hanford Co., Richland, WA (United States). 9 Jun 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015582. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a rewrite of the draft "C" that was agreed to "in principle" by SNF Project level 2 managers on EDT 609835, dated March 1995 (not released). The implementation process philosphy was changed in keeping with the ongoing reengineering of the WHC Controlled Manuals to achieve configuration management within the SNF Project.

2217 (WHC-SD-SNF-DQO–004) **Data quality objectives for the initial fuel conditioning examinations.** Lawrence, L.A. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014310. Source: OSTI; NTIS; INIS; GPO Dep.

The Data Quality Objectives (DQOs) were established for the response of the first group of fuel samples shipped from the K West Basin to the Hanford 327 Building hot cells for examinations to the proposed Path Forward conditioning process. Controlled temperature and atmosphere furnace testing testing will establish performance parameters using the conditioning process (drying, sludge drying, hydride decomposition passivation) proposed by the Independent Technical Assessment (ITA) Team as the baseline.

2218 (WHC-SD-SNF-SD–003-Vol.2) **Spent Nuclear Fuel Project technical baseline document fiscal year 1995. Volume 2: Supporting data.** Cramond, R. (TRW, Inc., Cleveland, OH (United States)); Paedon, R.J.; Ghigleri, T. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 315p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010600. Source: OSTI; NTIS; INIS; GPO Dep.

Volume 2 of this SNFP technical baseline document presents the data which supports the information contained in Volume 1 of this document, Baseline Description. This document presents the results of the SNFP systems engineering analyses since September 1994. The mission of the Spent Nuclear Fuel Project at Hanford is to provide safe, economic, and environmentally sound management of Hanford SNF in a manner that stages it to final disposition. Spent fuels include what are in the K Basins, various buildings throughout the site, and fuels from the FFTF.

2219 (WHC-SD-SNF-TC–004) **Development test procedure High Pressure Water Jet System.** Crystal, J.B. Westinghouse Hanford Co., Richland, WA (United States). 5 Jun 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015584. Source: OSTI; NTIS; INIS; GPO Dep.

Development testing will be performed on the water jet cleaning fixture to determine the most effective arrangement of water jet nozzles to remove contamination from the surfaces of canisters and other debris. The following debris may be stained with dye to simulate surface contaminates: Mark O, Mark I, and Mark II Fuel Storage Canisters (both stainless steel and aluminum), pipe of various size, (steel, stainless, carbon steel and aluminum). Carbon steel and stainless steel plate, channel, angle, I-beam and other surfaces, specifically based on the Scientific Ecology Group (SEG) inventory and observations of debris within the basin. Test procedure for developmental testing of High Pressure Water Jet System.

2220 (WHC-SD-SP-MAR–001) **309 Building deactivation mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013884. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the 309 Building (Plutonium Fuels Utilization Program) Deactivation Project mission analysis. Hanford systems engineering (SE) procedures call for a mission analysis. The mission analysis is an important first step in the SE process. The functions and requirements to successfully accomplish this mission, the selected alternatives and products will later be defined using the SE process.

2221 (WHC-SD-W059-DR–001) **Engineer/Constructor Management Plan B-Plant Canyon Ventilation Upgrade Project W-059.** Condron, J.D. ICF Kaiser Hanford Co., Richland, WA (United States). 27 Apr 1995. 131p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011545. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the conceptual design for Project W-059, B Plant Canyon Ventilation Upgrade.

2222 (WHC-SD-W236A-ER–021-Rev.2) **Multi-Function Waste Tank Facility phase out basis. Revision 2.** Awadalla, N.G. Westinghouse Hanford Co., Richland, WA (United States). 9 Jun 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014308. Source: OSTI; NTIS; INIS; GPO Dep.

Additional double-shell tank storage capacity is not needed until FY 2004 or later. The waste volume in the current baseline program can be managed within the existing tank capacity. However, this requires implementation of some risk management actions and significant investment in software and hardware to accomplish the actions necessary to maximize use of existing storage tank space.

2223 (WHC-SD-W236A-TI–07) **Position paper: Live load design criteria for Project W-236A Multi-Function Waste Tank Facility.** Giller, R.A. ICF Kaiser Hanford Co., Richland, WA (United States). 9 Jun 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015747. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to discuss the live loads applied to the underground storage tanks of the Multi Function Waste Tank Facility, and to provide the basis for Project W-236A live load criteria. Project 236A provides encompasses building a Weather Enclosure over the two underground storage tanks at the 200-West area. According to the Material Handling Study, the Groves AT 1100 crane used within the Weather Enclosure will have a gross vehicle weight of 66.5 tons. Therefore, a 100-ton concentrated live load is being used for the planning of the construction of the Weather Enclosure.

2224 (WHC-SD-W259-ACDR–001) **Advanced conceptual design report: T Plant secondary containment and leak detection upgrades. Project W-259.** Hookfin, J.D. Westinghouse Hanford Co., Richland, WA (United States). 12 May 1995. 141p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013337. Source: OSTI; NTIS; INIS; GPO Dep.

The T Plant facilities in the 200-West Area of the Hanford site were constructed in the early 1940s to produce nuclear materials in support of national defense activities. T Plant includes the 271-T facility, the 221-T facility, and several support facilities (eg, 2706-T), utilities, and tanks/piping systems. T Plant has been recommended as the primary interim decontamination facility for the Hanford site. Project W-259 will provide capital upgrades to the T Plant facilities to comply with Federal and State of Washington environmental regulations for secondary containment and leak detection. This document provides an advanced conceptual design concept that complies with functional requirements for the T Plant Secondary Containment and Leak Detection upgrades.

2225 (WHC-SD-WM-AP–037) **Alternatives for the disposition of PUREX organic solution.** Nelson, D.W. Westinghouse Hanford Co., Richland, WA (United States). 16 Jun 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015794. Source: OSTI; NTIS; INIS; GPO Dep.

This Supporting Document submits options and recommendations for final management of Tank 40 Plutonium-Uranium Extraction (PUREX) Plant organic solution per Tri-Party Agreement Milestorm Number M-80-00-T03. Hanford is deactivating the PUREX Plant for the US DOE. One the key element of this Deactivation is disposition of approximately 81,300 liters (21,500 gallons) of slightly radioactively contaminated organic solution to reduce risk to the environment, reduce cost of long-term storage, and assure regulatory compliance. An announcement in the Commerce Business Daily (CBD) on October 14, 1994 has resulted in the submission of proposals from two facilities capabLe of receiving and thermally destroying the solution. Total decomposition by thermal destruction is the recommended option for the disposition of the PUREX organic solution and WHC is evaluating the proposals from the two facilities.

2226 (WHC-SD-WM-DRR–049) **Flexible receiver adapter formal design review.** Krieg, S.A. Westinghouse Hanford Co., Richland, WA (United States). 13 Jun 1995. 316p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015788. Source: OSTI; NTIS; INIS; GPO Dep.

This memo summarizes the results of the Formal (90%) Design Review process and meetings held to evaluate the design of the Flexible Receiver Adapters, support platforms, and associated equipment. The equipment is part of the Flexible Receiver System used to remove, transport, and store long length contaminated equipment and components from both the double and single-shell underground storage tanks at the 200 area tank farms.

2227 (WHC-SD-WM-ES–283-Vol.1) **Long-term decontamination engineering study. Volume 1.** Geuther, W.J. Westinghouse Hanford Co., Richland, WA (United States). 3 Apr 1995. 154p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010930. Source: OSTI; NTIS; INIS; GPO Dep.

This report was prepared by Westinghouse Hanford Company (WHC) with technical and cost estimating support from Pacific Northwest Laboratories (PNL) and Parsons Environmental Services, Inc. (Parsons). This engineering study evaluates the requirements and alternatives for decontamination/treatment of contaminated equipment at the Hanford Site. The purpose of this study is to determine the decontamination/treatment strategy that best supports the Hanford Site environmental restoration mission. It describes the potential waste streams requiring treatment or decontamination, develops the alternatives under consideration establishes the criteria for comparison, evaluates the alternatives, and draws conclusions (i.e., the optimum strategy for decontamination). Although two primary alternatives are discussed, this study does identify other alternatives that may warrant additional study. hanford Site solid waste management program activities include storage, special processing, decontamination/treatment, and disposal facilities. This study focuses on the decontamination/treatment processes (e.g., waste decontamination, size reduction, immobilization, and packaging) that support the environmental restoration mission at the Hanford Site.

2228 (WHC-SD-WM-ES–283-Vol.2) **Long-term decontamination engineering study: Appendix A, Appendix B, Appendix C, Appendix D. Volume 2.** Westinghouse Hanford Co., Richland, WA (United States). [1995]. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010931. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains Appendix A,B,C, and D for the Long-Term Decontamination Study and is a compilation of presentations, draft documents, and supporting documents compiled by the Westinghouse Hanford Company T Plant Systems Engineering Team (TPSET). This information was not formally approved, but provides insight into understanding the uncertainty associated with waste stream projections, facility evaluations, and possible alternatives for decontamination/treatment. This information was used in developing and refining the decontamination/treatment alternatives considered in this study.

2229 (WHC-SD-WM-ES–283-Vol.3) **Long-term decontamination engineering study. Volume 3: Appendix E, Appendix F, Appendix G, Appendix H.** Geuther, W.J. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 609p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010932. Source: OSTI; NTIS; INIS; GPO Dep.

Appendix E contains a T plant condition and viability assessment. Appendix F describes the upgrades recommended by the viability assessment provided in Appendix D. Appendix G contains cost estimating information for the two T plant scenarios. Scenario 1 is the previously estimated and evaluated Long Term/Long Length option and Scenario 2 is the Full Service option, also previously estimated and evaluated. Appendix H contains costs estimating information for the two New Facility scenarios. Scenario 1 is the annex facility proposed to be placed near the existing 2706-T Facility. Scenario 2 is the large, full service, new facility previously estimated and evaluated.

2230 (WHC-SD-WM-ES–315) **T Plant canyon deck-level allowable floor-load study.** Barlow, D.E. Westinghouse Hanford Co., Richland, WA (United States). 19 Apr 1995. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010942. Source: OSTI; NTIS; INIS; GPO Dep.

T Plant is to become a decontamination facility for the Hanford Site. This mission will require that large pieces of equipment be installed on the deck-level floor of the canyon in 221-T building. The objective of this study is to determine the maximum loads that can be applied safely to the canyon deck-level floor. These loads are caused by the weight of installed equipment. These load limits are to be used as design limits for the installation of the new equipment. The load limits for normal operating conditions are based on American Concrete Institute (ACI) 318.1 permissible stresses. The various floor configurations in building sections 1 through 20 are considered. Cover blocks are considered to be installed in all deck openings to create the worst possible case. The building is designated as safety class 3. The internal stresses, resulting from the inertial forces caused by the concrete during horizontal seismic accelerations, are out of scope for this report. They are considered in the seismic analysis of the building section. Vertical reactions when equipment is subjected to overturning moments during horizontal seismic accelerations must be determined and applied as part of the floor load. The new equipment to be installed has relatively small mass compared to the building weight, and there is a 25% reduction in the load factor during seismic events. Thus, the seismic effects are expected to be accommodated within the envelope of this static analysis.

2231 (WHC-SD-WM-MAR–006) **B plant mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013901. Source: OSTI; NTIS; INIS; GPO Dep.

This report further develops the mission for B Plant originally defined in WHC-EP-0722, "System Engineering

Functions and Requirements for the Hanford Cleanup Mission: First Issue." The B Plant mission analysis will be the basis for a functional analysis that breaks down the B Plant mission statement into the necessary activities to accomplish the mission. These activities are the product of the functional analysis and will then be used in subsequent steps of the systems engineering process, such as identifying requirements and allocating those requirements to B Plant functions. The information in this mission analysis and the functional and requirements analysis are a part of the B Plant technical baseline.

2232 (WHC-SP–1167) **3000 Area Phase 1 environmental assessment.** Ranade, D.G. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003350. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is planning to sell the 3000 Area to prospective buyers. Environmental Services was requested by the WHC Economic Transition group to assess potential environmental liabilities in the area. Historical review of the area indicated that the site was the location of "Camp Hanford" in 1951 and has been used for a variety of purposes since then. The activities in the area have changed over the years. A number of Buildings from the area have been demolished and at least 15 underground storage tanks (USTs) have been removed. Part of the 3000 Area was identified as Operable Unit 1100-EM-3 in the Tri-Party Agreement and was cleaned up by the US Army Corps of Engineers (USACE). The cleanup included removal of contaminated soil and USTS. WHC and ICF KH had also performed sampling and analysis at some locations in the 3000 Area prior to USACE's work on the Operable Unit 1100-EM-3. They removed a number of USTs and performed remediation.

2233 (WSRC-TR–95-0157) **Shielded Cells D&D and Dismantlement System Requirements.** Witherspoon, R.L. Westinghouse Savannah River Co., Aiken, SC (United States). 27 Mar 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060139. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the basis for the development of the System for Highly Radioactive Equipment Dismantlement or SHRED. It is the result of a thorough investigation into current and past dismantlement practices at shielded cell facilities around the DOE complex. This information has been used to formulate the development requirements for the SHRED.

2234 (WSRC-TR–95-0231) **Chemicals, metals, and pesticide pits waste unit low induction number electromagnetic survey.** Cumbest, R.J.; Mohon, D. Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1995. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96002952. Source: OSTI; NTIS; INIS; GPO Dep.

An electromagnetic survey was conducted at the Chemicals, Metals, and Pesticide Waste Unit to identify any buried metallic objects that may be present in the materials used to fill and cover the pits after removal of pit debris. The survey was conducted with a Geonics EM-31 Terrain Conductivity Meter along north - south oriented traverses with 5-ft station intervals to produce a 5-ft by 5-ft square grid node pattern. Both conductivity and in-phase components were measured at each station for vertical dipole orientation with the common axis of the dipoles in the north - south and east - west orientations. The conductivity data clearly show elevated conductivities (2.1 to 7.0 mS/m) associated with the material over the pits, as compared with the surrounding area that is characterized by lower conductivities (1 to 2 mS/m). This is probably the result of the higher clay content of the fill material relative to the surrounding area, which has a higher sand to clay ratio and the presence of a plastic cover beneath the fill that has probably trapped water. Many metal objects are present in the survey area including manhole covers, monitoring well heads, metal, signs, drain culverts, abandoned wells, and BP waste unit marker balls. AU of these exhibit associated conductivity and in-phase anomalies of various magnitude. In addition to these anomalies that can be definitely associated with surface sources, conductivity and in-phase anomalies are also present with no obvious surface source. These anomalies are probably indicative of subsurface buried metallic objects. A high concentration of these objects appears to be present in the southwest corner of the survey area.

2235 (Y/WM–224) **Building 9201-4 at the Oak Ridge Y-12 Site annual surveillance and maintenance report 1994.** Sollenberger, M.L.; Sparkman, D.E.; Reynolds, R.M. Oak Ridge Y-12 Plant, TN (United States). Jan 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96003423. Source: OSTI; NTIS; INIS; GPO Dep.

The Oak Ridge Y-12 Plant Decontamination and Decommissioning (D&D) Program is part of the Waste Management/D&D Organization and is funded by the Office of Environmental Restoration (EM-40). Strategic goals are to protect human health and environment and to reduce the number of hazardous material-contaminated facilities by properly managing and dispositioning facilities when they are no longer required to fulfill a site mission. The D&D Program objectives include (1) providing surveillance and maintenance (S&M) activities in support of facilities in standby and awaiting D&D; (2) developing specific methods, schedules, and funding plans for the D&D of shutdown facilities; and (3) implementing plans to provide for facility disposition in a safe, compliant, and cost effective manner. Presently Building 9201-4 (Alpha-4) is the only facility at the complex that is in the Y-12 D&D Program. This report provides a status of the program plans and specific S&M requirements for Building 9201-4 as part of the Y-12 D&D Program.

2236 (CONF-9410231–3) **Model of rotary-actuated flexible beam with notch filter vibration suppression controller and torque feedforward load compensation controller.** Bills, K.C. (Oak Ridge National Lab., TN (United States)); Kress, R.L.; Kwon, D.S.; Baker, C.P. Oak Ridge National Lab., TN (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 8. Deneb user group meeting; Detroit, MI (United States); 10-14 Oct 1994. Order Number DE95014254. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes ORNL's development of an environment for the simulation of robotic manipulators. Simulation includes the modeling of kinematics, dynamics, sensors, actuators, control systems, operators, and environments. Models will be used for manipulator design, proposal evaluation, control system design and analysis, graphical preview of proposed motions, safety system development, and training. Of particular interest is the development of models for robotic manipulators having at least one flexible link. As a first application, models have been developed for the Pacific Northwest Laboratory's Flexible Beam Test Bed (PNL FBTB), which is a 1-Degree-of-Freedom, flexible arm with a hydraulic base actuator. ORNL transferred control algorithms developed for the PNL FBTB to controlling IGRIP models. A robust notch filter is running in IGRIP controlling a full dynamics model of the PNL test bed. Model results provide a reasonable match to the experimental results (quantitative results are being determined) and can run on ORNL's Onyx machine in approximately realtime. The flexible beam is modeled as six rigid sections with torsional springs between each segment. The spring constants were adjusted to match the physical response of the flexible beam model to the experimental results. The controller is able to improve performance on the model similar to the improvement seen on the experimental system. Some differences are apparent, most notably because the IGRIP model presently uses a different trajectory planner than the one used by ORNL on the PNL test bed. In the future, the trajectory planner will be modified so that the experiments and models are the same. The successful completion of this work provides the ability to link C code with IGRIP, thus allowing controllers to be developed, tested, and tuned in simulation and then ported directly to hardware systems using the C language.

2237 (CONF-9411197–2) **Fiber optic coherent laser radar 3d vision system.** Sebastian, R.L. (and others); Clark, R.B.; Simonson, D.L. Coleman Research Corp., Springfield, VA (United States). 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-94MC31190. From SPIE: International Society for Optical Engineering meeting; Boston, MA (United States); 2-4 Nov 1994. Order Number DE96008768. Source: OSTI; NTIS; INIS; GPO Dep.

Recent advances in fiber optic component technology and digital processing components have enabled the development of a new 3D vision system based upon a fiber optic FMCW coherent laser radar. The approach includes a compact scanner with no moving parts capable of randomly addressing all pixels. The system maintains the immunity to lighting and surface shading conditions which is characteristic of coherent laser radar. The random pixel addressability allows concentration of scanning and processing on the active areas of a scene, as is done by the human eye-brain system.

2238 (CONF-951006–32) **Long range position and orientation tracking system.** Armstrong, G.A.; Jansen, J.F.; Burks, B.L.; Bernacki, B.E.; Nypaver, D.J. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society (ANS); San Francisco, CA (United States); 29 Oct - 1 Nov 1995. Order Number DE96005542. Source: OSTI; NTIS; INIS; GPO Dep.

The long range position and orientation tracking system (LRPOTS) will consist of two measurement pods, a VME-based computer system, and a detector array. The system is used to measure the position and orientation of a target that may be attached to a robotic arm, teleoperated manipulator, or autonomous vehicle. The pods have been designed to be mounted in the man-ways of the domes of the Fernald K-65 waste silos. Each pod has two laser scanner subsystems as well as lights and camera systems. One of the laser scanners will be oriented to scan in the pan direction, the other in the tilt direction. As the lasers scan across the detector array, the angles of incidence with each detector are recorded. Combining measurements from each of the four lasers yields sufficient data for a closed-form solution of the transform describing the location and orientation of the Content Mobilization System (CMS). Redundant detectors will be placed on the CMS to accommodate occlusions, to provide improved measurement accuracy, and to determine the CMS orientation.

2239 (CONF-951006–33) **Remote systems for waste retrieval from the Oak Ridge National Laboratory gunite tanks.** Falter, D.D. (Oak Ridge National Lab., TN (United States). Robotics and Process Systems Div.); Babcock, S.M.; Burks, B.L.; Lloyd, P.D.; Randolph, J.D.; Rutenber, J.E.; Van Hoesen, S.D. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society (ANS); San Francisco, CA (United States); 29 Oct - 1 Nov 1995. Order Number DE96005647. Source: OSTI; NTIS; INIS; GPO Dep.

As part of a Comprehensive Environmental Response, Compensation, and Liability Act Treatability Study funded by the Department of Energy, the Oak Ridge National Laboratory (ORNL) is preparing to demonstrate and evaluate two approaches for the remote retrieval of wastes in underground storage tanks. This work is being performed to identify the most cost-effective and efficient method of waste removal before full-scale remediation efforts begin in 1998. System requirements are based on the need to dislodge and remove sludge wastes ranging in consistency from broth to compacted clay from Gunite (Shotcrete) tanks that are approaching fifty years in age. Systems to be deployed must enter and exit through the existing 0.6 m (23.5 in.) risers and conduct retrieval operations without damaging the layered concrete walls of the tanks. Goals of this project include evaluation of confined sluicing techniques and successful demonstration of a telerobotic arm-based system for deployment of the sluicing system. As part of a sister project formed on the Old Hydrofracture Facility tanks at ORNL, vehicle-based tank remediation will also be evaluated.

2240 (CONF-951006–36) **Topographical mapping system for hazardous and radiological environments.** Armstrong, G.A. (Oak Ridge National Lab., TN (United States)); Burks, B.L.; Bernacki, B.E.; Pardini, A. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society (ANS); San Francisco, CA (United States); 29 Oct - 1 Nov 1995. Order Number DE96005393. Source: OSTI; NTIS; INIS; GPO Dep.

This report focuses on the results of the acceptance test of the Topographical Mapping System (TMS) delivered to the Hanford site. The TMS was tested for accuracy over the specified range of 45 feet. The TMS was also tested to ensure that the unit could be deployed through multiple risers and maintain accuracy and registration of the surface mapping data. In addition, the TMS was disassembled and reassembled and redeployed to test field replacement of modules that make up the sensor head that is deployed in the vapor space of Underground Storage Tanks such as those located at the Hanford site in southeastern Washington State. The results from these tests along with temperature testing on the complete system and radiation testing of selected susceptible components are covered in this report. The primary purpose of the TMS is to generate reliable and accurate three-dimensional maps of the internal surfaces of storage tank. One use for these mapping systems is in creating and maintaining a current map of the tank interior as input to a robotic "world model" that is used to test remediation strategies or plan robot trajectories. Another use is tracking the movement of the waste surface as it responds to expanding bubbles of trapped Gas. A third use of the TMS is to perform a volumetric analysis of the amount of waste removed from the tanks during remediation.

2241 (CONF-951006–37) **Control issues for a hydraulically powered dissimilar teleoperated system.** Jansen, J.F.; Kress, R.L. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society (ANS); San Francisco, CA (United States); 29 Oct - 1 Nov 1995. Order Number DE96005987. Source: OSTI; NTIS; INIS; GPO Dep.

This paper will address two issues associated with the implementation of a hydraulically powered dissimilar master-slave teleoperated system. These issues are the overall system control architecture and the design of robust hydraulic servo controllers for the position control problem. Finally, a discussion of overall system performance on an actual teleoperated system will be presented. (Schilling's Titan II hydraulic manipulators are the slave manipulators and the master manipulators are from the Oak Ridge National Laboratory-developed Advanced Servo Manipulator.)

2242 (CONF-9510307–1) **Long range position and Orientation Tracking System.** Armstrong, G.A. (and others); Jansen, J.F.; Burks, B.L. Oak Ridge National Lab., TN (United States). 1996. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. topical meeting on robotics and remote systems; San Francisco, CA (United States); 29 Oct - 2 Nov 1995. Order Number DE96005986. Source: OSTI; NTIS; INIS; GPO Dep.

The long range Position and Orientation Tracking System is an active triangulation-based system that is being developed to track a target to a resolution of 6.35 mm (0.25 in.) and 0.009°(32.4 arcseconds) over a range of 13.72 m (45 ft.). The system update rate is currently set at 20 Hz but can be increased to 100 Hz or more. The tracking is accomplished by sweeping two pairs of orthogonal line lasers over infrared (IR) sensors spaced with known geometry with respect to one another on the target (the target being a rigid body attached to either a remote vehicle or a remote manipulator arm). The synchronization and data acquisition electronics correlates the time that an IR sensor has been hit by one of the four lasers and the angle of the respective mirror at the time of the hit. This information is combined with the known geometry of the IR sensors on the target to determine position and orientation of the target. This method has the advantage of allowing the target to be momentarily lost due to occlusions and then reacquired without having to return the target to a known reference point. The system also contains a camera with operator controlled lighting in each pod that allows the target to be continuously viewed from either pod, assuming their are no occlusions.

2243 (CONF-951135–25) **Practical risk-based decision making: Good decisions made efficiently.** Haire, M.J. (Oak Ridge National Lab., TN (United States)); Guthrie, V.; Walker, D.; Singer, R. Oak Ridge National Lab., TN (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1995 International mechanical engineering congress and exhibition; San Francisco, CA (United States); 12-17 Nov 1995. Order Number DE96003031. Source: OSTI; NTIS; INIS; GPO Dep.

The Robotics and Process Systems Division of the Oak Ridge National Laboratory and the Westinghouse Savannah River Company have teamed with JBF Associates, Inc. to address risk-based robotic planning. The objective of the project is to provide systematic, risk-based relative comparisons of competing alternatives for solving clean-up problems at DOE facilities. This paper presents the methodology developed, describes the software developed to efficiently apply the methodology, and discusses the results of initial applications for DOE. The paper also addresses current work in applying the approach to problems in other industries (including an example from the hydrocarbon processing industry).

2244 (CONF-960448–13) **Hydraulically powered dissimilar teleoperated system controller design.** Jansen, J.F.; Kress, R.L. Oak Ridge National Lab., TN (United States). 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From IEEE international conference on robotics and automation; Minneapolis, MN (United States); 22-28 Apr 1996. Order Number DE96008644. Source: OSTI; NTIS; INIS; GPO Dep.

This paper will address two issues associated with the implementation of a hydraulically powered dissimilar master-slave teleoperated system. These issues are the overall system control architecture and the design of robust hydraulic servo controllers for the position control problem. Finally, a discussion of overall system performance on an actual teleoperated system will be presented.

2245 (CONF-960448–14) **Workload, flow, and telepresence during teleoperation.** Draper, J.V. (Oak Ridge National Lab., TN (United States)); Blair, L.M. Oak Ridge National Lab., TN (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From IEEE international conference on robotics and automation; Minneapolis, MN (United States); 22-28 Apr 1996. Order Number DE96008805. Source: OSTI; NTIS; INIS; GPO Dep.

There is much speculation about the relations among workload, flow, telepresence, and performance during teleoperation, but few data that provide evidence concerning them. This paper presents results an investigation conducted during completion of a pipe cutting task using a teleoperator at ORNL. Results show support for the hypothesis that telepresence is related to expenditure of attentional resources, and some support for the hypothesis that telepresence is related to flow. The discussion examines the results from an attentional resources perspective on teleoperation.

2246 (DOE/EM–0250) **Robotics Technology Crosscutting Program. Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Jun 1995. 114p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016130. Source: OSTI; NTIS; INIS; GPO Dep.

The Robotics Technology Development Program (RTDP) is a needs-driven effort. A length series of presentations and discussions at DOE sites considered critical to DOE's Environmental Restoration and Waste Management (EM) Programs resulted in a clear understanding of needed robotics applications toward resolving definitive problems at the sites. A detailed analysis of the resulting robotics needs assessment revealed several common threads running through the sites: Tank Waste Retrieval (TWR), Contaminant Analysis Automation (CAA), Mixed Waste Operations (MWO), and Decontamination and Dismantlement (D and D). The RTDP Group also realized that some of the technology development in these four areas had common (Cross Cutting-CC) needs, for example, computer control and sensor interface protocols. Further, the OTD approach to the Research, Development, Demonstration, Testing, and Evaluation (RDDT and E) process urged an additional organizational breakdown between short-term (1–3 years) and long-term (3–5 years) efforts (Advanced Technology-AT). These factors lead to the formation of the fifth application area for Crosscutting and Advanced Technology (CC and AT) development. The RTDP is thus organized around these application areas – TWR, CAA, MWO, D and D, and CC and AT – with the first four developing short-term applied robotics. An RTDP Five-Year Plan was developed for organizing the Program to meet the needs in these application areas.

2247 (DOE/MC/29104–96/C0698) **Rosie: A mobile worksystem for decontamination and dismantlement operations.** Thompson, B.R.; Conley, L. Redzone Robotics, Inc., Pittsburgh, PA (United States). [1996]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29104. (CONF-960443–8: American Nuclear Society (ANS) topical meeting on decontamination and decommissioning, Chicago, IL (United States), 14-17 Apr 1996). Order Number DE96010171. Source: OSTI; NTIS; INIS; GPO Dep.

RedZone Robotics, Inc. and Carnegie Mellon University's Field Robotics Center have undertaken a contract to develop a next-generation worksystem for decommissioning and dismantlement tasks in Department of Energy (DOE) facilities. Currently, the authors are closing the second phase of this three phase effort and have completed the design and fabrication of the worksystem: Rosie. Rosie includes a locomotor, heavy manipulator, control center, and control system for robot operation. The locomotor is an omnidirectional platform with tether management and hydraulic power capabilities. The heavy manipulator is a high-payload, long-reach system intended to deploy tools into the work area. The heavy manipulator is capable of deploying systems such as the Dual-Arm Work Module–a five degree-of-freedom platform supporting two highly dexterous manipulators–or a single manipulator for performing simpler, less dexterous tasks. Rosie is telerobotic to the point of having servo-controlled motions which can be operated and coordinated through the control center.

2248 (DOE/MC/29113–4048) **Integrated computer-enhanced remote viewing system. Quarterly report Number 5, October 1993–December 1993.** Mechanical Technology, Inc., Latham, NY (United States). 22 Feb 1994. 199p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29113. Order Number DE95011301. Source: OSTI; NTIS; GPO Dep.

The Interactive, Computer-Enhanced, Remote Viewing System (ICERVS) is a system designed to provide a reliable geometric description of a robotic task space in a fashion that enables robotic remediation to be carried out more efficiently and economically that with present systems. The key elements are a faithful way to store empirical data and a friendly user interface that provides an operator with timely access to all that is known about a scene. ICERVS will help an operator to analyze a scene and generate additional geometric data for automating significant portions of the remediation activity. Features that enable this include the following: storage and display of empirical sensor data; ability to update segments of the geometric description of the task space; side-by-side comparisons of a live TV scene and a computer generated view of the same scene; ability to create and display computer models of perceived objects in the task space, together with textual comments, and easy export of data to robotic world models for robot guidance.

2249 (DOE/MC/29115–96/CO562) **An intelligent inspection and survey robot.** Byrd, J.S. South Carolina Universities Research and Education Foundation, Clemson, SC (United States). Strom Thurman Inst. 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29115. (CONF-9510108–23: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003435. Source: OSTI; NTIS; INIS; GPO Dep.

Large quantities of mixed and low-level radioactive waste contained in 55-, 85-, and 110-gallon steel drums are stored at Department of Energy (DOE) warehouses located throughout the United States. The steel drums are placed on pallets and stacked on top of one another, forming a column of drums ranging in heights of one to four drums and up to 16 feet high. The columns of drums are aligned in rows forming an aisle approximately three feet wide between the rows of drums. Tens of thousands of drums are stored in these warehouses throughout the DOE complex. ARIES (Autonomous Robotic Inspection Experimental System), is under development for the DOE to survey and inspect these drums. The robot will navigate through the aisles and perform an inspection operation, typically performed by a human operator, making decisions about the condition of the drums and maintaining a database of pertinent information about each drum.

2250 (DOE/MC/29115–96/CO586) **Mechanical deployment system on aries an autonomous mobile robot.** Rocheleau, D.N. South Carolina Universities Research, Clemson, SC (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29115. (CONF-951258–1: 4. national applied mechanisms and robotics conference, Cincinnati, OH (United States), 10-13 Dec 1995). Order Number DE96003445. Source: OSTI; NTIS; INIS; GPO Dep.

ARIES (Autonomous Robotic Inspection Experimental System) is under development for the Department of Energy (DOE) to survey and inspect drums containing low-level radioactive waste stored in warehouses at DOE facilities. This paper focuses on the mechanical deployment system-referred to as the camera positioning system (CPS)-used in the project. The CPS is used for positioning four identical but separate camera packages consisting of vision cameras and other required sensors such as bar-code readers and light stripe projectors. The CPS is attached to the top of a mobile robot and consists of two mechanisms. The first is a lift mechanism composed of 5 interlocking rail-elements which starts from a retracted position and extends upward to simultaneously position 3 separate camera packages to inspect the top three drums of a column of four drums. The second is a parallelogram special case Grashof four-bar mechanism which is used for positioning a camera package on drums on the floor. Both mechanisms are the subject of this paper, where the lift mechanism is discussed in detail.

2251 (DOE/MC–30165-3972) **Remote Operated Vehicle with CO_2 Blasting (ROVCO$_2$). Phase 1.** Oceaneering Technologies, Upper Marlboro, MD (United States). Oct 1994. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30165. Order Number DE95000056. Distribution: UC-2060. Source: OSTI; NTIS; GPO Dep.

This report documents the first phase of the Remote Operated Vehicle with CO_2 Blasting (ROVCO$_2$) Program. The ROVCO$_2$ Program's goal is to develop and demonstrate a tool to improve the productivity of concrete floor decontamination. The first phase adapted and tested the critical subsystems; the CO_2 blasting, the workhead manipulation, the controls, and the base vehicle. The testing documented the performance of the subsystems and preformed a concept demonstration of the integrated ROVCO$_2$ system. This testing and demonstration verified that the ROVCO$_2$ development exceeded it Phase 1 success criteria.

2252 (DOE/MC/30358–4067) **Geophex Airborne Unmanned Survey System (GAUSS). Topical report, October 1993–March 1995.** Geophex Ltd., Raleigh, NC (United States). Mar 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-93MC30358. Order Number DE95009713. Source: OSTI; NTIS; GPO Dep.

The objectives of the project are to construct a geophysical sensor system based on a remotely operated model helicopter (ROH) and to evaluate the efficacy of the system for characterization of hazardous environmental sites. Geophex Airborne Unmanned Survey System (GAUSS) is a geophysical survey system that uses a ROH as the survey vehicle. We have selected the ROH because of its advantages over fixed wing and ground based vehicles. Lower air speed and superior maneuverability of the ROH make it better suited for geophysical surveys than a fixed wing model aircraft. The ROH can fly close to the ground, allowing detection of weak or subtle anomalies. Unlike ground based vehicles, the ROH can traverse difficult terrain while providing a stable sensor platform. ROH does not touch the ground during the course of a survey and is capable of functioning over water and surf zones. The ROH has been successfully used in the motion picture industry and by geology companies for payload bearing applications. The only constraint to use of the airborne system is that the ROH must remain visible to the pilot. Obstructed areas within a site can be characterized by relocating the base station to alternate positions. GAUSS consists of a ROH with radio controller, a data acquisition and processing (DAP) system, and lightweight digital sensor systems. The objective of our Phase I research was to develop a DAP and sensors suitable for ROH operation. We have constructed these subsystems and integrated them to produce an automated, hand-held geophysical surveying system, referred to as the "pre-prototype". We have performed test surveys with the pre-prototype to determine the functionality of the and DAP and sensor subsystems and their suitability for airborne application. The objective of the Phase II effort will be to modify the existing subsystems and integrate them into an airborne prototype. Efficacy of the prototype for geophysical survey of hazardous sites will then be determined.

2253 (DOE/MC/30362–96/CO620) **BOA: Pipe asbestos insulation removal robot system.** Schempf, H. (and others); Bares, J.; Schnorr, W. Carnegie-Mellon Univ., Pittsburgh, PA (United States). 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-93MC30362. (CONF-9510108–32: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003686. Source: OSTI; NTIS; INIS; GPO Dep.

The BOA system is a mobile pipe-external robotic crawler used to remotely strip and bag asbestos-containing lagging and insulation materials (ACLIM) from various diameter pipes in (primarily) industrial installations. Steam and process lines within the DOE weapons complex warrant the use of a remote device due to the high labor costs and high level of radioactive contamination, making manual removal extremely costly and highly inefficient. Currently targeted facilities for demonstration and remediation are Fernald in Ohio and Oak Ridge in Tennessee.

2254 (DOE/MC/30362–4049) **BOA: Asbestos pipe insulation removal robot system. Phase 1.** Schempf, H.; Bares, J.E. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Robotics Inst. Feb 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-93MC30362. Order Number DE95000095. Source: OSTI; NTIS; GPO Dep.

The project described in this report targets the development of a mechanized system for safe, cost-efficient and automated abatement of asbestos containing materials used as pipe insulation. Based on several key design criteria and site visits, a proof-of-concept prototype robot system, dubbed BOA, was designed and built, which automatically strips the lagging and insulation from the pipes, and encapsulates them under complete vacuum operation. The system can operate on straight runs of piping in horizontal or vertical orientations. Currently we are limited to four-inch diameter piping without obstacles as well as a somewhat laborious emplacement and removal procedure – restrictions to be alleviated through continued development. BOA removed asbestos at a rate of 4-5 ft./h compared to 3 ft./h for manual removal of asbestos with a 3-person crew. The containment and vacuum system on BOA was able to achieve the regulatory requirement for airborne fiber emissions of 0.01 fibers/ccm/8-hr. shift. This program consists of two phases. The first phase was completed and a demonstration was given to a review panel, consisting of DOE headquarters and site representatives as well as commercial abatement industry representatives. Based on the technical and programmatic recommendations drafted, presented and discussed during the review meeting, a new plan for the Phase II effort of this project was developed. Phase 11 will consist of a 26-month effort, with an up-front 4-month site-, market-, cost/benefit and regulatory study before the next BOA robot (14 months) is built, and then deployed and demonstrated (3 months) at a DOE site (such as Fernald or Oak Ridge) by the beginning of FY'97.

2255 (DOE/MC/30362–5113) **BOA: Asbestos pipe-insulation removal robot system. Phase I. Topical report, November 1993–December 1994.** Schempf, H.; Bares, J.E. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Jan 1995. 105p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AR21-93MC30362. Order Number DE96004341. Source: OSTI; NTIS; INIS; GPO Dep.

Based on several key design criteria and site visits, we developed a Robot design and built a system which automatically strips the lagging and insulation from the pipes, and encapsulates them under complete vacuum operation. The system can operate on straight runs of piping in horizontal or vertical orientations. Currently we are limited to four-inch diameter piping without obstacles as well as a somewhat laborious emplacement and removal procedure. Experimental results indicated that the current robotic abatement process is sound yet needs to be further expanded and modified. One of the main discoveries was that a longitudinal cut to fully allow the paddles to dig in and compress the insulation off the pipe is essential. Furthermore, a different cutting method might be explored to alleviate the need for a deeper cut and to enable a combination of certain functions such as compression and cutting. Unfortunately due to a damaged mechanism caused by extensive testing, we were unable to perform vertical piping abatement experiments, but foresee no trouble in implementing them in the next proposed Phase. Other encouraging results have BOA removing asbestos at a rate of 4-5 ft./h compared to 3 ft./h for manual removal of asbestos with a 3-person crew. However, we feel confident that we can double the asbestos removal rate by improving cutting speed, and increasing the length of the BOA robot. The containment and vacuum system on BOA is able to achieve the regulatory requirement for airborne fiber emissions of 0.01 fibers/ccm/8-hr. shift. Currently, BOA weighs about 117 pounds which is more than a human is permitted to lift overhead under OSHA requirements (i.e., 25 pounds). We are considering designing the robot into two components (i.e., locomotor section and cutter/removal section) to aid human installation as well as incorporating composite materials. A more detailed list of all the technical modifications is given in this topical report.

2256 (DOE/MC/30363–90/C0627) **A robotic end effector for inspection of storage tanks.** Hughes, G.; Gittleman, M. Oceaneering Space Systems, Houston, TX (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-93MC30363. (CONF-9510108–46: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96004625. Source: OSTI; NTIS; INIS; GPO Dep.

The structural integrity of waste storage tanks is of primary importance to the DOE, and is one aspect of the High-Level Waste Tank Remediation focus area. Cracks and/or corrosion damage in the inner tank walls can lead to the release of dangerous substances into the environment. The detection and sizing of corrosion and cracking in steel tank walls through remote non destructive evaluation (NDE) is the primary focus of this work.

2257 (DOE/MC–31190-96/CO630) **Environmental technology development through industry partnership.** Sebastion, R.L. Coleman Research Corp., Springfield, VA (United States). 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-94MC31190. (CONF-9510108–45: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003774. Source: OSTI; NTIS; INIS; GPO Dep.

The Coherent Laser Vision System (CLVS) is being developed to provide precision real-time 3D world views to support site characterization and robotic operations and during facilities Decontamination and Decommissioning. Autonomous or semiautonomous robotic operations requires an accurate, up-to-date 3D world view. Existing technologies for real-time 3D imaging, such as AM laser radar, have limited accuracy at significant ranges and have variability in range estimates caused by lighting or surface shading. Recent advances in fiber optic component technology and digital processing components have enabled the development of a new 3D vision system based upon a fiber optic FMCW coherent laser radar. The approach includes a compact scanner with no-moving parts capable of randomly addressing all pixels. The system maintains the immunity to lighting and surface shading conditions which is characteristic to coherent laser radar. The random pixel addressability allows concentration of scanning and processing on the active areas of a scene, as is done by the human eye-brain system. The precision measurement capability of the coherent laser radar (CLR) technology has already been demonstrated in the form of the CLR 3D Mapper, of which several copies have been delivered or are under order. The CLVS system, in contrast to the CLR 3D Mapper, will have substantially greater imaging speed with a compact no-moving parts scanner, more suitable for real-time robotic operations.

2258 (DOE/MC/32092–96/CO621) **Houdini: Reconfigurable in-tank robot.** White, D.W.; Slifko, A.D.; Thompson, B.R.; Fisher, C.G. Redzone Robotics, Inc., Pittsburgh, PA (United States). 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32092. (CONF-9510108–42: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003691. Source: OSTI; NTIS; INIS; GPO Dep.

RedZone Robotics, Inc. and Carnegie Mellon University (CMU) are developing a tethered mobile robot, Houdini, to work inside waste storage tanks in support of the Department of Energy's Environmental Restoration and Waste Management (EM) Program. This project is funded by the DOE's Environmental Management Office of Technology Development through the Morgantown Energy Technology Center (METC). Our goal is to develop technology that is useful for in-tank operations throughout the DOE's EM program. The first application of the Houdini system is to support the waste retrieval action planned for the final remediation of the Fernald site's waste silos. RedZone and CMU have discussed potential applications for the system with personnel from several other DOE sites, and have found that the system would be widely useful in the DOE complex for tasks both inside and outside of waste storage tanks. We are tailoring the first implementation of the Houdini system to the specific needs of the Fernald silo remediation. The Fernald application-specific design constraints are primarily interface issues and should not interfere with the utility of the system at other sites. In addition, DOE personnel at the Oak Ridge National Laboratories (ORNL) have expressed a strong interest in the Houdini system. They have a target application scheduled for mid-1996. This program represents a unique opportunity to develop a new technology that has immediate application in two CERCLA cleanup actions; the proposed applications at Fernald and ORNL support Federal Facility compliance agreements.

2259 (DOE/MC–92113-4016) **Interactive Computer-Enhanced Remote Viewing System (ICERVS). Phase 2.** Tourtellott, J. Mechanical Technology, Inc., Latham, NY (United States). Nov 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29113. Order Number DE95000086. Distribution: UC-2060. Source: OSTI; NTIS; GPO Dep.

This report documents the results of the Phase 2 development of ICERVS. Supporting the USDOE missions in environmental restoration, ICERVS integrates capabilities for data acquisition, data visualization, data analysis, and geometric model synthesis in a workstation-based system. The following sections trace ICERVS development from intermediate system design, prototyping of critical elements, and detailed design of seven subsystems through implementation of source code and system performance testing. As a result of Phase 2, ICERVS has demonstrated the combined capabilities of integration and display of 3D sensor data, and interactive synthesis and display of geometric shapes to model regions in 3D space. Such capabilities are essential to effective, efficient task planning, path planning, and collision avoidance in robotic remediation systems.

2260 (DOE/OR/21400–T482) **Development of a modular integrated control architecture for flexible manipulators. Final report.** Burks, B.L. (Oak Ridge National Lab., TN (United States)); Battiston, G. Oak Ridge National Lab., TN (United States). 8 Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96000762. Source: OSTI; NTIS; INIS; GPO Dep.

In April 1994, ORNL and SPAR completed the joint development of a manipulator controls architecture for flexible structure controls under a CRADA between the two organizations. The CRADA project entailed design and development of a new architecture based upon the Modular Integrated Control Architecture (MICA) previously developed by ORNL. The new architecture, dubbed MICA-II, uses an object-oriented coding philosophy to provide a highly modular and expandable architecture for robotic manipulator control. This architecture can be readily ported to control of many different manipulator systems. The controller also provides a user friendly graphical operator interface and display of many forms of data including system diagnostics. The capabilities of MICA-II were demonstrated during oscillation damping experiments using the Flexible Beam Experimental Test Bed at Hanford.

2261 (INEL–95/0090) **Functions and requirements for the INEL light duty utility arm sampler end effector.** Pace, D.P.; Barnes, G.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002372. Source: OSTI; NTIS; INIS; GPO Dep.

This sampler end effector system functions and requirements document defines the system functions that the end effector must perform as well as the requirements the design must meet. Safety, quality assurance, operations, environmental conditions, and regulatory requirements have been considered. The main purpose of this document is to provide a basis for the end effector engineering, design, and fabrication activities. The document shall be the living reference document to initiate the development activities and will be updated as system technologies are finalized.

2262 (INEL–95/0091) **Functions and requirements for the INEL light duty utility arm gripper end effector.** Pace, D.P.; Barnes, G.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002373. Source: OSTI; NTIS; INIS; GPO Dep.

This gripper end effector system functions and requirements document defines the system functions that the end effector must perform as well as the requirements the design must meet. Safety, quality assurance, operations, environmental conditions, and regulatory requirements have been considered. The main purpose of this document is to provide a basis for the end effector engineering, design, and fabrication activities. The document shall be the living reference document to initiate the development activities and will be updated as system technologies are finalized.

2263 (INEL–95/00196) **Remote technologies for buried waste retrieval.** Smith, A.M.; Rice, P. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9506184–3: Society of Women Engineers national meeting, Boston, MA (United States), 27 Jun - 1 Jul 1995). Order Number DE96001610. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE is evaluating what should be done with this buried waste. Although the radioactive waste is not particularly mobile unless airborne, some of it was buried with volatile organics and/or other substances that tend to spread easily to surrounding soil or water tables. Volatile organics are hazardous materials (such as trichloroethylene) and require clean-up at certain levels in drinking water. There is concern that the buried volatile organics will spread into the water table and contaminate drinking water. Because of this, the DOE is considering options for handling this buried waste and reducing the risks of spreading or exposure. There are two primary options: containment and stabilization, or retrieval. Containment and stabilization systems would include systems that would leave the waste where it is, but contain and stabilize it so that the radioactive and hazardous materials would not spread to the surrounding soil, water, or air. For example, an in situ vitrification system could be used to melt the waste into a composite glass-like material that would not leach into the surrounding soil, water, or air. Retrieval systems are those that would remove the waste from its burial location for treatment and/or repackaging for long term storage. The objective of this project was to develop and demonstrate remote technologies that would minimize dust generation and the spread of airborne contaminants during buried waste retrieval. Remote technologies are essential for the retrieval of buried waste because they remove workers from the hazardous environment and provide greater automation, reducing the chances of human error. Minimizing dust generation is also essential to increased safety for the workers and the environment during buried waste retrieval. The main contaminants within the waste are micron-sized particles of plutonium and americium oxides, chlorides, and hydroxides, which are easily suspended in air and spread if disturbed.

2264 (INEL–95/0231) **Cooperative Telerobotic Retrieval system Phase 1 technology evaluation report.** Hyde, R.A.; Croft, K.M. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Mar 1995. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001560. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the results from the Cooperative Telerobotic Retrieval demonstration and testing conducted at the Idaho National Engineering Laboratory during December 1994 and January 1995. The purpose of the demonstration was to ascertain the feasibility of the system for deploying tools both independently and cooperatively for supporting remote characterization and removal of buried waste in a safe manner and in compliance with all regulatory requirements. The procedures and goals of the demonstration were previously defined in the Cooperative Telerobotic Retrieval System Test Plan for Fiscal Year 1994, which served as a guideline for evaluating the system.

2265 (INEL–95/0266) **Safety plan for the cooperative telerobotic retrieval system equipment development area.** Haney, T.J.; Jessmore, J.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jul 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003547. Source: OSTI; NTIS; INIS; GPO Dep.

This plan establishes guidelines to minimize safety risks for the cooperative telerobotic retrieval project at the North Boulevard Annex (NBA). This plan has the dual purpose of minimizing safety risks to workers and visitors and of securing sensitive equipment from inadvertent damage by nonqualified personnel. This goal will be accomplished through physical control of work zones and through assigned responsibilities for project personnel. The scope of this plan is limited to establishing the working zone boundaries and entry requirements, and assigning responsibilities for project personnel. This plan does not supersede current safety organization responsibilities for the Landfill Stabilization Focus Area Transuranic (LSFA TRU) Arid outlined in the Environment, Safety, Health, and Quality Plan for the Buried Waste Integrated Demonstration Program; Tenant Manual; Idaho Falls Building Emergency Control Plan;; applicable Company Procedures; the attached Interface Agreement (Appendix A).

2266 (PNL–10757) **Structural vibration control of micro/macro-manipulator using feedforward and feedback approaches.** Lew, J.Y. (Pacific Northwest Lab., Richland, WA (United States)); Cannon, D.W.; Magee, D.P.; Book, W.J. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001341. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory (PDL) researchers investigated the combined use of two control approaches to minimize micro/macro-manipulator structural vibration: (1) modified input shaping and (2) inertial force active damping control. Modified input shaping (MIS) is used as a feedforward controller to modify reference input by canceling the vibratory motion. Inertial force active damping (IFAD) is applied as a feedback controller to increase the system damping and robustness to unexpected disturbances. Researchers implemented both control schemes in the PNL micro/macro flexible-link manipulator testbed collaborating with Georgia Institute of Technology. The experiments successfully demonstrated the effectiveness of two control approaches in reducing structural vibration. Based on the results of the experiments, the combined use of two controllers is recommended for a micro/macro manipulator to achieve the fastest response to commands while canceling disturbances from unexpected forces.

2267 (PNL-SA–26161) **Micro-manipulator motion control to suppress macro-manipulator structural vibrations.** Lew, J.Y.; Trudnowski, D.J.; Evans, M.S.; Bennett, D.W. Pacific Northwest Lab., Richland, WA (United States). May 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505193–5: 1995 international conference on robotics and automation, Nagoya (Japan), 21-27 May 1995). Order Number DE95014614. Source: OSTI; NTIS; GPO Dep.

The feasibility of several pyrochemical approaches for separating non-radioactive constituents from ICPP BLW calcine were examined. The removal of aluminum as $AlCl_3$ from aluminia calcine was successfully demonstrated. The examination of pyrochemical processes to remove non-radioactive constituents, primarily aluminium, zirconium, calcium and fluorine, from zirconia calcine showed that fluorine removal was required inorder to chlorinate the calcine. A molten calcium chloride wash, a calcium reduction, and a sulfuric acid treatment were examined as possible zirconia calcine pretreatment options for fluorine removal. Fluorine removal from simulated ICPP zirconia calcine was demonstrated by both a $CaCl_2$ wash method and a sulfuric acid treatment method. X-ray fluorescence analysis indicated that greater than 97% of the fluorine can be removed by either method. Fluorine removal by a calcium reduction using an alloying agent, zinc, or a calcium reduction using a filtration separation were also demonstrated, but the efficiencies of fluorine removal were considerably less ranging from 50 to 90%.

2268 (SAND–94-3267) **Performance benefits of telerobotics and teleoperation - enhancements for an arm-based tank waste retrieval system.** Horschel, D.S. (Sandia National Labs., Albuquerque, NM (United States)); Gibbons, P.W.; Draper, J.V. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013912. Distribution: UC-2030. Source: OSTI; NTIS; INIS; GPO Dep.

This report evaluates telerobotic and teleoperational arm-based retrieval systems that require advanced robotic controls. These systems will be deployed in waste retrieval activities in Hanford's Single Shell Tanks (SSTs). The report assumes that arm-based, retrieval systems will combine a teleoperational arm and control system enhanced by a number of advanced and telerobotic controls. The report describes many possible enhancements, spanning the full range of the control spectrum with the potential for technical maturation. The enhancements considered present a variety of choices and factors including: the enhancements to be included in the actual control system, safety, detailed task analyses, human factors, cost-benefit ratios, and availability and maturity of technology. Because the actual system will be designed by an offsite vendor, the procurement specifications must have the flexibility to allow bidders to propose a broad range of ideas, yet build in enough restrictions to filter out infeasible and undesirable approaches. At the same time they must allow selection of a technically promising proposal. Based on a preliminary analysis of the waste retrieval task, and considering factors such as operator limitations and the current state of robotics technology, the authors recommend a set of enhancements that will (1) allow the system to complete its waste retrieval mission, and (2) enable future upgrades in response to changing mission needs and technological advances.

2269 (SAND–95-0849C) **Motion planning for multiple moving objects.** Hwang, Y.K. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract

AC04-94AL85000. (CONF-9508119–1: 1. international symposium on assembly and task planning, Pittsburgh, PA (United States), 10-11 Aug 1995). Order Number DE95011888. Source: OSTI; NTIS; GPO Dep.

We present a motion planner for multiple moving objects in two dimensions. The search for collision-free paths is performed in the composite configuration space of all the moving objects to guarantee a solution, and the efficiency of our planner is demonstrated with examples. Our motion planner can be characterized with a hierarchical, multi-resolution search of the configuration space along with a generate-and-test paradigm for solution paths. Because of the high dimensionality of the composite configuration space, our planner is most useful for cases with a small number of moving objects. Some of the potential applications are navigation of several mobile robots, and planning part motions for a multi-handed assembly operation.

2270 (SAND–95-2196C) **Trajectory generation for two robots cooperating to perform a task.** Lewis, C.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960448–4: IEEE international conference on robotics and automation, Minneapolis, MN (United States), 22-28 Apr 1996). Order Number DE96001725. Source: OSTI; NTIS; INIS; GPO Dep.

This paper formulates an algorithm for trajectory generation for two robots cooperating to perform an assembly task. Treating the two robots as a single redundant system, this paper derives two Jacobian matrices which relate the joint rates of the entire system to the relative motion of the grippers with respect to one another. The advantage of this formulation over existing methods is that a variety of secondary criteria can be conveniently satisfied using motion in the null-space of the relative Jacobian. This paper presents methods for generating dual-arm joint trajectories which perform assembly tasks while at the same time avoiding obstacles and joint limits, and also maintaining constraints on the absolute position and orientation of the end-effectors.

2271 (SAND–95-2393) **View graph presentations of the sixth DOE industry/university/lab forum on robotics for environmental restoration and waste management.** Sandia National Labs., Albuquerque, NM (United States). Oct 1995. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9508189--Summ.: 6. DOE industry/university/lab forum on robotics for environmental restoration and waste management, Albuquerque, NM (United States), 16-17 Aug 1995). Order Number DE96002342. Distribution: UC-2060. Source: OSTI; NTIS; INIS; GPO Dep.

Contains vugraphs.

The mission of the Robotics Technology Development Program involves the following: develop robotic systems where justified by safety, cost, and/or efficiency arguments; integrate the best talent from National Labs, industry, and universities in focused teams addressing complex-wide problems; and involve customers in the identification and development of needs driven technologies. This presentation focuses on five areas. They are: radioactive tank waste remediation (Richland); mixed waste characterization, treatment, and disposal (Idaho Falls); decontamination and decommissioning (Morgantown); landfill stabilization (Savannah River); and contaminant plumes containment and remediation (Savannah River).

2272 (SAND–96-0485C) **System design for safe robotic handling of nuclear materials.** Drotning, W.; Wapman, W.; Fahrenholtz, J.; Kimberly, H.; Kuhlmann, J. Sandia National Labs., Albuquerque, NM (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9606123–1: Robotics for challenging environments, Albuquerque, NM (United States), 1-6 Jun 1996). Order Number DE96006399. Source: OSTI; NTIS; INIS; GPO Dep.

Robotic systems are being developed by the Intelligent Systems and Robotics Center at Sandia National Laboratories to perform automated handling tasks with radioactive nuclear materials. These systems will reduce the occupational radiation exposure to workers by automating operations which are currently performed manually. Because the robotic systems will handle material that is both hazardous and valuable, the safety of the operations is of utmost importance; assurance must be given that personnel will not be harmed and that the materials and environment will be protected. These safety requirements are met by designing safety features into the system using a layered approach. Several levels of mechanical, electrical and software safety prevent unsafe conditions from generating a hazard, and bring the system to a safe state should an unexpected situation arise. The system safety features include the use of industrial robot standards, commercial robot systems, commercial and custom tooling, mechanical safety interlocks, advanced sensor systems, control and configuration checks, and redundant control schemes. The effectiveness of the safety features in satisfying the safety requirements is verified using a Failure Modes and Effects Analysis. This technique can point out areas of weakness in the safety design as well as areas where unnecessary redundancy may reduce the system reliability.

2273 (SAND–96-0521) **System analysis: Developing tools for the future.** De Jong, K.; clever, J.; Draper, J.V.; Davies, B.; Lonks, A. Sandia National Labs., Albuquerque, NM (United States). Feb 1996. 154p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96008356. Source: OSTI; NTIS; GPO Dep.

This report introduces and evaluates system analysis tools that were developed, or are under development, for the Robotics Technology Development Program (RTDP). Additionally, it discusses system analysis work completed using these tools aimed at completing a system analysis of the retrieval of waste from underground storage tanks on the Hanford Reservation near Richland, Washington. The tools developed and evaluated include a mixture of commercially available tools adapted to RTDP requirements, and some tools developed in house. The tools that are included in this report include: a Process Diagramming Tool, a Cost Modeling Tool, an Amortization Modeling Tool, a graphical simulation linked to the Cost Modeling Tool, a decision assistance tool, and a system thinking tool. Additionally, the importance of performance testing to the RTDP and the results of such testing executed is discussed. Further, the results of the Tank Waste Retrieval (TWR) System Diagram, the TWR Operations Cost Model, and the TWR Amortization Model are presented, and the implication of the results are discussed. Finally, the RTDP system analysis tools are assessed and some recommendations are made regarding continuing development of the tools and process.

2274 (SAND–96-0881C) **Rapid world modelling for robotics.** Littile, C.Q. (Sandia National Labs., Albuquerque, NM (United States)); Wilson, C.W. Sandia National Labs., Albuquerque, NM (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9603143–1: International symposium on robotics and manufacturing (ISRM), Montpellier (France), 27-30 Mar 1996). Order Number DE96008906. Source: OSTI; NTIS; INIS; GPO Dep.

The ability to use an interactive world model, whether it is for robotics simulation or most other virtual graphical environments, relies on the users ability to create an accurate world model. Typically this is a tedious process, requiring many hours to create 3-D CAD models of the surfaces within a workspace. The goal of this ongoing project is to develop usable methods to rapidly build world models of real world workspaces. This brings structure to an unstructured environment and allows graphical based robotics control to be accomplished in a reasonable time frame when traditional CAD modelling is not enough. To accomplish this, 3D range sensors are deployed to capture surface data within the workspace. This data is then transformed into surface maps, or models. A 3D world model of the workspace is built quickly and accurately, without ever having to put people in the environment.

2275 (UCRL-JC–118897) **Automated system for handling tritiated mixed waste.** Dennison, D.K.; Merrill, R.D.; Reitz, T.C. Lawrence Livermore National Lab., CA (United States). Mar 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950877–7: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95011842. Source: OSTI; NTIS; INIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) is developing a semi system for handling, characterizing, processing, sorting, and repackaging hazardous wastes containing tritium. The system combines an IBM-developed gantry robot with a special glove box enclosure designed to protect operators and minimize the potential release of tritium to the atmosphere. All hazardous waste handling and processing will be performed remotely, using the robot in a teleoperational mode for one-of-a-kind functions and in an autonomous mode for repetitive operations. Initially, this system will be used in conjunction with a portable gas system designed to capture any gaseous-phase tritium released into the glove box. This paper presents the objectives of this development program, provides background related to LLNL's robotics and waste handling program, describes the major system components, outlines system operation, and discusses current status and plans.

2276 (WHC-SA–2924) **Remote controlled tool systems for nuclear sites have subsea applications.** Bath, B. (Sonsub Environmental Services, Houston, TX (United States)); Yemington, C.; Kuhta, B. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9501119–1: Underwater intervention conference, New Orleans, LA (United States), 5-7 Jan 1995). Order Number DE96005188. Source: OSTI; NTIS; INIS; GPO Dep.

Remotely operated underwater tool systems designed to operate in Nuclear Fuel Storage Basins can be applied to deep water, subsea oilfield applications. Spent nuclear fuel rods re stored underwater in large indoor swimming pool-like facilities where the water cover shields the workers from the radiation. This paper describes three specialized tooling systems that were designed and built by Sonsub for work at the Department of Energy's Hanford site. The Door Seal Tool removed an existing seal system, cleaned a 20 ft. tall, carbon steel, underwater hatch and installed a new stainless steel gasket surface with underwater epoxy. The Concrete Sampling Tool was built to take core samples from the vertical, concrete walls of the basins. The tool has three hydraulic drills with proprietary hollow core drill bits to cut and retrieve the concrete samples. The Rack Saw remotely attached itself to a structure, cut a variety of steel shapes and pipes, and retained the cut pieces for retrieval. All of these systems are remotely operated with onboard video cameras and debris collection systems. The methods and equipment proven in this application are available to refurbish sealing surfaces and to drill or sample concrete in offshore oil field applications.

2277 (WHC-SA–2974-FP) **Radiation exposure modeling and project schedule visualization.** Jaquish, W.R. (ICF Kaiser Hanford Co., Richland, WA (United States)); Enderlin, V.R. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9510206–3: Deneb Robotics' user group conference and exhibition, Ypsilanti, MI (United States), 9-13 Oct 1995). Order Number DE96004830. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses two applications using IGRIP (Interactive Graphical Robot Instruction Program) to assist environmental remediation efforts at the Department of Energy (DOE) Hanford Site. In the first application, IGRIP is used to calculate the estimated radiation exposure to workers conducting tasks in radiation environments. In the second, IGRIP is used as a configuration management tool to detect interferences between equipment and personnel work areas for multiple projects occurring simultaneously in one area. Both of these applications have the capability to reduce environmental remediation costs by reducing personnel radiation exposure and by providing a method to effectively manage multiple projects in a single facility.

2278 (WSRC-MS–95-0271) **SWAMI, Stored Waste Autonomous Mobile Inspector.** McCarthy, K. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9507186–2: Meeting of the Korea Atomic Energy Research Institute, Taejon (Korea, Republic of), 16-22 Jul 1995). 2280 (ANL–94/41) **Analytical electron microscopy characterization of Fernald soils. Annual report, October 1993–September 1994.** Buck, E.C.; Brown, N.R.; Dietz, N.L. Argonne National Lab., IL (United States). Mar 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95010856. Source: OSTI; NTIS; INIS; GPO Dep.

A combination of backscattered electron imaging and analytical electron microscopy (AEM) with electron diffraction have been used to determine the physical and chemical properties of uranium contamination in soils from the Fernald Environmental Management Project in Ohio. The information gained from these studies has been used in the development and testing of remediation technologies. Most chemical washing techniques have been reasonably effective with uranyl [U(VI)] phases, but U(IV) phases have proven difficult to remove from the soils. Carbonate leaching in an oxygen environment (heap leaching) has removed some of the U(IV) phases, and it appears to be the most effective technique developed in the program. The uranium metaphosphate, which was found exclusively at an incinerator site, has not been removed by any of the chemical methods. We suggest that a physical extraction procedure (either a magnetic separation or aqueous biphasic process) be used to remove this phase. Analytical electron microscopy has also been used to determine the effect of the chemical agents on the uranium phases. It has also been used to examine soils from the Portsmouth site in Ohio. The contamination there took the form of uranium oxide and uranium calcium oxide phases. Technology transfer efforts over FY 1994 have led to industry-sponsored projects involving soil characterization.

2281 (ANL/ACL–94/2) **The determination of PCBs in Rocky Flats Type IV waste sludge by gas chromatography/electron capture detection. Part 2.** Parish, K.J.; Applegate, D.V.; Postlethwait, P.D.; Boparai, A.S.; Reedy, G.T. Argonne National Lab., IL (United States). Dec 1994. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015692. Source: OSTI; NTIS; INIS; GPO Dep.

Before disposal, radioactive sludge (Type IV) from Rocky Flats Plant (RFP) must be evaluated for polychlorinated biphenyl (PCB) content. The Type IV sludge consists of organic solvents, degreasers, cutting oils, and transuranic (TRU) waste mixed with calcium silicate (MicroCel E® and Oil Dri® to form a grease or paste-like material. For laboratory testing, a nonradioactive simulated Type 17V RFP sludge was prepared at Argonne National Laboratory-East (ANL-E). This sludge has a composition similar to that expected from field samples. In an earlier effort, a simplified method was developed for extraction, cleanup of extract, and determination of PCBs in samples of simulated sludge spiked with Aroclors 1254 and 1260. The simplified method has now been used to determine the presence and quantities of other Aroclors in the simulated sludge, namely, Aroclors 10 1 6, 1221, 1232, 1242, and 1248. The accuracy and precision of the data for these Aroclors were found to be similar to the data for sludges spiked with Aroclors 1254 and 1260. Since actual sludges may vary in composition, the method was also verified by analyzing another source of Type IV simulated sludge, prepared by Argonne National Laboratory-West (ANL-W).

2282 (ANL/ACL–94/3) **Determination of the toxicity characteristic for metals in soil: A comparison of the toxicity characteristic leaching procedure and total metal determination.** Bass, D.A.; Taylor, J.D. Argonne National Lab., IL (United States). Dec 1994. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013359. Source: OSTI; NTIS; GPO Dep.

A comparison is made of the concentrations of metals extracted from soils using the Toxicity Characteristic Leaching Procedure (TCLP) and a total determination method. This information is of interest in two ways. First, it is hoped that a relationship might be established between the amount of each metal determined after extraction by the TCLP and the amount determined using a total determination method. And second, data are also presented which indicate the general extractability of various metals in soil samples using the TCLP. This study looks specifically at inorganic elements (Sb, As, Ba, Cd, Cu, Cr, Pb, Mg, Hg, Se, Ag, Sn, and Zn) in soils from a firing range. Results show that total determination methods for metals can not generally be used for heterogeneous samples, such as soil samples from a firing range. Some correlation between a total determination method and TCLP was observed when Ba and Cd were present in the samples at lower concentrations (less than 80 mg/kg for Ba and less than 25 mg/kg for Cd); however, additional data are necessary to verify this correlation.

2283 (ANL/ACL–95/3) **Waste minimization through high-pressure microwave digestion of soils for gross α/β analyses.** Yaeger, J.S.; Smith, L.L. Argonne National Lab., IL (United States). Apr 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017580. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of the U.S. Department of Energy's (DOE) environmental restoration and waste management activities, laboratories receive numerous analytical requests for gross α/β analyses. Traditional sample preparation methods for gross α/β analysis of environmental and mixed waste samples require repetitive leaching, which is time consuming and generates large volumes of secondary wastes. An alternative to leaching is microwave digestion. In the past. microwave technology has had limited application in the radiochemical laboratory because of restrictions on sample size resulting from vessel pressure limitations. However, new microwave vessel designs allow for pressures on the order of 11 MPa (1500 psi). A procedure is described in which microwave digestion is used to prepare environmental soil samples for gross α/β analysis. Results indicate that the described procedure meets performance requirements for several soil types and is equivalent to traditional digestion techniques. No statistical differences at the 95% confidence interval exist between the measurement on samples prepared from the hot plate and microwave digestion procedures for those soils tested. Moreover, microwave digestion allows samples to be prepared in a fraction of the time with significantly less acid and with lower potential of cross-contamination. In comparison to the traditional hot plate method, the waste volumes required for the microwave procedure are a factor of 10 lower, while the analyst time for sample processing is at least a factor of three lower.

2284 (ANL/CMT-ACL/CP–86742) **Application of Empore™ disk technology to environmental radiochemical analysis.** Smith, L.L. (Argonne National Lab., IL (United States)); Orlandini, K.A.; Alvarado, J.S.; Hoffmann, K.M.; Seely, D.C.; Shannon, R.T. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9511133–3: 41. annual conference on bioassay, analytical and environmental radiochemistry, Boston, MA (United States), 12-16 Nov 1995). Order Number DE96004657. Source: OSTI; NTIS; INIS; GPO Dep.

The costs associated with environmental restoration and waste management at both government and private facilities are burdensome, and continue to grow. The Department of Energy estimates that over one million samples, many containing radioactive components, will be analyzed per annum to support remediation programs at its 4000 sites. The development and implementation of new analytical technologies can significantly reduce the high costs associated with these programs. Disk solid-phase extraction technology has been proven to be highly effective for sample preparation in the analysis of organic compounds, waste waters, and other aqueous samples. Disk technology significantly improves sample throughput, while reducing secondary waste and costs. Moreover, many of the hazardous chemicals associated with traditional procedures are eliminated. This technology may be readily automated and lends itself to field applications. Through a Cooperative Research and Development Agreement, the 3M Company and Argonne National Laboratory are expanding this technology to address sample preparation and recovery of radionuclides from aqueous samples, i.e., surface, ground, and drinking waters. Disks have been developed which demonstrate high selectivity and great affinity for important radionuclides, including ^{99}Tc, $^{89/90}$Sr, and $^{226/228}$Ra.

2285 (ANL/CMT-ACL/VU–84890) **Determination of naturally-occurring actinides and their progeny in fresh water using inductively coupled plasma-mass spectrometry and batch separation.** Crain, J.S. (Argonne National Lab., IL (United States)); Yaeger, J.S.; Alvarado, J.A.; Smith, L.L.; Kiely, J.T.; Smith, F.G. Argonne National Lab., IL (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950402–9-Vugraphs: 209. American Chemical Society (ACS) national meeting, Anaheim, CA (United States), 2-6 Apr 1995). Order Number DE95011822. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this report is to show the use of ICP-MS in combination with appropriate preparative techniques for the determination of actinide elements in the environment. It examines and identifies the sample introduction and preparation techniques necessary to achieve required detection limits and mitigate interferences. This volume contains a set of viewgraphs.

2286 (ANL/CMT-ACL/VU–87803) **Actinides at the crossroads: ICP-MS or alpha spectrometry?.** Crain, J.S.; Yaeger, J.S.; Smith, F.P.; Alvarado, J.A.; Smith, L.L.; Kiely, J.T.; Graczyk, D.G. Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9511102–1-Vugraphs: 4. annual meeting of the Coucil on Ionising Radiation Measurements and Standards: advanced techniques in ionising radiation measurements, Gaithersburg, MD (United States), 28-30 Nov 1995). Order Number DE96004175. Source: OSTI; NTIS; INIS; GPO Dep.

The report contains viewgraphs only that summarize the following: Why turn to mass spectrometry for radiochemical measurements; What might be some advantages of using ICP mass spectrometry; Sensitivity of ETV-ICP-MS relative to decay counting (versus half-life); ICP-MS instrument detection limits for dissolved actinide isotopes; Effect of dissolved solids on USN-ICP-MS analysis; Polyatomic ion interferences in ICP-MS actinide measurements; Effect of operating conditions on uranium and protonated uranium signal; ICP mass spectrometry performance in actinide determinations; Determination of actinide elements in soil; Leachable Th-230 and Pu-239 in soil as determined by ICP-MS and alpha spectrometry; Leachable U-234 and U-238 in soil by ICP-MS and alpha spectrometry; Determination of uranium isotopic composition on smears; Activity ratios (U-234/U-238) as determined by mass spectrometry and alpha spectrometry; Uranium isotopic abundances as determined by TIMS and ICP-MS; and Comparison of uranium atom percentages determined by TIMS and ICP-MS. It is concluded that isotope dilution and radiochemical preparative techniques work well in radioanalytical applications of ICP-MS; radioanalytical ICP-MS data are equivalent to data from standard methods (TIMS, alpha spectrometry); and applications in radiation protection and earth sciences are certain to expand further.

2287 (ANL/CMT/CP–86433) **Developing innovative environmental technologies for DOE needs.** Devgun, J.S. (Argonne National Lab., IL (United States)); Sewell, I.O.; DeGregory, J. Argonne National Lab., IL (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950729–7: 30. Intersociety energy conversion conference, Orlando, FL (United States), 30 Jul - 5 Aug 1995). Order Number DE95014242. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental restoration and waste management activities at US Department of Energy (DOE) facilities are diverse and complex. Contamination at DOE sites and facilities includes radionuclides, chlorinated hydrocarbons, volatile organic compounds, non-aqueous phase liquids, and heavy metals, among others. Soil and groundwater contamination are major areas of concern and DOE has focused very significant efforts in these areas. Relevant technology development activities are being conducted at DOE's own national laboratories, as well as through collaborative efforts with other federal agencies and the private sector. These activities span research and development (R&D) of new concepts and techniques to demonstration and commercialization of mature technologies. Since 1990, DOE has also supported R&D of innovative technologies through interagency agreements with US Environmental Protection Agency (EPA), US Department of Defense, the National Science Foundation, and others.

2288 (ANL/EA/CP–84904) **Sensitivities to source-term parameters of emergency planning zone boundaries for waste management facilities.** Mueller, C.J. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950430–8: 5. ANS topical meeting on emergency preparedness and response, Savannah, GA (United States), 18-21 Apr 1995). Order Number DE95013683. Source: OSTI; NTIS; INIS; GPO Dep.

This paper reviews the key parameters comprising airborne radiological and chemical release source terms, discusses the ranges over which values of these parameters occur for plausible but severe waste management facility accidents, and relates the concomitant sensitivities of emergency planning zone boundaries predicted on calculated distances to early severe health effects.

2289 (ANL/EA/CP–86614) **Applying RESRAD-CHEM for chemical risk assessment.** Cheng, J.J. (Argonne National Lab., IL (United States). Environmental Assessment Div.); Yu, C. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9506222–2: MACPAC 95: Mid-America Chinese Professional annual convention, Itasca, IL (United States), 23-25 Jun 1995). Order Number DE95013740. Source: OSTI; NTIS; INIS; GPO Dep.

RESRAD-CHEM is a multiple pathway analysis computer code to evaluate chemically contaminated sites; it was developed at Argonne National Laboratory for the US Department of Energy. The code is designed to predict human health risks from exposure to hazardous chemicals and to derive cleanup criteria for chemically contaminated soils. It consists of environmental fate and transport models and is capable of predicting chemical concentrations over time in different environmental media. The methodology used in RESRAD-CHEM for exposure assessment and risk characterization follows the US Environmental Protection Agency's guidance on Human Health Evaluation for Superfund. A user-friendly interface is incorporated for entering data, operating the code, and displaying results. RESRAD-CHEM is easy to use and is a powerful tool to assess chemical risk from environmental exposure.

2290 (ANL/EA/CP–88577) **Efficient data exchange: Integrating a vector GIS with an object-oriented, 3-D visualization system.** Kuiper, J. (Argonne National Lab., IL (United States)); Ayers, A.; Johnson, R.; Tolbert-Smith, M. Argonne National Lab., IL (United States). [1996]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960164–2: 3. international conference/workshop on integrating GIS and environmental modeling, Santa Fe, NM (United States), 21-25 Jan 1996). Order Number DE96006755. Source: OSTI; NTIS; INIS; GPO Dep.

A common problem encountered in Geographic Information System (GIS) modeling is the exchange of data between different software packages to best utilize the unique features of each package. This paper describes a project to integrate two systems through efficient data exchange. The first is a widely used GIS based on a relational data model. This system has a broad set of data input, processing, and output capabilities, but lacks three-dimensional (3-D) visualization and certain modeling functions. The second system is a specialized object-oriented package designed for 3-D visualization and modeling. Although this second system is useful for subsurface modeling and hazardous waste site characterization, it does not provide many of the, capabilities of a complete GIS. The system-integration project resulted in an easy-to-use program to transfer information between the systems, making many of the more complex conversion issues transparent to the user. The strengths of both systems are accessible, allowing the scientist more time to focus on analysis. This paper details the capabilities of the two systems, explains the technical issues associated with data exchange and how they were solved, and outlines an example analysis project that used the integrated systems.

2291 (ANL/EMO/CP–86349) **Action-oriented characterization at Argonne National Laboratory.** Moos, L.P.; Swale, R.E. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505101–3: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE95013444. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory-East and the US Department of Energy have initiated a voluntary corrective action strategy to characterize and clean up some of the on-site solid waste management units that are subject to the Resource Conservation and Recovery Act Corrective Action process. This strategy is designed for the current atmosphere of reduced funding levels and, increased demands for cleanup actions. A focused characterization program is used to identify and roughly delineate the areas of greatest risk, relying as much as possible on existing data about the site; then, removal or interim remedial actions are implemented, where appropriate. Two interim cleanup operations were completed in 1994. Two additional interim actions are planned for 1995.

Future actions may include decontamination operations, soil remediation, and construction of containment barriers.

2292 (ANL/ER/CP--84542) **Argonne's Expedited Site Characterization: An integrated approach to cost- and time-effective remedial investigation.** Burton, J.C.; Walker, J.L.; Aggarwal, P.K.; Meyer, W.T. Argonne National Lab., IL (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States);Department of Agriculture, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950646--26: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95013717. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory has developed a methodology for remedial site investigation that has proven to be both technically superior to and more cost- and time-effective than traditional methods. This methodology is referred to as the Argonne Expedited Site Characterization (ESC). Quality is the driving force within the process. The Argonne ESC process is abbreviated only in time and cost and never in terms of quality. More usable data are produced with the Argonne ESC process than with traditional site characterization methods that are based on statistical-grid sampling and multiple monitoring wells. This paper given an overview of the Argonne ESC process and compares it with traditional methods for site characterization. Two examples of implementation of the Argonne ESC process are discussed to illustrate the effectiveness of the process in CERCLA (Comprehensive Environmental Response, Compensation, and Liability Act) and RCRA (Resource Conservation and Recovery Act) programs.

2293 (ANL/ER/CP--85995) **The greening of PCB analytical methods.** Erickson, M.D. (and others); Alvarado, J.S.; Aldstadt, J.H. Argonne National Lab., IL (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9508190--1: PCB seminar, Boston, MA (United States), 29-31 Aug 1995). Order Number DE96002694. Source: OSTI; NTIS; GPO Dep.

Green chemistry incorporates waste minimization, pollution prevention and solvent substitution. The primary focus of green chemistry over the past decade has been within the chemical industry; adoption by routine environmental laboratories has been slow because regulatory standard methods must be followed. A related paradigm, microscale chemistry has gained acceptance in undergraduate teaching laboratories, but has not been broadly applied to routine environmental analytical chemistry. We are developing green and microscale techniques for routine polychlorinated biphenyl (PCB) analyses as an example of the overall potential within the environmental analytical community. Initial work has focused on adaptation of commonly used routine EPA methods for soils and oils. Results of our method development and validation demonstrate that: (1) Solvent substitution can achieve comparable results and eliminate environmentally less-desirable solvents, (2) Microscale extractions can cut the scale of the analysis by at least a factor of ten, (3) We can better match the amount of sample used with the amount needed for the GC determination step, (4) The volume of waste generated can be cut by at least a factor of ten, and (5) Costs are reduced significantly in apparatus, reagent consumption, and labor.

2294 (ANL/ER/CP--87350) **Improved radioanalytical methods.** Erickson, M.D.; Aldstadt, J.H.; Alvarado, J.S.; Crain, J.S.; Orlandini, K.A.; Smith, L.L. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950868--42: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96006641. Source: OSTI; NTIS; INIS; GPO Dep.

Methods for the chemical characterization of the environment are being developed under a multitask project for the Analytical Services Division (EM-263) within the US Department of Energy (DOE) Office of Environmental Management. This project focuses on improvement of radioanalytical methods with an emphasis on faster and cheaper routine methods. We have developed improved methods, for separation of environmental levels of technetium-99 and strontium-89/90, radium, and actinides from soil and water; and for separation of actinides from soil and water matrix interferences. Among the novel separation techniques being used are element- and class-specific resins and membranes. (The 3M Corporation is commercializing Empore ™ membranes under a cooperative research and development agreement [CRADA] initiated under this project). We have also developed methods for simultaneous detection of multiple isotopes using inductively coupled plasma-mass spectrometry (ICP-MS). The ICP-MS method requires less rigorous chemical separations than traditional radiochemical analyses because of its mass-selective mode of detection. Actinides and their progeny have been isolated and concentrated from a variety of natural water matrices by using automated batch separation incorporating selective resins prior to ICP-MS analyses. In addition, improvements in detection limits, sample volume, and time of analysis were obtained by using other sample introduction techniques, such as ultrasonic nebulization and electrothermal vaporization. Integration and automation of the separation methods with the ICP-MS methodology by using flow injection analysis is underway, with an objective of automating methods to achieve more reproducible results, reduce labor costs, cut analysis time, and minimize secondary waste generation through miniaturization of the process.

2295 (ANL/ER/CP--89080) **Pollution prevention in the analytical laboratory--Microscale and other techniques do add up.** Erickson, M.D.; Alvarado, J.S.; Lu, C.-S.; Peterson, D.P.; Silzer, J. Argonne National Lab., IL (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960741--5: Pollution prevention conference, Chicago, IL (United States), 9-11 Jul 1996). Order Number DE96012689. Source: OSTI; NTIS; INIS; GPO Dep.

The principles of pollution prevention in the analytical laboratory have not been addressed sufficiently. Although the amount of reagent used per sample is often only a few milliliters, the aggregate of many routine test each day in thousands of laboratories becomes significant. Current recycling practices are not practical with small streams. Therefore, we have adopted the principles of microscale chemistry, along with other modern analytical approaches, to develop routine analytical methods that significantly curtail waste but still maintain acceptable analytical figures of merit and achieve cost savings through reduced reagent consumption and reduced labor cost.

2296 (ANL/ES/CP--86380) **Advances in the development of FTIR continuous emission monitor for incinerators.** Mao, Zhouxiong; Demirgian, J.C.; Hwang, E. Argonne National Lab., IL (United States). [1995]. 14p.

Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950542–3: 14. international symposium on thermal treatment technologies: incineration conference, Seattle, WA (United States), 8-12 May 1995). Order Number DE95013445. Source: OSTI; NTIS; GPO Dep.

The integrated, transportable FTIR-CEM was successfully tested from September 13 to 21, 1994, at the K-25 TSCA incinerator, in Oak Ridge, Tennessee. the field test followed the requirements of a procedure, which was submitted to the EPA for approval. The test results met all the requirement listed in the proposed procedure. Extensive spiking tests were conducted during the field test. The FTIR-CEM quantitatively detected all spiked analytes measured the stack emission variation during the ignition period of the incinerator. For the stack samples obtained under normal incineration conditions, no target analytes were detected at concentrations above the instrument detection limits, except for methane, which was occasionally detected at 4-5 ppM. Future work will involve making the master control software more robust to use, improving the accuracy of the analytical methods, and testing system effectiveness for various emission sources. A commercial version of the system is currently being developed.

2297 (ANL/ES/PP–80277) **Development of an ultrasonic process for soil remediation.** Wu, J.M.; Huang, H.S.; Livengood, C.D. Argonne National Lab., IL (United States). [1995]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95012208. Source: OSTI; NTIS; INIS; GPO Dep.

An ultrasonic process for the detoxification of carbon tetrachloride- (CCl_4^-) contaminated soil was investigated in the laboratory by using a batch irradiation reactor equipped with a 600-W ultrasonic power supply operated at a frequency of 20 kHz. Key parameters studied included soil characteristics, irradiation time, CCl_4 concentration, steady-state operating temperature, applied ultrasonic-wave energy, and the ratio of soil to water in the system. The results of the experiments showed that (1) residual CCl_4 concentrations could be decreased with longer irradiation periods and (2) detoxification efficiency was proportional to steady-state operating temperature and applied ultrasonic-wave energy. The characteristics of the contaminated soil were found to be an important factor in the design of an ultrasonic detoxification system. A soil-phase CCl_4 concentration below 1 ppm (initial concentration of 56 ppm) was achieved through this process, indicating that the application of ultrasonic irradiation is feasible and effective in the detoxification of soil contaminated by organic compounds. On the basis of the experimental results, a schematic of a full-scale ultrasonic soil-detoxification system was developed. Improvements to this novel process are discussed.

2298 (BHI–00162) **Sampling and analysis plan for the characterization of eight drums at the 200-BP-5 pump-and-treat systems.** Laws, J.R. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005052. Source: OSTI; NTIS; INIS; GPO Dep.

Samples will be collected and analyzed to provide sufficient information for characterization of mercury and aluminum contamination in drums from the final rinse of the tanks in the two pump-and-treat systems supporting the 200-BP-5 Operable Unit. The data will be used to determine the type of contamination in the drums to properly designate the waste for disposal or treatment. This sampling plan does not substitute the sampling requirements but is a separate sampling event to manage eight drums containing waste generated during an unanticipated contamination of the process water with mercury and aluminum nitrate nonahydrate (ANN). The Toxicity Characteristic Leaching Procedure (TCLP) will be used for extraction, and standard US Environmental Protection Agency (EPA) methods will be used for analysis.

2299 (BHI–00196-Rev.1) **Strategy paper. Remedial design/remedial action 100 Area. Revision 1.** Donahoe, R.L. Bechtel National, Inc., Richland, WA (United States). Jul 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005875. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this planning document is to identify and define the approach for remedial design and remedial action (RD/RA) in the 100 Area of the Hanford Site, located in southeastern Washington State. Additionally, this document will support the Hanford Site Environmental Restoration Contract (ERC) team, the US Department of Energy (DOE), and regulatory agencies in identifying and agreeing upon the complete process for expedited cleanup of the 100 Area.

2300 (BHI–00196-Rev.2) **Strategy paper. Remedial design/remedial action 100 Area. Revision 2.** Donahoe, R.L. Bechtel National, Inc., Richland, WA (United States). Oct 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005874. Source: OSTI; NTIS; INIS; GPO Dep.

This strategy paper identifies and defines the approach for remedial design and remedial action (RD/RA) for source waste sites in the 100 Area of the Hanford Site, located in southeastern Washington State. This paper provides the basis for the US Department of Energy (DOE) to assess and approve the Environmental Restoration Contractor's (ERC) approach to RD/RA. Additionally, DOE is requesting review/agreement from the US Environmental Protection Agency (EPA) and Washington State Department of Ecology (Ecology) on the strategy presented in this document in order to expedite remedial activities.

2301 (BHI–00230) **Geologic field inspection of the sedimentary sequence at the environmental restoration disposal facility.** Fecht, K.R.; Weekes, D.C. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012118. Source: OSTI; NTIS; INIS; GPO Dep.

The sedimentary sequence in the Environmental Restoration Disposal Facility (ERDF) excavation was examined during construction (1) to document the geologic features identified during site characterization and (2) to determine if additional engineering measures to this vase design would be required. Periodic field inspections were made of vertical exposures created by earth-moving equipment during excavation of the disposal cells Inspections were also made of the trench sidewalls in the final excavation. This report presents the results of the field inspections of the sedimentary sequence at the ERDF.

2302 (BHI–00232) **Readiness evaluation plan for operation of the 200-ZP-1 pump-and-treat system.** Lehrschall, R.R. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009917. Source: OSTI; NTIS; INIS; GPO Dep.

The Project Readiness Evaluation (RE) process will show that the 200-ZP-1 Phase 2 and Phase 3 Interim Response Measure (IRM) remedial activity is prepared to safely and effectively commence work activities. In order to ensure readiness to commence the 200-ZP-1 Pump-and-Treat (P and T) activities, a formal RE will be performed in accordance with this plan. A Readiness Evaluation Team (RET) will evaluate and confirm readiness by reviewing the work activities and by conducting field verifications. The Project Final Hazard Classification (FHC) prepared for the 200-ZP-1 P and T IRM has determined that the operation is a Non-Nuclear Low Hazard activity. The goal of this IRM is to reduce further migration of the carbon tetrachloride, chloroform, and trichloroethylene (TCE) in the groundwater of the 200 West Area. The Phase 2 and Phase 3 IRM treatment system will be designed to initiate hydraulic containment of the contaminant mass in the high-concentration portion (i.e., the 2,000- to 3,000-ppb contour) of the CCl_4 plume. This system will be located just north of the Plutonium Finishing Plant in the 200 West Area and will utilize air stripping and vapor-phase granular activated carbon (GAC) adsorption of the CCl_4. Air stripping is performed by forcing clean air through the contaminated groundwater stream. Based on chemical equilibrium, volatile organic compounds are transferred from the groundwater stream into the air stream. The air stream, containing the contamination in vapor phase, will be passed through vapor-phase GAC columns to remove and collect the organic contaminants. Saturated GAC will then be shipped offsite for carbon regeneration, where the contamination will be destroyed at a permitted facility.

2303 (BHI–00317) **Environmental restoration disposal facility applicable or relevant and appropriate requirements study report. Revision 00.** Roeck, F.V. (and others); Vedder, B.L.; Rugg, J.E. Bechtel Hanford, Inc., Richland, WA (United States). Oct 1995. 186p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008196. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Restoration Disposal Facility (ERDF) will be a landfill authorized under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) and will comply with the Resource Conservation and Recovery Act of 1976 (RCRA) substantive requirements. The facility will also comply with applicable or relevant and appropriate requirements (ARAR), including portions of the U.S. Environmental Protection Agency (EPA) regulations, Washington Administrative Code (WAC), and to-be-considered (TBC) elements such as U.S. Department of Energy (DOE) Orders. In considering the requirements of CERCLA, a detailed analysis of various alternatives for ERDF was completed using the nine CERCLA criteria, National Environmental Policy Act of 1969 (NEPA), and public comments. The ERDF record of decision (ROD) selected an alternative that includes a RCRA-compliant double-lined trench for the disposal of radioactive, hazardous, and mixed wastes resulting from the remediation of operable units (OU) within the National Priorities List (NPL) sites in the 100, 200, and 300 Areas. Only wastes resulting from the remediation of Hanford NPL sites will be allowed in the ERDF. Of the various siting and design alternatives proposed for ERDF, the selected alternative provides the best combination of features by balancing the nine CERCLA criteria, ARAR compliance, environmentally protective site, and various stakeholder and public recommendations. The ERDF trench design, compliant with RCRA Subtitle C minimum technical requirements (MTR), will be double lined and equipped with a leachate collection system. This design provides a more reliable system to protect groundwater than other proposed alternatives. The ERDF is located on the Hanford Site Central Plateau, southeast of the 200 West Area.

2304 (BHI–00466) **Sampling and analysis plan for the 116-C-5 retention basins characteristic dangerous waste determination.** Bauer, R.G.; Dunks, K.L. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009918. Source: OSTI; NTIS; INIS; GPO Dep.

Cooling water flow from the rear face of the 100-B and 100-C reactors was diverted to large retention basins prior to discharge to the Columbia River. These retention basins delayed the release of the reactor coolant for decay of the short-lived activation products and for thermal cooling. Some of the activation products were deposited in sludge that settled in the basins and discharge lines. In addition, some contamination was deposited in soil around the basins and associated piping. The sampling objective of this project is to determine if regulated levels of leachable lead are present in the abrasive materials used to decontaminate the retention basin tank walls, in the material between the tank base plate and the concrete foundation, and in the soils immediately surrounding the perimeter of the retention basins. Sampling details, including sampling locations, frequencies, and analytical requirements, are discussed. Also described is the quality assurance plan for this project.

2305 (BHI–00532) **1330-N Waste Handling Facility waste designation sampling requirements.** Bryant, D.L. Bechtel Hanford, Inc., Richland, WA (United States). Dec 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005877. Source: OSTI; NTIS; INIS; GPO Dep.

This sampling and analysis requirements document details the protocols and responsibilities required to perform sampling and field screening for waste designation purposes. This Sampling and Analysis Plan (SAP) covers sample collection, field screening, sample analysis, sample shipping, and final report preparation for the characterization and designation of waste at the 1330-N Waste Handling Facility. At the direction of Field Support Waste Management (FSWM), this SAP may be used for sampling/field screening efforts at locations other than the 1330-N Waste Handling Facility.

2306 (BHI–00545) **Characterization plan for routine waste from surveillance and maintenance of 221-U and associated facilities.** Encke, D.B. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008014. Source: OSTI; NTIS; INIS; GPO Dep.

This characterization plan describes how to collect samples, gather radiological survey information, and identify what chemical/radiological analyses are necessary to characterize routine waste generated during surveillance and maintenance of 221-U and associated facilities.

2307 (BHI–00618) **Sample activity report for cobalt sampling at the 300-FF-1 South Process Pond.** Carlson, R.A. Bechtel Hanford, Inc., Richland, WA (United States). Nov 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96013572. Source: OSTI; NTIS; INIS; GPO Dep.

This report has been prepared to summarize the sampling conducted under the Cobalt Sampling Plan for the South

Process Pond (SPP). The sampling plan was prepared to support near-term decisions being made with respect to cleanup criteria for cobalt-60 in the SPP within the 300-FF-1 Operable Unit. Statistically based sampling was designed to provide sufficient data to state confidence and error in estimating the mean of cobalt-60 concentrations in the SPP surface soils. Process knowledge and sample data taken in 1987 and 1991 indicate that the major SPP contaminants are cobalt-60 and uranium with some metals at low concentrations. Specifically, the cobalt-60 data indicate the current average concentration of cobalt-60 in the surface soils of the pond as near 8 pCi/g based on eight surface samples. The sampling event was designed to verify the average cobalt-60 concentration by taking enough randomly located samples to make statistical statements regarding the data. Sampling procedures conformed to the requirements established by the Environmental Restoration Contractor Team Environmental Investigations Procedures. The sampling plan called for only four biased samples. During the sampling, additional biased samples were taken to investigate several hot spots in the SPP.

2308 (BHI–00624) **100 Areas soil washing tradeoff study.** Belden, R.D. Bechtel Hanford, Inc., Richland, WA (United States). Nov 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96013570. Source: OSTI; NTIS; INIS; GPO Dep.

The complex nature of cost analysis and systems work demands a level of effort to ensure that decisions made support the best interests of all parties. This tradeoff study will act as a formal decision analysis method for the evaluation of many variables. The documentation of the decision rationale and system design is essential for successful planning and implementation of any system. The Hanford Site offers unique problems for economic analysis of remediation alternatives. The variations in the size of sites, geographic locations, and possible cleanup scenarios all add to the complexity of the tradeoff analysis. A thorough examination of all alternatives must be held to a level of detail appropriate to current regulatory and budgetary considerations. This study will compare the economics of two specific alternatives for remediation of soils at the Hanford Site. Remove and dispose is compared to remove, treat, and dispose. The treatment analyzed in this study is volume reduction through soil washing.

2309 (BHI–00626) **Summary analysis of a Monte Carlo simulation of ecology's statistical guidance and a proposed alternative.** Petersen, S.W. Bechtel Hanford, Inc., Richland, WA (United States). Nov 1995. 173p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013571. Source: OSTI; NTIS; INIS; GPO Dep.

The State of Washington has recommended a specific statistical test procedure for identifying soil contamination at a potential waste site, referred to here as the State test. An alternative to this test has been presented (DOE/RL 1994), which uses the Wilcoxon Rank Sum, Quantile, and Hot Measurement Comparison tests (WQH). These same tests are recommended by the U.S. Environmental Protection Agency (EPA) to determine if soils from a waste site differ from site-specific, reference-based standards.

2310 (BHI–00713) **300-FF-1 operable unit predesign report.** Hadley, J.T. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1996. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012137. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this report is to provide a brief overview of the 300-FF-1 Operable Unit remediation project and package all pertinent project information to effectively transfer the project to the remedial design subcontractor. This is achieved by summarizing the following: site description; Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and Resource Conservation and Recovery Act (RCRA) documents; proposed remedy; and general design criteria. The 300-FF-1 Operable Unit is a source/vadose zone operable unit for the northeast portion of the 300 Area near the Columbia River. The 300-FF-1 Operable Unit contains CERCLA sites and a RCRA site.

2311 (BHI–00715) **Geophysical investigation of the 116-H-1 liquid waste disposal trench, 100-HR-1 operable unit.** Bergstrom, K.A.; Mitchell, T.H. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96013562. Source: OSTI; NTIS; INIS; GPO Dep.

A geophysical investigation and data integration were conducted for the 116-H-1 Liquid Waste Disposal Trench, which is located in the 100-HR-1 Operable Unit. The 116-H-1 Liquid Waste Disposal Trench is also known as the 107-H Liquid Waste Disposal Trench, the 107-H Rupture Effluent Trench, and the 107-H Trench (Deford and Einan 1995). The trench was primarily used to hold effluent from the 107-H Retention Basin that had become radioactive from contact with ruptured fuel elements. The effluent may include debris from the ruptured fuel elements (Koop 1964). The 116-H-1 Liquid Waste Disposal Trench was also used to hold water and sludge from the 107-H Retention Basin during the basin's deactivation in 1965.

2312 (BHI–00716) **Geophysical investigation of the 116-C-5 Retention Basin 100-BC-1, Operable Unit.** Bergstrom, K.A.; Mitchell, T.H. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005709. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a summary of the results of geophysical investigations and data integration conducted for the 116-C-5 Retention Basin. The retention basin and the surrounding terrain have changed significantly since they were in operation. The walls of the retention basins have been completely removed and the bottom of the basins have been covered with 1 to 5 ft of fill. The expansion boxes/diversion boxes near the edges of the basin have been partially destroyed with only the subsurface portion of the structures still intact. Numerous piles of soil and debris, that appear to be related to the removal of the walls, are found throughout the site. The objectives of this investigation include the following: locate and accurately map the perimeter of the two retention basins; locate and accurately map any unknown features (e.g. , major concentration of debris, pipelines, and utilities) that could be a factor during subsurface remediation work; and determine optimum locations for cone penetrometers and test pits that are to be used to assess the presence of subsurface contamination.

2313 (BHI–00717) **Geophysical investigation of the 116-B-11 retention basin, 116-B-1 liquid waste disposal trench, and 116-B-13 sludge trench, 100-BC-1 Operable**

Unit. Bergstrom, K.A.; Mitchell, T.H. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008043. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the results of geophysical investigations and data integration conducted for the 116-B-1 liquid waste disposal trench, the 116-B-11 retention basin, and the 116-B-13 sludge trench, which are all located at the 100-BC-1 Operable Unit (Figure 1). The objectives of this investigation include the following: Map the extent of 116-B-1 trench and any anomalous debris/material that may have been buried in it; Locate and accurately map the walls and pipelines associated with the 116-B-11 retention basin; and Locate and map the 116-B-13 sludge trench.

2314 (BHI–00720) **Performance evaluation report for soil vapor extraction system operations at the carbon tetrachloride site, February 1992–June 1995.** Rohay, V.J. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008035. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to review carbon tetrachloride soil vapor extraction (SVE) operating data and to provide a summary of the effectiveness of SVE operations in addressing unsaturated zone (vadose zone) contamination based on the existing design. The report covers the operating period from February 25, 1992 through June 30, 1995. The scope of the report includes the history of SVE operations, the efficiency of those operations over time, the volume of vapor processed per system, the change in carbon tetrachloride concentrations with time, and the mass of carbon tetrachloride removed per site.

2315 (BHI–00722) **100 Area rock screening study.** Belden, R.D. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 153p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008961. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the activities and results of the 100-Area rock screening study performed on 116-C-1 Trench soils. The study was designed to provide sufficient information for evaluating the effectiveness of bulk screening rocks as a volume reduction technique during soil remediation. Therefore, the intent of this report is to provide valuable information that may be used to assess the feasibility of rock screening waste sites in the 100-BC Area as well as other waste sites in the 100 Area of the Hanford site. Rock screening, as a method of volume reduction, is the physical separation of cleaner, larger rocks, cobbles, and gravels from the finer more contaminated sands and silts without the use of water as a washing agent and without scrubbing or abrasion of any particle surfaces. A detailed cost analysis was performed to determine the cost effectiveness of rock screening versus direct disposal. The cost comparison indicated that rock screening could be cost effective if a substantial volume reduction (at least 41%) could be achieved; however, the cost difference with direct disposal was extremely small. And this study indicates that a 41% volume reduction cannot be achieved with the soils used in the study. Based on the results from this study, dry sieving of the samples was not successful in removing a sufficient amount of contamination from the larger material. Although better results may be achieved on soils with lower levels of contamination, further study of this reduced volume is not warranted at this time.

2316 (BHI–00724) **Technical basis to describe and document the parameters under which the electra ratemeter with DP-6 can be operated.** Wade, C.D. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1996. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012136. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this technical basis document is to describe the parameters under which the electra ratemeter with DP-6 probe can be operated at a 95% confidence level in support of characterization and release surveys.

2317 (BHI–00731-Rev.) **Disposal of sediments from the 1300-N Emergency Dump Basin.** Keen, R.; Duncan, G.M. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1996. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005928. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the characterization of the 1300-N Emergency Dump Basin (EDB) sediments, summarizes the data obtained, the resultant waste categorization, and the preferred disposal method. The EDB is an outdoor, concrete storage pond with a 3/16-in. carbon steel liner. The basin (completed in 1963) originally served as a quenching pool for reactor blowdown in the event of a primary coolant leak. Later, the basin received blowdown from the N Reactor steam generators. The steam generator blowdowns and leading isolation valves allowed radioactively contaminated water (from primary and secondary reactor coolant leaks) to enter the basin. Windblown dust and sand have settled in the basin over the years (because of its outdoor location), causing the present layer of sediments. To minimize potential airborne contamination, the water level was kept constant by adding water. However, the addition of water was stopped to minimize the amount of contaminated water needing disposal. To ensure that the surfaces exposed as a result of evaporation pose no immediate airborne contaminant problem, the contamination levels are monitored by Radiation Control Technicians. As part of the deactivation of N Reactor facilities, the EDB will be stabilized for long-term surveillance and maintenance prior to final decontamination and demolition.

2318 (BHI–00786) **Geophysical investigations in the group II sites 100-D area.** Bergstrom, K.A.; Mitchell, T.H. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96013566. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the results of a geophysical investigation of nine Group II sites: (1) 116-D-7 and 116-DR-9 Retention Basins (2) 116-DR- 1 and 116-DR-2 Liquid Effluent Trenches (3) 107-D-1, 107-D-2, 107-D-3, 107-D-4, and 107-D-5 Sludge trenches. All nine sites were directly associated with the operation of the retention basins which are located in the 100-DR-1 Operable Unit. An area south of 116-D-7 was also investigated as an area that may have contained buried debris. The objectives of this investigation include the following: (1) Locate, map, and/or verify locations of subsurface pipelines and utilities. (2) Locate and map five sludge disposal trenches. (3) Map the extent of 116-DR-1 and 116-DR-2 liquid disposal trenches. (4) Locate and accurately map any unknown features (e.g., major concentration of debris, pipelines, and utilities) that could be a factor during subsurface remediation work.

2319 (BHI–00810) **Radiological characterization survey methodology and sampling and analysis strategy for the 104-B-1 Tritium Vault and 104-B-2 Tritium Laboratory.** Harris, R.A. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012130. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the radiological characterization survey and sample collection and sample analysis for the 104-B-1 Tritium Vault and 104-B-2 Tritium Laboratory. The analytical data will be used to identify the radiological contamination and presence of hazardous materials to allow for disposal of the demolition debris.

2320 (CONF-9201182–Summ.) **Low-level waste forum meeting reports.** Sternwheeler, W.D.E. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 1992. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste winter meeting; San Diego, CA (United States); 29-31 Jan 1992. Order Number DE96013283. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides highlights from the 1992 winter meeting of the Low Level Radioactive Wastes Forum. Topics of discussion included: legal information; state and compact reports; freedom of information requests; and storage.

2321 (CONF-950209–8) **Assays and screening of alpha contaminated soils using low-resolution alpha spectroscopy of thick soil samples.** Meyer, K.E. (Oak Ridge National Lab., TN (United States)); Lucas, A.C.; Padovan, S. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. TTP/OR158102. From 4. international symposium on field screening methods for hazardous wastes and toxic chemicals; Las Vegas, NV (United States); 22-24 Feb 1995. Order Number DE95008969. Source: OSTI; NTIS; INIS; GPO Dep.

A new approach to estimating concentrations of alpha-emitting contaminants (e.g. U, Th, Ra, Pu, Am) in soil samples has been evaluated. The Victoreen Alpha Activity Monitor has been designed to empirically assay soil samples using low-resolution alpha spectroscopy, of thick soil samples. Pre-processing of the soil samples is minimal, involving only drying the soils and milling them to reduce inhomoceneities. Several laboratory tests of the instrument have been conducted. It has been shown that the instrument obeys simple counting statistics with measurement reproducibility improving with the inverse square root of the counting time. Using acquisition times of 1 to 24 hours the instrument Generated alpha assays of eighteen reference and field soil samples which were in good agreement with radiochemical analyses. It was observed that the alpha activity due to a 10pCi/g ^{239}Pu spike added to a clean soil could be very readily distinguished from the 14pCi/g background activity of the soil. In a mock field screening test of 100 Pu-contaminated soils, the instrument demonstrated screening success rates ranging from 70% (at a screening level of 5pCi/g) to greater than 90% (at a screening level of 30pCi/g).

2322 (CONF-950209–10) **Non-conventional passive sensors for monitoring tritium on surfaces.** Gammage, R.B. (Oak Ridge National Lab., TN (United States). Health Sciences Research Div.); Brock, J.L.; Meyer, K.E. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. international symposium on field screening methods for hazardous wastes and toxic chemicals; Las Vegas, NV (United States); 22-24 Feb 1995. Order Number DE95013356. Source: OSTI; NTIS; INIS; GPO Dep.

TTP/OR158102.

The authors describe development of small passive, solid-state detectors for in-situ measurements of tritium, or other weak beta-emitting radionuclides, on surfaces. One form of detector operates on the principle of thermally stimulated exoelectron emission (TSEE), the other by discharge of an electret ion chamber (EIC). There are currently two specific types of commercially available detector systems that lend themselves to making surface measurements. One is the thin-film BeO on a graphite disc, and the other is the Teflon EIC. Two other types of TSEE dosimeters (ceramic BeO and carbon doped alumina) are described but lack either a suitable commercially available reader or standardized methods of fabrication. The small size of these detectors allows deployment in locations difficult to access with conventional windowless gas-flow proportional counters. Preliminary testing shows that quantitative measurements are realized with exposure times of 1–10 hours for the TSEE dosimeters (at the DOE release guideline of 5,000 dpm/100 cm^2 for fixed beta contamination). The EIC detectors exhibit an MDA of 26,000 dpm/100 cm^2 for a 24 hour exposure. Both types of integrating device are inexpensive and reusable. Measurements can, therefore, be made that are faster, cheaper, safer, and better than those possible with baseline monitoring technology.

2323 (CONF-950209–11) **Use of passive alpha detectors to screen for uranium contamination in a field at Fernald, Ohio.** Dudney, C.S. (Oak Ridge National Lab., TN (United States)); Meyer, K.E.; Gammage, R.B.; Wheeler, R.V.; Salasky, M.; Kotrappa, P. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. international symposium on field screening methods for hazardous wastes and toxic chemicals; Las Vegas, NV (United States); 22-24 Feb 1995. Order Number DE95013353. Source: OSTI; NTIS; INIS; GPO Dep.

TTP/OR158102.

This paper reports the results from a field test of newly developed techniques for inexpensive, in situ screening of soil for alpha contamination. Passive alpha detectors that are commercially available for the detection indoor airborne alpha activity (i.e., ^{222}Rn) have been modified so they can be applied to the detection of alpha contamination on surfaces or in soils. Results reported here are from an intercomparison involving several different techniques with all measurements being made at the same sites in a field near the formerly used uranium processing facility at Fernald, Ohio, during the summer of 1994. The results for two types of passive alpha detector show that the quality of calibration is improved if soils samples are milled to increase homogeneity within the soil matrices. The correlation between laboratory based radiochemical analyses and quick, field-based screening measurements is acceptable and can be improved if the passive devices are left for longer exposure times in the field. The total cost per measurement for either type of passive alpha detector is probably less than $25 and should provide a cost-effective means for site managers to develop the information needed to find areas with remaining alpha contamination so resources can be allocated efficiently.

2324 (CONF-9503121-2) **Characterization of sediments in the Clinch River, Tennessee, using remote sensing and multi-dimensional GIS techniques.** Levine, D.A.; Hargrove, W.W.; Hoffman, F. Oak Ridge National Lab., TN (United States). 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Geographic Information System (GIS); Vancouver (Canada); 27-30 Mar 1995. Order Number DE96004558. Source: OSTI; NTIS; INIS; GPO Dep.

Remotely-sensed hydro-acoustic data were used as input to spatial extrapolation tools in a GIS to develop two- and three-dimensional models of sediment densities in the Clinch River arm of Watts Bar Reservoir, Tennessee. This work delineated sediment deposition zones to streamline sediment sampling and to provide a tool for estimating sediment volumes and extrapolating contaminant concentrations throughout the system. The Clinch River arm of Watts Bar Reservoir has been accumulating sediment-bound contaminants from three Department of Energy (DOE) facilities on the Oak Ridge Reservation, Tennessee. Public concern regarding human and ecological health resulted in Watts Bar Reservoir being placed on the National Priorities List for SUPERFUND. As a result, DOE initiated and is funding the Clinch River Environmental Restoration Program (CR-ERP) to perform a remedial investigation to determine the nature and extent of sediment contamination in the Watts Bar Reservoir and the Clinch River and to quantify any human or ecological health risks. The first step in characterizing Clinch River sediments was to determine the locations of deposition zones. It was also important to know the sediment type distribution within deposition zones because most sediment-bound contaminants are preferentially associated to fine particles. A dual-frequency hydro-acoustic survey was performed to determine: (1) depth to the sediment water interface, (2) depth of the sediment layer, and (3) sediment characteristics (density) with depth (approximately 0.5-foot intervals). An array of geophysical instruments was used to meet the objectives of this investigation.

2325 (CONF-9503121-3) **Interpolation of bottom bathymetry and potential erosion in a large Tennessee reservoir system using GRASS.** Hargrove, W.W. (Oak Ridge National Lab., TN (United States). Environmental Sciences Div.); Hoffman, F.M.; Levine, D.A. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Geographic Information System (GIS); Vancouver (Canada); 27-30 Mar 1995. Order Number DE96004557. Source: OSTI; NTIS; INIS; GPO Dep.

A regularized spline with tension was used to interpolate a bathymetric bottom surface for the Watts Bar reservoir just south of Oak Ridge, TN as part of an effort to predict the spatial distribution of radionuclide contaminants. Cesium 137 was released as a by-product of the production of fissionable materials during the mid-1950s. Cesium is strongly adsorbed onto clay and silt particles in the water column, and tends to settle to the bottom. An understanding of the shape and contours of the bottom is important for understanding and prediction of the location and extent of contaminated sediments. The results of the investigations are available on the World Wide Web (WWW) at URL: http://www.esd.ornl.gov/programs/CRERP/INDEX.HTM. The Waterways Experiment Station (WES) of the US Army Corps of Engineers conducted a hydro-acoustic study of the Clinch River arm of Watts Bar Reservoir to determine the distribution, thickness, and type of bottom sediments that had accumulated since completion of Watts Bar Dam in 1942. WES has developed a rapid geophysical technique to determine material characteristics of bottom and subbottom sediments. Acoustic impedance values determined from seismic reflection data are directly related to the density and material type of the subbottom sediments. The objective was to quantify with depth the density and type of bottom and subbottom sediments up to depths of 15 ft below the bottom surface along the Clinch River and Poplar Creek, TN.

2326 (CONF-950483-10) **Phospholipid anaysis of extant microbiota for monitoring in situ bioremediation effectiveness.** Pinkart, H.C.; Ringelberg, D.B.; Stair, J.O.; Sutton, S.D..; Pfiffner, S.M.; White, D.C. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 3. international in situ and on-site bioreclamation symposium; San Diego, CA (United States); 24-27 Apr 1995. Order Number DE96005646. Source: OSTI; NTIS; INIS; GPO Dep.

Two sites undergoing bioremediation were studied using the signature lipid biomarker (SLB) technique. This technique isolates microbial lipid moieties specifically related to viable biomass and to both prokaryotic and eukaryotic biosynthetic pathways. The first site was a South Pacific atoll heavily contaminated with petroleum hydrocarbons. The second site was a mine waste reclamation area. The SLB technique was applied to quantitate directly the viable biomass, community structure, and nutritional/physiological status of the microbiota in the soils and subsurface sediments of these sites. All depths sampled at the Kwajalein Atoll site showed an increase in biomass that correlated with the co-addition of air, water, and nutrients. Monoenoic fatty acids increased in abundance with the nutrient amendment, which suggested an increase in gram-negative bacterial population. Ratios of specific phospholipid fatty acids indicative of nutritional stress decreased with the nutrient amendment. Samples taken from the mine reclamation site showed increases in total microbial biomass and in Thiobacillus biomass in the plots treated with lime and bactericide, especially when a cover soil was added. The plot treated with bactericide and buffered lime without the cover soil showed some decrease in Thiobacillus numbers, but was still slightly higher than that observed in the control plots.

2327 (CONF-9509287-1) **Evaluation of metal and radionuclide data from neutron activation and acid-digestion-based spectrometry analyses of background soils: Significance in environmental restoration.** Lee, S.Y. (Oak Ridge National Lab., TN (United States)); Watkins, D.R.; Jackson, B.L.; Schmoyer, R.L.; Lietzke, D.A.; Burgoa, B.B.; Branson, J.T.; Ammons, J.T. Oak Ridge National Lab., TN (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9. international conference on modern trends in activation analysis; Seoul (Korea, Republic of); 24-30 Sep 1995. Order Number DE96004929. Source: OSTI; NTIS; INIS; GPO Dep.

A faster, more cost-effective, and higher-quality data acquisition procedure for natural background-level metals and radionuclides in soils is needed for remedial investigations of contaminated sites. In this project, a total of 120 soil samples were collected from uncontaminated areas on and near the Oak Ridge Reservation. The samples were taken at three different depths and from three different geologic groups to establish background concentrations of metals and radionuclides. The objective of this presentation is to discuss the advantages and disadvantages of neutron activation analysis (NAA) compared with those of acid-digestion-based spectrometry (ADS) methods; the advantages and disadvantages were evaluated from Al, Sb, As, Cr, Co, Fe, Mg, Mn, Hg, K, Ag, ^{232}Th, ^{235}U, ^{238}U, V, and Zn data. The ADS methods used for this project were inductively coupled plasma (ICP), ICP-mass spectrometry (ICP-MS), and alpha spectrometry. The scatter plots showed that the NAA results for As, Co, Fe, Mn, ^{232}Th, and ^{238}U are reasonably correlated with the results from the other analytical methods. Compared to NAA, however, the ADS methods underestimated Al, Cr, Mg, K, V, and Zn. The skew distributions were caused by incomplete dissolution of the analytes during acid digestion of the soil samples. Because of the high detection limits of the spectrometric methods, the NAA results and the ADS results for some elements, including Sb, Hg, and Ag, did not show a definite relationship. The NAA results were highly correlated with the alpha spectrometry results for ^{232}Th and ^{238}U but poorly correlated for ^{235}U, probably because of a larger counting error associated with the lower activity of the isotope. The NAA methods, including the delayed neutron counting method, were far superior techniques for quantifying background levels of radionuclides (^{232}Th, ^{235}U, and ^{238}U) and metals (Al, Cr, Mg, K, V, and Zn) in soils.

2328 (CONF-951057–7) **Investigation of electrokinetic decontamination of concrete.** DePaoli, D.W.; Harris, M.T.; Morgan, I.L.; Ally, M.R. Oak Ridge National Lab., TN (United States). [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9. symposium on separation science and technology for energy applications; Gatlinburg, TN (United States); 22-26 Oct 1995. Order Number DE96005751. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments have been conducted to investigate the capabilities of electrokinetic decontamination of concrete. Batch equilibration studies have determined that the loading of cesium and strontium on concrete may be decreased using electrolyte solutions containing competing cations, while solubilization of uranium and cobalt, that precipitate at high pH, will require lixiviants containing complexing agents. Dynamic electrokinetic experiments showed greater mobility of cesium than strontium, while some positive results were obtained for the transport of cobalt through concrete using EDTA and for uranium using carbonate.

2329 (CONF-951091–) **Nondestructive assay and nondestructive examination waste characterization conference: Proceedings.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States); Idaho State Univ., Pocatello, ID (United States). [1995]. 550p. Sponsored by USDOE, Washington, DC (United States);Idaho State Univ., Pocatello, ID (United States). DOE Contract AC07-94ID13223. From 4. nondestructive assay and nondestructive examination waste characterization conference; Salt Lake City, UT (United States); 24-26 Oct 1995. Order Number DE96002403. Source: OSTI; NTIS; INIS; GPO Dep.

The 4th Nondestructive Assay and Nondestructive Examination Waste Characterization Conference is provided as a forum for the communication of current and projected nondestructive waste assay and examination (NDA/NDE) issues. Evolving waste management policies, requirements, and schedules are pressing the field of waste NDA/NDE to its attainable level of technological maturity. This naturally requires the technology to reconcile its capabilities and limitations with respect to the actuality for the waste form configurations and their characterizations. Individual papers have been indexed separately for the database.

2330 (CONF-951091–10) **Source imaging of drums in the APNEA system.** Hensley, D. Oak Ridge National Lab., TN (United States). [1995]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. nondestructive assay and nondestructive examination waste characterization conference; Salt Lake City, UT (United States); 24-26 Oct 1995. Order Number DE96005981. Source: OSTI; NTIS; INIS; GPO Dep.

The APNea System is a neutron assay device utilizing both a passive mode and a differential-dieaway active mode. The total detection efficiency is not spatially uniform, even for an empty chamber, and a drum matrix in the chamber can severely distort this response. In order to achieve a response which is independent of the way the source material is distributed in a drum, an imaging procedure has been developed which treats the drum as a number of virtual (sub)volumes. Since each virtual volume of source material is weighted with the appropriate instrument parameters (detection efficiency and thermal flux), the final assay result is essentially independent of the actual distribution of the source material throughout the drum and its matrix.

2331 (CONF-951091–11) **Autonomous identification of matrices in the APNea system.** Hensley, D. Oak Ridge National Lab., TN (United States). 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. nondestructive assay and nondestructive examination waste characterization conference; Salt Lake City, UT (United States); 24-26 Oct 1995. Order Number DE96005980. Source: OSTI; NTIS; INIS; GPO Dep.

The APNea System is a passive and active neutron assay device which features imaging to correct for nonuniform distributions of source material. Since the imaging procedure requires a detailed knowledge of both the detection efficiency and the thermal neutron flux for (sub)volumes of the drum of interest, it is necessary to identify which mocked-up matrix, to be used for detailed characterization studies, best matches the matrix of interest. A methodology referred to as the external matrix probe (EMP) has been established which links external measures of a drum matrix to those of mocked-up matrices. These measures by themselves are sufficient to identify the appropriate mock matrix, from which the necessary characterization data are obtained. This independent matrix identification leads to an autonomous determination of the required system response parameters for the assay analysis.

2332 (CONF-9510125–1) **In situ techniques for the characterization and monitoring of a radioactively contaminated site for in situ vitrification.** Cline, S.R.; Bogle, M.A.; Spalding, B.P.; Naney, M.T. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International symposium on environmental technologies: plasma systems and applications; Atlanta, GA (United States); 8-11 Oct 1995. Order Number DE95012896. Source: OSTI; NTIS; INIS; GPO Dep.

A treatability study was in October 1993 to evaluate the application of in situ vitrification (ISV) to an old seepage pit used for the disposal of radioactive liquid waste at the Oak Ridge National Laboratory (ORNL). This pit is one of seven inactive seepage pits and trenches at ORNL. During the 3 months that the pit was operated as a disposal facility, it is estimated to have received approximately 398 curies of mixed fission products, primarily ^{137}Cs, ^{90}Sr, and ^{106}Ru. Based on data from analysis of sludge from another pit, the activities for waste sludge in Pit 1 decay corrected to 1993 have been roughly estimated to be 71 and 17.5 curies of ^{137}Cs, and ^{90}Sr, respectively. The ^{106}Ru, with a half-life of 367 days, has decayed completely in the 42 years since its disposal in the pit Earthen fill material was added to the pit in 1981, and the pit area was then covered with an approximately 4–6 inch thick asphalt surface. Because so little information necessary for the effective and safe ISV of Pit 1 was available, the first phasm of the treatability study focused on site characterization activities. Several in-situ techniques were developed and used during characterization to ascertain the pit's lateral and vertical dimensions hydraulic and hydrologic properties, soil composition, contaminant inventory, and lateral and vertical distribution of radionuclides. At the end of the treatability study, this characterization effort will be evaluated to determine which properties were the most useful for designing and controlling the ISV process. Such information will be invaluable in efficiently and safely gathering characterization data for the remediation of the other seepage pits and trenilim at ORNL via ISV or alternative remediation techniques. This abstract briefly describes some of the major components of the field characterization activities and their results.

2333 (CONF-9510319–2) **Use of remote sensing to identify waste sources at ORNL's SWSA 4.** Huff, D.D. (and others); Doll, W.E.; Nyquist, J.E. Oak Ridge National Lab., TN (United States). 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 11. annual model conference; Oak Ridge, TN (United States); 16-18 Oct 1995. Order Number DE96010591. Source: OSTI; NTIS; INIS; GPO Dep.

Solid waste storage area (SWSA) 4, at Oak Ridge National Laboratory (ORNL), contributes 25% of the ^{90}Sr release from the ORNL complex. Disposal records were destroyed in a fire, thus limiting the ability to locate waste sources contributing to the releases. The use of remote sensing products, including photos and thermal spectra images, provided the needed information to allow field work to progress in an efficient and cost-effective manner. As a result, four major sources were identified. Preliminary estimates suggest that cost avoidance in excess of $5 million will be possible because of the detailed source location knowledge.

2334 (CONF-951271–1) **Performance of immunoassay kits for site characterization and remediation.** Waters, L.C.; Palausky, A.; Counts, R.W.; Jenkins, R.A. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From On-site analysis: when is it the viable option?; Arlington, VA (United States); 11-12 Dec 1995. Order Number DE96005971. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is supporting efforts to identify, validate and implement the use of effective, low-cost alternatives to currently used analytical methods for environmental management. As part of that program, we have evaluated the performances of a number of immunoassay (IA) kits with specificities for environmental contaminants of concern to the DOE. The studies were done in the laboratory using both spiked and field test samples. The analyte specificity and manufacturers of the kits evaluated were the following: mercury, BioNebraska; polychlorinated biphenyls (PCBs), EnSys and Millipore; petroleum fuel hydrocarbons, Millipore and Ohmicron; and polyaromatic hydrocarbons (PAHs), Ohmicron and Millipore. The kits were used in either a semiquantitative or quantitative format according to the preference of the manufacturers.

2335 (CONF-960212–80) **Underground radioactive waste tank remote inspection and sampling.** Bzorgi, F.M.; Kelsey, A.P.; Van Hoesen, S.D.; Wiles, C.O. Oak Ridge National Lab., TN (United States). 1996. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment; Tucson, AZ (United States); 25-29 Feb 1996. Order Number DE96008803. Source: OSTI; NTIS; INIS; GPO Dep.

Characterization is a critical step in the remediation of contaminated materials and facilities. Severe physical- and radiological-access restrictions made the task of characterizing the World War II-era underground radioactive storage tanks at the Oak Ridge National Laboratory (ORNL) particularly challenging. The innovative and inexpensive tank characterization system (TCS) developed to meet this challenge at ORNL is worthy of consideration for use in similar remediation projects. The TCS is a floating system that uses the existing water in the tank as a platform that supports instruments and samplers mounted on a floating boom. TCS operators feed the unit into an existing port of the tank to be characterized. Once inserted, the system's position is controlled by rotation and by insertion and withdrawal of the boom. The major components of the TCS system include the following: (1) boom support system that consists of a boom support structure and a floating boom, (2) video camera and lights, (3) sludge grab sampler, (4) wall chip sampler, and (5) sonar depth finder. This simple design allows access to all parts of a tank. Moreover, the use of off-the-shelf components keeps the system inexpensive and minimizes maintenance costs. The TCS proved invaluable in negotiating the hazards of ORNL's Gunite and Associated Tanks, which typically contain a layer of radioactive sludge, have only one to three access ports that are usually only 12- or 24-in. in diameter, and range from 12 to 50 ft in diameter. This paper reviews both the successes and the difficulties encountered in using the TCS for treatability studies at ORNL and discusses the prospects for its wider application in remediation activities.

2336 (CONF-960477–1) **Clean enough for industry? An airborne geophysical case study.** Nyquist, J.E.; Beard, L.P. Oak Ridge National Lab., TN (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9. annual symposium on the application of geophysics to engineering and environmental problems; Denver, CO (United States); 15 Apr - 1 May 1996. Order Number DE96005483. Source: OSTI; NTIS; INIS; GPO Dep.

Data from two airborne geophysical surveys of the Department of Energy's Oak Ridge Reservation (ORR) were extremely valuable in deciding whether a 1000-acre (400 hectare) parcel of the ORR should be released to the City of Oak Ridge for industrial development. Our findings, based on electromagnetic and magnetic data, were incorporated in the federally mandated Environmental Assessment Statement (EAS), and in general supported claims that this land was never used as a hazardous waste disposal site. We estimated the amount of iron required to produce each anomaly using a simple dipole model. All anomalies with equivalent sources greater than approximately 1000 kg of iron were checked in the field, and the source of all but one identified as either a bridge, reinforced concrete debris, or a similarly benign object. Additionally, some smaller anomalies (equivalent sources of roughly 500 kg) have been checked; thus far, these also have innocuous sources. Airborne video proved invaluable in identifying logging equipment as the source of some of these anomalies. Geologic noise may account for some of the remaining anomalies. Naturally occurring accumulations of magnetic minerals in the soil on the ORR have been shown to produce anomalies which, at a sensor height of 30 m, are comparable to the anomaly produced by about 500 kg of iron. By comparison, the electronic noise of the magnetic gradiometer, 0.01–0.02 nT/m, is equivalent to only about 50–100 kg of iron at a 30 m sensor height. The electromagnetic data, combined with field mapping of karst structures, provided evidence of a northeast-southwest striking conduit spanning the parcel. The possible existence of a karst conduit led the EAS authors to conclude that this is a "sensitive hydrologic setting." We conclude that aerial geophysics is an extremely cost-effective, and efficient technique for screening large tracts of land for environmental characterization.

2337 (CONF-9606116–7) **Characterization of the molten salt reactor experiment fuel and flush salts.** Williams, D.F.; Peretz, F.J. Oak Ridge National Lab., TN (United States). 1996. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual meeting of the American Nuclear Society (ANS); Reno, NV (United States); 16-20 Jun 1996. Order Number DE96008657. Source: OSTI; NTIS; INIS; GPO Dep.

Wise decisions about the handling and disposition of spent fuel from the Molten Salt Reactor Experiment (MSRE) must be based upon an understanding of the physical, chemical, and radiological properties of the frozen fuel and flush salts. These "static" properties can be inferred from the extensive documentation of process history maintained during reactor operation and the knowledge gained in laboratory development studies. Just as important as the description of the salt itself is an understanding of the dynamic processes which continue to transform the salt composition and govern its present and potential physicochemical behavior. A complete characterization must include a phenomenological characterization in addition to the typical summary of properties. This paper reports on the current state of characterization of the fuel and flush salts needed to support waste management decisions.

2338 (CONF-960804–6) **Methodology for development of treatment and disposal options for compressed gas cylinders contaminated with radionuclides.** Conley, T.B. (Oak Ridge National Lab., TN (United States)); Czor, K.R.; Wright, W.T. Oak Ridge National Lab., TN (United States). 1996. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From SPECTRUM '96: international conference on nuclear and hazardous waste management; Seattle, WA (United States); 18-23 Aug 1996. Order Number DE96009625. Source: OSTI; NTIS; INIS; GPO Dep.

Compressed gas cylinders contaminated with radionuclides are a unique waste item that may become a Resource Conservation and Recovery Act (RCRA) hazardous waste through two mechanisms: either the contents of the compressed gas cylinder are regulated under RCRA or the internal pressure of the compressed gas cylinder gives it the characteristic of reactivity. The characteristic of reactivity is defined by RCRA in 40 Code of Federal Regulations (CFR) 261.23(a)(6) as a waste that is capable of detonation or explosive reaction if it is subjected to a strong initiating source or heated under confinement. In a letter dated September 1, 1989, the U.S. Environmental Protection Agency (EPA) Office of Solid Waste referred the interpretation of the definition of reactivity to the EPA Regional Office and/or the state (if the state has primacy). The Tennessee Department of Environment and Conservation (TDEC) has made the interpretation that to meet the definition of reactive as specified in 40 CFR 261.23(a)(6) there must be a chemical reaction that causes the explosion or detonation. This interpretation limits the compressed gas cylinders that have to be treated as RCRA hazardous waste to those that have other RCRA characteristic codes or contain listed wastes. The difficulty in treating compressed gas cylinders is heightened in the case of radiologically contaminated compressed gas cylinders because the internal pressure and possible hazardous constituents must be treated in most cases before decontamination of the cylinder is possible. Special procedures must be followed to ensure that radiological contamination is not transferred to clean gas cylinders or released into the environment.

2339 (CONF-960804–7) **Estimating surface water risk at Oak Ridge National Laboratory: Effects of site conditions on modeling results.** Curtis, A.H. III. Oak Ridge National Lab., TN (United States). Aug 1996. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From SPECTRUM '96: international conference on nuclear and hazardous waste management; Seattle, WA (United States); 18-23 Aug 1996. Order Number DE96009634. Source: OSTI; NTIS; INIS; GPO Dep.

Multiple source term and groundwater modeling runs were executed to estimate surface water ^{90}Sr concentrations resulting from leaching of sludges in five 180,000 gallon Gunite™ tanks at Oak Ridge National Laboratory. Four release scenarios were analyzed: (1) leaching of unstabilized sludge with immediate tank failure; (2) leaching of unstabilized sludge with delayed tank failure due to chemical degradation; (3) leaching of stabilized sludge with immediate tank failure; and (4) leaching of residual contamination out of the shells of empty tanks. Source terms and concentrations of ^{90}Sr in the stream directly downgradient of the tanks were calculated under these release scenarios. The following conclusions were drawn from the results of the modeling: (1) small changes in soil path length resulted in relatively large changes in the modeled ^{90}Sr concentrations in the stream; (2) there was a linear relationship between the amount of sludge remaining in a tank and the peak concentration of ^{90}Sr in the stream; (3) there was a linear relationship between the cumulative ^{90}Sr release from a tank and the peak concentration of ^{90}Sr in the stream; (4) sludge stabilization resulted in significantly reduced peak concentrations of ^{90}Sr in the stream; and (5) although radioactive decay of ^{90}Sr during the period of tank degradation resulted in incrementally lower peak ^{90}Sr concentrations in surface water than under the immediate tank failure scenarios these concentrations were equivalent under the two scenarios after about 90 years.

2340 (DOE/CAO–95-1076) **Performance demonstration program plan for analysis of simulated headspace gases.** USDOE Carlsbad Area Office, NM (United States). Jun 1995. 36p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96003981. Source: OSTI; NTIS; INIS; GPO Dep.

The Performance Demonstration Program (PDP) for analysis of headspace gases will consist of regular distribution and analyses of test standards to evaluate the capability for analyzing VOCs, hydrogen, and methane in the headspace of transuranic (TRU) waste throughout the Department of Energy (DOE) complex. Each distribution is termed a PDP cycle. These evaluation cycles will provide an objective measure of the reliability of measurements performed for TRU waste characterization. Laboratory performance will be demonstrated by the successful analysis of blind audit samples of simulated TRU waste drum headspace gases according to the criteria set within the text of this Program Plan. Blind audit samples (hereinafter referred to as PDP samples) will be used as an independent means to assess laboratory performance regarding compliance with the QAPP QAOs. The concentration of analytes in the PDP samples will encompass the range of concentrations anticipated in actual waste characterization gas samples. Analyses which are required by the WIPP to demonstrate compliance with various regulatory requirements and which are included in the PDP must be performed by laboratories which have demonstrated acceptable performance in the PDP.

2341 (DOE/CH/10575–T5) **Application of modern diagnostic methods to environmental improvement. Annual progress report, October 1994–September 1995.** Shepard, W.S. Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab. Dec 1995. 198p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-93CH10575. Order Number DE96003939. Source: OSTI; NTIS; INIS; GPO Dep.

The Diagnostic Instrumentation and Analysis Laboratory (DIAL), an interdisciplinary research department in the College of Engineering at Mississippi State University (MSU), is under contract with the US Department of Energy (DOE) to develop and apply advanced diagnostic instrumentation and analysis techniques to aid in solving DOE's nuclear waste problem. The program is a comprehensive effort which includes five focus areas: advanced diagnostic systems; development/application; torch operation and test facilities; process development; on-site field measurement and analysis; technology transfer/commercialization. As part of this program, diagnostic methods will be developed and evaluated for characterization, monitoring and process control. Also, the measured parameters, will be employed to improve, optimize and control the operation of the plasma torch and the overall plasma treatment process. Moreover, on-site field measurements at various DOE facilities are carried out to aid in the rapid demonstration and implementation of modern fieldable diagnostic methods. Such efforts also provide a basis for technology transfer.

2342 (DOE/EA–1030) **Characterization of stored defense production spent nulcear fuel and associated materials at Hanford Site, Richland Washington: Environmental assessment.** USDOE, Washington, DC (United States). Mar 1995. 62p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012247. Source: OSTI; NTIS; INIS; GPO Dep.

There are about 2,100 tonnes (2,300 tons) of defense production spent nuclear fuel stored in the 100-K Area Basins located along the south shore of the Columbia River in the northern part of the Hanford Site. Some of the fuel which has been in storage for a number of years is in poor condition and continues to deteriorate. The basins also contain fuel fragments and radioactively contaminated sludge. The DOE needs to characterize defense production spent nuclear fuel and associated materials stored on the Hanford Site. In order to satisfy that need, the Department of Energy (DOE) proposes to select, collect and transport samples of spent nuclear fuel and associated materials to the 327 Building for characterization. As a result of that characterization, modes of interim storage can be determined that would be compatible with the material in its present state and alternative treatment processes could be developed to permit a broader selection of storage modes. Environmental impacts of the proposed action were determined to be limited principally to radiation exposure of workers, which, however, were found to be small. No health effects among workers or the general public would be expected under routine operations. Implementation of the proposed action would not result in any impacts on cultural resources, threatened, endangered and candidate species, air or water quality, socioeconomic conditions, or waste management.

2343 (DOE/EM–0232-Vol.2) **Estimating the cold war mortgage: The 1995 baseline environmental management report. Volume II: Site summaries.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Mar 1995. 740p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012533. Source: OSTI; NTIS; INIS; GPO Dep.

This volume, Volume II presents the site data that was used to generate the Department of Energy's (DOE) initial Baseline Environmental Management Report (BEMR). The raw data was obtained by DOE field personnel from existing information sources and anticipated environmental management strategies for their sites and was tempered by general assumptions and guidance developed by DOE Headquarters personnel. This data was then integrated by DOE Headquarters personnel and modified to ensure that overall constraints such as funding and waste management capacity were addressed. The site summaries are presented by State and broken out by discrete activities and projects. The Volume I Glossary has been repeated to facilitate the reader's review of Volume II. The information presented in the site summaries represents the best data and assumptions available as of February 1, 1995. Assumptions that have not been mandated by formal agreement with appropriate regulators and other stakeholders do not constitute decisions by the Department nor do they supersede existing agreements. In addition, actions requiring decisions from external sources regarding unknowns such as future land use and funding/scheduling alternatives, as well as internal actions such as the Department's Strategic Realignment initiative, will alter the basis and general assumptions used to generate the results for this report. Consequently, the numbers presented in the site summaries do not represent outyear budget requests by the field installations.

2344 (DOE/EM–0238) **Cost Quality Management Assessment for the Oakland Operations Office. Final report.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of

Engineering and Cost Management. Jun 1995. 114p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013582. Source: OSTI; NTIS; INIS; GPO Dep.

The prime contractor of Lawrence Livermore National Laboratory (LLNL), University of California, is responsible for conducting environmental restoration (ER) and waste management (WM) activities at LLNL under the direction of the Oakland Operations Office (DOE-OAK). This report examines the overall DOE-OAK and LLNL process with respect to cost quality management for EM-30, EM-40, and EM-60 activities. The Round II Cost Quality Management Assessment (CQMA) conducted October 17–28, 1994, reviewed DOE-LAK's cost and cost-related management practices against Performance Objective and Criteria (POCs) contained in the CQMA Handbook (Rev. 3). Three subteams (Cost- and Schedule-Estimating Process, Independent Cost Review, and Management and Technical Evaluation) conducted interviews and reviewed documentation to assess cost and cost-related practices associated with EM-30, -40, and -60 activities. The detailed reports of the subteams are presented in section III. Included in the appendices are organizational charts of the Oakland Operations Office and Lawrence Livermore National Laboratory.

2345 (DOE/EM–0254) **Characterization, monitoring, and sensor technology crosscutting program: Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of the Deputy Assistant Secretary for Technology Development. Jun 1995. 155p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016175. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Characterization, Monitoring, and Sensor Technology Crosscutting Program (CMST-CP) is to deliver appropriate characterization, monitoring, and sensor technology (CMST) to the Office of Waste Management (EM-30), the Office of Environmental Restoration (EM-40), and the Office of Facility Transition and Management (EM-60). The technology development must also be cost effective and appropriate to EM-30/40/60 needs. Furthermore, the required technologies must be delivered and implemented when needed. Accordingly, and to ensure that available DOE and other national resources are focused an the most pressing needs, management of the technology development is concentrated on the following Focus Areas: Contaminant Plume Containment and Remediation (PFA); Landfill Stabilization (LSFA); High-Level Waste Tank Remediation (TFA); Mixed Waste Characterization, Treatment, and Disposal (MWFA); and Facility Deactivation, Decommissioning, and Material Disposition (FDDMDFA). Brief descriptions of CMST-CP projects funded in FY95 are presented.

2346 (DOE/EM–0276) **Annual report on waste generation and waste minimization progress 1993.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Dec 1995. 206p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96009319. Source: OSTI; NTIS; INIS; GPO Dep.

This Report presents and analyzes 1993 DOE waste generation information and efforts to minimize all waste types. This is the second annual report and covers 55 reporting sites in 25 states. The purpose of this Report is to document and track waste generation and waste minimization activities within the DOE complex.

2347 (DOE/EM–0287) **Flameless thermal oxidation. Innovative technology summary report.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Sep 1995. 19p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96009312. Source: OSTI; NTIS; INIS; GPO Dep.

The Flameless Thermal Oxidizer (FTO) is a commercial technology offered by Thermatrix, Inc. The FTO has been demonstrated to be an effective destructive technology for process and waste stream off-gas treatment of volatile organic compounds (VOCs), and in the treatment of VOC and chlorinated volatile organic compounds (CVOCs) off-gases generated during site remediation using either baseline or innovative in situ environmental technologies. The FTO process efficiently converts VOCs and CVOCs to carbon dioxide, water, and hydrogen chloride. When FTO is coupled with a baseline technology, such as soil vapor extraction (SVE), an efficient in situ soil remediation system is produced. The innovation is in using a simple, reliable, scalable, and robust technology for the destruction of VOC and CVOC off-gases based on a design that generates a uniform thermal reaction zone that prevents flame propagation and efficiently oxidizes off-gases without forming products of incomplete combustion (PICs).

2348 (DOE/EM–0288) **SEAMIST™. Innovative technology summary report.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Aug 1995. 23p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI; GPO Dep.

SEAMIST has been demonstrated and deployed as an innovative tool to better access the subsurface for characterization and monitoring of contaminants in both vertical and horizontal boreholes. The technology has been developed by industry with assistance from DOE's Office of Technology Development to ensure it meets the needs of the environmental restoration market.

2349 (DOE/EM–0289) **In situ enhanced soil mixing. Innovative technology summary report.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Feb 1996. 25p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI; GPO Dep.

In Situ Enhanced Soil Mixing (ISESM) is a treatment technology that has been demonstrated and deployed to remediate soils contaminated with volatile organic compounds (VOCs). The technology has been developed by industry and has been demonstrated with the assistance of the U.S. Department of Energy's Office of Science and Technology and the Office of Environmental Restoration. The technology is particularly suited to shallow applications, above the water table, but can be used at greater depths. ISESM technologies demonstrated for this project include: (1) Soil mixing with vapor extraction combined with ambient air injection. [Contaminated soil is mixed with ambient air to vaporize volatile organic compounds (VOCs). The mixing auger is moved up and down to assist in removal of contaminated vapors. The vapors are collected in a shroud covering the treatment area and run through a treatment unit containing a carbon filter or a catalytic oxidation unit with a wet scrubber system and a high efficiency particulate air (HEPA) filter.] (2) soil mixing with vapor extraction combined with hot air injection [This process is the same as the ambient air injection except that hot air or steam is injected.] (3) soil mixing with hydrogen peroxide injection [Contaminated soil is mixed with ambient air that contains a mist of diluted hydrogen peroxide

(H_2O_2) solution. The H_2O_2 solution chemically oxidizes the VOCs to carbon dioxide (CO_2) and water.] (4) soil mixing with grout injection for solidification/stabilization [Contaminated soil is mixed as a cement grout is injected under pressure to solidify and immobilize the contaminated soil in a concrete-like form.] The soils are mixed with a single-blade auger or with a combination of augers ranging in diameter from 3 to 12 feet.

2350 (DOE/EM–0298) **Characterization monitoring & sensor technology crosscutting program.** USDOE Office of Science and Technology, Washington, DC (United States). Office of Program Analysis. Aug 1996. 154p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013520. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Characterization, Monitoring, and Sensor Technology Crosscutting Program (CMST-CP) is to deliver appropriate characterization, monitoring, and sensor technology (CMST) to the OFfice of Waste Management (EM-30), the Office of Environmental Restoration (EM-40), and the Office of Facility Transition and Management (EM-60).

2351 (DOE/EM–0302) **Documenting cost and performance for environmental remediation projects: Department of Energy Office of Environmental Management.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). 8 Aug 1996. 44p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013716. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this DOE guide is to facilitate the use of consistent procedures to document cost and performance information for projects involving the remediation of media contaminated with hazardous and radioactive wastes. It provides remedial action project managers with a standardized set of data to document completed remediation projects. Standardized reporting of data will broaden the utility of the information, increase confidence in the effectiveness of future remedial technologies, and enhance the organization, storage and retrieval of relevant information for future cleanup projects. The foundation for this guide was laid down by the Federal Remediation Technologies Roundtable (FRTR) in their publication, Guide to Documenting Cost and Performance for Remediation Projects, EPA-542-B- 95-002. Member agencies of the FRTR include the US EPA, the US DOD, the US DOE, and the US DOI. All the member agencies are involved in site remediation projects and anticipate following the guidance provided in the above reference. Therefore, there is much to be gained for DOE to be consistent with the other member agencies as it will be easier to compare projects across different agencies and also to learn from the experiences of a wider spectrum of prior completed projects.

2352 (DOE/HWP–153) **Chemometrics review for chemical sensor development, task 7 report.** Oak Ridge National Lab., TN (United States); Advanced Sciences, Inc., Albuquerque, NM (United States). May 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014025. Source: OSTI; NTIS; INIS; GPO Dep.

This report, the seventh in a series on the evaluation of several chemical sensors for use in the U.S. Department of Energy's (DOE's) site characterization and monitoring programs, concentrates on the potential use of chemometrics techniques in analysis of sensor data. Chemometrics is the chemical discipline that uses mathematical, statistical, and other methods that employ formal logic to: design or select optimal measurement procedures and experiments and provide maximum relevant chemical information by analyzing chemical data. The report emphasizes the latter aspect. In a formal sense, two distinct phases are in chemometrics applications to analytical chemistry problems: (1) the exploratory data analysis phase and (2) the calibration and prediction phase. For use in real-world problems, it is wise to add a third aspect - the independent validation and verification phase. In practical applications, such as the ERWM work, and in order of decreasing difficulties, the most difficult tasks in chemometrics are: establishing the necessary infrastructure (to manage sampling records, data handling, and data storage and related aspects), exploring data analysis, and solving calibration problems, especially for nonlinear models. Chemometrics techniques are different for what are called zeroth-, first-, and second-order systems, and the details depend on the form of the assumed functional relationship between the measured response and the concentrations of components in mixtures. In general, linear relationships can be handled relatively easily, but nonlinear relationships can be difficult.

2353 (DOE/ID–10516) **Air emission inventory for the Idaho National Engineering Laboratory: 1994 emissions report.** USDOE Idaho Field Office, Idaho Falls, ID (United States). Jul 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003533. Source: OSTI; NTIS; INIS; GPO Dep.

This report Presents the 1994 update of the Air Emission inventory for the Idaho National Engineering Laboratory (INEL). The INEL Air Emission Inventory documents sources and emissions of non-radionuclide pollutants from operations at the INEL. The report describes the emission inventory process and all of the sources at the INEL, and provides non-radionuclide emissions estimates for stationary sources.

2354 (DOE/ID/12735–1) **Existing air sparging model and literature review for the development of an air sparging optimization decision tool.** MSE, Inc., Butte, MT (United States); MSE Technologies Applications, Inc., Butte, MT (United States); Parsons Engineering Science, Inc., Cleveland, OH (United States). Aug 1995. 135p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88ID12735. Order Number DE96012447. Source: OSTI; NTIS; GPO Dep.

The objectives of this Report are two-fold: (1) to provide overviews of the state-of-the-art and state-of-the-practice with respect to air sparging technology, air sparging models and related or augmentation technologies (e.g., soil vapor extraction); and (2) to provide the basis for the development of the conceptual Decision Tool. The Project Team conducted an exhaustive review of available literature. The complete listing of the documents, numbering several hundred and reviewed as a part of this task, is included in Appendix A. Even with the large amount of material written regarding the development and application of air sparging, there still are significant gaps in the technical community's understanding of the remediation technology. The results of the literature review are provided in Section 2. In Section 3, an overview of seventeen conceptual, theoretical, mathematical and empirical models is presented. Detailed descriptions of each of the models reviewed is provided in Appendix B. Included in Appendix D is a copy of the questionnaire used to compile information about the models. The remaining sections of the document reflect the analysis and synthesis of the information gleaned during the literature and model reviews. The results of these efforts provide the basis for development of the decision tree and conceptual decision tool for determining applicability and optimization of air sparging. The preliminary decision tree and accompanying information provided in Section 6 describe a three-tiered approach for determining air sparging applicability: comparison with established scenarios; calculation of conceptual design parameters; and the conducting of pilot-scale studies to confirm applicability. The final two sections of this document provide listings of the key success factors which will be used for evaluating the utility of the Decision Tool and descriptions of potential applications for Decision Tool use.

2355 (DOE/ID/12735-2) **Conceptual air sparging decision tool in support of the development of an air sparging optimization decision tool.** Parsons Engineering Science, Inc., Cleveland, OH (United States); MSE Technologies Applications, Inc., Butte, MT (United States). Sep 1995. 196p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88ID12735. Order Number DE96012448. Source: OSTI; NTIS; GPO Dep.

The enclosed document describes a conceptual decision tool (hereinafter, Tool) for determining applicability of and for optimizing air sparging systems. The Tool was developed by a multi-disciplinary team of internationally recognized experts in air sparging technology, lead by a group of project and task managers at Parsons Engineering Science, Inc. (Parsons ES). The team included Mr. Douglas Downey and Dr. Robert Hinchee of Parsons ES, Dr. Paul Johnson of Arizona State University, Dr. Richard Johnson of Oregon Graduate Institute, and Mr. Michael Marley of Envirogen, Inc. User Community Panel Review was coordinated by Dr. Robert Siegrist of Colorado School of Mines (also of Oak Ridge National Laboratory) and Dr. Thomas Brouns of Battelle/Pacific Northwest Laboratory. The Tool is intended to provide guidance to field practitioners and environmental managers for evaluating the applicability and optimization of air sparging as remedial action technique.

2356 (DOE/LLW-219) **Mixed Waste Management Options: 1995 Update. National Low-Level Waste Management Program.** Kirner, N. (Foster Wheeler Environmental Corp. (United States)); Kelly, J.; Faison, G.; Johnson, D. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). May 1995. 371p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95014020. Source: OSTI; NTIS; INIS; GPO Dep.

In the original mixed Waste Management Options (DOE/LLW-134) issued in December 1991, the question was posed, "Can mixed waste be managed out of existence?" That study found that most, but not all, of the Nation's mixed waste can theoretically be managed out of existence. Four years later, the Nation is still faced with a lack of disposal options for commercially generated mixed waste. However, since publication of the original Mixed Waste Management Options report in 1991, limited disposal capacity and new technologies to treat mixed waste have become available. A more detailed estimate of the Nation's mixed waste also became available when the US Environmental Protection Agency (EPA) and the US Nuclear Regulatory Commission (NRC) published their comprehensive assessment, titled National Profile on Commercially Generated Low-Level Radioactive Mixed Waste (National Profile). These advancements in our knowledge about mixed waste inventories and generation, coupled with greater treatment and disposal options, lead to a more applied question posed for this updated report: "Which mixed waste has no treatment option?" Beyond estimating the volume of mixed waste requiring jointly regulated disposal, this report also provides a general background on the Atomic Energy Act (AEA) and the Resource Conservation and Recovery Act (RCRA). It also presents a methodical approach for generators to use when deciding how to manage their mixed waste. The volume of mixed waste that may require land disposal in a jointly regulated facility each year was estimated through the application of this methodology.

2357 (DOE/MC/28245-4072) **Soil treatment to remove uranium and related mixed radioactive heavy metal contaminants. Ninth quarterly technical and financial progress report, January 1, 1995–March 31, 1995.** Atomic Energy of Canada Ltd., Chalk River, ON (Canada). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC28245. Order Number DE95009718. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this project is to design and develop a physico-chemical treatment process for the removal of uranium and heavy metals from contaminated soil to achieve target contamination levels below 35 pCi/g of soil and a target for non-radioactive heavy metals below concentration levels permissible for release of the soil. The work will involve bench-scale and pilot-scale tests, using chelation-flotation, chemical leaching and ultrasonic leaching techniques, in conjunction with cross-flow microfiltration and filter-press operations. The effectiveness of an integrated process to treat leachates generated from soil processing will be demonstrated. Process flow-sheets suitable for in-situ and ex-situ applications will be developed and preliminary costs will be provided for the soil and leachate treatment technologies. In accordance with 10CFR 600.31 (d)(i), an extension of the project period including final report submission to 31 July 1995 was made in anticipation of potential delays in receiving Fernald soil samples at Chalk River Laboratories for the planned pilot-scale verification tests. Ex-situ pilot-scale soil decontamination and leachate treatment tests using Chalk River Chemical Pit soil are nearing completion. Soil decontamination tests using Fernald Incinerator Area soil originally scheduled for February 1995 was postponed to May 1995 as result of unexpected delays in the preparation of two drums of soils (~416 kg) by FERMCO and paperwork required to arrange for export/import licenses.

2358 (DOE/MC/29101-96/CO564) **The LASI high-frequency ellipticity system.** Sternberg, B.K.; Poulton, M.M. Arizona Univ., Tucson, AZ (United States). Lab. for Advanced Subsurface Imaging. 1995. 15p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States);Department of the Interior, Washington, DC (United States);Department of Defense, Washington, DC (United States);Arizona Univ., Tucson, AZ (Uni DOE Contract AC21-92MC29101. (CONF-9510108-35: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003687. Source: OSTI; NTIS; GPO Dep.

A high-frequency, high-resolution, electromagnetic (EM) imaging system has been developed for environmental geophysics surveys. Some key features of this system include: (1) rapid surveying to allow dense spatial sampling over a large area, (2) high-accuracy measurements which are used to produce a high-resolution image of the subsurface, (3) measurements which have excellent signal-to-noise ratio over a wide bandwidth (31 kHz to 32 MHz), (4) large-scale physical modeling to produce accurate theoretical responses over targets of interest in environmental geophysics surveys, (5) rapid neural network interpretation at the field site, and (6) visualization of complex structures during the survey.

2359 (DOE/MC–29103-95/C0459) **Lightguide-coupled sensor for in-situ radiation monitoring.** Reed, S.E.; Berthold, J.W. Babcock and Wilcox Co., Alliance, OH (United States). Research and Development Div. [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29103. (CONF-9506183–1: Optics for environmental and public safety, Munich (Germany), 19-23 Jun 1995). Order Number DE95012313. Source: OSTI; NTIS; INIS; GPO Dep.

The authors are developing a multi-point radiation monitoring system for long-term, continuous monitoring of radiation levels in the vadose zone of radioactive waste sites. The system is based on gamma detection with a lightguide-coupled scintillator built into a probe buried in the ground. The lightguide transmits the visible light pulses produced by the scintillator to the surface where detection and signal multiplexing take place. The system is to be capable of monitoring large numbers of such passive probes which are to be permanently installed throughout the waste site. The authors have recently completed tests of a prototype single-probe system. In this paper, they report on the development and testing of the single-probe system.

2360 (DOE/MC/29108–95/C0417) **Field Raman spectrograph for environmental analysis.** Carrabba, M.M. EIC Labs., Inc., Norwood, MA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29108. (CONF-9411149–28: Opportunity 95: environmental technology through small business, Morgantown, WV (United States), 16-17 Nov 1994). Order Number DE95007969. Source: OSTI; NTIS; INIS; GPO Dep.

The use of Raman Spectroscopy in the screening of soils, ground water, and surface waters for pollutants is described. A probe accessory for conducting surface enhanced Raman Spectroscopy is undergoing testing for dilute chlorinated solvents.

2361 (DOE/MC/29108–96/CO568) **Field Raman spectrograph for environmental analysis.** Haas, J.W. III; Forney, R.W.; Carrabba, M.M.; Rauh, R.D. EIC Labs., Inc., Norwood, MA (United States). 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29108. (CONF-9510108–5: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003447. Source: OSTI; NTIS; INIS; GPO Dep.

The enormous cost for chemical analysis at DOE facilities predicates that cost-saving measures be implemented. Many approaches, ranging from increasing laboratory sample throughput by reducing preparation time to the development of field instrumentation, are being explored to meet this need. Because of the presence of radioactive materials at many DOE sites, there is also a need for methods that are safer for site personnel and analysts. This project entails the development of a compact Raman spectrograph for field screening and monitoring of a wide variety of wastes, pollutants, and corrosion products in storage tanks, soils, and ground and surface waters. Analytical advantages of the Raman technique include its ability to produce a unique, spectral fingerprint for each contaminant and its ability to analyze both solids and liquids directly, without the need for isolation or cleanup.

2362 (DOE/MC/29109–96/CO569) **Road Transportable Analytical Laboratory (RTAL) system.** Finger, S.M. Engineering Computer Opteconomics, Inc., Annapolis, MD (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29109. (CONF-9510108–19: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003441. Source: OSTI; NTIS; INIS; GPO Dep.

U.S. Department of Energy (DOE) facilities around the country have, over the years, become contaminated with radionuclides and a range of organic and inorganic wastes. Many of the DOE sites encompass large land areas and were originally sited in relatively unpopulated regions of the country to minimize risk to surrounding populations. In addition, wastes were sometimes stored underground at the sites in 55-gallon drums, wood boxes or other containers until final disposal methods could be determined. Over the years, these containers have deteriorated, releasing contaminants into the surrounding environment. This contamination has spread, in some cases polluting extensive areas. Remediation of these sites requires extensive sampling to determine the extent of the contamination, to monitor clean-up and remediation progress, and for post-closure monitoring of facilities. The DOE would benefit greatly if it had reliable, road transportable, fully independent laboratory systems that could perform on-site the full range of analyses required. Such systems would accelerate and thereby reduce the cost of clean-up and remediation efforts by (1) providing critical analytical data more rapidly, and (2) eliminating the handling, shipping and manpower associated with sample shipments. The goal of the Road Transportable Analytical Laboratory (RTAL) Project is the development and demonstration of a system to meet the unique needs of the DOE for rapid, accurate analysis of a wide variety of hazardous and radioactive contaminants in soil, groundwater, and surface waters. This laboratory system has been designed to provide the field and laboratory analytical equipment necessary to detect and quantify radionuclides, organics, heavy metals and other inorganic compounds. The laboratory system consists of a set of individual laboratory modules deployable independently or as an interconnected group to meet each DOE site's specific needs.

2363 (DOE/MC/29109–5013) **Road Transportable Analytical (RTAL) laboratory system. Quarterly report, February 1995–April 1995.** Engineering Computer Opteconomics, Inc., Annapolis, MD (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29109. Order Number DE96000585. Source: OSTI; NTIS; INIS; GPO Dep.

US Department of Energy (DOE) facilities around the country have, over the years, become contaminated with radionuclides and a range of organic and inorganic wastes. The major types of contamination found at the various sites have been summarized in the 'Environmental Restoration and Management Five Year Plan' and, except for radionuclides (at most locations) and high explosives (at a few locations), are representative of the types of wastes found at many industrial facilities. The DOE faces additional unique challenges in cleaning up this contamination. Many of the DOE sites encompass large land areas and were originally sited in relatively unpopulated regions of the country to minimize risk to surrounding populations. In addition, many times wastes were stored underground at the sites in 55-gallon drums, wood boxes or other containers until final disposal methods could be determined. Over the years, these containers have deteriorated, releasing contaminants into the surrounding environment. This contamination has spread, in some cases polluting extensive areas.

2364 (DOE/MC/29109–5074) **Road Transportable Analytical Laboratory (RTAL) system. Quarterly report, May–July 1995.** Engineering Computer Optecnomics, Inc., Annapolis, MD (United States). Aug 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29109. Order Number DE96000605. Source: OSTI; NTIS; GPO Dep.

Goal is to develop and demonstrate a system for rapid, accurate analysis of hazardous and radioactive contaminants in soil, groundwater, and surface waters. Goal throughput is 20 samples per day, within 16 hours on each sample (after sample preparation). Purpose is to improve the efficiency of cleanup and remediation throughout the DOE complex. During this period, the tasks on prototype system construction and on-site prototype demonstration were worked on; progress is reported.

2365 (DOE/MC/29118–96/CO572) **Field-usable portable analyzer for chlorinated organic compounds.** Buttner, W.J.; Penrose, W.R.; Stetter, J.R. Transducer Research, Inc., Naperville, IL (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29118. (CONF-9510108–7: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003450. Source: OSTI; NTIS; GPO Dep.

Transducer Research, Inc. (TRI) has been working with the DOE Morgantown Energy Technology Center to develop a new chemical monitor based on a unique sensor which responds selectively to vapors of chlorinated solvents. We are also developing field applications for the monitor in actual DOE cleanup operations. During the initial phase, prototype instruments were built and field tested. Because of the high degree of selectivity that is obtained, no response was observed with common hydrocarbon organic compounds such as BTX (benzene, toluene, xylene) or POLs (petroleum, oil, lubricants), and in fact, no non-halogen-containing chemical has been identified which induces a measurable response. By the end of the Phase I effort, a finished instrument system was developed and test marketed. This instrument, called the RCL MONITOR, was designed to analyze individual samples or monitor an area with automated repetitive analyses. Vapor levels between 0 and 500 ppm can be determined in 90 s with a lower detection limit of 0.2 ppm using the hand-portable instrument. In addition to the development of the RCL MONITOR, advanced sampler systems are being developed to: (1) extend the dynamic range of the instrument through autodilution of the vapor and (2) allow chemical analyses to be performed on aqueous samples. When interfaced to the samplers, the RCL MONITOR is capable of measuring chlorinated solvent contamination in the vapor phase up to 5000 ppm and in water and other condensed media from 10 to over 10,000 ppb(wt)–without hydrocarbon and other organic interferences.

2366 (DOE/MC/29118–5014) **Field-usable portable analyzer for chlorinated organic compounds. Topical report, September 1992–May 1994.** Buttner, W.J.; Williams, R.D. Science Applications International Corp., Arlington, VA (United States). Center for Seismic Studies. May 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29118. Order Number DE96000584. Source: OSTI; NTIS; GPO Dep.

Through a U.S. DOE-funded program, an advanced chlorinated organic (RCL) vapor monitor has been built and tested in actual hazardous waste site operations. The monitor exploits the analytical capabilities of a solid-state sensor which was recently developed and has remarkable selectivity for chlorinated organic vapors at sub-parts-per-million sensitivity. The basic design goal of a user-friendly, reliable, instrument with a broad dynamic range for the selective detection of chlorinated solvent vapors was demonstrated. To date, no non-halogen-containing compound has been identified that induces a measurable response on the sensor, including commonly encountered contaminants such as BTXs (benzene, toluene, and xylenes) or POLs (petroleum, oils, lubricants). In addition to the development of the RCL MONITOR, advanced sampler systems were developed to further extend the analytical capability of this instrument, allowing chemical analyses to be performed for both vapor phase and condensed contamination. The sampling methods include fixed dilution, preconcentration, and closed-loop air stripping for condensed media. With uniform success, these different series of field tests were conducted at DOE facilities on several types of samples. Independent cost-benefit analysis has concluded that significant cost savings can be achieved using the RCL MONITOR in DOE applications. This effort provides a sound fundamental technology base for the development of advanced analytical methods that are needed by the US DOE. In addition, advanced methods for detecting chlorinated hydrocarbons that are made possible by this technology will save time, reduce costs, and improve human health and safety in restoration operations. To fully achieve all possible cost savings, continued effort is necessary to develop validated methods for the use of the RCL MONITOR. The development of methods through case studies is the theme of the Phase II effort, which is currently underway.

2367 (DOE/MC/29120–96/CO573) **Innovative vitrification for soil remediation.** Jetta, N.W.; Patten, J.S.; Hart, J.G. Vortec Corp., Collegeville, PA (United States). 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29120. (CONF-9510108–28: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003431. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this DOE demonstration program is to validate the performance and operation of the Vortec Cyclone Melting System (CMS™) for the processing of LLW contaminated soils found at DOE sites. This DOE vitrification demonstration project has successfully progressed through the first two phases. Phase 1 consisted of pilot scale testing with surrogate wastes and the conceptual design of a process plant operating at a generic DOE site. The objective of Phase 2, which is scheduled to be completed the end of FY 95, is to develop a definitive process plant design for the treatment of wastes at a specific DOE facility. During Phase 2, a site specific design was developed for the processing of LLW soils and muds containing TSCA organics and RCRA metal contaminants. Phase 3 will consist of a full scale demonstration at the DOE gaseous diffusion plant located in Paducah, KY. Several DOE sites were evaluated for potential application of the technology. Paducah was selected for the demonstration program because of their urgent waste remediation needs as well as their strong management and cost sharing financial support for the project. During Phase 2, the basic nitrification process design was modified to meet the specific needs of the new waste streams available at Paducah. The system design developed for Paducah has significantly enhanced the processing capabilities of the Vortec vitrification process. The overall system design now includes the capability to shred entire drums and drum packs containing mud, concrete, plastics and PCB's as well as bulk waste materials. This enhanced processing capability will substantially expand the total DOE waste remediation applications of the technology.

2368 (DOE/MC/30172—96/C0582) **Alpha detection in pipes using an inverting membrane scintillator.** Kendrick, D.T.; Cremer, C.D.; Lowry, W.; Cramer, E. Science and Engineering Associates, Inc., Albuquerque, NM (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30172. (CONF-9510108–49: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96004622. Source: OSTI; NTIS; INIS; GPO Dep.

Characterization of surface alpha emitting contamination inside enclosed spaces such as piping systems presents an interesting radiological measurement challenge. Detection of these alpha particles from the exterior of the pipe is impossible since the alpha particles are completely absorbed by the pipe wall. Traditional survey techniques, using hand-held instruments, simply can not be used effectively inside pipes. Science and Engineering Associates, Inc. is currently developing an enhancement to its Pipe Explorer™ system that will address this challenge. The Pipe Explorer™ uses a unique sensor deployment method where an inverted tubular membrane is propagated through complex pipe runs via air pressure. The inversion process causes the membrane to fold out against the pipe wall, such that no part of the membrane drags along the pipe wall. This deployment methodology has been successfully demonstrated at several DOE sites to transport specially designed beta and gamma scintillation detectors into pipes ranging in length up to 250 ft. The measurement methodology under development overcomes the limitations associated with conventional hand-held survey instruments by remotely emplacing an alpha scintillator in direct contact with the interior pipe surface over the entire length to be characterized. This is accomplished by incorporating a suitable scintillator into the otherwise clear membrane material. Alpha particles emitted from the interior pipe surface will intersect the membrane, resulting in the emission of light pulses from the scintillator. A photodetector, towed by the inverting membrane, is used to count these light pulses as a function of distance into the pipe, thereby producing a log of the surface alpha contamination levels. It is anticipated that the resulting system will be able to perform measurements in pipes as small as two inches in diameter, and several hundred feet in length.

2369 (DOE/MC/30172–96/C0583) **Characterization of radioactive contamination inside pipes with the Pipe Explorer™ system.** Kendrick, D.T.; Cremer, C.D.; Lowry, W.; Cramer, E. Science and Engineering Associates, Inc., Albuquerque, NM (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30172. (CONF-9510108–50: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96004621. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy's nuclear facility decommissioning program needs to characterize radiological contamination inside piping systems before the pipe can be recycled, remediated, or disposed. Science and Engineering associates, Inc. under contract with the DOE Morgantown Energy Technology Center has developed and demonstrated the Pipe Explorer™ system, which uses an inverting membrane to transport various characterization sensors into pipes. The basic process involves inverting (turning inside out) a tubular impermeable membrane under air pressure. A characterization sensor is towed down the interior of the pipe by the membrane. Advantages of this approach include the capability of deploying through constrictions in the pipe, around 90° bends, vertically up and down, and in slippery conditions. Because the detector is transported inside the membrane (which is inexpensive and disposable), it is protected from contamination, which eliminates cross-contamination. Characterization sensors that have been demonstrated with the system thus far include: gamma detectors, beta detectors, video cameras, and pipe locators. Alpha measurement capability is currently under development. A remotely operable Pipe Explorer™ system has been developed and demonstrated for use in DOE facilities in the decommissioning stage. The system is capable of deployment in pipes as small as 2-inch-diameter and up to 250 feet long. This paper describes the technology and presents measurement results of a field demonstration conducted with the Pipe Explorer™ system at a DOE site. These measurements identify surface activity levels of U-238 contamination as a function of location in drain lines. Cost savings to the DOE of approximately $1.5 million dollars were realized from this one demonstration.

2370 (DOE/MC/30174–96/CO585) **Rapid surface sampling and archival record system.** Barren, E.; Berdahl, D.R.; Penney, C.M.; Sheldon, R.B. General Electric Co., Schenectady, NY (United States). Corporate Research and Development Center. 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30174. (CONF-9510108–13: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003463. Source: OSTI; NTIS; GPO Dep.

A number of contamination sites exist in this country where the area and volume of material to be remediated is very large, approaching or exceeding 10^6 M^2 and 10^6 M^3. Typically, only a small fraction of this material is actually contaminated. In such cases there is a strong economic motivation to test the material with a sufficient density of measurements to identify which portions are uncontaminated, so extensively they be left in place or be disposed of as uncontaminated waste. Unfortunately, since contamination often varies rapidly from position to position, this procedure can involve upwards of one million measurements per site. The situation is complicated further in many cases by the difficulties of sampling porous surfaces, such as concrete. For example, on concrete the standard wipe test provides results that are strongly operator- and surface condition-dependent. The results are not usually available real time, because the wipe samples are sent to a remote laboratory for analysis, entailing a delay of days to weeks between sampling and results. Further, the cost of analysis of a clean sample is usually the same as that of a contaminated sample; analysis of clean samples thereby increases the total analysis costs considerably. Another method for surface/subsurface characterization is to obtain a boring or a drilling. This method also involves the off-site analysis of the drilled material, incorporating the time and economic penalties described above. Other disadvantages of drilling techniques are disfiguration of the surface and distribution of contamination through byproduct dust. It is for the above reasons that we have chosen to develop thermal sampling methods for characterization of concrete, transite, and contaminated bulk debris. The sampling system we describe has been designed to greatly reduce the economic penalty posed by these difficulties.

2371 (DOE/MC/30175–96/CO588) **Portable sensor for hazardous waste.** Piper, L.G.; Fraser, M.E.; Davis, S.J. Physical Sciences, Inc., Andover, MA (United States). 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30175. (CONF-9510108–6: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003456. Source: OSTI; NTIS; GPO Dep.

We are beginning the second phase of a three and a half year program designed to develop a portable monitor for sensitive hazardous waste detection. The ultimate goal of the program is to develop our concept to the prototype instrument level. Our monitor will be a compact, portable instrument that will allow real-time, in situ, monitoring of hazardous wastes. Further, our instrument can show whether cleanup technologies are successful at reducing hazardous materials concentrations below regulated levels, and will provide feedback to allow changes in remediation operations, if necessary, to enhance their efficacy. Our approach is to excite atomic and molecular fluorescence by the technique of active nitrogen energy transfer (ANET). The active nitrogen is made in a dielectric-barrier (D-B) discharge in nitrogen at atmospheric pressure. Only a few emission lines or bands are excited for each hazardous species, so spectral resolution requirements are greatly simplified over those of other spectroscopic techniques. The dielectric-barrier discharge is compact, 1 to 2 cm in diameter and 1 to 10 cm long. During the first phase of the program we demonstrated that a variety of hazardous species could be detected by the technique of active nitrogen energy transfer (ANET) excitation of atomic and molecular fluorescence. Species investigated included heavy metals, Hg, Cr, and Se, both chlorinated and non-chlorinated organics, and uranyl compounds. For most of these species we demonstrated sensitivity limits for their detection at parts per billion (ppb) levels. Our principal goals for this second phase of the program are to develop and breadboard test instrument components and to design a prototype instrument suitable for construction and evaluation in the final phase of the program. A secondary goal is to extend the ANET technology to encompass a greater number of hazardous species, primarily additional heavy metals and radionuclides.

2372 (DOE/MC/30175–5033) **Portable sensor for hazardous waste. Topical report, October 1993–September 1994.** Piper, L.G. Physical Sciences, Inc., Andover, MA (United States). Oct 1994. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30175. Order Number DE96000569. Source: OSTI; NTIS; INIS; GPO Dep.

We describe an innovative technique to detect hazardous materials at sub part-per-billion levels. Our approach exploits active nitrogen energy-transfer (ANET) to excite atomic and molecular fluorescence characteristic of various hazardous species. ANET excitation is very state specific, generating simple spectra that are easily detected with instrumentation of modest resolution. Typical spectral features include 254 nm emission from Hg, 388 and 420 nm emission from CN when organics are sampled, and 278 nm emission from M when chlorinated organics are sampled. We also observe several broadbands between 450 and 540 nm where uranium compounds are added to the D-B discharge region. We attribute this spectrum to electronic transitions of uranium oxide, probably UO. Additionally, we have used ANET to detect a number of heavy metals such as Cr, Se, Cd, Pb, and Cu. Dielectric-barrier (D-B) discharge technology generates the active nitrogen. This approach affords atmospheric-pressure operation, fluorescence excitation in gaseous, particulate, and aqueous sample matrices, and is amenable to field operation because the discharge and associated electronics are compact and can be powered by 12V batteries. This report details the results of the first phase of a three and a half year program designed to develop a portable monitor for sensitive hazardous waste detection. The ultimate goal of the program is to develop our concept to the prototype instrument level. In this first phase we have demonstrated the applicability of the ANET technology to a variety of hazardous species, and have determined detection sensitivity limits for Hg, Se, organics, and chlorinated organics to be at part-per-billion levels or below.

2373 (DOE/MC/30176–96/CO589) **Three dimensional characterization and archiving system.** Sebastian, R.L. (and others); Clark, R.; Gallman, P. Coleman Research Corp., Springfield, VA (United States). 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30176. (CONF-9510108–20: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003439. Source: OSTI; NTIS; INIS; GPO Dep.

The Three Dimensional Characterization and Archiving System (3D-ICAS) is being developed as a remote system to perform rapid in situ analysis of hazardous organics and radionuclide contamination on structural materials. Coleman Research and its subcontractors, Thermedics Detection, Inc. (TD) and the University of Idaho (UI) are in the second phase of a three phase program to develop 3D-ICAS to support Decontamination and Decommissioning (D&D) operations. Accurate physical characterization of surfaces and the radioactive and organic is a critical D&D task. Surface characterization includes identification of potentially dangerous inorganic materials, such as asbestos and transite. Real-time remotely operable characterization instrumentation will significantly advance the analysis capabilities beyond those currently employed. Chemical analysis is a primary area where the characterization process will be improved. Chemical analysis plays a vital role throughout the process of decontamination. Before clean-up operations can begin the site must be characterized with respect to the type and concentration of contaminants, and detailed site mapping must clarify areas of both high and low risk. During remediation activities chemical analysis provides a means to measure progress and to adjust clean-up strategy. Once the clean-up process has been completed the results of chemical analysis will verify that the site is in compliance with federal and local regulations.

2374 (DOE/MC/30177–5047) **Treatability study using prompt gamma neutron activation analysis (PGNAA) technology, Phase I. Topical report.** Congedo, T.V. (and others); Dulloo, A.R.; Ruddy, F.H. Westinghouse Electric

Corp., Pittsburgh, PA (United States). Science and Technology Center. Jun 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30177. Order Number DE96000588. Source: OSTI; NTIS; INIS; GPO Dep.

This report reviews the progress accomplished during Phase I of a two-phase project intended to demonstrate the use of Prompt Gamma Neutron Activation Analysis (PGNAA) as a technology for the characterization of hazardous and radioactive contaminants in concrete floors. A comprehensive experimental program was undertaken using the N-SCAN™ PGNAA system, which was initially developed by Westinghouse for soil characterization, to determine the sensitivity of PGNAA for several contaminants in concrete. The experiments were performed in a test facility specially designed and constructed for this project. The lower limits of detection derived from the experimental data were encouraging for mercury, cadmium, uranium-238, thorium-232, technetium-99, chlorine, uranium-235 and chromium. These limits were achieved after modifications made to the original N-SCAN system significantly improved its sensitivity for elements located at or near the surface of concrete. With the implementation of additional performance-enhancing modifications scheduled in Phase II, the detection sensitivity of N-SCAN at the end of this project is expected to be at least one order of magnitude higher, allowing N-SCAN to become an effective characterization tool. N-SCAN has several important advantages over current characterization methods and technologies.

2375 (DOE/MC/30357–96/C0592) **Three-dimensional subsurface imaging synthetic aperture radar.** Wuenschel, E. Mirage Systems, Sunnyvale, CA (United States). 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-93MC30357. (CONF-9510108–: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96004620. Source: OSTI; NTIS; INIS; GPO Dep.

Inadequate resources, aggravated by the limited capabilities of existing site characterization technologies, require that new systems be developed to effectively aid site cleanup. The quantity, condition, and the precise location of buried waste storage containers is often unknown, and is always difficult to assess. Significant safety hazards may also be present at these sites. Therefore, new non-invasive detection techniques are needed that will be cost effective, user friendly, and have a growth path toward a system capable of accessing remote terrain. These detection methods must be economical to use and be capable of exploring large land areas quickly with minimal personnel risk. They should provide the precision for identifying the size, depth, type, and possibly the condition of the waste containers.

2376 (DOE/MC/30358–96/CO593) **Geophex Airborne Unmanned Survey System.** Won, I.L.; Keiswetter, D. Geophex Ltd., Raleigh, NC (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-93MC30358. (CONF-9510108–44: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003738. Source: OSTI; NTIS; INIS; GPO Dep.

Ground-based surveys place personnel at risk due to the proximity of buried unexploded ordnance (UXO) items or by exposure to radioactive materials and hazardous chemicals. The purpose of this effort is to design, construct, and evaluate a portable, remotely-piloted, airborne, geophysical survey system. This non-intrusive system will provide stand-off capability to conduct surveys and detect buried objects, structures, and conditions of interest at hazardous locations. During a survey, the operators remain remote from, but within visual distance of, the site. The sensor system never contacts the Earth, but can be positioned near the ground so that weak geophysical anomalies can be detected. The Geophex Airborne Unmanned Survey System (GAUSS) is designed to detect and locate small-scale anomalies at hazardous sites using magnetic and electromagnetic survey techniques. The system consists of a remotely-piloted, radio-controlled, model helicopter (RCH) with flight computer, light-weight geophysical sensors, an electronic positioning system, a data telemetry system, and a computer base-station. The report describes GAUSS and its test results.

2377 (DOE/MC/31186–96/CO628) **Measuring fuel contamination using high speed gas chromotography and cone penetration techniques.** Farrington, S.P.; Bratton, W.L.; Akard, M.L.; Klemp, M. Applied Research Associates, Inc., South Royalton, VT (United States). 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC31186. (CONF-9510108–41: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003690. Source: OSTI; NTIS; GPO Dep.

Decision processes during characterization and cleanup of hazardous waste sites are greatly retarded by the turnaround time and expense incurred through the use of conventional sampling and laboratory analyses. Furthermore, conventional soil and groundwater sampling procedures present many opportunities for loss of volatile organic compounds (VOC) by exposing sample media to the atmosphere during transfers between and among sampling devices and containers. While on-site analysis by conventional gas chromatography (GC) can reduce analytical turnaround time, time-consuming sample preparation procedures are still often required, and the potential for loss of VOC is not reduced.

2378 (DOE/MC/32087–96/CO631) **An advanced open-path atmospheric pollution monitor for large areas.** Taylor, L. Westinghouse Electric Corp., Pittsburgh, PA (United States). Science and Technology Center. 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32087. (CONF-9510108–39: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003740. Source: OSTI; NTIS; INIS; GPO Dep.

Large amounts of toxic waste materials, generated in manufacturing fuel for nuclear reactors, are stored in tanks buried over large areas at DOE sites. Flammable and hazardous gases are continually generated by chemical reactions in the waste materials. To prevent explosive concentrations of these gases, the gases are automatically vented to the atmosphere when the pressure exceeds a preset value. Real-time monitoring of the atmosphere above the tanks with automatic alarming is needed to prevent exposing workers to unsafe conditions when venting occurs. This project is to design, develop, and test an atmospheric pollution monitor which can measure concentrations of DOE-specified and EPA-specified hazardous gases over ranges as long as 4km. A CO_2 laser to measure absorption spectra and to determine the distance over which the measurements are made, is combined with an acousto-optic tunable filter (AOTF) to measure thermal emission spectra.

2379 (DOE/MC/32089–96/CO615) **Fiber optic/cone penetrometer system for subsurface heavy metals detection.** Saggese, S.; Greenwell, R. Science and Engineering Associates, Inc., Albuquerque, NM (United States). 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32089. (CONF-9510108–10: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003454. Source: OSTI; NTIS; GPO Dep.

This document describes a project designed to develop an intergrated fiber optic sensor/cone penetrometer system to analyze the heavy metals content of the subsurface as a site characterization tool.

2380 (DOE/MC/32090–96/C0622) **Radioactivity measurements using storage phosphor technology.** Cheng, Y.T.; Hwang, J.; Hutchinson, M.R. NeuTek, Darnestown, MD (United States). 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32090. (CONF-9510108–48: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96004623. Source: OSTI; NTIS; INIS; GPO Dep.

We propose to apply a recently developed charged particle radiation imaging concept in bio-medical research for fast, cost-effective characterization of radionuclides in contaminated sites and environmental samples. This concept utilizes sensors with storage photostimulable phosphor (SPP) technology as radiation detectors. They exhibit high sensitivity for all types of radiation and the response is linear over a wide dynamic range ($>10^5$), essential for quantitative analysis. These new sensors have an active area of up to 35 cm x 43 cm in size and a spatial resolution as fine as 50 μm. They offer considerable promise as large area detectors for fast characterization of radionuclides with an added ability to locate and identify hot spots.

2381 (DOE/MC/32109–96/CO613) **Barometric pumping with a twist: VOC containment and remediation without boreholes.** Lowry, W.; Dunn, S.D.; Walsh, R.; Zakian, P. Science and Engineering Associates, Inc., Santa Fe, NM (United States). 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32109. (CONF-9510108–33: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003685. Source: OSTI; NTIS; INIS; GPO Dep.

A large national cost is incurred in remediating near-surface contamination such as surface spills, leaking buried pipelines, and underground storage tank sites. Many of these sites can be contained and remediated using enhanced natural venting, capitalizing on barometric pumping. Barometric pumping is the cyclic movement experienced by soil gas due to oscillations in atmospheric pressure. Daily variations of 5 millibars are typical, while changes of 25 to 50 millibars can occur due to major weather front passage. The fluctuations can cause bulk vertical movement in soil gas ranging from centimeters to meters, depending on the amplitude of the pressure oscillation, soil gas permeability, and depth to an impermeable boundary such as the water table. Since the bulk gas movement is cyclic, under natural conditions no net advective vertical movement occurs over time. Science and Engineering Associates, Inc., is developing an engineered system to capitalize on the oscillatory flow for soil contaminant remediation and containment. By design, the system allows normal upward movement of soil gas but restricts the downward movement during barometric highs. The earth's surface is modified with a sealant and vent valve such that the soil gas flow is literally "ratcheted" to cause a net upward flow over time. A key feature of the design is that it does not require boreholes, resulting in a very low cost remediation effort and reduced personnel exposure risk. In the current phase (Phase I) the system's performance is being evaluated. Static and transient analysis results are presented which illustrate the relative magnitude of this advective movement compared to downward contaminant diffusion rates. Calculations also indicate the depth of influence for various surface and soil configurations. The system design will be presented, as well as a cost assessment compared to conventional techniques.

2382 (DOE/MC/32110–96/C0626) **Measurement of radionuclides using ion chromatography and flow-cell scintillation counting with pulse shape discrimination.** DeVol, T.A.; Fjeld, R.A. South Carolina Universities Research and Education Foundation, Clemson, SC (United States). Strom Thurman Inst. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32110. (CONF-9510108–52: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96005242. Source: OSTI; NTIS; INIS; GPO Dep.

A project has been initiated at Clemson Univ. to develop a HPLC/flow- cell system for analysis of non-gamma emitting radionuclides in environmental samples; an important component is development of a low background flow-cell detector that counts alpha and beta particles separately through pulse shape discrimination. Objective of the work presented here is to provide preliminary results of an evaluation of the following scintillators: CaF_2:Eu, scintillating glass, and BaF_2. Slightly acidic aqueous solutions of the alpha emitter ^{233}U and the beta emitter ^{45}Ca were used. Detection efficiencies and minimum detectable activities were determined.

2383 (DOE/MC/32111–5193) **Integrated optic chemical sensor for the simultaneous detection and quantification of multiple ions. Final report, March–September 1995.** Mendoza, E. Physical Optics Corp., Torrance, CA (United States). Sep 1995. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32111. Order Number DE96004474. Source: OSTI; NTIS; GPO Dep.

This final report summarizes the work performed by Physical Optics Corporation (POC) on the DOE contract entitled "Integrated Optic Chemical Sensor for the Simultaneous Detection and Quantification of Multiple Metal Ions". This project successfully demonstrated a multi-element integrated optic chemical sensor (IOCS) system capable of simultaneous detection and quantification of metal ions in a water flow stream. POC's innovative integrated optic chemical sensor technology uses an array of chemically active optical waveguides integrated in parallel in a single small IOCS chip. The IOCS technique uses commonly available materials and straightforward processing to produce channel waveguides in porous glass, each channel treated with a chemical indicator that responds optically to heavy metal ions in a water flow stream. The porosity of the glass allows metal ions present in the water to diffuse into the glass and interact with the immobilized indicators, producing a measurable optical chance. For the "proof-of-concept" demonstration, POC designed and fabricated two types of IOCS chips. Type I uses an array of four straight channel waveguides, three of which are doped with a metal sensitive indicator, an ionophore. The undoped fourth channel is used as the reference channel. Type II uses a 1 x 4 star coupler structure with three sensing channels and a reference channel. Successful implementation of the IOCS technology is expected to have a broad impact on water quality control as well as in the commercial environmental monitoring market. Because of the self-referenced, multidetection capability of the IOCS technique, POC's water quality sensors are expected to find markets in environmental monitoring and protection, ground water monitoring, and in-line process control. Specific applications include monitoring of chromium, copper, and iron ions in water discharged by the metal plating industry.

2384 (DOE/MC/32116–96/CO617) **Analyze imagery and other data collected at the Los Alamos National Laboratory.** David, N.; Ginsberg, I. Environmental Research Inst. of Michigan, Ann Arbor, MI (United States). 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32116. (CONF-9510108–17: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003467. Source: OSTI; NTIS; INIS; GPO Dep.

Unfortunately, areas of waste disposal at DOE sites are not all documented and located. There are a number of reasons for this situation: records have been lost or destroyed, the locations were not documented, and memories have been lost. The search of large areas at these sites for buried waste and buried-waste containers is a difficult and expensive problem when using conventional, ground-based methods. Typical conventional methods involve the drilling of wells/boreholes (point sampling), and interpolation is required to obtain the needed a real information. Drilling for buried waste is expensive, potentially hazardous, and time-consuming, yet accurate interpolation can require a large number of holes per-unit-area. A similar problem is encountered in gaining current information about: the boundaries of toxic waste plumes in the ground, transport pathways, and the composition and concentration of toxic materials. The purpose of this effort is to analyze existing imagery data collected under various Department of Energy and other programs. This analysis will be useful for screening, characterization, and monitoring work in the waste site remediation process.

2385 (DOE/MC/32116–5148) **Imaging data analyses for hazardous waste applications. Final report.** David, N.; Ginsberg, I.W. Environmental Research Inst. of Michigan, Ann Arbor, MI (United States). Dec 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32116. Order Number DE96004368. Source: OSTI; NTIS; INIS; GPO Dep.

The paper presents some examples of the use of remote sensing products for characterization of hazardous waste sites. The sites are located at the Los Alamos National Laboratory (LANL) where materials associated with past weapons testing are buried. Problems of interest include delineation of strata for soil sampling, detection and delineation of buried trenches containing contaminants, seepage from capped areas and old septic drain fields, and location of faults and fractures relative to hazardous waste areas. Merging of site map and other geographic information with imagery was found by site managers to produce useful products. Merging of hydrographic and soil contaminant data aided soil sampling strategists. Overlays of suspected trench on multispectral and thermal images showed correlation between image signatures and trenches. Overlays of engineering drawings on recent and historical photos showed error in trench location and extent. A thermal image showed warm anomalies suspected to be areas of water seepage through an asphalt cap. Overlays of engineering drawings on multispectral and thermal images showed correlation between image signatures and drain fields. Analysis of aerial photography and spectral signatures of faults/fractures improved geologic maps of mixed waste areas.

2386 (DOE/NV/10833–33) **Application of EPA quality assurance procedures to a soil characterization study at the DOE Nevada Test Site.** Snyder, K.E. (Lockheed-Martin Environmental Systems and Technologies Co., Las Vegas, NV (United States)); Byers, G.E.; Van Remortel, R.D.; Gustafson, D.L. Raytheon Services Nevada, Las Vegas, NV (United States). Dec 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-91NV10833. (CONF-960212–95: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96012337. Source: OSTI; NTIS; INIS; GPO Dep.

The transfer, modification, and application of well formulated and tested quality assurance (QA) procedures from one project to another deserves consideration. The use of a proven QA program design could result in cost savings and the collection of data with a greater degree of confidence. To test this thesis, a QA program, originally developed for large nationwide Environmental Protection Agency (EPA) programs, was adapted and implemented in a site characterization study at the Department of Energy (DOE) Nevada Test Site to ensure that laboratory data satisfied predetermined measurement quality objectives (MQOs). The QA Program was adapted from EPA programs such as the National Acid Precipitation Assessment Program, the Environmental Monitoring and Assessment Program, and to a lesser degree, the Comprehensive Environmental Recovery, Compensation and Liability Act (CERCLA) Program. The QA design adopted the batch or lot concept, in which samples are organized into groups of quality samples (non-blinds, blinds, and double-blinds), which were included in each batch to evaluate and control measurement uncertainty and to address sample preparation. Detectability was assessed using instrument detection limits and precision data for low-concentration samples. Precision was assessed using data from reference samples under a two-tiered system based on concentration ranges. Accuracy was investigated in terms of bias with respect to reference values. The results showed that QA concepts developed for previous nationwide EPA programs were successfully adapted for the site-specific DOE project.

2387 (DOE/OR–01-1179-D2) **Phase I remedial investigation report of Waste Area Grouping 2 at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Miller, D.E. (ed.). Oak Ridge National Lab., TN (United States). Jul 1995. 141p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016109. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the activities and findings of the first phase of a three-phase remedial investigation (RI) of Waste Area Grouping (WAG) 2 at Oak Ridge National Laboratory

(ORNL) in Oak Ridge, Tennessee, and updates the scope and strategy for WAG-2-related efforts. WAG 2 contains White Oak Creek (WOC) and its tributaries downstream of the ORNL main plant area, White Oak Lake, White Oak Creek Embayment on the Clinch River, and the associated floodplain and subsurface environment. Water, sediment, soil, and biota in WAG 2 are contaminated and continue to receive contaminants from upgradient WAGs. This report includes field activities completed through October 1992. The remediation of WAG 2 is scheduled to follow the cessation of contaminant input from hydrologically upgradient WAGs. While upgradient areas are being remediated, the strategy for WAG 2 is to conduct a long-term monitoring and investigation program that takes full advantage of WAG 2's role as an integrator of contaminant fluxes from other ORNL WAGs and focuses on four key goals: (1) Implement, in concert with other programs, long-term, multimedia environmental monitoring and tracking of contaminants leaving other WAGs, entering WAG 2, and being transported off-site. (2) Provide a conceptual framework to integrate and develop information at the watershed-level for pathways and processes that are key to contaminant movement, and so support remedial efforts at ORNL. (3) Provide periodic updates of estimates of potential risk (both human health and ecological) associated with contaminants accumulating in and moving through WAG 2 to off-site areas. (4) Support the ORNL Environmental Restoration Program efforts to prioritize, remediate, and verify remedial effectiveness for contaminated sites at ORNL, through long-term monitoring and continually updated risk assessments.

2388 (DOE/OR–01-1192&D2) **Environmental monitoring plan for Waste Area Grouping 6 at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** USDOE Oak Ridge Operations Office, TN (United States). Sep 1995. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER-158&D2). Order Number DE96006228. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents an Environmental Monitoring Plan (EMP) for Waste Area Grouping (WAG 6) at Oak Ridge National Laboratory (ORNL). This document updates a draft monitoring plan developed in 1993. The draft plan was never finalized awaiting resolution of the mechanisms for addressing RCRA concerns at a site where the CERCLA process resulted in a decision to defer action, i.e., postpone closure indefinitely. Over the past two years the Tennessee Department of Environment and Conservation (TDEC), US Department of Energy (DOE), and US Environmental Protection Agency (EPA) Region IV, have agreed that RCRA authority at the site will be maintained through a post- closure permit; "closure" in this case referring to deferred action. Both a Revised Closure Plan (DOE 1995a) and a Post-Closure Permit Application (DOE 1995b) have been developed to document this agreement; relevant portions of the EMP will be included in the RCRA Post-Closure Permit Application. As the RCRA issues were being negotiated, DOE initiated monitoring at WAG 6. The purpose of the monitoring activities was to (1) continue to comply with RCRA groundwater quality assessment requirements, (2) install new monitoring equipment, and (3) establish the baseline conditions at WAG 6 against which changes in contaminant releases could be measured. Baseline monitoring is scheduled to end September 30, 1995. Activities that have taken place over the past two years are summarized in this document.

2389 (DOE/OR–01-1273/V1&D2/A1) **Addendum to the remedial investigation report on Bear Creek Valley Operable Unit 2 (Rust Spoil Area, Spoil Area 1, and SY-200 Yard) at the Oak Ridge Y-12 Plant Oak Ridge, Tennessee. Volume 1: Main text.** Oak Ridge Y-12 Plant, TN (United States); Science Applications International Corp., Oak Ridge, TN (United States). Apr 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (Y/ER–182/V1&D2/A1). Order Number DE96003471. Source: OSTI; NTIS; INIS; GPO Dep.

This addendum to the Remedial Investigation (RI) Report on Bear Creek Valley Operable Unit (OU) 2 at the Oak Ridge Y-12 Plant was prepared in accordance with requirements under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) for reporting the results of a site characterization for public review. This addendum is a supplement to a document that was previously issued in January 1995 and that provided the Environmental Restoration Program with information about the results of the 1993 investigation performed at OU 2. The January 1995 D2 version of the RI Report on Bear Creek Valley OU 2 included information on risk assessments that have evaluated impacts to human health and the environment. Information provided in the document formed the basis for the development of the Feasibility Study Report. This addendum includes revisions to four chapters of information that were a part of the document issued in January 1995. Specifically, it includes revisions to Chaps. 2, 3, 4, and 9. Volume 1 of this document is not being reissued in its entirety as a D3 version because only the four chapters just mentioned have been affected by requested changes. Note also that Volume 2 of this RI Report on Bear Creek Valley OU 2 is not being reissued in conjunction with Volume 1 of this document because there have been no changes requested or made to the previously issued version of Volume 2 of this document.

2390 (DOE/OR–01-1326-D1/V2) **Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 2, Appendix A: Characterization methods and data summary.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Mar 1995. 335p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–284-D1/V2; ORNL/ER/Sub–87-99053/76/V2). Order Number DE95012490. Source: OSTI; NTIS; INIS; GPO Dep.

This appendix presents background regulatory and technical information regarding the solid waste management units (SWMUs) at Waste Area Grouping (WAG) 5 to address requirements established by the Federal Facility Agreement (FFA) for the Oak Ridge Reservation (ORR). The Department of energy (DOE) agreed to conduct remedial investigations (RIs) under the FFA at various sites at Oak Ridge National Laboratory (ORNL), including SWMUs and other areas of concern on WAG 5. The appendix gives an overview of the regulatory background to provide the context in which the WAG 5 RI was planned and implemented and documents how historical sources of data, many of which are SWMU-specific, were evaluated and used.

2391 (DOE/OR–01-1326-D1/V3) **Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 3,**

Appendix B, Technical findings and conclusions. Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Mar 1995. 433p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER-284-D1/V3; ORNL/ER/Sub-87-99053/76/V3). Order Number DE95012492. Source: OSTI; NTIS; INIS; GPO Dep.

This Remedial Investigation Report on Waste Area Grouping, (NVAG) 5 at Oak Ridge National Laboratory was prepared in accordance with requirements under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) for reporting, the results of a site chacterization for public review. This work was performed under Work Breakdown Structure 1.4.12.6.1.05.40.02 (Activity Data Sheet 3305, "WAG 5"). Publication of this document meets a Federal Facility Agreement milestone of March 31, 1995. This document provides the Environmental Restoration Program with information about the results of investigations performed at WAG 5. It includes information on risk assessments that have evaluated long-term impacts to human health and the environment. Information provided in this document forms the basis for decisions regarding, the need for subsequent remediation work at WAG 5.

2392 (DOE/OR-01-1326-D1/V4) **Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 4: Appendix C, Risk assessment.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Mar 1995. 959p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Subcontract 95B-99053C. (ORNL/ER-284-D1/V4; ORNL/ER/Sub-87-99053/76/V4). Order Number DE95012540. Source: OSTI; NTIS; INIS; GPO Dep.

Waste Area Grouping (WAG) 5 is part of Oak Ridge National Laboratory (ORNL) and is located on the United States Department of Energy's Oak Ridge Reservation (DOE-ORR). The site lies southeast of Haw Ridge in Melton Valley and comprises approximately 32 ha (80 ac) [12 ha (30 ac) of forested area and the balance in grassed fields]. The western and southern boundaries of WAG are contiguous with the WAG 2 area which includes White Oak Creek and Melton Branch and associated floodplains. Waste Area Grouping 5 consists of several contaminant source areas for the disposal of low-level radioactive, transuranic (TRU), and fissile wastes (1959 to 1973) as well as inorganic and organic chemical wastes. Wastes were buried in trenches and auger holes. Radionuclides from buried wastes are being transported by shallow groundwater to Melton Branch and White Oak Creek. Different chemicals of potential concern (COPCS) were identified (e.g., cesium-137, strontium-90, radium-226, thorium-228, etc.); other constituents and chemicals, such as vinyl chloride, bis(2-ethylhexyl)phthalate, trichloroethene, were also identified as COPCS. Based on the results of this assessment contaminants of concern (COCS) were subsequently identified. The human health risk assessment methodology used in this risk assessment is based on Risk Assessment Guidance for Superfund (RAGS) (EPA 1989). First, the data for the different media are evaluated to determine usability for risk assessment. Second, through the process of selecting COPCS, contaminants to be considered in the BHHRA are identified for each media, and the representative concentrations for these contaminants are determined. Third, an assessment of exposure potential is performed, and exposure pathways are identified. Subsequently, exposure is estimated quantitatively, and the toxicity of each of the COPCs is determined. The results of the exposure and toxicity assessments are combined and summarized in the risk characterization section.

2393 (DOE/OR-01-1326&D2/V1) **Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 1: Technical summary.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Sep 1995. 170p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER-284&D2/V1; ORNL/ER/Sub-87-99053/76/D2/V1). Order Number DE96004371. Source: OSTI; NTIS; INIS; GPO Dep.

A remedial investigation (RI) was performed to support environmental restoration activities for Waste Area Grouping (WAG) 5 at the Oak Ridge National Laboratory (ORNL) in Oak Ridge, Tennessee. The WAG 5 RI made use of the observational approach, which concentrates on collecting only information needed to assess site risks and support future cleanup work. This information was interpreted and is presented using the framework of the site conceptual model, which relates contaminant sources and release mechanisms to migration pathways and exposure points that are keyed to current and future environmental risks for both human and ecological receptors. The site conceptual model forms the basis of the WAG 5 remedial action strategy and remedial action objectives. The RI provided the data necessary to verify this model and allows recommendations to be made to accomplish those objectives.

2394 (DOE/OR-01-1326&D2/V2) **Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 2 – Appendix A: Characterization methods and data summary.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Sep 1995. 420p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER-284&D2/V2; ORNL/ER/Sub-87-99053/76/D2/V2). Order Number DE96004372. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the Environmental Restoration Program with information about the results of investigations performed at Waste Area Grouping (WAG) 5. It includes information on risk assessments that have evaluated long-term impacts to human health and the environment. Information provided in this document forms the basis for decisions regarding the need for subsequent remediation work at WAG 5. This appendix presents background regulatory and technical information regarding the solid waste management units (SWMUs) at WAG 5 to address requirements established by the Federal Facility Agreement (FFA) for the Oak Ridge Reservation (ORR). The US Department of Energy (DOE) agreed to conduct remedial investigations (RIs) under the FFA at various sites at Oak Ridge National

Laboratory (ORNL), including SWMUs and other areas of concern on WAG 5. The appendix gives an overview of the regulatory background to provide the context in which the WAG 5 RI was planned and implemented and documents how historical sources of data, many of which are SWMU-specific, were evaluated and used.

2395 (DOE/OR--01-1326&D2/V3) **Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 3 – Appendix B: Technical findings and conclusions.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Sep 1995. 420p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER--284&D2/V3; ORNL/ER/Sub--87-99053/76/D2/V3). Order Number DE96004373. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the Environmental Restoration Program with information about the results of investigations performed at Waste Area Grouping (WAG) 5. It includes information on risk assessments that have evaluated long-term impacts to human health and the environment. Information provided in this document forms the basis for decisions regarding the need for subsequent remediation work at WAG 5. Sections B1.1 through B1.4 present an overview of the environmental setting of WAG 5, including location, population, land uses, ecology, and climate, and Sects. B1.5 through B1.7 give site-specific details (e.g., topography, soils, geology, and hydrology). The remediation investigation (RI) of WAG 5 did not entail en exhaustive characterization of all physical attributes of the site; the information presented here focuses on those most relevant to the development and verification of the WAG 5 conceptual model. Most of the information presented in this appendix was derived from the RI field investigation, which was designed to complement the existing data base from earlier, site-specific studies of Solid Waste Storage Area (SWSA) 5 and related areas.

2396 (DOE/OR--01-1326&D2/V4) **Remedial investigation report on waste area grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 4, Appendix C, Risk assessment.** Oak Ridge National Lab., TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States). Sep 1995. 900p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER--284&D2/V4; ORNL/ER/Sub--87-99053/76/D2/V4). Order Number DE96004374. Source: OSTI; NTIS; INIS; GPO Dep.

Waste Area Grouping (WAG) 5 is part of Oak Ridge National Laboratory (ORNL) and is located on the United States Department of Energy's Oak Ridge Reservation (DOE-ORR). The site lies southeast of Haw Ridge in Melton Valley and comprises approximately 32 ha (80 ac) [12 ha (30 ac) of forested area and the balance in grassed fields]. Waste Area Grouping 5 consists of several contaminant source areas for the disposal of low-level radioactive, transuranic (TRU), and fissile wastes (1959 to 1973) as well as inorganic and organic chemical wastes. Wastes were buried in trenches and auger holes. Radionuclides from buried wastes are being transported by shallow groundwater to Melton Branch and White Oak Creek. Different chemicals of potential concern (COPCs) were identified (e.g., cesium-137, strontium-90, radium-226, thorium-228, etc.); other constituents and chemicals, such as vinyl chloride, bis(2-ethylhexyl)phthalate, trichloroethene, were also identified as COPCs. Based on the results of this assessment contaminants of concern (COCs) were subsequently identified. The objectives of the WAG 5 Baseline Human Health Risk Assessment (BHHRA) are to document the potential health hazards (i.e., risks) that may result from contaminants on or released from the site and provide information necessary for reaching informed remedial decisions. As part of the DOE-Oak Ridge Operations (ORO), ORNL and its associated waste/contamination sites fall under the auspices of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), also known as Superfund under the Superfund Amendments and Reauthorization Act (SARA). The results of the BHHRA will (1) document and evaluate risks to human health, (2) help determine the need for remedial action, (3) determine chemical concentrations protective of current and future human receptors, and (4) help select and compare various remedial alternatives.

2397 (DOE/OR--01-1337-D1) **Waste Area Grouping 4 Site Investigation Sampling and Analysis Plan, Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); CDM Federal Programs Corp., Oak Ridge, TN (United States). Dec 1994. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER--292). Order Number DE96007106. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration Program.

Waste Area Grouping (WAG) 4 is one of 17 WAGs within and associated with Oak Ridge National Laboratory (ORNL), on the Oak Ridge Reservation in Oak Ridge, Tennessee. WAG 4 is located along Lagoon Road south of the main facility at ORNL. WAG 4 is a shallow-waste burial site consisting of three separate areas: (1) Solid Waste Storage Area (SWSA) 4, a shallow-land burial ground containing radioactive and potentially hazardous wastes; (2) an experimental Pilot Pit Area, including a pilot-scale testing pit; and (3) sections of two abandoned underground pipelines formerly used for transporting liquid, low-level radioactive waste. In the 1950s, SWSA 4 received a variety of low-and high-activity wastes, including transuranic wastes, all buried in trenches and auger holes. Recent surface water data indicate that a significant amount of ^{90}Sr is being released from the old burial trenches in SWSA 4. This release represents a significant portion of the ORNL off-site risk. In an effort to control the sources of the ^{90}Sr release and to reduce the off-site risk, a site investigation is being implemented to locate the trenches containing the most prominent ^{90}Sr sources. This investigation has been designed to gather site-specific data to confirm the locations of ^{90}Sr sources responsible for most off-site releases, and to provide data to be used in evaluating potential interim remedial alternatives prepared to direct the site investigation of the SWSA 4 area at WAG 4.

2398 (DOE/OR--01-1393V1&D1) **Remedial investigation/feasibility study for the Clinch River/Poplar Creek operable unit. Volume 1. Main text.** Oak Ridge National Lab., TN (United States). Sep 1995. 554p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER--315/V1&D1). Order Number DE96010201. Source: OSTI; NTIS; INIS; GPO Dep.

This is the combined Remedial Investigation/Feasibility Study Report for the Clinch River/Poplar Crack (CR/PC) Operable Unit (OU). The CR/PC OU is located in Anderson and Roane Counties, Tennessee and consists of the Clinch River and several of its embayments in Melton Hill and Watts Bar Reservoirs. These waters have received hazardous substances released over a period of 50 years from the US Department of Energy's Oak Ridge Reservation (ORR), a National Priority List site established under the Comprehensive Environmental Response, Compensation, and Liability Act. A remedial investigation has been conducted to determine the current nature and extent of any contamination and to assess the resulting risk to human health and the environment. The feasibility study evaluates remedial action alternatives to identify any that are feasible for implementation and that would effectively reduce risk. Historical studies had indicated that current problems would likely include ^{137}Cs in sediment of the Clinch River, mercury in sediment and fish of Poplar Creek and PCBs and pesticides in fish from throughout the OU. Peak releases of mercury and ^{137}Cs occurred over 35 years ago, and current releases are low. Past releases of PCBs from the ORR are poorly quantified, and current releases are difficult to quantify because levels are so low. The site characterization focused on contaminants in surface water, sediment, and biota. Contaminants in surface water were all found to be below Ambient Water Quality Criteria. Other findings included the following: elevated metals including cesium 137 and mercury in McCoy Branch sediments; PCBs and chlordane elevated in several fish species, presenting the only major human health risk, significant ecological risks in Poplar Creek but not in the Clinch River.

2399 (DOE/OR–01-1393/V2&D1) **Remedial investigation/feasibility study for the Clinch River/Poplar Creek operable unit. Volume 2. Appendixes A, B, C, D.** Oak Ridge National Lab., TN (United States). Sep 1995. 390p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–315/V2&D1). Order Number DE96010202. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains appendices A (water characterization), B (sediment characterization), C (biota Characterization), D (applicable or relevant and appropriate requirements) from the combined Remedial Investigation/ Feasibility Study Report for the Clinch River/Poplar Crack (CR/PC) Operable Unit (OU). The CR/PC OU is located in Anderson and Roane Counties, Tennessee and consists of the Clinch River and several of its embayments in Melton Hill and Watts Bar Reservoirs. Appendixes A, B, C, D.** Oak Ridge National Lab., TN (United States). Mar 1996. 370p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. (ORNL/ER–315/V2&D2). Order Number DE96013718. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the findings of an investigation into contamination of the Clinch River and Poplar Creek near the U.S. Department of Energy's (DOE's) Oak Ridge Reservation (ORR) in eastern Tennessee. For more than 50 years, various hazardous and radioactive substances have been released to the environment as a result of operations and waste management activities at the ORR. In 1989, the ORR was placed on the National Priorities List (NPL), established and maintained under the federal Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). Under CERCLA, NPL sites must be investigated to determine the nature and extent of contamination at the site, assess the risk to human health and the environment posed by the site, and, if necessary, identify feasible remedial alternatives that could be used to clean the site and reduce risk. To facilitate the overall environmental restoration effort at the ORR, CERCLA activities are being implemented individually as distinct operable units (OU's). This document is the combined Remedial Investigation and Feasibility Study Report for the Clinch River/Poplar Creek OU.

The Quality Assurance/Quality Control (QA/QC) Program for Phase 2 of the Clinch River Remedial Investigation (CRRI) was designed to comply with both Department of Energy (DOE) Order 5700.6C and Environmental Protection Agency (EPA) QAMS-005/80 (EPA 1980a) guidelines. QA requirements and the general QA objectives for Phase 2 data were defined in the Phase 2 Sampling and Analysis Plan (SAP)-Quality Assurance Project Plan, and scope changes noted in the Phase 2 Sampling and Analysis Plan Addendum. The QA objectives for Phase 2 data were the following: (1) Scientific data generated will withstand scientific and legal scrutiny. (2) Data will be gathered using appropriate procedures for sample collection, sample handling and security, chain of custody (COC), laboratory analyses, and data reporting. (3) Data will be of known precision and accuracy. (4) Data will meet data quality objectives (DQOs) defined in the Phase 2 SAP.

2406 (DOE/OR–01-1393/V5&D2) **Remedial investigation/feasibility study of the Clinch River/Poplar Creek operable unit. Volume 5.** Lockheed Martin Energy Systems, Inc., Oak Ridge, TN (United States). Mar 1996. 204p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. (ORNL/ER-315/V5&D2). Order Number DE96013721. Source: OSTI; NTIS; INIS; GPO Dep.

This volume is in support of the findings of an investigation into contamination of the Clinch River and Poplar Creek near the Oak Ridge Reservation (for more than 50 years, various hazardous and radioactive substances have been released to the environment as a result of operations and waste management activities there). It addresses the quality assurance objectives for measuring the data, presents selected historical data, contains data from several discrete water characterization studies, provides data supporting the sediment characterization, and contains data related to several biota characterization studies.

2407 (DOE/OR–01-1393/V5&D3) **Remedial investigation/feasibility study of the Clinch River/Poplar Creek Operable Unit. Volume 5. Appendixes J, K, L, M, and N-other supporting information.** Oak Ridge National Lab., TN (United States). Jun 1996. 196p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. (ORNL/ER–315/V5&D3). Order Number DE96014009. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the findings of an investigation into contamination of the Clinch River and Poplar Creek near the U.S. Department of Energy's (DOE's) Oak Ridge Reservation (ORR) in eastern Tennessee. For more than 50 years, various hazardous and radioactive substances have been released to the environment as a result of operations and waste management activities at the ORR. In 1989, the ORR was placed on the National Priorities List (NPL), established and maintained under the federal Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). Under CERCLA, NPL sites must be investigated to determine the nature and extent of contamination at the site, assess the risk to human health and the environment posed by the site, and, if necessary, identify feasible remedial alternatives that could be used to clean the site and reduce risk. To facilitate the overall environmental restoration effort at the ORR, CERCLA activities are being implemented individually as distinct operable units (OUs). This document is Volume 5 of the combined Remedial Investigation and Feasibility Study Report for the Clinch River/Poplar Creek OU.

2408 (DOE/OR–01-1395&D1) **Remedial design work plan for Lower East Fork Poplar Creek Operable Unit, Oak Ridge, Tennessee.** Oak Ridge Y-12 Plant, TN (United States). Oct 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (Y/ER–248). Order Number DE96003971. Source: OSTI; NTIS; INIS; GPO Dep.

The Remedial Design Work Plan (RDWP) for Lower East Fork Poplar Creek (EFPC) Operable Unit (OU) in Oak Ridge, Tennessee. This remedial action fits into the overall Oak Ridge Reservation (ORR) cleanup strategy by addressing contaminated floodplain soil. The objective of this remedial action is to minimize the risk to human health and the environment from contaminated soil in the Lower EFPC floodplain pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the Federal Facility Agreement (FFA) (1992). In accordance with the FFA, a remedial investigation (RI) (DOE 1994a) and a feasibility study (DOE 1994b) were conducted to assess contamination of the Lower EFPC and propose remediation alternatives. The remedial investigation determined that the principal contaminant is mercury, which originated from releases during Y-12 Plant operations, primarily between 1953 and 1963. The recommended alternative by the feasibility study was to excavate and dispose of floodplain soils contaminated with mercury above the remedial goal option. Following the remedial investigation/feasibility study, and also in accordance with the FFA, a proposed plan was prepared to more fully describe the proposed remedy.

2409 (DOE/OR–01-1396&D1) **Remedial investigation work plan for the Upper East Fork Poplar Creek characterization area, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee.** Oak Ridge Y-12 Plant, TN (United States); CDM Federal Programs Corp., Oak Ridge, TN (United States). Sep 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (Y/ER–230&D1). Order Number DE96003469. Source: OSTI; NTIS; INIS; GPO Dep.

The Oak Ridge Y-12 Plant, located within the Oak Ridge Reservation (ORR), is owned by the US Department of Energy (DOE) and managed by Lockheed Martin Energy Systems, Inc. The entire ORR was placed on the National Priorities List (NPL) of CERCLA sites in November 1989. Following CERCLA guidelines, sites under investigation require a remedial investigation (RI) to define the nature and extent of contamination, evaluate the risks to public health and the environment, and determine the goals for a feasibility study (FS) of potential remedial actions. The need to complete RIs in a timely manner resulted in the establishment of the Upper East Fork Poplar Creek (UEFPC) Characterization Area (CA) and the Bear Creek CA. The CA approach considers the entire watershed and examines all appropriate media within it. The UEFPC CA, which includes the main Y-12 Plant area, is an operationally and hydrogeologically complex area that contains numerous contaminants and containment sources, as well as ongoing industrial and defense-related activities. The UEFPC CA also is the suspected point of origin for off-site groundwater and surface-water contamination. The UEFPC CA RI also will address a carbon-tetrachloride/chloroform-dominated groundwater plume that extends east of the DOE property line into Union Valley, which appears to be connected with springs in the valley. In addition, surface water in UEFPC to the Lower East Fork Poplar Creek CA boundary will be addressed. Through investigation of the entire watershed as one "site," data gaps and contaminated areas will be identified and prioritized more efficiently than through separate investigations of many discrete units.

2410 (DOE/OR–01-1441/V1) **Oak Ridge Reservation Federal Facility Agreement for the Environmental Restoration Program. Volume 1, Quarterly report, October–December 1995.** Oak Ridge National Lab., TN (United States). Jan 1996. 115p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006081. Source: OSTI; NTIS; GPO Dep.

This Oak Ridge Reservation Federal Facility Agreement Quarterly Report for the Environmental Restoration Program was prepared to satisfy requirements for progress reporting on Environmental Restoration Program (ER) activities as specified in the Oak Ridge Reservation Federal Facility Agreement (FFA) established between the US Department of Energy (DOE), the US Environmental Protection Agency, and the Tennessee Department of Environment and Conservation. The reporting period covered in this document is October through December 1995. This work was performed under Work Breakdown Structure 1.4.12.2.3.04 (Activity Data Sheet 8304). Publication of this document meets two FFA milestones. The FFA Quarterly Report meets an FFA milestone defined as 30 days following the end of the applicable reporting period. Appendix A of this report meets the FFA milestone for the Annual Removal Action Report for the period FYs 1991–95. This document provides information about ER Program activities conducted on the Oak Ridge Reservation under the FFA. Specifically, it includes information on milestones scheduled for completion during the reporting period, as well as scheduled for completion during the next reporting period (quarter); accomplishments of the ER Program; concerns related to program work; and scheduled activities for the next quarter. It also provides a listing of the identity and assigned tasks of contractors performing ER Program work under the FFA.

2411 (DOE/OR–07-1414-D1) **Project plan for the background soils project for the Paducah Gaseous Diffusion Plant, Paducah, Kentucky.** Oak Ridge National Lab., TN (United States). Sep 1995. 152p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ES/ER/TM–155-D1). Order Number DE96006670. Source: OSTI; NTIS; INIS; GPO Dep.

ESD Publication 4419.

The Background Soils Project for the Paducah Gaseous Diffusion Plant (BSPP) will determine the background concentration levels of selected naturally occurring metals, other inorganics, and radionuclides in soils from uncontaminated areas in proximity to the Paducah Gaseous Diffusion Plant (PGDP) in Paducah, Kentucky. The data will be used for comparison with characterization and compliance data for soils, with significant differences being indicative of contamination. All data collected as part of this project will be in addition to other background databases established for the PGDP. The BSPP will address the variability of surface and near-surface concentration levels with respect to (1) soil taxonomical types (series) and (2) soil sampling depths within a specific soil profile. The BSPP will also address the variability of concentration levels in deeper geologic formations by collecting samples of geologic materials. The BSPP will establish a database, with recommendations on how to use the data for contaminated site assessment, and provide data to estimate the potential human and health and ecological risk associated with background level concentrations of potentially hazardous constituents. BSPP data will be used or applied as follows.

2412 (DOE/OR/21400–T483) **Final report on the Vitro CRADA.** Oak Ridge National Lab., TN (United States). Feb 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96000664. Source: OSTI; NTIS; INIS; GPO Dep.

ORNL and Vitro investigated the application of advanced Geographic Information System (GIS) technologies to site characterization and environmental remediation work. The six tasks were to do feasibility studies for integrating GIS tools with DBMS, graphics, and other packages to aid in environmental analyses, develop environmental and geographic data standards and guidelines including data structures/quality assurance practices/metadata, investigate environmental and remediation predictive modeling and their integration with GIS, study remote sensing techniques including Global Positioning Systems techniques, and investigate display enhancement techniques including 2D/3D visualization coupled with GIS data bases.

2413 (DOE/OR/22160–T17) **Demonstration testing and evaluation of in situ soil heating. Management Plan, Revision 2.** Dev, H. IIT Research Inst., Chicago, IL (United States). 6 Mar 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-93OR22160. Order Number DE95007851. Source: OSTI; NTIS; INIS; GPO Dep.

This is the second revision to the Management Plan for US DOE contract entitled, "Demonstration Testing and Evaluation of In Situ Soil Heating," Contract Number DE-AC05-93OR22160, IITRI Project Number C06787. The cost plan and schedule have been revised herein. The Management Plan was revised once before, in March 1994. In this project IITRI will demonstrate its in situ soil heating and decontamination technology which uses 60 Hz AC power to heat soil to a temperature of about 900C. This technology is aimed at the decontamination of soil by the removal of organic hazardous constituents by the action of heat and a vacuum gas collection system.

2414 (DOE/OR/22160–T22-Vol.1) **Demonstration, testing, & evaluation of in situ heating of soil. Draft final report, Volume I.** Dev, H.; Enk, J.; Jones, D.; Saboto, W. IIT Research Inst., Chicago, IL (United States). 12 Feb 1996. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-93OR22160. Order Number DE96006051. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a draft final report (Volume 1) for US DOE contract entitled, "Demonstration Testing and Evaluation of In Situ Soil Heating," Contract No. DE-AC05-93OR22160, IITRI Project No. C06787. This report is presented in two volumes. Volume I contains the technical report and Volume II contains appendices with background information and data. In this project approximately 300 cu. yd. of clayey soil containing a low concentration plume of volatile organic chemicals was heated in situ by the application of electrical energy. It was shown that as a result of heating the effective permeability of soil to air flow was increased such that in situ soil vapor extraction could be performed. The initial permeability of soil was so low that the soil gas flow rate was immeasurably small even at high vacuum levels. When scaled up, this process can be used for the environmental clean up and restoration of DOE sites contaminated with VOCs and other organic chemicals boiling up to 120° to 130°C in the vadose zone. Although it may applied to many types of soil formations, it is particularly attractive for low permeability clayey soil where conventional in situ venting techniques are limited by low air flow.

2415 (DOE/OR/22160–T22-Vol.2) **Demonstration, testing, & evaluation of in situ heating of soil. Draft final report, Volume II: Appendices A to E.** Dev, H.; Enk, J.; Jones, D.; Saboto, W. IIT Research Inst., Chicago, IL (United States). 12 Feb 1996. 340p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-93OR22160. Order Number DE96005711. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a draft final report for US DOE contract entitled, "Demonstration Testing and Evaluation of In Situ Soil Heating," Contract No. DE-AC05-93OR22160, IITRI Project No. C06787. This report is presented in two volumes. Volume I contains the technical report This document is Volume II, containing appendices with background information and data. In this project approximately 300 cu. yd. of clayey soil containing a low concentration plume of volatile organic chemicals was heated in situ by the application of electrical energy. It was shown that as a result of heating the effective permeability of soil to air flow was increased such that in situ soil vapor extraction could be performed. The initial permeability of soil was so low that the soil gas flow rate was immeasurably small even at high vacuum levels. When scaled up, this process can be used for the environmental clean up and restoration of DOE sites contaminated with VOCs and other organic chemicals boiling up to 120°to 130°C in the vadose zone. Although it may applied to many types of soil formations, it is particularly attractive for low permeability clayey soil where conventional in situ venting techniques are limited by low air flow.

2416 (DOE/OR/22160–T23-Vol.1) **Demonstration, testing, and evaluation of in situ heating of soil. Volume 1, Final report.** Dev, H.; Enk, J.; Jones, D.; Sabato, W. IIT Research Inst., Chicago, IL (United States). 5 Apr 1996. 186p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-93OR22160. Order Number DE96009599. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a final reports in two volumes. Volume I contains the technical report and Volume II contains appendices with background information and data. In this project approximately 300 cubic yards of clayey soil containing a low concentration plume of volatile organic chemicals was heated in situ by the application of electrical energy. It was shown that as a result of heating the effective permeability of soil to air flow was increased such that in situ soil vapor extraction could be performed. The initial permeability of soil was so low that the soil gas flow rate was immeasurably small even at high vacuum levels. It was demonstrated that the mass flow rate of the volatile organic chemicals was enhanced in the recovered soil gas as a result of heating.

2417 (DOE/OR/22160–T23-Vol.2) **Demonstration, testing, and evaluation of in situ heating of soil. Final report, Volume 2, Appendices A to E.** Dev, H.; Enk, J.; Jones, D.; Sabato, W. IIT Research Inst., Chicago, IL (United States). 5 Apr 1996. 336p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-93OR22160. Order Number DE96009600. Source: OSTI; NTIS; INIS; GPO Dep.

This is a final report presented in two volumes. Volume I contains the technical report and Volume II contains appendices with background information and data. In this project approximately 300 cubic yards of clayey soil containing a low concentration plume of volatile organic chemicals was heated in situ by the application of electrical energy. It was shown that as a result of heating the effective permeability of soil to air flow was increased such that in situ soil vapor extraction could be performed. The initial permeability of soil was so low that the soil gas flow rate was immeasurably small even at high vacuum levels. It was demonstrated that the mass flow rate of the volatile organic chemicals was enhanced in the recovered soil gas as a result of heating. When scaled up, this process can be used for the environmental clean up and restoration of DOE sites contaminated with VOC's and other organic chemicals. Although it may be applied to many types of soil formations, it is particularly attractive for low permeability clayey soil where conventional in situ venting techniques are limited by air flow.

2418 (DOE/ORO–2033) **Benchmarking analysis of three multimedia models: RESRAD, MMSOILS, and MEPAS.** Cheng, J.J. (and others); Faillace, E.R.; Gnanapragasam, E.K. Oak Ridge National Lab., TN (United States); Argonne National Lab., IL (United States); Pacific Northwest Lab., Richland, WA (United States); Tetra Tech, Inc., Lafayette, CA (United States); Environmental Protection Agency, Athens, GA (United States). Environmental Research Lab.; Tennessee Univ., Knoxville, TN (United States). Nov 1995. 300p. Sponsored by USDOE, Washington, DC (United States);Environmental Protection Agency, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/M–4922). Order Number DE96006086. Source: OSTI; NTIS; INIS; GPO Dep.

Multimedia modelers from the United States Environmental Protection Agency (EPA) and the United States Department of Energy (DOE) collaborated to conduct a comprehensive and quantitative benchmarking analysis of three multimedia models. The three models-RESRAD (DOE), MMSOILS (EPA), and MEPAS (DOE)-represent analytically based tools that are used by the respective agencies for performing human exposure and health risk assessments. The study is performed by individuals who participate directly in the ongoing design, development, and application of the models. A list of physical/chemical/biological processes related to multimedia-based exposure and risk assessment is first presented as a basis for comparing the overall capabilities of RESRAD, MMSOILS, and MEPAS. Model design, formulation, and function are then examined by applying the models to a series of hypothetical problems. Major components of the models (e.g., atmospheric, surface water, groundwater) are evaluated separately and then studied as part of an integrated system for the assessment of a multimedia release scenario to determine effects due to linking components of the models. Seven modeling scenarios are used in the conduct of this benchmarking study: (1) direct biosphere exposure, (2) direct release to the air, (3) direct release to the vadose zone, (4) direct release to the saturated zone, (5) direct release to surface water, (6) surface water hydrology, and (7) multimedia release. Study results show that the models differ with respect to (1) environmental processes included (i.e., model features) and (2) the mathematical formulation and assumptions related to the implementation of solutions (i.e., parameterization).

2419 (DOE/RF/00646–T1) **Wind tunnel evaluation of the RAAMP sampler. Final report.** Vanderpool, R.W.; Peters, T.M. Research Triangle Inst., Research Triangle Park, NC (United States). Center for Environmental Technology. Nov 1994. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI34-93RF00646. Order Number DE96010070. Source: OSTI; NTIS; INIS; GPO Dep.

Wind tunnel tests of the Department of Energy RAAMP (Radioactive Atmospheric Aerosol Monitoring Program) monitor have been conducted at wind speeds of 2 km/hr and 24 km/hr. The RAAMP sampler was developed based on three specific performance objectives: (1) meet EPA PM10 performance criteria, (2) representatively sample and retain particles larger than 10 { micro} m for later isotopic analysis, (3) be capable of continuous, unattended operation for time periods up to 2 months. In this first phase of the evaluation, wind tunnel tests were performed to evaluate the sampler as a potential candidate for EPA PM10 reference or equivalency status. As an integral part of the project, the EPA wind tunnel facility was fully characterized at wind speeds of 2 km/hr and 24 km/hr in conjunction with liquid test aerosols of 10 { micro} m aerodynamic diameter. Results showed that the facility and its operating protocols met or exceeded all 40 CFR Part 53 acceptance criteria regarding PM10 size-selective performance evaluation. Analytical procedures for quantitation of collected mass deposits also met 40 CFR Part 53 criteria. Modifications were made to the tunnel's test section to accommodate the large dimensions of the RAAMP sampler's instrument case.

2420 (DOE/RL–93-46-Rev.2) **RCRA Facility investigation/corrective measures study work plan for the 100-DR-2 Operable Unit, Hanford Site, Richland, Washington. Revision 2.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). May 1995. 440p. Sponsored by USDOE, Washington, DC (United States);Environmental Protection Agency, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95012048. Source: OSTI; NTIS; INIS; GPO Dep.

This work plant establishes the operable unit setting and the objectives, approach, tasks, and schedule for conducting the Resource Conservation Recovery Act Facility Investigation/Corrective Measure Study for the Hanford 100-DR-2 Operable Unit, which contains liquid, sludge, and solid waste units used in support of DR Reactor operation, and also the (100-DR-3) solid waste burial grounds. The work plan is focused on limited field investigation activities.

2421 (DOE/RL–94-53) **Limited field investigation report for the 100-HR-2 Operable Unit.** Bechtel National, Inc., Richland, WA (United States). Jul 1995. 125p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017533. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the data collection and analysis activities conducted during the 100-HR-2 Operable Unit investigative phase and the associated qualitative risk assessment. The 100-HR-2 Operable Unit contains solid waste burial grounds, an ash pit, burn pits, electrical facilities, septic systems, and support facilities. All known and suspected areas of contamination were classified as solid waste burial grounds or low-priority waste sites based on the collective knowledge of the operable unit managers (representatives from the US Department of Energy, the US Environmental Protection Agency, and Washington State Department of Ecology during the preparation of the 100-HR-2 Operable Unit Work Plan (DOE-RL 1993f). Solid waste burial grounds were judged to pose sufficient risk(s), through one or more pathways, to require evaluation for an interim remedial measure as per the Hanford Past-Practice Strategy (DOE-RL 1991) and negotiations with the Department of Energy, US Environmental Protection Agency, and Washington State Department of Ecology. An interim remedial measure is intended to achieve remedies that are likely to lead to a final record of decision. Low-priority sites are those judged not to pose significant risk to require the streamlined evaluation. There were six low-priority waste sites and seven solid waste burial grounds identified. The purpose of this report is to: (1) provide a summary of site investigative activities; (2) refine the conceptual exposure model (as needed); (3) identify chemical- and location-specific corrective action requirements; and 4) provide a human health and ecological QRA associated with solid waste burial grounds.

2422 (DOE/RL–94-61-Vol.2) **100 Area Source Operable Unit focused feasibility study. Volume 2.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Aug 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017537. Source: OSTI; NTIS; INIS; GPO Dep.

This 100-KR-1 Operable Unit Focused Feasibility Study (FFS) is prepared in support of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) remedial investigation/feasibility study (RI/FS) process for the 100 Areas. This 100-KR-1 FFS, evaluates the remedial alternatives for interim action at high-priority waste sites within the 100-KR-1 Operable Unit, and provides the information needed for the timely selection of the most appropriate interim action at each waste site. The FFS process for the 100 Areas is conducted in two stages: an evaluation of remedial alternatives for waste-site groups and an evaluation of the remedial alternatives for individual waste sites. Whenever the characteristics of the individual waste-sites are sufficiently similar to the characteristics of the waste-site groups, the evaluation of alternatives in the Process Document is used. This approach, referred to as the "plug-in" approach, is used because there are many waste sites within the 100 Areas that are similar to each other.

2423 (DOE/RL–94-99) **Proposed plan for interim remedial measures at the 100-BC-1 Operable Units.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Jun 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017538. Source: OSTI; NTIS; INIS; GPO Dep.

This Proposed Plan identifies the preferred alternative for interim remedial measures for remedial action of radioactive liquid waste disposal sites that include contaminated soils and structures at the 100-BC-1 Operable Unit, located at the Hanford Site. It also summarizes other remedial alternatives evaluated for interim remedial measures in this Operable Unit. The intent of interim remedial measures is to speed up actions to address contaminated areas that pose potential threats to human health and the environment. The preferred alternative presented in this Proposed Plan is to remove, treat as appropriate or required, and dispose of the contaminated soil and associated structures from nine source areas within the 100-BC-1 Operable Unit. Treatment would be conducted as necessary or appropriate for cost effective operations. The preferred alternative will reduce potential threats to human health and the environment at 100-BC-1 Operable Unit radioactive liquid waste disposal sites. The remedial actions described are intended to reduce potential human health and ecological risks and to ensure that contaminants present at these waste sites will not adversely impact groundwater beneath the sites or the Columbia River.

2424 (DOE/RL–94-100) **Proposed plan for interim remedial measures at the 100-DR-1 Operable Unit.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Jun 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017540. Source: OSTI; NTIS; INIS; GPO Dep.

This proposed plan identifies the preferred alternative for interim remedial measures for remedial action of radioactive liquid waste disposal sites that include contaminated soils and structures at the 100-DR-1 Operable Unit, located at the Hanford Site. It also summarizes other remedial alternatives evaluated for interim remedial measures in this Operable

Unit. The intent of interim remedial measures is to speed up actions to address contaminated areas that pose potential threats to human health and the environment. The preferred alternative presented in this Proposed Plan is to remove, treat as appropriate or required, and dispose of the contaminated soil and associated structures from twelve source areas within the 100-DR-1 Operable Unit. The preferred alternative will reduce potential threats to human health and the environment at 100-DR-1 Operable Unit radioactive liquid waste disposal sites. The remedial actions described are intended to reduce potential human health and ecological risks and to ensure that contaminants present at these waste sites will not adversely impact groundwater beneath the sites or the Columbia River.

2425 (DOE/RL–94-101) **Proposed plan for interim remedial measures at the 100-HR-1 Operable Unit, Hanford Site, Richland, Washington.** USDOE Richland Operations Office, WA (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017539. Source: OSTI; NTIS; INIS; GPO Dep.

This proposed plan identifies the preferred alternative for interim remedial measures for remedial action of radioactive liquid waste disposal sites at the 100-HR-1 Operable Unit, located at the Hanford Site. It also summarizes other remedial alternatives evaluated for interim remedial measures in this operable unit. The intent of interim remedial measures is to speed up actions to address contaminated areas that historically received radioactive liquid waste discharges that pose a potential threat to human health and the environment. This proposed plan is being issued by the Washington State Department of Ecology (Ecology), the lead regulatory agency; the US Environmental Protection Agency (EPA), the support regulatory agency; and the US Department of Energy (DOE), the responsible agency. Ecology, EPA, and DOE are issuing this proposed plan as part of their public participation responsibilities under Section 117(a) of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), commonly known as the "Superfund Program." The proposed plan is intended to be a fact sheet for public review that (1) briefly describes the remedial alternatives analyzed; (2) proposes a preferred alternative; (3) summarizes the information relied upon to recommend the preferred alternative; and (4) provides a basis for an interim action record of decision (ROD). The preferred alternative presented in this proposed plan is removal, treatment (as appropriate), and disposal of contaminated soil and associated structures. Treatment will be conducted if there is cost benefit.

2426 (DOE/RL–94-101-Rev.1) **Proposed plan for interim remedial measures at the 100-HR-1 Operable Unit. Revision 1.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Jun 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017541. Source: OSTI; NTIS; INIS; GPO Dep.

This Proposed Plan identifies the preferred alternative for interim remedial measures for remedial action of radioactive liquid waste disposal sites that include contaminated soils and structures at the 100-HR-1 Operable Unit, located at the Hanford Site. It also summarizes other remedial alternatives evaluated for interim remedial measures in this Operable Unit. The intent of interim remedial measures is to speed up actions to address contaminated areas that pose potential threats to human health and the environment. The preferred alternative presented in this Proposed Plan is to remove, treat (as appropriate or required), and dispose of the contaminated soil and associated structures from three source areas within the 100-HR-1 Operable Unit. These are the 116-H-1 Process Effluent Trench, the 116-H-7 Retention Basin, and the 100-H Buried Process Effluent Pipelines. The preferred alternative will reduce potential threats to human health and the environment at 100-HR-1 Operable Unit radioactive liquid waste disposal sites. The remedial actions described are intended to reduce potential human health and ecological risks and to ensure that contaminants present at these waste sites will not adversely impact groundwater beneath the sites or the Columbia River.

2427 (DOE/RL–94-104) **Description of work for vadose zone characterization of the 1301-N and 1325-N liquid waste disposal facilities.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Sep 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96000284. Source: OSTI; NTIS; INIS; GPO Dep.

This description of work (DOW) details the field activities associated with a limited field investigation (LFI) of soil contamination beneath the 1301-N and 1325-N Liquid Waste Disposal Facilities (LWDFs), and will serve as a field guide for those performing the work. These activities are undertaken pursuant to the Hanford Federal Facility Agreement and consent Order (Tri-Party Agreement) (Ecology et al. 1994a) Milestone M-16-94-01H-T1 and the June 30, 1994, Milestone Change Request M-16-94-02 (Ecology et al. 1994b). The scope of these activities was defined during a Streamlined Approach for Environmental Restoration (SAFER) workshop and a US Department of Energy, Richland Operations Office (RL) workshop where data quality objectives (DQOs) and technical criteria for the LFI were developed. Results of the SAFER workshop are discussed in Section 1.1. the locations of the 1301-N and 1325-N LWDFs (116-N-1 and 116-N-3) are shown in Figure 1. Both the 1301-N and 1325-N LWDFs consist o a crib and a trench. Both LWDFs were used to receive and dispose of the cooling water originating from the 100-N Reactor and are classified as RCRA treatment, storage, and/or disposal (TSD) units. The LWDFs are no longer receiving waste effluent. Although these facilities are classified as RCRA TSD units, the RL and regulatory agencies have determined that this LFI will be conducted as a past-practice investigation under the auspices of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), in accordance with the Hanford Site Past-Practice Investigation Strategy (DOE-RL 1991) and the 100-NR-1 Operable Unit RFI/CMS Work Plan (DOE-RL 1994).

2428 (DOE/RL–94-104-Rev.1) **Description of work for vadose zone characterization of the 1301-N and 1325-N liquid waste disposal facilities, Revision 1.** Department of Energy, Richland, WA (United States). Richland Operations Office. Dec 1995. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96004132. Source: OSTI; NTIS; INIS; GPO Dep.

This description of work (DOW) details the field activities associated with a limited field investigation (LFI) of soil contamination beneath the 1301-N and 1325-N Liquid Waste Disposal Facilities (LWDFs), and will serve as a field guide for those performing the work. These activities are undertaken pursuant to the Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement) Milestone M-16-94-01H-TI and the June 30, 1994, Milestone Change Request M-16-94-02. The scope of these activities was defined during a Streamlined Approach for Environmental Restoration (SAFER) workshop and a U.S. Department of Energy, Richland Operations Office (RL) workshop where data quality objectives (DQOs) and technical criteria for the LFI were developed. Results of the SAFER workshop and the RL workshop are discussed in Section 1.1. Other supporting documents to be used in conjunction with the DOW include the RCRA Facility Investigational Corrective Measures Study Work Plan for the 100-NR-1 Operable Unit, Hanford Site, Richland, Washington (DOE-RL 1994) for operable unit-scale investigation strategy and the Environmental Investigations Procedures (BH1 1995c) for specific procedures. The 1301-N and 1325-N LWDFs are identified as the 116-N-1 and 116-N-3 sites in the 100-NR-1 Operable Unit Resource Conservation and Recovery Act of 1976 (RCRA) Facility Investigation/Corrective Measures Study (RFI/CMS) Work Plan (DOE-RL 1994). The locations of the 1301-N and 1325-N LWDFs (116-N-1 and 116-N-3) arc shown in Figure 1. Both the 1301-N and 1325-N LWDFs consist of a crib and a trench. Both LWDFs were used to receive and dispose of the cooling water originating from the 100-N Reactor and are classified as RCRA treatment, storage, and/or disposal (TSD) units. The LWDFs are no longer receiving waste effluent.

2429 (DOE/RL--94-113-Rev.1) **Proposed plan for interim remedial measure at the 100-KR-4 operable unit, Revision 1.** USDOE Richland Operations Office, WA (United States). Sep 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017496. Source: OSTI; NTIS; INIS; GPO Dep.

This proposed plan identifies the preferred alternative for an interim remedial action plan for the 100-KR-4 Operable Unit at the Hanford Site. The alternative presented is to remove contaminated groundwater from the Unit, treat it by ion exchange, and then dispose of treated groundwater by using upgradient injection wells to return it to the acquifer. This will protect the Columbia River environment from toxic hexavalent chromium. This alternative is the initial recommendation of the EPA, Ecology, and the DOE. Public comment on this plan is invited.

2430 (DOE/RL--95-34) **118-B-1 burial ground excavation treatability test report.** Bechtel National, Inc., Richland, WA (United States). Aug 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017515. Source: OSTI; NTIS; INIS; GPO Dep.

This treatability investigation focused on the feasibility of excavating, analytical screening, and handling waste materials from the 118-B-1 Burial Ground located in the 100 B/C Area of the Hanford Site. The 118-B-1 Burial Ground consists of approximately 24 trenches on a 7-acre parcel. Solid low-level radioactive wastes and other debris and trash associated with reactor operations were disposed in 28 burial grounds in the 100 Area between 1944 and 1973. The majority of waste generated from routine reactor operations was placed in seven primary burial grounds, including 118-B-1. The 118-B-1 Burial Ground was selected as the location to perform this treatability test based on the availability of historical data for this site, and because it was thought to be representative of other primary-use burial grounds in the 100 Area. Geophysical surveys were conducted over the burial ground to map the concentrations of waste and aid in the selection of test pit excavation locations. The test plan developed for this study integrated the Streamlined Approach for Environmental Restoration (SAFER), a US Department of Energy (DOE) initiative based on both the Data Quality Objective (DQO) process and the observational approach. This treatability test is the first one at the Hanford Site to use the SAFER approach. The purpose of this study was (1) to support development of the Proposed Plan and Record of Decision, which would identify the approach to be used for burial ground remediation and (2) to provide specific engineering information for receiving waste generated from the 100 Area removal actions. The results of the treatability test can be used to determine the feasibility of performing excavation, analytical screening, and handling of burial ground materials from similar burial grounds.

2431 (DOE/RL--95-52) **Nonradioactive air emissions notice of construction for the stabilization of the 1300-N emergency dump basin.** Bechtel National, Inc., Richland, WA (United States). May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017500. Source: OSTI; NTIS; INIS; GPO Dep.

The 1300-N Emergency Dump Basin (EDB) is a carbon steel lined retention basin with a one million gallon capacity (3.7 million liters) (Figure 1). It was originally designed to receive primary coolant water during an emergency from the 100-N Reactor, although it was never used for that purpose. However, the EDB was later used as a holding basin for water periodically generated during the N Reactor steam generator blowdown operations until 1987 when N Reactor was shut down. In 1991, approximately 20,000 gallons (75,750 liters) of water was transferred to the EDB from the Lift Station. There is currently 400,000 gallons of water in the basin which consists mainly of filtered water which was added to control contamination. Wind-blown dust and debris has created a sediment layer on the bottom of the basin. This sediment has been classified as mixed waste and has a wet, settled volume estimated at 1664 ft^3($47m^3$). As part of the stabilization process, the majority of the remaining EDB water will be pumped to the 109-N sumps for later treatment and disposal. Sediment will be removed with the remaining water using a slurry process (similar to a vacuum process), and will be packaged in a moist condition in order to prevent potential airborne releases. The liner will then be stabilized and left intact until area remediation has begun. Periodic surveillance and maintenance will be conducted until the site is remediated.

2432 (DOE/RL--95-55) **Hanford Site background: Evaluation of existing soil radionuclide data.** Bechtel National, Inc., Richland, WA (United States). Jul 1995. 160p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017498. Source: OSTI; NTIS; INIS; GPO Dep.

This report is an evaluation of the existing data on radiological background for soils in the vicinity of the Hanford Site. The primary purpose of this report is to assess the adequacy of the existing data to serve as a radiological background baseline for use in environmental restoration and remediation activities at the Hanford Site. The soil background data compiled and evaluated in this report were collected by the Pacific Northwest Laboratory (PNL) and Washington State Department of Health (DOH) radiation surveillance programs in southeastern Washington. These two programs provide the largest well-documented, quantitative data sets available to evaluate background conditions at the Hanford Site. The data quality objectives (DQOs) considered in this evaluation include the amount of data, number of sampling localities, spatial coverage, number and types of radionuclides reported, frequency of reporting, documentation and traceability of sampling and laboratory methods used, and comparability between sets of data. Although other data on soil radionuclide abundances around the Hanford Site exist, they are generally limited in scope and lack the DQOs necessary for consideration with the PNL and DOH data sets. Collectively, these two sources provide data on the activities of 25 radionuclides and four other parameters (gross alpha, gross beta, total uranium, and total thorium). These measurements were made on samples from the upper 2.5 cm of soil at over 70 localities within the region.

2433 (DOE/WIPP–91-043-Rev.) **Transuranic waste characterization sampling and analysis methods manual.** Westinghouse Electric Corp., Carlsbad, NM (United States). May 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE96004514. Source: OSTI; NTIS; INIS; GPO Dep.

The Transuranic Waste Characterization Sampling and Analysis Methods Manual (Methods Manual) provides a unified source of information on the sampling and analytical techniques that enable Department of Energy (DOE) facilities to comply with the requirements established in the current revision of the Transuranic Waste Characterization Quality Assurance Program Plan (QAPP) for the Waste Isolation Pilot Plant (WIPP) Transuranic (TRU) Waste Characterization Program (the Program). This Methods Manual includes all of the testing, sampling, and analytical methodologies accepted by DOE for use in implementing the Program requirements specified in the QAPP.

2434 (DOE/WIPP–91-043-Rev.1) **Transuranic waste characterization sampling and analysis methods manual. Revision 1.** Suermann, J.F. USDOE Carlsbad Area Office, NM (United States). Apr 1996. 339p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013556. Source: OSTI; NTIS; INIS; GPO Dep.

This Methods Manual provides a unified source of information on the sampling and analytical techniques that enable Department of Energy (DOE) facilities to comply with the requirements established in the current revision of the Transuranic Waste Characterization Quality Assurance Program Plan (QAPP) for the Waste Isolation Pilot Plant (WIPP) Transuranic (TRU) Waste Characterization Program (the Program) and the WIPP Waste Analysis Plan. This Methods Manual includes all of the testing, sampling, and analytical methodologies accepted by DOE for use in implementing the Program requirements specified in the QAPP and the WIPP Waste Analysis Plan. The procedures in this Methods Manual are comprehensive and detailed and are designed to provide the necessary guidance for the preparation of site-specific procedures. With some analytical methods, such as Gas Chromatography/Mass Spectrometry, the Methods Manual procedures may be used directly. With other methods, such as nondestructive characterization, the Methods Manual provides guidance rather than a step-by-step procedure. Sites must meet all of the specified quality control requirements of the applicable procedure. Each DOE site must document the details of the procedures it will use and demonstrate the efficacy of such procedures to the Manager, National TRU Program Waste Characterization, during Waste Characterization and Certification audits.

2435 (DOE/WIPP–95-2094) **Waste Isolation Pilot Plant site environmental report for calendar year 1994.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. Jun 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE96003975. Source: OSTI; NTIS; INIS; GPO Dep.

US Department of Energy (DOE) Order 5400.1 General Environmental Protection Program, requires each DOE facility that conducts significant environmental protection programs to prepare an Annual Site Environmental Report (ASER). The purpose of the ASER is to summarize environmental data in order to characterize site environmental management performance, to confirm compliance with environmental standards and requirements, and to highlight significant programs and efforts. This ASER not only documents the required data, it also documents new and continued monitoring and compliance activities during the 1994 calendar year. Data contained in this report are derived from those monitoring programs directed by the Waste Isolation Pilot Plant (WIPP) Environmental Monitoring Plan (EMP) (DOE/WIPP 94-024). The EMP defines a comprehensive set of parameters that must be monitored to detect potential impacts to the environment and to establish baseline measurements for future environmental evaluations. Surface water, groundwater, air, soil, and biotics are monitored for radiological and nonradiological activity levels. The baseline radiological surveillance program covers the broader geographic area that encompasses nearby ranches, villages, and cities. Nonradiological studies focus on the area immediately surrounding the WIPP site.

2436 (DOE/WIPP–95-2100) **Geotechnical analysis report for July 1993–June 1994.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. Aug 1995. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE96003982. Source: OSTI; NTIS; INIS; GPO Dep.

The geotechnical data from the underground excavations at the WIPP are interpreted and presented in this Geotechnical Analysis Report. The data are used to characterize conditions, assess design assumptions, and understand and predict the performance of the underground excavations during operations. The data are obtained as part of a regular monitoring program. The format of the Geotechnical Analysis Report was selected to meet the needs of several audiences. This report focuses on the geotechnical performance of the various underground facilities including the shafts, shaft stations, access drifts, experimental rooms, and waste storage areas. The results of excavation effects, investigations, stratigraphic mapping, and other geologic studies are also included. The report provides an evaluation of the geotechnical aspects of performance in the context of the relevant design criteria and also describes the techniques used to acquire the data and the performance history of the instruments. The depth and breadth of the evaluation for the different underground facilities varies according to the types and quantities of data that are available, and the complexity of the recorded geotechnical responses.

2437 (DOE/WIPP–95-2129) **Underground mining and deep geologic disposal - Two compatible and complementary activities.** Rempe, N.T. Westinghouse Electric Corp., Carlsbad, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (CONF-960911–1: Canadian Nuclear Society (CNS) international conference on deep geological disposal of radioactive waste, Winnipeg (Canada), 15-18 Sep 1996). Order Number DE96014294. Source: OSTI; NTIS; INIS; GPO Dep.

Active and mature underground mining districts offer conditions favorable to deep geologic disposal because their geology is known in more detail, the feasibility of underground excavations has already been demonstrated, mining leaves distinctive footprints and records that alert subsequent generations to the anthropogenic alterations of the underground environment, and subsequent exploration and production proceeds with great care and accuracy to locate and generally to avoid old mine workings. Compatibility of mining with deep geologic waste disposal has been proven by decades of experience with safe storage and disposal in former mines and in the mined-out areas of still active mining operations. Mineral extraction around an intended repository reduces the incentive for future disturbance. Incidental features of mineral exploration and extraction such as lost circulation zones, allochthonous backfill, and permanent surface markers can deter future intrusion into a repository. Thus exploration and production of mineral resources should be compatible with, and complementary to, deep geologic waste disposal.

2438 (ES/ER/TM–106/R1) **Preliminary remediation goals for use at the US Department of Energy Oak Ridge Operations Office. Revision 1.** Oak Ridge K-25 Site, TN (United States). May 1996. 959p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96010693. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

This technical memorandum presents Preliminary Remediation Goals (PRGs) for use in human health risk assessment efforts under the United States Department of Energy, Oak Ridge Operations Office Environmental Restoration (ER) Division. This document provides the ER Division with standardized PRGs which are integral to the Remedial Investigation/Feasibility Study process. They are used during project scooping (Data Quality Objectives development), in screening level risk assessments to support early action or No Further Investigation decisions, and in the baselines risk assessment where they are employed in the selection of chemicals of potential concern. The primary objective of this document is to standardize these values and eliminate any duplication of effort by providing PRGs to all contractors involved in risk activities. In addition, by managing the assumptions and systems used in PRG derivation, the ER Risk Assessment Program will be able to control the level of quality assurance associated with these risk-based guideline values.

2439 (ES/ER/TM–162/R1) **Preliminary remediation goals for ecological endpoints.** Efroymson, R.A.; Suter, G.W. II; Sample, B.E.; Jones, D.S. Oak Ridge National Lab., TN (United States). Jul 1996. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96013229. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary remediation goals (PRGs) are useful for risk assessment and decision making at Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) sites. PRGs are upper concentration limits for specific chemicals in specific environmental media that are anticipated to protect human health or the environment. They can be used for multiple remedial investigations at multiple facilities. In addition to media and chemicals of potential concern, the development of PRGs generally requires some knowledge or anticipation of future land use. In Preliminary Remediation Goals for Use at the U.S. Department of Energy Oak Ridge Operations Office (Energy Systems 1995), PRGs intended to protect human health were developed with guidance from Risk Assessment Guidance for Superfund: Volume I - Human Health Evaluation Manual, Part B (RAGS) (EPA 1991). However, no guidance was given for PRGs based on ecological risk. The numbers that appear in this volume have, for the most part, been extracted from toxicological benchmarks documents for Oak Ridge National Laboratory (ORNL) and have previously been developed by ORNL. The sources of the quantities, and many of the uncertainties associated with their derivation, are described in this technical memorandum.

2440 (ES/ER/TM–170) **Daytime multispectral scanner aerial surveys of the Oak Ridge Reservation, 1992–1994: Overview of data processing and analysis by the Environmental Restoration Remote Sensing Program, Fiscal year 1995.** Smyre, J.L.; Hodgson, M.E.; Moll, B.W.; King, A.L.; Cheng, Yang. Oak Ridge National Lab., TN (United States). Nov 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006095. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration (ER) Remote Sensing and Special Surveys Program was in 1992 to apply the benefits of remote sensing technologies to Environmental Restoration Management (ERWM) programs at all of the five United States Department of Energy facilities operated and managed by Martin Marietta Energy Systems, Inc. (now Lockheed Martin Energy Systems)-the three Oak Ridge Reservation (ORR) facilities, the Paducah Gaseous Diffusion Plant (PGDP), the Portsmouth Gaseous Diffusion Plant (PORTS)-and adjacent off-site areas. The Remote Sensing Program includes the management of routine and special surveys at these sites, application of state-of-the-art remote sensing and geophysical technologies, and data transformation, integration, and analyses required to make the information valuable to ER. Remotely-sensed data collected of the ORR include natural color and color infrared (IR) aerial photography, 12-band multispectral scanner imagery, predawn thermal IR sensor imagery, magnetic and electromagnetic geophysical surveys, and gamma radiological data.

2441 (ES/ER/TM–173) **Gamma radiological surveys of the Oak Ridge Reservation, Paducah Gaseous Diffusion Plant, and Portsmouth Gaseous Diffusion Plant, 1990-1993, and overview of data processing and analysis by the Environmental Restoration Remote Sensing Program, Fiscal Year 1995.** Smyre, J.L.; Moll, B.W.; King, A.L. Oak Ridge National Lab., TN (United States). Jun 1996. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96012841. Source: OSTI; NTIS; INIS; GPO Dep.

Three gamma radiological surveys have been conducted under auspices of the ER Remote Sensing Program: (1) Oak Ridge Reservation (ORR) (1992), (2) Clinch River (1992), and (3) Portsmouth Gaseous Diffusion Plant (PORTS) (1993). In addition, the Remote Sensing Program has acquired the results of earlier surveys at Paducah Gaseous Diffusion Plant (PGDP) (1990) and PORTS (1990). These radiological surveys provide data for characterization and long-term monitoring of U.S. Department of Energy (DOE) contamination areas since many of the radioactive materials processed or handled on the ORR, PGDP, and

PORTS are direct gamma radiation emitters or have gamma emitting daughter radionuclides. High resolution airborne gamma radiation surveys require a helicopter outfitted with one or two detector pods, a computer-based data acquisition system, and an accurate navigational positioning system for relating collected data to ground location. Sensors measure the ground-level gamma energy spectrum in the 38 to 3,026 KeV range. Analysis can provide gamma emission strength in counts per second for either gross or total man-made gamma emissions. Gross count gamma radiation includes natural background radiation from terrestrial sources (radionuclides present in small amounts in the earth's soil and bedrock), from radon gas, and from cosmic rays from outer space as well as radiation from man-made radionuclides. Man-made count gamma data include only the portion of the gross count that can be directly attributed to gamma rays from man-made radionuclides. Interpretation of the gamma energy spectra can make possible the determination of which specific radioisotopes contribute to the observed man-made gamma radiation, either as direct or as indirect (i.e., daughter) gamma energy from specific radionuclides (e.g., cesium-137, cobalt-60, uranium-238).

2442 (GA–C22131(1-96)) **E-SMART system for in-situ detection of environmental contaminants. Quarterly progress report.** General Atomics, San Diego, CA (United States). Jan 1996. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96006532. Source: OSTI; NTIS; GPO Dep.

Environmental Systems Management, Analysis and Reporting neTwork (E-SMART) is a comprehensive, fully-integrated approach to in-situ, real-time detection and monitoring of environmental contaminants. E-SMART will provide new class of smart, highly sensitive, chemically-specific, in-situ, multichannel microsensors utilizing integrated optical interferometry technology, large, commercially viable set of E-SMART-compatible sensors, samplers, and network management components, and user-friendly graphical user interface for data evaluation and visualization.

2443 (INEL–94/00066) **Treatability studies and large-scale treatment of aqueous mixed waste containing heavy metals.** Haefner, D.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9508198–1: Mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE96003512. Source: OSTI; NTIS; INIS; GPO Dep.

Wastes have accumulated at the Idaho National Engineering Laboratory through routine laboratory practices, experimental engineering operations, and decommissioning and decontamination of nuclear reactor facilities. A storage tank at the Test Area North held approximately 129,000 L of acidic wastewater and contained prohibited levels of lead and mercury. Radioactive constituents were also present; the most predominant being radiocesium Cs-137 and radiocobalt Co-60. Bench-scale studio were undertaken to evaluate ion exchange as a means of removing the contaminants. A set of breakthrough curves was obtained and identified capacity constraints, selectivities, and operating requirements of candidate resins. Treatment studies indicated that Purolite S-920 resin could effectively remove mercury, while Rohm and Haas' Amberlite 200-CH was used for lead and radionuclide removal. Based on these laboratory tests a full-scale facility, using multiple ion exchange columns, was designed and operated in the spring of 1994. The liquid effluents were discharged to an onsite evaporation pond and met RCRA disposal limits for hazardous metals and self-imposed radionuclide limits. All secondary wastes and residues were sampled and subjected to the to)dc characteristic leaching procedure. The resulting leachate concentrations were below RCRA discharge limits and, therefore, these will be disposed of at the onsite low-level disposal facility. After concluding the tank wastewater operations, enough reserve resin capacity was available to treat three additional mixed wastes residing onsite. These totaled about 1,900 L (500 gal) and contained prohibited levels of chromium, cadmium, and barium. Laboratory studies demonstrated that these heavy metals could also be removed by the existing resins. Treatment was performed at the full-scale facility with the effluents discharged to the evaporation pond.

2444 (INEL–94/0080) **Virtual environmental applications for buried waste characterization technology evaluation report.** National Renewable Energy Lab., Golden, CO (United States). May 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001179. Source: OSTI; NTIS; INIS; GPO Dep.

The project, Virtual Environment Applications for Buried Waste Characterization, was initiated in the Buried Waste Integrated Demonstration Program in fiscal year 1994. This project is a research and development effort that supports the remediation of buried waste by identifying and examining the issues, needs, and feasibility of creating virtual environments using available characterization and other data. This document describes the progress and results from this project during the past year.

2445 (INEL–94/0098) **INEL metal recycle radioactive scrap metal survey report.** Funk, D.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002942. Source: OSTI; NTIS; INIS; GPO Dep.

DOE requested that inventory and characterization of radioactive scrap metal (RSM) be conducted across the DOE complex. Past studies have estimated the metal available from unsubstantiated sources. In meetings held in FY-1993, with seven DOE sites represented and several DOE-HQ personnel present, INEL personnel discovered that these numbers were not reliable and that large stockpiles did not exist. INEL proposed doing in-field measurements to ascertain the amount of RSM actually available. This information was necessary to determine the economic viability of recycling and to identify feed stock that could be used to produce containers for radioactive waste. This inventory measured the amount of RSM available at the selected DOE sites. Information gathered included radionuclide content and chemical form, general radiation field, alloy type, and mass of metal.

2446 (INEL–94/00148) **Method of estimating maximum VOC concentration in void volume of vented waste drums using limited sampling data: Application in transuranic waste drums.** Liekhus, K.J.; Connolly, M.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950877–23: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD

(United States), 7-11 Aug 1995). Order Number DE96003506. Source: OSTI; NTIS; INIS; GPO Dep.

A test program has been conducted at the Idaho National Engineering Laboratory to demonstrate that the concentration of volatile organic compounds (VOCs) within the innermost layer of confinement in a vented waste drum can be estimated using a model incorporating diffusion and permeation transport principles as well as limited waste drum sampling data. The model consists of a series of material balance equations describing steady-state VOC transport from each distinct void volume in the drum. The primary model input is the measured drum headspace VOC concentration. Model parameters are determined or estimated based on available process knowledge. The model effectiveness in estimating VOC concentration in the headspace of the innermost layer of confinement was examined for vented waste drums containing different waste types and configurations. This paper summarizes the experimental measurements and model predictions in vented transuranic waste drums containing solidified sludges and solid waste.

2447 (INEL–94/0162) **Remote measurement of corrosion using ultrasonic techniques.** Garcia, K.M.; Porter, A.M. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Feb 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001194. Source: OSTI; NTIS; INIS; GPO Dep.

Supercritical water oxidation (SCWO) technology has the potential of meeting the US Department of Energy's treatment requirements for mixed radioactive waste. A major technical constraint of the SCWO process is corrosion. Safe operation of a pilot plant requires monitoring of the corrosion rate of the materials of construction. A method is needed for measurement of the corrosion rate taking place during operation. One approach is to directly measure the change in wall thickness or growth of oxide layer at critical points in the SCWO process. In FY-93, a brief survey of the industry was performed to evaluate nondestructive evaluation (NDE) methods for remote corrosion monitoring in supercritical vessels. As a result of this survey, it was determined that ultrasonic testing (UT) methods would be the most cost-effective and suitable method of achieving this. Therefore, the objective for FY-94 was to prove the feasibility of using UT to monitor corrosion of supercritical vessels remotely during operation without removal of the insulation.

2448 (INEL–94/0251) **A review of the current state-of-the-art methodology for handling bias and uncertainty in performing criticality safety evaluations. Final report.** Disney, R.K. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Oct 1994. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002933. Source: OSTI; NTIS; INIS; GPO Dep.

The methodology for handling bias and uncertainty when calculational methods are used in criticality safety evaluations (CSE's) is a rapidly evolving technology. The changes in the methodology are driven by a number of factors. One factor responsible for changes in the methodology for handling bias and uncertainty in CSE's within the overview of the US Department of Energy (DOE) is a shift in the overview function from a "site" perception to a more uniform or "national" perception. Other causes for change or improvement in the methodology for handling calculational bias and uncertainty are; (1) an increased demand for benchmark criticals data to expand the area (range) of applicability of existing data, (2) a demand for new data to supplement existing benchmark criticals data, (3) the increased reliance on (or need for) computational benchmarks which supplement (or replace) experimental measurements in critical assemblies, and (4) an increased demand for benchmark data applicable to the expanded range of conditions and configurations encountered in DOE site restoration and remediation.

2449 (INEL–95/0015-Rev.1) **Waste management facilities cost information for transuranic waste.** Shropshire, D.; Sherick, M.; Biagi, C. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001371. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains preconceptual designs and planning level life-cycle cost estimates for managing transuranic waste. The report's information on treatment and storage modules can be integrated to develop total life-cycle costs for various waste management options. A procedure to guide the U.S. Department of Energy and its contractor personnel in the use of cost estimation data is also summarized in this report.

2450 (INEL–95/0036) **Results of performance tests on chemical and radiation measurement systems for use at a dig-face.** Gehrke, R.J.; Lawrence, R.S.; Pawelko, R.J. Idaho National Engineering Lab., Idaho Falls, ID (United States). Apr 1995. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001183. Source: OSTI; NTIS; INIS; GPO Dep.

Chemical and radiation measurement systems are being developed for use at a dig-face to provide sensing capability during the excavation of previously buried waste. it is believed that on-line dig-face characterization will reduce environmental, health, and safety risks during the cleanup of buried waste sites as well as improve the efficiency of the cleanup process. This report describes progress in the development of three measurement systems: (a) a γ/neutron monitor that scans the dig-face for high levels of radiation prior to excavation, (b) a Ge spectrometer that identifies specific radionuclides located with the γ/neutron monitor, and (c) a prompt γ neutron activation analysis (PGNAA) system that measures the presence of chlorine and chlorinated compounds often associated with hazardous waste. The Ge spectrometer and PGNAA system also will provide off-line but on-site capability of radionuclide and elemental identification of excavated waste prior to handling, treatment, transportation, or disposal.

2451 (INEL–95/00040) **Multiphased use of an X-MET 880 XRF to survey lead in soil at the Idaho National Engineering Laboratory.** Gianotto, D.F.; Anderson, I.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950209–12: 4. international symposium on field screening methods for hazardous wastes and toxic chemicals, Las Vegas, NV (United States), 22-24 Feb 1995). Order Number DE96001628. Source: OSTI; NTIS; INIS; GPO Dep.

An X-ray fluorescence spectrometer was used in a multiphased approach to analyze soil samples for lead contamination. The objectives of this investigation were to characterize the spatial distribution of lead contamination, identify two areas of surficial soil with elevated lead concentrations (hot-spots), and quantify subsurface soil contamination at the hot-spots to evaluate the vertical migration of lead. Phase I consisted of using non-site-specific standards to calibrate the XRF instrument to qualitatively and semi-quantitatively assess lead contamination (Type I XRF analysis). Phase III involved selecting soil samples for off-site SW-846 analysis and using the results to develop a calibration model based on site-specific calibration standards (SSCS). The XRF was used in Phase III to obtained quantitative results (Type II XRF analysis).

2452 (INEL–95/0051) **The status of soil mapping for the Idaho National Engineering Laboratory.** Olson, G.L. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Lee, R.D.; Jeppesen, D.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1995. 180p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002354. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the production of a revised version of the general soil map of the 2304-km^2 (890-mi^2) Idaho National Engineering Laboratory (INEL) site in southeastern Idaho and the production of a geographic information system (GIS) soil map and supporting database. The revised general soil map replaces an INEL soil map produced in 1978 and incorporates the most current information on INEL soils. The general soil map delineates large soil associations based on National Resources Conservation Services [formerly the Soil Conservation Service (SCS)] principles of soil mapping. The GIS map incorporates detailed information that could not be presented on the general soil map and is linked to a database that contains the soil map unit descriptions, surficial geology codes, and other pertinent information.

2453 (INEL–95/0076) **Test plan guidance for transuranic-contaminated arid landfill remedial technology development.** Evans, J.; Shaw, P. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001348. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides guidance for preparing plans to test or demonstrate buried waste assessment or remediation technologies supported by the U.S. Department of Energy's Landfill Stabilization Focus Area, Transuranic-Contaminated Arid Landfill Product Line. This document also provides guidance for development of data quality objectives, along with the necessary data to meet the project objectives. The purpose is to ensure that useful data of known quality are collected to support conclusions associated with the designated demonstration or test. A properly prepared test plan will integrate specific and appropriate objectives with needed measurements to ensure data will reflect the Department of Energy Office of Technology Development's mission, be consistent with Landfill Stabilization Focus Area test goals, and be useful for the Department of Energy Environmental Restoration and Waste Management programs and other potential partners (e.g., commercial concerns). The test plan becomes the planning and working document for the demonstration or test to be conducted ensuring procedures are followed that will allow data of sufficient quality to be collected for comparison and evaluation.

2454 (INEL–95/0089) **Buried Waste Integrated Demonstration FY-95 Deployment Plan.** Stacey, D.E. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Mar 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001195. Source: OSTI; NTIS; INIS; GPO Dep.

The Buried Waste Integrated Demonstration (BWID) is a program funded by the U.S. Department of Energy Office of Technology Development. BWID supports the applied research, development, demonstration, testing, and evaluation of a suite of advanced technologies that together form a comprehensive remediation system for the effective and efficient remediation of buried waste. The FY-95 effort will fund 24 technologies in five areas of buried waste site remediation: site characterization, waste characterization, retrieval, treatment, and containment/stabilization. Ten of these technologies will take part in the integrated field demonstration that will take place at the Idaho National Engineering Laboratory (INEL) facilities in the summer of 1995. This document is the basic operational planning document for deployment of all BWID projects funded in FY-95. Discussed in this document are the BWID preparations for the INEL integrated field demonstration, INEL research and development (R&D) demonstrations, non-INEL R&D demonstrations, and office research and technical review meetings. Each project will have a test plan detailing the specific procedures, objectives, and tasks of the test. Therefore, information that is specific to testing each technology is intentionally limited in this document.

2455 (INEL–95/0171) **Test plan for a live drum survey using the gamma-neutron sensor.** Gehrke, R.J.; Roybal, L.G.; Thompson, D.N. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jul 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003550. Source: OSTI; NTIS; INIS; GPO Dep.

This plan describes performance tests to be made with the Gamma/Neutron Sensor (GNS), which that was designed and built for infield assay at an excavation site. The performance tests will be performed in Building WMF-628 in the Transuranic Storage Area of the Radioactive Waste Management Complex at the Idaho National Engineering Laboratory on stored 55-gal drums of transuranic waste from the Rocky Flats Plant. The GNS is mounted on a wooden pallet that will allow horizontal and vertical scans of the stacked drums. Scanning speed and GNS sensitivity for gamma and neutron radiation fields will be estimated. Effects of temperature, electronic, and acoustic noise will be evaluated. Two- and three-dimensional plots of radiation field as a function of position will be developed from the data.

2456 (INEL–95/0233) **Field test plan: Buried waste technologies, Fiscal Year 1995.** Heard, R.E. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Hyde, R.A.; Engleman, V.S.; Evans, J.D.; Jackson, T.W. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001561. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy, Office of Technology Development, supports the applied research, development, demonstration, testing, and evaluation of a suite of advanced technologies that, when integrated with commercially available baseline technologies, form a comprehensive remediation system for the effective and efficient remediation of buried waste. The Fiscal Year 1995 effort is to deploy and test multiple technologies from four functional areas of buried waste remediation: site characterization, waste characterization, retrieval, and treatment. This document is the basic operational planning document for the deployment and testing of the technologies that support the field testing in Fiscal Year 1995. Discussed in this document are the scope of the tests; purpose and objective of the tests; organization and responsibilities; contingency plans; sequence of activities; sampling and data collection; document control; analytical methods; data reduction, validation, and verification; quality assurance; equipment and instruments; facilities and utilities; health and safety; residuals management; and regulatory management.

2457 (INEL–95/00235) **The results of an ecological risk assessment screening at the Idaho National Engineering's waste area group 2.** VanHorn, R. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950868–30: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96004006. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

The Idaho National Engineering Laboratory (INEL) is a Department of Energy (DOE) facility located in southeastern Idaho and occupies approximately 890 square miles on the northwestern portion of the eastern Snake River Plain. INEL has been devoted to nuclear energy research and related activities since its establishment in 1949. In the process of fulfilling this mission, wastes were generated, including radioactive and hazardous materials. Most materials were effectively stored or disposed of, however, some release of contaminants to the environment has occurred. For this reason, the INEL was listed by the US environmental Protection Agency on the National Priorities List (NPL), in November, 1989. This report describes the results of an ecological risk assessment performed for the Waste Area Groups 2 (WAG 2) at the INEL. It also summarizes the performance of screening level ecological risk assessments (SLERA).

2458 (INEL–95/00263) **Neural network utility in nondestructive transuranic waste assay, initial investigations.** Becker, G. EG and G Idaho, Inc., Idaho Falls, ID (United States); Pacific Northwest Lab., Richland, WA (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830 ; AC07-94ID13223. (CONF-9503132–3: 74. annual Gas Processors Association (GPA) meeting, San Antonio, TX (United States), 13-15 Mar 1995). Order Number DE96002525. Source: OSTI; NTIS; INIS; GPO Dep.

The determination of transuranic (TRU) and associated radioactive material quantities entrained in waste forms is a necessary component of waste characterization. Measurement performance requirements are specified in the National TRU Waste Characterization Program quality assurance plan for which compliance must be demonstrated prior to the transportation and disposition of wastes. With respect to this criterion, the existing TRU nondestructive waste assay (NDA) capability is inadequate for a significant fraction of the US Department of Energy (DOE) complex waste inventory. This is a result of the general application of safeguard-type measurement and calibration schemes to waste form configurations. Incompatibilities between such measurement methods and actual waste form configurations complicate regulation. compliance demonstration processes and illustrate the need for an alternate measurement interpretation paradigm. Hence, it appears necessary to supplement or perhaps restructure the perceived solution and approach to the waste NDA problem. The first step is to understand the magnitude of the waste matrix/source attribute space associated with those waste form configurations in inventory and how this creates complexities and unknowns with respect to existing NDA methods. Once defined and/or bounded, a conceptual method must be developed that specifies the necessary tools and the framework in which the tools are used. A promising framework is a hybridized neural network structure. Discussed are some typical complications associated with conventional waste NDA techniques and how improvements can be obtained through the application of neural networks.

2459 (INEL–95/0269) **Environment, safety, health, and quality plan for the TRU- Contaminated Arid Soils Project of the Landfill Stabilization Focus Area Program.** Watson, L.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003483. Source: OSTI; NTIS; INIS; GPO Dep.

The Landfill Stabilization Focus Area (LSFA) is a program funded by the US Department of Energy Office of Technology Development. LSFA supports the applied research, development, demonstration, testing, and evaluation of a suite of advanced technologies that together form a comprehensive remediation system for the effective and efficient remediation of buried waste. The TRU-Contaminated Arid Soils project is being conducted under the auspices of the LSFA Program. This document describes the Environment, Safety, Health, and Quality requirements for conducting LSFA/Arid Soils activities at the Idaho National Engineering Laboratory. Topics discussed in this report, as they apply to LSFA/Arid Soils operations, include Federal, State of Idaho, and Environmental Protection Agency regulations, Health and Safety Plans, Quality Program, Data Quality Objectives, and training and job hazard analysis. Finally, a discussion is given on CERCLA criteria and system and performance audits as they apply to the LSFA Program.

2460 (INEL–95/00269) **Vitrification of surrogate mixed wastes in a graphite electrode arc melter.** Soelberg, N.R. (and others); Chambers, A.G.; Ball, L. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950542–5: 14. international symposium on thermal treatment technologies: incineration conference, Seattle, WA (United States), 8-12 May 1995). Order Number DE96001927. Source: OSTI; NTIS; INIS; GPO Dep.

Demonstration tests for vitrifying mixed wastes and contaminated soils have been conducted using a small (800 kVA), industrial-scale, three-phase AC, graphite electrode furnace located at the Albany Research Center of the United States Bureau of Mines (USBM). The feed mixtures were non-radioactive surrogates of various types of mixed (radioactive and hazardous), transuranic-contaminated wastes stored and buried at the Idaho National Engineering Laboratory (INEL). The feed mixtures were processed with added soil from the INEL. Objectives being evaluated include (1) equipment capability to achieve desired process conditions and vitrification products for different feed compositions, (2) slag and metals tapping capability, (3) partitioning of transuranic elements and toxic metals among the furnace products, (4) slag, fume, and metal products characteristics, and (5) performance of the feed, furnace and air pollution control systems. The tests were successfully completed in mid-April 1995. A very comprehensive process monitoring, sampling and analysis program was included in the test program. Sample analysis, data reduction, and results evaluation are currently underway. Initial results indicate that the furnace readily processed around 20,000 lb of widely ranging feed mixtures at feedrates of up to 1,100 lb/hr. Continuous feeding and slag tapping was achieved. Molten metal was also tapped twice during the test program. Offgas emissions were efficiently controlled as expected by a modified air pollution control system.

2461 (INEL–95/0281) **Idaho National Engineering Laboratory code assessment of the Rocky Flats transuranic waste.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States); Wastren, Inc., Idaho Falls, ID (United States). Jul 1995. 475p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001548. Source: OSTI; NTIS; INIS; GPO Dep.

This report is an assessment of the content codes associated with transuranic waste shipped from the Rocky Flats Plant in Golden, Colorado, to INEL. The primary objective of this document is to characterize and describe the transuranic wastes shipped to INEL from Rocky Flats by item description code (IDC). This information will aid INEL in determining if the waste meets the waste acceptance criteria (WAC) of the Waste Isolation Pilot Plant (WIPP). The waste covered by this content code assessment was shipped from Rocky Flats between 1985 and 1989. These years coincide with the dates for information available in the Rocky Flats Solid Waste Information Management System (SWIMS). The majority of waste shipped during this time was certified to the existing WIPP WAC. This waste is referred to as precertified waste. Reassessment of these precertified waste containers is necessary because of changes in the WIPP WAC. To accomplish this assessment, the analytical and process knowledge available on the various IDCs used at Rocky Flats were evaluated. Rocky Flats sources for this information include employee interviews, SWIMS, Transuranic Waste Certification Program, Transuranic Waste Inspection Procedure, Backlog Waste Baseline Books, WIPP Experimental Waste Characterization Program (headspace analysis), and other related documents, procedures, and programs. Summaries are provided of: (a) certification information, (b) waste description, (c) generation source, (d) recovery method, (e) waste packaging and handling information, (f) container preparation information, (g) assay information, (h) inspection information, (i) analytical data, and (j) RCRA characterization.

2462 (INEL–95/0291) **Waste streams that preferentially corrode 55-gallon steel storage drums.** Zirker, L.R.; Beitel, G.A.; Reece, C.M. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001558. Source: OSTI; NTIS; INIS; GPO Dep.

When 55-gal steel drum waste containers fail in service, i.e., leak, corrode or breach, the standard fix has been to overpack the drum. When a drum fails and is overpacked into an 83-gal overpack drum, there are several negative consequences. Identifying waste streams that preferentially corrode steel drums is essential to the pollution prevention philosophy that "an ounce of prevention is worth a pound of cure." It is essential that facilities perform pollution prevention measures at the front end of processes to reduce pollution on the back end. If these waste streams can be identified before they are packaged, the initial drum packaging system could be fortified or increased to eliminate future drum failures, breaches, clean-ups, and the plethora of other consequences. Therefore, a survey was conducted throughout the US Department of Energy complex for information concerning waste streams that have demonstrated preferential corrosion of 55-gal steel drums. From 21 site contacts, 21 waste streams were so identified. The major components of these waste streams include acids, salts, and solvent liquids, sludges, and still bottoms. The solvent-based waste streams typically had the shortest time to failure, 0.5 to 2 years. This report provides the results of this survey and research.

2463 (INEL–95/0302) **Results of the gamma-neutron mapper performance test on 55-gallon drums at the RWMC.** Gehrke, R.J.; Lawrence, R.S.; Roybal, L.G.; Svoboda, J.M.; Harker, D.J.; Thompson, D.N.; Carpenter, M.V.; Josten, N.E. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jul 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001337. Source: OSTI; NTIS; INIS; GPO Dep.

The primary purpose of the gamma-neutron mapper (G@) is to provide accurate and quantitative spatial information of the gamma-ray and neutron radiation fields as a function of position about the excavation of a radioactive waste site. The GNM is designed to operate remotely and can be delivered to any point on an excavation by the robotic gantry crane developed by the dig-face project at the Idaho National Engineering Laboratory (INEL). It can also be easily adapted to other delivery systems. The GNM can be deployed over a waste site at a predetermined scan rate and has sufficient accuracy to identify and quantify radioactive contaminants of importance. The results reported herein are from a performance test conducted at the Transuranic Storage Area, Building 628, of the Radioactive Waste Management Complex located at the INEL. This building is an active interim-storage area for 55-gal drums of transuranic waste from the Department of Energy's Rocky Flats Plant. The performance test consisted of scanning a stack of drums five high by five wide. Prior to the test, radiation fields were measured by a health physicist at the center of the drums and ranged from 0.5 mR/h to 35 mR/h. Scans of the drums using the GNM were taken at standoff distances from the vertical drum stack of 15 cm, 30 cm, 45 cm, and 90 cm. Data were acquired at scan speeds of 7.5 cm/s and 15 cm/s. The results of these scans and a comparison of these results with the manifests of these drums are compared and discussed.

2464 (INEL–95/00311) **Performance test of a gamma/neutron mapper on stored TRU waste drums at the RWMC.** Gehrke, R.J. (and others); Josten, N.E.; Lawrence, R.S. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951091–4: 4. nondestructive assay and nondestructive examination waste characterization conference, Salt Lake City, UT (United States), 24-26 Oct 1995). Order Number DE96002513. Source: OSTI; NTIS; INIS; GPO Dep.

The results from a performance test of a γ- and neutron-radiation measurement instrument used to provide two-dimensional radiation field maps are reported. The performance test was conducted at the Transuranic Storage Area of the Radioactive Waste Management Complex (RWMC) where interim storage is provided for 55-gal. drums of TRU waste from the Department of Energy's Rocky Flats Plant. The performance test consisted of scanning drums stacked five high and five wide to identify high radiation areas and possible discrepancies with the waste manifest. Scans were taken at standoff distances of 15 cm, 30 cm, 45 cm and 90 cm. Data were acquired at scan speeds of 7.5 cm/s and 15 cm/s. The results of these scans are presented as one, two and three dimensional contour plots of the radiation fields. A comparison of these results with manifests of these drums are compared and discussed. While the T-radiation fields as measured by the Health Physicist and by the radiation maps are in general in agreement, the TRU content as given in the manifest did not often correlate with the neutron map.

2465 (INEL–95/00313) **Pulsed eddy current thickness measurements of transuranic waste containers.** O'Brien, T.K.; Kunerth, D.C. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951091–12: 4. nondestructive assay and nondestructive examination waste characterization conference, Salt Lake City, UT (United States), 24-26 Oct 1995). Order Number DE96007704. Source: OSTI; NTIS; INIS; GPO Dep.

Thickness measurements on fifty five gallon waste drums for drum integrity purposes have been traditionally performed at the INEL using ultrasonic testing methods. Ultrasonic methods provide high resolution repeatable thickness measurements in a timely manner, however, the major drawback of using ultrasonic techniques is coupling to the drum. Areas with severe exterior corrosion, debonded paper labels or any other obstacle in the acoustic path will have to be omitted from the ultrasonic scan. We have developed a pulsed eddy current scanning system that can take thickness measurements on fifty five gallon carbon steel drums with wall thicknesses up to 65 mils. This type of measurement is not susceptible to the problems mentioned above. Eddy current measurements in the past have excluded ferromagnetic materials such as carbon steel because of the difficulty in penetrating the material and in compensating for changes in permeability from material to material. New developments in data acquisition electronics as well as advances in personal computers have made a pulsed eddy current system practical and inexpensive. Certain aspects of the pulsed eddy current technique as well as the operation of such a system and features such as real time pass/fail thresholds for overpacking identification and full scan data archiving for future evaluation will be discussed.

2466 (INEL–95/0321) **Buried Waste Integrated Demonstration fiscal Year 1994 close-out report.** Owen, K.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jul 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001335. Source: OSTI; NTIS; INIS; GPO Dep.

The Buried Waste integrated Demonstration (BWID) supports the applied research, development, demonstration, and evaluation of a multitude of advanced technologies. These technologies are being integrated to form a comprehensive remediation system for the effective and efficient remediation of buried waste. These efforts are identified and coordinated in support of the US Department of Energy Environmental Restoration and Waste Management needs and objectives. BWID works with universities and private industry to develop these technologies, which are being transferred to the private sector for use nationally and internationally. A public participation policy has been established to provide stakeholders with timely and accurate information and meaningful opportunities for involvement in the technology development and demonstration process. To accomplish this mission of identifying technological solutions for remediation deficiencies, the Department of Energy Office of Technology Development initiated BMD at the Idaho National Engineering Laboratory. This report summarizes the activities of the BWID program during Fiscal Year 1994. In Fiscal Year 1995, these activities are transitioning into the Landfill Stabilization Focus Area.

2467 (INEL–95/00356) **Innovative technologies for the remediation of transuranic- contaminated landfills.** Kostelnik, K.M. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9507187–1: International Atomic Energy Agency Research Meeting, Idaho Falls, ID (United States), 24-28 Jul 1995). Order Number DE96001851. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) has initiated a comprehensive research,development, demonstration, testing and evaluation program to provide innovative technology systems to achieve its environmental management responsibilities. The Office of Technology Development (OTD) is responsible for this research in support of the Offices of Environmental Restoration and Waste Management efforts. In fiscal year (FY) 1992 the OTD established the Buried Waste Integrated Demonstration (BWID). The BWID mission was to support the development of emerging technologies for their application to the remediation of DOE buried waste site. During FY95, the BWID program was transitioned into a larger program which will focus its attention to DOE Landfills and Contaminated Soils. There search and activities formerly referred to as the BWID will now be associated with the Transuranic-contaminated Arid Landfill Stabilization Program.(TALS). The TALS Program supports these buried waste remediation efforts by seeking out the best talent to solve the technology challenges as identified in baseline remediation strategies. Experts from throughout the DOE complex, universities, private sector, and the international community are being included in this program to solve these challenges and ensure implementation and commercialization of innovative technologies.

2468 (INEL–95/00370) **Feasibility and applications of cone beam x-ray imaging for containerized wastes.** Roney, T. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Galbraith, S.; White, T.; Clack, R.; O'Reilly, M.; Defrise, M.; Noo, F. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951091–7: 4. nondestructive assay and nondestructive examination waste characterization conference, Salt Lake City, UT (United States), 24-26 Oct 1995). Order Number DE96002776. Source: OSTI; NTIS; INIS; GPO Dep.

Large area scintillation screens coupled to video and scientific-grade CCD cameras allow high speed digital data acquisition for both single 2-D x-ray projections and tomographic data sets comprised of multiple 2-D projections. While the data cquisition may proceed more rapidly than data acquisition using a linear detector array, there are geometric distortions associated with the projection cone angle long processing times for 3-D tomographic data. This paper reviews issues associated with processing and interpretation of the data and approaches to resolving some of the problems for containerized waste inspection. Results obtained with the Idaho National Engineering Laboratory's Digital Radiography and Computed Tomography scanner are presented.

2469 (INEL–95/0411) **Innovative Technology Development Program. Final summary report.** Beller, J. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002363. Source: OSTI; NTIS; INIS; GPO Dep.

Through the Office of Technology Development (OTD), the U.S. Department of Energy (DOE) has initiated a national applied research, development, demonstration, testing, and evaluation program, whose goal has been to resolve the major technical issues and rapidly advance technologies for environmental restoration and waste management. The Innovative Technology Development (ITD) Program was established as a part of the DOE, Research, Development, Demonstration, Testing, and Evaluation (RDDT&E) Program. The plan is part of the DOE's program to restore sites impacted by weapons production and to upgrade future waste management operations. On July 10, 1990, DOE issued a Program Research and Development Announcement (PRDA) through the Idaho Operations Office to solicit private sector help in developing innovative technologies to support DOE's clean-up goals. This report presents summaries of each of the seven projects, which developed and tested the technologies proposed by the seven private contractors selected through the PRDA process.

2470 (INEL–95/0445) **CFD model development and data comparison for thermal-hydraulic analysis of HTO pilot scale reactor.** Kochan, R.J.; Oh, C.H. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002194. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE Hydrothermal Oxidation (HTO) program is validating computational methods for use in scaling up small HTO systems to production scale. As part of that effort, the computational fluid dynamics code FLUENT is being used to calculate the integrated fluid dynamics and chemical reactions in an HTO vessel reactor designed by MODAR, Inc. Previous validation of the code used data from a benchscale reactor. This reports presents the validation of the code using pilotscale (10 times greater throughput than benchscale) data. The model for the pilotscale reactor has been improved based upon the benchscale data by including better fluid thermal properties, a better solution algorithm, addition of external heat transfer, investigation of the effects of turbulent flow, and, although not built into the computer model, a technique for using the calculated adiabatic oxidation temperatures for selecting initial conditions. Thermal results from this model show very good agreement with the limited test data from MODAR Run 920. In addition to the reactor temperatures, flowfield details, including chemical reaction distribution, and simulated salt particle transport were obtained. This model will be very beneficial in designing and evaluating larger commercial scale units. The results of these calculations indicate that for model validation, more accurate boundary conditions need to be measured in future test runs.

2471 (INEL–95/0454) **Version 1.00 programmer's tools used in constructing the INEL RML/analytical radiochemistry sample tracking database and its user interface.** Femec, D.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 190p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002188. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes two code-generating tools used to speed design and implementation of relational databases and user interfaces: CREATE-SCHEMA and BUILD-SCREEN. CREATE-SCHEMA produces the SQL commands that actually create and define the database. BUILD-SCREEN takes templates for data entry screens and generates the screen management system routine calls to display the desired screen. Both tools also generate the related FORTRAN declaration statements and precompiled SQL calls. Included with this report is the source code for a number of FORTRAN routines and functions used by the user interface. This code is broadly applicable to a number of different databases.

2472 (INEL–95/00462) **Mercury retorting of calcine waste, contaminated soils and railroad ballast at the Idaho National Egineering Laboratory.** Cotten, G.B. (Parsons Engineering Science, Inc., Houston, TX (United States)); Rothermel, J.S.; Sherwood, J.; Heath, S.A.; Lo, T.Y.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 28 Feb 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960212–30: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96007281. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory (INEL) has been involved in nuclear reactor research and development for over 40 years. One of the earliest major projects involved the development of a nuclear powered aircraft engine, a long-term venture which used mercury as a shielding medium. Over the course of several years, a significant amount of mercury was spilled along the railroad tracks where the test engines were transported and stored. In addition, experiments with volume reduction of waste through a calcine process employing mercury as a catalyst resulted in mercury contaminated calcine waste. Both the calcine and Test Area North wastes have been identified in Department of Energy Action Memorandums to be retorted, thereby separating the mercury from the various contaminated media. Lockheed Idaho Technologies Company awarded the Mercury Retort contract to ETAS Corporation and assigned Parsons Engineering Science, Inc. to manage the treatment field activities. The mercury retort process entails a mobile unit which consists of four trailer-mounted subsystems requiring electricity, propane, and a water supply. This mobile system demonstrates an effective strategy for retorting waste and generating minimal secondary waste.

2473 (INEL–95/0475) **Uncertainty analysis of the SWEPP drum assay system for graphite content code 300.** Harker, Y.D.; Blackwood, L.G.; Meachum, T.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002355. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory is being used as a temporary storage facility for transuranic waste generated by the U.S. Nuclear Weapons program at the Rocky Flats Plant (RFP) in Golden, Colorado. Currently, there is a large effort in progress to prepare to ship this waste to the Waste Isolation Pilot Plant (WIPP) in Carlsbad, New Mexico. In order to meet the TRU Waste Characterization Quality Assurance Program Plan nondestructive assay compliance requirements and quality assurance objectives, it is necessary to determine the total uncertainty of the radioassay results produced by the Stored Waste Examination Pilot Plant (SWEPP) Passive Active Neutron (PAN) radioassay system. This paper discusses a modified statistical sampling and verification approach used to determine the total uncertainty of a SWEPP/PAN measurement. In this modified approach the total performance of the SWEPP/PAN nondestructive assay system is simulated using computer models of the assay system and the resultant output is compared with the known input to assess the total uncertainty. The first waste form to be tested using this approach is weapons grade plutonium-contaminated graphite molds contained in 207 liter drums. The validity of the simulation approach is verified by comparing simulated output against results from calibration measurements using known plutonium sources and a graphite waste form calibration drum. For actual graphite waste form conditions, a set of 50 cases covering a statistical sampling of the conditions exhibited in graphite wastes was compiled using a Latin hypercube statistical sampling approach. The distributions from which Latin hypercube sample was drawn was derived from reviews of approximately 100 real-time radiography video tapes of RFP graphite waste drums, results from previous SWEPP/PAN measurements on graphite waste drums, and shipping data from RFP where the graphite waste was generated.

2474 (INEL–95/00503) **Utility of neural networks in nondestructive waste assay measurement methods.** Becker, G.K. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Roney, T.J.; Watts, C.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951091–5: 4. nondestructive assay and nondestructive examination waste characterization conference, Salt Lake City, UT (United States), 24-26 Oct 1995). Order Number DE96002500. Source: OSTI; NTIS; INIS; GPO Dep.

Concepts devised to utilize nondestructive assay measurement techniques to quantify waste entrained radioactive material mass, transuranic and otherwise, must necessarily contain provisions for complexity. Such complexities are founded in the multi-variate attribute distributions associated with the typical waste form and the inherently limited nature of present-day nondestructive assay (NDA) sensors and detection techniques. For many waste forms, the attribute variables are such that commonly employed NDA techniques do not possess the capability to acquire accurate measures useful in deriving a viable solution using first principle modeling techniques. The existence of limitations in commonly employed NDA instrumentation and techniques logically leads to a search for an alternate view or paradigm for data treatment. The approach addressed in this paper shifts from model-driven algorithmic methods to data-driven empirical methods. Such empirical methods are statistical in nature, and possess desirable characteristics of adaptivity and learning. Examples of modern empirical methods include neural networks, fuzzy logic, genetic algorithms, and combinations thereof. This work provides an investigation into the utility of three neural network architectures for deriving useful information for nondestructive waste assay solutions. To illustrate the inherent capability of these data-driven techniques, a simple waste form classification exercise is performed using radial basis function, counterpropagation, and adaptive resonance theory neural networks. The classifications are derived solely from the self-organizing and adaptation capabilities of the network architectures and associated learning rules. No apriori information or models are assumed during the classification exercises.

2475 (INEL–95/0513) **Bibliography for nuclear criticality accident experience, alarm systems, and emergency management.** Putman, V.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 225p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002218. Source: OSTI; NTIS; INIS; GPO Dep.

The characteristics, detection, and emergency management of nuclear criticality accidents outside reactors has been an important component of criticality safety for as long as the need for this specialized safety discipline has been recognized. The general interest and importance of such topics receives special emphasis because of the potentially lethal, albeit highly localized, effects of criticality accidents and because of heightened public and regulatory concerns for any undesirable event in nuclear and radiological fields. This bibliography lists references which are potentially applicable to or interesting for criticality alarm, detection, and warning systems; criticality accident emergency management; and their associated programs. The lists are annotated to assist bibliography users in .dentifying applicable: industry and regulatory guidance and requirements, with historical development information and comments; criticality accident characteristics, consequences, experiences, and responses; hazard-, risk-, or safety-analysis criteria; CAS design and qualification criteria; CAS calibration, maintenance, repair, and testing criteria; experiences of CAS designers and maintainers; criticality accident emergency management (planning, preparedness, response, and recovery) requirements and guidance; criticality accident emergency management experience, plans, and techniques; methods and tools for analysis; and additional bibliographies.

2476 (INEL–96/0014) **Characterization of nuclear decontamination solutions at the Idaho Chemical Processing Plant from 1982-1990.** Zohner, S.K. Idaho National Engineering Lab., Idaho Falls, ID (United States). Mar 1996. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96010361. Source: OSTI; NTIS; INIS; GPO Dep.

This report represents possibly the single largest collection of operational decontamination data from a nuclear reprocessing facility at the Idaho National Engineering Laboratory and perhaps anywhere in the world. The uniqueness of this data is due to the Idaho Chemical Processing Plant's (ICPP's) ability to process different types of highly enriched nuclear fuel. The report covers an 8-year period, during which six campaigns were conducted to dissolve nuclear fuel clad in stainless steel, aluminum, graphite, and zirconium. Each fuel type had a separate head-end process with unique dissolution chemistry, but shared the same extraction process equipment. This report presents data about decontamination activities of the ICPP's First Cycle extraction vessels, columns, piping, and aluminum dissolution vessels. Operating data from 1982 through 1990 has been collected, analyzed, and characterized. Chemicals used in the decontamination processes are documented along with quantities used. The chemical solutions are analyzed to compare effectiveness. Radioisotopic analysis is recorded, showing and quantifying what nuclides were removed by the various solutions. The original data is also provided to make it possible for researchers to address questions and test other hypotheses not discussed in this report.

2477 (INEL–96/0068) **A technical review of the SWEPP gamma-ray spectrometer system.** Hartwell, J.K. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Mar 1996. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96009904. Source: OSTI; NTIS; INIS; GPO Dep.

The SWEPP Gamma-ray Spectrometer (SGRS) was developed by INEL researchers as a nonintrusive method of determining the isotopic ratios of TRU and U materials in a 208-liter waste drums. The SGRS has been in use at SWEPP since mid-1994. Enough questions have been raised regarding the system reliability and technical capabilities, that, coupled with a desire to procure an additional gamma-ray spectroscopy system in order to increase the drum throughput of SWEPP, have prompted an independent technical review of the SGRS. The author was chosen as the reviewer, and this report documents the results of the review. While the SGRS is accurate in its isotopic ratio results, the system is not calculationally robust. The primary reason for this lack of calculational reliability is the implementation of the attenuation corrections. Suggested changes may improve the system reliability dramatically. The SGRS is a multiple detector spectrometry system. Tests were conducted on various methods for combining the four detector results into a single drum representative value. No clear solution was reached for the cases in which the isotopic ratios are vertically segregated; however, some methods showed promise. These should be investigated further. 14 refs. , 15 figs., 23 tabs.

2478 (INEL–96/0076) **Use of Monte Carlo methods in environmental risk assessments at the INEL: Applications and issues.** Harris, G.; Van Horn, R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1996. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96013294. Source: OSTI; NTIS; INIS; GPO Dep.

The EPA is increasingly considering the use of probabilistic risk assessment techniques as an alternative or refinement of the current point estimate of risk. This report provides an overview of the probabilistic technique called Monte Carlo Analysis. Advantages and disadvantages of implementing a Monte Carlo analysis over a point estimate analysis for environmental risk assessment are discussed. The general methodology is provided along with an example of its implementation. A phased approach to risk analysis that allows iterative refinement of the risk estimates is recommended for use at the INEL.

2479 (INEL–96/0113) **Alternate fluid to improve energy efficiency of supercritical water oxidation process.** Oh, C.H. Idaho National Engineering Lab., Idaho Falls, ID (United States). Mar 1996. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96010354. Source: OSTI; NTIS; GPO Dep.

This report discusses the replacement of water by carbon dioxide in both the quench stream and the supercritical water oxidation (SCWO) reactor feed in order to reduce the energy utilization in the process. FLUENT was used to generate the input requirements and ASPEN PLUS was used to model the SCWO process. Simulations were made for normal MODAR operating conditions (baseline case) and two other cases replacing water by carbon dioxide. The basis for and assumptions used in the simulation are given. Economic evaluations were made and costs were compared with the baseline case and a case with 60% replacement of water by carbon dioxide. The equipment cost is almost the same. However, the case with replacement of water by carbon dioxide reduces the energy requirement in the end process by a factor of three, which is a significant energy savings in the operation. Also, the injection of carbon dioxide into the SCWO reactor feed is expected to reduce corrosion and makes salt particles non-sticky. However, these advantages need to be confirmed by experiment.

2480 (INEL–96/0151) **Decomposition of PCBs in oils using gamma radiolysis: A treatability study. Final report.** Mincher, B.J.; Arbon, R.E. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Apr 1996. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96010360. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of a treatability study of radiologically and PCB contaminated waste hydraulic oils at the Idaho National Engineering Laboratory (INEL). The goal of the study was to demonstrate that PCBs could be selectively removed from the contaminated oils. The PCBs were selectively decomposed in an in-situ fashion via gamma-ray radiolysis. The gamma-ray source was spent nuclear fuel at the Advanced Test Reactor (ATR) canal at the Test Reactor Area (TRA), of the INEL. Exposure to gamma-rays does not induce radioactivity in the exposed solutions. The treatability study was the culmination of five years of research concerning PCB radiolysis conducted at INEL which investigated the mechanism and kinetics of the reaction in several solvents. The major findings of this research are summarized here. Based upon these findings three INEL waste streams were selected for testing of the process. The Environmental Protection Agency (EPA) treatment standard of 2 mg/kg was successfully achieved in all waste streams. The interference of contaminants other than PCBs is discussed.

2481 (IS-M–840) **Applications of lasers to the solution of environmental problems.** Allen, L.; Pang, H.-M.; Edelson, M.C. Ames Lab., IA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. (CONF-9511198–1: 3. symposium on laser spectroscopy at the Korean Atomic Energy Research Institute, Taejon (Korea, Republic of), 9 Nov 1995). Order Number DE96006840. Source: OSTI; NTIS; GPO Dep.

This presentation will focus on current work in the Ames Laboratory where laser ablation is being used for both analytical sampling and metal surface cleaning. Examples will be presented demonstrating the utility of optical spectroscopy for monitoring laser ablation processes.

2482 (K/WM–96) **Pollution prevention opportunity assessment for the K-25 Site Toxic Substances Control Act Incinerator Operations, Level III.** Oak Ridge K-25 Site, TN (United States); PAI Corp., Oak Ridge, TN (United States). Sep 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96000422. Source: OSTI; NTIS; INIS; GPO Dep.

Waste Management Program.

A Level III pollution prevention opportunity assessment (PPOA) was performed for the Oak Ridge K-25 Site Toxic Substances Control Act (TSCA) Incinerator to evaluate pollution prevention (P2) options for various waste streams: The main objective of this study was to identify and evaluate options to reduce the quantities of each waste stream generated by the TSCA Incinerator operations to realize significant environmental and/or economic benefits from P2. For each of the waste streams, P2 options were evaluated following the US Environmental Protection Agency (EPA) hierarchy to (1) reduce the quantity of waste generated, (2) recycle the waste, and/or (3) use alternate waste treatment or segregation methods. This report provides process descriptions, identification and evaluation of P2 options, and final recommendations.

2483 (LA--12986) **Area G perimeter surface-soil and single-stage water sampling: Environmental surveillance for fiscal year 1993.** Conrad, R.; Childs, M.; Rivera-Dirks, C.; Coriz, F. Los Alamos National Lab., NM (United States). Jul 1995. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95016707. Source: OSTI; NTIS; INIS; GPO Dep.

Area G, in Technical Area 54, has been the principle facility at Los Alamos National Laboratory for the storage and disposal of low-level and transuranic (TRU) radioactive wastes since 1957. The current environmental investigation consisted of ESH-19 personnel who collected soil and single-stage water samples around the perimeter of Area G to characterize possible contaminant movement through surface-water runoff. These samples were analyzed for tritium, total uranium, isotopic plutonium, americium-241 (soil only), and cesium 137. The metals, mercury, lead, and barium, were analyzed using x-ray fluorescence.

2484 (LA-SUB--95/141) **Assessment of remote sensing technologies to discover and characterize waste sites.** Los Alamos National Lab., NM (United States); Environmental Research Inst. of Michigan, Ann Arbor, MI (United States). 11 Mar 1992. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96003258. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents details about waste management practices that are being developed using remote sensing techniques to characterize DOE waste sites. Once the sites and problems have been located and characterized and an achievable restoration and remediation program have been established, efforts to reclaim the environment will begin. Special problems to be considered are: concentrated waste forms in tanks and pits; soil and ground water contamination; ground safety hazards for workers; and requirement for long-term monitoring.

2485 (LA-SUB--95-141-Prelim.) **Assessment of remote sensing technologies to discover and characterize waste sites.** Los Alamos National Lab., NM (United States); Environmental Research Inst. of Michigan, Ann Arbor, MI (United States). 11 Mar 1992. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96003542. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents details about waste management practices that are being developed using remote sensing techniques to characterize DOE waste sites. Special problems to be considered are: concentrated wastes in tanks and pits; soil and ground water contamination; ground safety hazards for workers; and requirements for long-term monitoring.

2486 (LA-SUB--96-2) **Laboratory analysis of soil hydraulic properties of G-5 soil samples.** Los Alamos National Lab., NM (United States); Stephens (Daniel B.) and Associates, Inc., Albuquerque, NM (United States). Jan 1995. 218p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96009520. Source: OSTI; NTIS; GPO Dep.

The Hydrologic Testing Laboratory at DBS&A has completed laboratory tests on TA-54 samples from well G5 as specified by Daniel James and summarized in Table 1. Tables 2 through 8 give the results of the specified analyses. Raw laboratory data and graphical plots of data (where appropriate) are contained in Appendices A through G. Appendix H lists the methods used in these analyses. A detailed description of each method is available upon request. Several sample-specific observations are important for data interpretation. Sample G-5 @ 21.5 was a short core and showed indications of preferential flow. Sample G-5 @ 92.5 developed a visually apparent crack during drying which correlates with the higher air permeabilities observed at lower water contents. Several samples yielded negative estimates of extrapolated intrinsic permeability while measured apparent permeabilities were reasonable. For consistency, however, only intrinsic values are presented. While our defined task is to provide data for interpretation, the following comments are offered as a context for some of the common parameter extraction issues. Further details and a more comprehensive summary of TA-54 data can be found in Unsaturated hydraulic characteristics of the Bandelier tuff at TA-54 dated November 17, 1994.

2487 (LA-SUB--96-10) **EMFLUX® soil-gas survey of Technical Area 54, Los Alamos National Laboratory, New Mexico.** Los Alamos National Lab., NM (United States); Quadrel Services, Inc., Ijamsville, MD (United States). 30 Sep 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96008998. Source: OSTI; NTIS; INIS; GPO Dep.

This EMFLUXR Soil-Gas Survey was conducted on Material Disposal Areas (MDAS) G, J, and L in Technical Area 54 at Los Alamos National Laboratory (LANL), New Mexico. MDA L has been used for disposal of volatile organic compounds (VOCs) and MDA G (comprising sub-areas G-1 through G-8) for disposal of both VOCs and radioactive waste; MDA I has reportedly been used for disposal of waste without either of these contaminants. All three of the sites are currently active. Figure 1 shows the location of the three MDAs within Technical Area 54 of operable Unit 1148. The purpose of the EMFLUX® Soil-Gas Survey was to determine the presence, identities, and relative strengths of contaminants within the three areas of LANL investigated. Quadrel understands that this information will be used in Phase-I assessment of these areas to determine flux rates of -- VOCs emanating from the ground.

2488 (LA-SUB--96-64) **Aerodynamics of the Large-Volume, Flow-Through Detector System. Final report.** Reed, H. (Arizona State Univ., Tempe, AZ (United States).

Aerospace Research Center); Saric, W.; Laananen, D.; Martinez, C.; Carrillo, R.; Myers, J.; Clevenger, D. Los Alamos National Lab., NM (United States); Arizona State Univ., Tempe, AZ (United States). Aerospace Research Center. Mar 1996. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96009556. Source: OSTI; NTIS; INIS; GPO Dep.

The Large-Volume Flow-Through Detector System (LVFTDS) was designed to monitor alpha radiation from Pu, U, and Am in mixed-waste incinerator offgases; however, it can be adapted to other important monitoring uses that span a number of potential markets, including site remediation, indoor air quality, radon testing, and mine shaft monitoring. Goal of this effort was to provide mechanical design information for installation of LVFTDS in an incinerator, with emphasis on ability to withstand the high temperatures and high flow rates expected. The work was successfully carried out in three stages: calculation of pressure drop through the system, materials testing to determine surrogate materials for wind-tunnel testing, and wind-tunnel testing of an actual configuration.

2489 (LA-SUB–96-99-Pt.2) **Air quality impacts analysis for area G. Final report.** Kowalewsky, K. (Radian Corp., Austin, TX (United States)); Eklund, B.; Vold, E.L. Radian Corp., Austin, TX (United States); Los Alamos National Lab., NM (United States). 5 Jul 1995. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96013265. Source: OSTI; NTIS; INIS; GPO Dep.

The impact of fugitive radioactive emissions from the disposal site, Area G, was evaluated in support of site characterization for the Performance Assessment and for the Radioactive Air Emissions Management (RAEM) program. Fugitive emissions of tritiated water and contaminated windblown dust were considered. Data from an extensive field measurement program were used to estimate annual emissions of tritiated water. Fugitive dust models were used to calculate estimates of the annual emissions of windblown dust. These estimates were combined with data on contamination levels in surface soils to develop annual emission rates for specific radionuclides: tritium, uranium-238, cesium-137, plutonium-238, plutonium-239,240, and strontium-90. The CAP-88 atmospheric transport model was used to predict areas potentially affected by long-term dust deposition and atmospheric concentrations. The annual emission rate of tritiated water was estimated from the field data to be 14.0 Ci/yr. The emission rate of soil-borne radionuclides from open areas and from soils handling operations totaled less than $1x10^{-4}$ Ci/yr. The CAP-88 results were used to develop effective dose equivalents (EDEs) for receptor locations downwind of Area G. All EDEs were several orders of magnitude below the national standard of 10 mrem/yr. Fugitive air emissions from Area G were found not to pose a health threat to persons living or working downwind of the facility.

2490 (LA-SUB–96-108) **Transuranic waste characterization sampling and analysis plan.** Los Alamos National Lab., NM (United States); Rogers and Associates Engineering Corp., Salt Lake City, UT (United States); Wastren, Inc., Westminster, CO (United States). 31 Dec 1994. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96013684. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos National Laboratory (the Laboratory) is located approximately 25 miles northwest of Santa Fe, New Mexico, situated on the Pajarito Plateau. Technical Area 54 (TA-54), one of the Laboratory's many technical areas, is a radioactive and hazardous waste management and disposal area located within the Laboratory's boundaries. The purpose of this transuranic waste characterization, sampling, and analysis plan (CSAP) is to provide a methodology for identifying, characterizing, and sampling approximately 25,000 containers of transuranic waste stored at Pads 1, 2, and 4, Dome 48, and the Fiberglass Reinforced Plywood Box Dome at TA-54, Area G, of the Laboratory. Transuranic waste currently stored at Area G was generated primarily from research and development activities, processing and recovery operations, and decontamination and decommissioning projects. This document was created to facilitate compliance with several regulatory requirements and program drivers that are relevant to waste management at the Laboratory, including concerns of the New Mexico Environment Department.

2491 (LA-UR–95-3382) **Mobile waste inspection real time radiography system.** Vigil, J. (Los Alamos National Lab., NM (United States). Chemical Science and Waste Technology); Taggart, D.; Betts, S.; Rael, C.; Martinez, F.; Mendez, J. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-951091–1: 4. nondestructive assay and nondestructive examination waste characterization conference, Salt Lake City, UT (United States), 24-26 Oct 1995). Order Number DE96001383. Source: OSTI; NTIS; INIS; GPO Dep.

The 450-KeV Mobile Real Time Radiography System was designed and purchased to inspect containers of radioactive waste produced at Los Alamos National Laboratory (LANL). The Mobile Real Time Radiography System has the capability of inspecting waste containers of various sizes from 5-gal. buckets to standard waste boxes (SWB, dimensions 54.5 in. x 71 in. x 37 in.). The fact that this unit is mobile makes it an attractive alternative to the costly road closures associated with moving waste from the waste generator to storage or disposal facilities.

2492 (LA-UR–95-3644) **Volatile organic compound monitoring by photo acoustic radiometry.** Sollid, J.E.; Trujillo, V.L.; Limback, S.P.; Woloshun, K.A. Los Alamos National Lab., NM (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9509111–1: Society of Photo-Optical Instrumentation Engineers (SPIE) meeting on environmental monitoring, San Francisco, CA (United States), 25-28 Sep 1995). Order Number DE96002589. Source: OSTI; NTIS; INIS; GPO Dep.

Two methods for sampling and analyzing volatile organics in subsurface pore gas were developed for use at the Hazardous Waste Disposal Site at Los Alamos National Laboratory. One is Thermal Desorption Gas Chromatography Mass Spectrometry (TDGCMS), the other is Photoacoustic Radiometry (PAR). Presented here are two years worth of experience and lessons learned as both techniques matured. The sampling technique is equally as important as the analysis method. PAR is a nondispersive infrared technique utilizing band pass filters in the region from 1 to 15 μm. A commercial instrument, the Model 1302 Multigas Analyzer, made by Bruel and Kjaer, was adapted for field use. To use the PAR there must be some a priori knowledge of the constellation of analytes to be measured. The TDGCMS method is sensitive to 50 analytes. Hence TDGCMS is used in an initial survey of the site to determine what compounds are present and at what concentration. Once the major constituents of the soil-gas vapor plume are known the PAR can be configured to monitor for the five analytes of most interest. The PAR can analyse a sample in minutes, while in the field. The PAR is also quite precise in controlled situations.

2493 (LA-UR–95-4293) **Characterization of waste streams and suspect waste from largest Los Alamos National Laboratory generators.** Soukup, J.D. (Benchmark Environmental Corp., Albuquerque, NM (United States)); Erpenbeck, G.J. Los Alamos National Lab., NM (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960212–4: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96005598. Source: OSTI; NTIS; INIS; GPO Dep.

A detailed waste stream characterization of 4 primary generators of low level waste at LANL was performed to aid in waste minimization efforts. Data was compiled for these four generators from 1988 to the present for analyses. Prior waste minimization efforts have focused on identifying waste stream processes and performing source materials substitutions or reductions where applicable. In this historical survey, the generators surveyed included an accelerator facility, the plutonium facility, a chemistry and metallurgy research facility, and a radiochemistry research facility. Of particular interest in waste minimization efforts was the composition of suspect low level waste in which no radioactivity is detected through initial survey. Ultimately, this waste is disposed of in the LANL low level permitted waste disposal pits (thus filling a scarce and expensive resource with sanitary waste). Detailed analyses of the waste streams from these 4 facilities, have revealed that suspect low level waste comprises approximately 50% of the low level waste by volume and 47% by weight. However, there are significant differences in suspect waste density when one considers the radioactive contamination. For the 2 facilities that deal primarily with beta emitting activation and spallation products (the radiochemistry and accelerator facilities), the suspect waste is much lower density than all low level waste coming from those facilities. For the 2 facilities that perform research on transuranics (the chemistry and metallurgy research and plutonium facilities), suspect waste is higher in density than all the low level waste from those facilities. It is theorized that the low density suspect waste is composed primarily of compactable lab trash, most of which is not contaminated but can be easily surveyed. The high density waste is theorized to be contaminated with alpha emitting radionuclides, and in this case, the suspect waste demonstrates fundamental limits in detection.

2494 (LA-UR–96-34) **A new computationally-efficient computer program for simulating spectral gamma-ray logs.** Conaway, J.G. Los Alamos National Lab., NM (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9510335–1: Minerals and Geotechnical Logging Society conference, Santa Fe, NM (United States), Oct 1995). Order Number DE96007187. Source: OSTI; NTIS; INIS; GPO Dep.

Several techniques to improve the accuracy of radionuclide concentration estimates as a function of depth from gamma-ray logs have appeared in the literature. Much of that work was driven by interest in uranium as an economic mineral. More recently, the problem of mapping and monitoring artificial gamma-emitting contaminants in the ground has rekindled interest in improving the accuracy of radioelement concentration estimates from gamma-ray logs. We are looking at new approaches to accomplishing such improvements. The first step in this effort has been to develop a new computational model of a spectral gamma-ray logging sonde in a borehole environment. The model supports attenuation in any combination of materials arranged in 2-D cylindrical geometry, including any combination of attenuating materials in the borehole, formation, and logging sonde. The model can also handle any distribution of sources in the formation. The model considers unscattered radiation only, as represented by the background-corrected area under a given spectral photopeak as a function of depth. Benchmark calculations using the standard Monte Carlo model MCNP show excellent agreement with total gamma flux estimates with a computation time of about 0.01% of the time required for the MCNP calculations. This model lacks the flexibility of MCNP, although for this application a great deal can be accomplished without that flexibility.

2495 (LA-UR–96-100) **Comparison of photoacoustic radiometry to gas chromatography/mass spectrometry methods for monitoring chlorinated hydrocarbons.** Sollid, J.E.; Trujillo, V.L.; Limback, S.P.; Woloshun, K.A. Los Alamos National Lab., NM (United States). [1996]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9606125–2: Air and Waste Management (AWM) annual meeting, Nashville, TN (United States), 23-28 Jun 1996). Order Number DE96007170. Source: OSTI; NTIS; INIS; GPO Dep.

A comparison of two methods of gas chromatography mass spectrometry (GCMS) and a nondispersive infrared technique, photoacoustic radiometry (PAR), is presented in the context of field monitoring a disposal site. First is presented an historical account describing the site and early monitoring to provide an overview. The intent and nature of the monitoring program changed when it was proposed to expand the Radiological Waste Site close to the Hazardous Waste Site. Both the sampling methods and analysis techniques were refined in the course of this exercise.

2496 (LA-UR–96-369) **Hydrogeologic analyses in support of the conceptual model for the LANL Area G LLRW performance assessment.** Vold, E.L.; Birdsell, K.; Rogers, D.; Springer, E.; Krier, D.; Turin, H.J. Los Alamos National Lab., NM (United States). [1996]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960212–66: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96008161. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory low level radioactive waste disposal facility at Area G is currently completing a draft of the site Performance Assessment. Results from previous field studies have estimated a range in recharge rate up to 1 cm/yr. Recent estimates of unsaturated hydraulic conductivity for each stratigraphic layer under a unit gradient assumption show a wide range in recharge rate of 10^{-4} to 1 cm/yr depending upon location. Numerical computations show that a single net infiltration rate at the mesa surface does not match the moisture profile in each stratigraphic layer simultaneously, suggesting local source or sink terms possibly due to surface connected porous regions. The best fit to field data at deeper stratigraphic layers occurs for a net infiltration of about 0.1 cm/yr. A recent detailed analysis evaluated liquid phase vertical moisture flux, based on moisture profiles in several boreholes and van Genuchten fits to the hydraulic properties for each of the stratigraphic units. Results show a near surface infiltration region averages 8m deep, below which is a dry, low moisture content, and low flux region, where liquid phase recharge averages to zero. Analysis shows this low flux region is dominated by vapor movement. Field data from tritium diffusion studies, from pressure fluctuation attenuation studies, and from comparisons of in-situ and core sample permeabilities indicate that the vapor diffusion is enhanced above that expected in the matrix and is presumably due to enhanced flow through the fractures. Below this dry region within the mesa is a moisture spike which analyses show corresponds to a moisture source. The likely physical explanation is seasonal transient infiltration through surface-connected fractures. This anomalous region is being investigated in current field studies, because it is critical in understanding the moisture flux which continues to deeper regions through the unsaturated zone.

2497 (LA-UR–96-578) **Airborne radioactive contamination monitoring.** Whitley, C.R.; Adams, J.R.; Bounds, J.A.; MacArthur, D.W. Los Alamos National Lab., NM (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9603129–2: 1996 New Mexico conference on the environment, Albuquerque, NM (United States), 12-14 Mar 1996). Order Number DE96006966. Source: OSTI; NTIS; INIS; GPO Dep.

Current technologies for the detection of airborne radioactive contamination do not provide real-time capability. Most of these techniques are based on the capture of particulate matter in air onto filters which are then processed in the laboratory; thus, the turnaround time for detection of contamination can be many days. To address this shortcoming, an effort is underway to adapt LRAD (Long-Range-Alpha-Detection) technology for real-time monitoring of airborne releases of alpa-emitting radionuclides. Alpha decays in air create ionization that can be subsequently collected on electrodes, producing a current that is proportional to the amount of radioactive material present. Using external fans on a pipe containing LRAD detectors, controlled samples of ambient air can be continuously tested for the presence of radioactive contamination. Current prototypes include a two-chamber model. Sampled air is drawn through a particulate filter and then through the first chamber, which uses an electrostatic filter at its entrance to remove ambient ionization. At its exit, ionization that occurred due to the presence of radon is collected and recorded. The air then passes through a length of pipe to allow some decay of short-lived radon species. A second chamber identical to the first monitors the remaining activity. Further development is necessary on air samples without the use of particulate filtering, both to distinguish ionization that can pass through the initial electrostatic filter on otherwise inert particulate matter from that produced through the decay of radioactive material and to separate both of these from the radon contribution. The end product could provide a sensitive, cost-effective, real-time method of determining the presence of airborne radioactive contamination.

2498 (LA-UR–96-633) **Migration of Sr-20, Cs-137, and Pu-239/240 in Canyon below Los Alamos outfall.** Murphy, J.M.; Mason, C.F.V.; Boak, J.M.; Longmire, P.A. Los Alamos National Lab., NM (United States). 1996. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960212–72: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96008509. Source: OSTI; NTIS; INIS; GPO Dep.

Technical Area-21 (TA-21) of Los Alamos National Laboratory (LANL) is on a mesa bordered by two canyons DP Canyon and Los Alamos (LA) Canyon. DP Canyon is a small semiarid watershed with a well defined channel system where the stream flow is ephemeral. TA-21 has had a complex history of waste disposal as research to determine the chemical and metallurgical properties of nuclear materials occurred here from 1945-1978. Due to these operations, the TA-21 mesa top and bordering canyons have been monitored and characterized by the LANL Environmental Restoration Program. Results identify radionuclide values at outfall. 21-011 (k) which exceed Screening Action Levels, and points along DP Canyon which exceed regional background levels. The radiocontaminants considered in this study are strontium-90, cesium-137, and plutonium-239. This research examines sediment transport and speciation of radionuclide contaminant migration from a source term named SWMU 21-011 (k) down DP Canyon. Three dimensional surface plots of data from 1977-1994 are used to portray the transport and redistribution of radioactive contaminants in an alluvial stream channel. An overall decrease in contamination concentration since 1983 has been observed which could be due to more stringent laboratory controls and also to the removal of main plutonium processing laboratories to another site.

2499 (LA-UR–96-732) **Contaminant analysis automation, an overview.** Hollen, R.; Ramos, O. Jr. Los Alamos National Lab., NM (United States). [1996]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9603129–5: 1996 New Mexico conference on the environment, Albuquerque, NM (United States), 12-14 Mar 1996). Order Number DE96009785. Source: OSTI; NTIS; INIS; GPO Dep.

To meet the environmental restoration and waste minimization goals of government and industry, several government laboratories, universities, and private companies have formed the Contaminant Analysis Automation (CAA) team. The goal of this consortium is to design and fabricate robotics systems that standardize and automate the hardware and software of the most common environmental chemical methods. In essence, the CAA team takes conventional, regulatory- approved (EPA Methods) chemical analysis processes and automates them. The automation consists of standard laboratory modules (SLMs) that perform the work in a much more efficient, accurate, and cost-effective manner.

2500 (LA-UR–96-1051) **Mass transfer of SCWO processes: Molecular diffusion and mass transfer coefficients of inorganic nitrate species in sub- and supercritical water.** Goemans, M.G.E. (Univ. of Texas, Austin, TX (United States). Dept. of Civil Engineering); Gloyna, E.F.; Buelow, S.J. Los Alamos National Lab., NM (United States). 1996. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960252–2: 2. international symposium on environmental applications of advanced oxidation technologies, San Francisco, CA (United States), 28 Feb - 1 Mar 1996). Order Number DE96009771. Source: OSTI; NTIS; GPO Dep.

Molecular diffusion coefficients of lithium-, sodium-, potassium-, cesium-, calcium-, and strontium nitrate in subcritical water were determined by analysis of Taylor dispersion profiles. Pressures ranged from 300 to 500 bar at temperatures ranging from 25°C to 300°C. The reported diffusion values were determined at infinite dilution. Molecular diffusion coefficients were 10 to 20 times faster in near-critical subcritical water than in water at ambient temperature and pressure (ATP). These findings implied that the diffusion rates were more liquid like than they were gas like, hence experimental results were correlated with diffusion models for liquids. The subcritical diffusion data presented in this work, and supercritical diffusion results published elsewhere were correlated with hydrodynamic diffusion equations. Both the Wilke-Chang correlation and the Stokes-Einstein equation yielded predictions within 10% of the experimental results if the structure of the diffusing species could be estimated. The effect of the increased diffusion rates on mass transfer rates in supercritical water oxidation applications was quantified, with emphasis on heterogeneous oxidation processes. This study and results published elsewhere showed that diffusion limited conditions are much more likely to be encountered in SCWO processes than commonly acknowledged.

2501 (LA-UR–96-1172) **Environmental waste site characterization utilizing aerial photographs and satellite imagery: Three sites in New Mexico, USA.** Van Eeckhout, E. (Los Alamos National Lab., NM (United States)); Pope, P.; Becker, N.; Wells, B.; Lewis, A.; David, N. Los Alamos National Lab., NM (United States). 1 Apr 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9607107–1: 18. international Society for Photogrammetry and Remote Sensing's congress, Vienna (Austria), 9-19 Jul 1996). Order Number DE96009028. Source: OSTI; NTIS; INIS; GPO Dep.

The proper handling and characterization of past hazardous waste sites is becoming more and more important as world population extends into areas previously deemed undesirable. Historical photographs, past records, current aerial satellite imagery can play an important role in characterizing these sites. These data provide clear insight into defining problem areas which can be surface samples for further detail. Three such areas are discussed in this paper: (1) nuclear wastes buried in trenches at Los Alamos National Laboratory, (2) surface dumping at one site at Los Alamos National Laboratory, and (3) the historical development of a municipal landfill near Las Cruces, New Mexico.

2502 (LA-UR–96-1272) **LANL's mobile nondestructive assay and examination systems for radioactive wastes.** Taggart, D.P. Betts, S.E.; Vigil, J.J. Los Alamos National Lab., NM (United States). 9 Apr 1996. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960804–14: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96009226. Source: OSTI; NTIS; INIS; GPO Dep.

The ability to accurately and rapidly measure nuclear material within drums and examine their contents without having to unpack the drums saves time, reduces characterization costs and minimizes radiation exposure. Over the past two years, Los Alamos National Laboratory (LANL) has developed and fielded a suite of mobile nondestructive assay and examination systems for use primarily on its own transuranic (TRU) waste but that also have application to low level, mixed and hazardous wastes. It has become obvious that systems like these are generally useful and have applications at other Department of Energy (DOE) production and environmental technology sites. Mobile capabilities present a potential cost savings where waste drums have to be transported to a fixed NDA facility. In other cases they fill a void where there is no fixed facility available because construction costs are prohibitive (as in the case of small quantity sites) or the available facilities may not meet current or evolving safety standards. Rather than bringing waste to a facility to be characterized, one can bring the characterization capability to the waste. The three systems described are: (1) mobile radiography system; (2) mobile segmented/tomographic gamma scanner; and (3) mobile passive/active neutron assay system.

2503 (LA-UR–96-1322) **Characterization and immobilization of cesium-137 in soil at Los Alamos National Laboratory.** Lu, Ningping; Mason, C.F.V.; Turney, W.R.J.R. Los Alamos National Lab., NM (United States). 1996. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9606219–1: 3. international conference on precision agriculture, St. Paul, MN (United States), 23-26 Jun 1996). Order Number DE96010480. Source: OSTI; NTIS; INIS; GPO Dep.

At Los Alamos National Laboratory, cesium-137 (^{137}Cs) is a major contaminant in soils of Technical Area 21 (TA-21) and is mainly associated with soil particles $\leq$2.00 mm. Cesium-137 was not leached by synthetic groundwater or acid rainwater. Soil erosion is a primary mechanism of ^{137}Cs transport in TA-21. The methodology that controls soil particle runoff can prevent the transport of ^{137}Cs.

2504 (LA-UR–96-1328) **Cost effectiveness of sonic drilling.** Masten, D.; Booth, S.R. Los Alamos National Lab., NM (United States). Mar 1996. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96010943. Source: OSTI; NTIS; INIS; GPO Dep.

Sonic drilling (combination of mechanical vibrations and rotary power) is an innovative environmental technology being developed in cooperation with DOE's Arid-Site Volatile Organic Compounds Integrated Demonstration at Hanford and the Mixed Waste Landfill Integrated Demonstration at Sandia. This report studies the cost effectiveness of sonic drilling compared with cable-tool and mud rotary drilling. Benefit of sonic drilling is its ability to drill in all types of formations without introducing a circulating medium, thus producing little secondary waste at hazardous sites. Progress has been made in addressing the early problems of failures and downtime.

2505 (LA-UR–96-1428) **Real-time monitoring for alpha emitters in high-airflow environments.** Koster, J.E.; MacArthur, D.W.; Bounds, J.A.; Rawool-Sullivan, M; Whitley, C.R.; Conaway, J.G.; Steadman, P.A. Los Alamos National Lab., NM (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960804–33: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96010492. Source: OSTI; NTIS; INIS; GPO Dep.

Key problems in detecting alpha contamination for site characterization and decontamination and decommissioning that remain to be solved include measurement of airborne contamination, material holdup within pipes, and leakage of material containers. These problems are very difficult using traditional alpha detectors and systems. The ionization detection method (long-range alpha detection of LRAD) offers a number of specific advantages for these environmental measurements. An LRAD system detects the air molecules ionized by alpha-emitting contamination rather than the alpha particles. Thus, LRAD-based detectors are not limited by the short range of alpha particles and can be used to detect contamination anywhere that air can penetrate. Extending this technology to large enclosures of long pipes requires a system optimized for large airflows. In this paper we will present designs and preliminary results for high-volume flow-through air monitors based on the LRAD technique. In addition, we will discuss the behavior of the monitors and their potential applications.

2506 (LA-UR–96-1566) **A self-directing elastic backscatter lidar system for debris cloud tracking and characterization.** Clark, D.A. (Los Alamos National Lab., NM (United States)); Dighe, K.A.; Tunnell, T.W. Los Alamos National Lab., NM (United States). [1996]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960770–2: 18. international laser radar conference, Berlin (Germany), 22-26 Jul 1996). Order Number DE96011257. Source: OSTI; NTIS; GPO Dep.

An elastic backscatter lidar that utilizes the lidar signal itself to direct the system towards fast moving isolated aerosol clouds has been developed. However, detecting and tracking invisible transient effluents from unknown locations, though conceptually straightforward, has still remained experimentally challenging. Accurate cloud volume, cloud density distribution, and track information have been obtained on small, fast moving, subvisible debris clouds resulting from above ground tests in which conventional explosives were detonated.

2507 (LA-UR–96-1970) **Cyclodextrin-based surface acoustic wave chemical microsensors.** Li, D.Q.; Shi, J.X.; Springer, K.; Swanson, B.I. Los Alamos National Lab., NM (United States). [1996]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960804–42: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96012749. Source: OSTI; NTIS; GPO Dep.

Cyclodextrin thin films were fabricated using either self-assembled monolayer (SAM) or solgel techniques. The resulting host receptor thin films on the substrates of surface acoustic wave (SAW) resonators were studied as method of tracking organic toxins in vapor phase. The mass loading of surface-attached host monolayers on SAW resonators gave frequency shifts corresponding to typical monolayer surface coverages for SAM methods and "multilayer" coverages for sol-gel techniques. Subsequent exposure of the coated SAW resonators to organic vapors at various concentrations, typically 5,000 parts per millions (ppm) down to 100 parts per billions (ppb) by mole, gave responses indicating middle-ppb-sensitivity (~50 ppb) for those sensor-host-receptors and organic-toxin pairs with optimum mutual matching of polarity, size, and structural properties.

2508 (LBL–36775) **Methods of constructing a 3D geological model from scatter data.** Horsman, J.; Bethel, W. Lawrence Berkeley Lab., CA (United States). Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9504204–1: Advanced visual systems conference, Boston, MA (United States), 19-21 Apr 1995). Order Number DE96000131. Source: OSTI; NTIS; GPO Dep.

Most geoscience applications, such as assessment of an oil reservoir or hazardous waste site, require geological characterization of the site. Geological characterization involves analysis of spatial distributions of lithology, porosity, etc. Because of the complexity of the spatial relationships, the authors find that a 3-D model of geology is better suited for integration of many different types of data and provides a better representation of a site than a 2-D one. A 3-D model of geology is constructed from sample data obtained from field measurements, which are usually scattered. To create a volume model from scattered data, interpolation between points is required. The interpolation can be computed using one of several computational algorithms. Alternatively, a manual method may be employed, in which an interactive graphics device is used to input by hand the information that lies between the data points. For example, a mouse can be used to draw lines connecting data points with equal values. The combination of these two methods presents yet another approach. In this study, the authors will compare selected methods of 3-D geological modeling, They used a flow-based, modular visualization environment (AVS) to construct the geological models computationally. Within this system, they used three modules, scat_3d, trivar and scatter_to_ucd, as examples of computational methods. They compare these methods to the combined manual and computational approach. Because there are no tools readily available in AVS for this type of construction, they used a geological modeling system to demonstrate this method.

2509 (LBL–37339) **Electrical resistivity for detecting subsurface non-aqueous phase liquids: A progress report.** Lee, K.H.; Shan, C.; Javandel, I. Lawrence Berkeley Lab., CA (United States). Jun 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95016527. Source: OSTI; NTIS; INIS; GPO Dep.

Soils and groundwater have been contaminated by hazardous substances at many places in the United States and many other countries. The contaminants are commonly either petroleum products or industrial solvents with very low solubility in water. These contaminants are usually called non-aqueous phase liquids (NAPLs). The cost of cleaning up the affected sites in the United States is estimated to be of the order of 100 billion dollars. In spite of the expenditure of several billion dollars during the last 15 years, to date, very few, if any major contaminated site has been restored. The presence of NAPL pools in the subsurface is believed to be the main cause for the failure of previous cleanup activities. Due to their relatively low water solubility, and depending on their volume, it takes tens or even hundreds of years to deplete the NAPL sources if they are not removed from the subsurface. The intrinsic electrical resistivity of most NAPLs is typically in the range of 10^7 to $10^{12}\Omega$-m, which is several orders of magnitude higher than that of groundwater containing dissolved solids (usually in the range of a few Ω-m to a few thousand Ω-m). Although a dry soil is very resistive, the electrical resistivity of a wet soil is on the order of 100 Ω-m and is dependent on the extent of water saturation. For a given soil, the electrical resistivity increases with decrease of water saturation. Therefore, if part of the pore water is replaced by a NAPL, the electrical resistivity will increase. At many NAPL sites, both the vadose and phreatic zones can be partially occupied by NAPL pools. It is the great contrast in electrical resistivity between the NAPLs and groundwater that may render the method to be effective in detecting subsurface NAPLs at contaminated sites. The following experiments were conducted to investigate the change of the electrical resistivity of porous media when diesel fuel (NAPL) replaces part of the water.

2510 (LBL–37554) **A field test of permeation grouting in heterogeneous soils using a new generation of barrier liquids.** Moridis, G.J. (Lawrence Berkeley Lab., CA (United States)); Persoff, P.; Apps, J.A.; Myer, L.; Pruess, K.; Yen, P. Lawrence Berkeley Lab., CA (United States). Aug 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950868–20: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96001123. Source: OSTI; NTIS; INIS; GPO Dep.

A field demonstration of permeation grouting was conducted at a gravel quarry near Los Banos, California, with the purpose of demonstrating the feasibility of the concept. Two grouts were used: a form of colloidal silica that gels after the addition of a gelling agent, and a polysiloxane that polymerizes after the addition of a catalyst. Both create relatively impermeable barriers in response to the large increase in viscosity during gelation or polymerization, respectively. The grouts were successfully injected at a depth between 10 and 14ft. Subsequent exhumation of the injected gravels revealed that both grouts produced relatively uniform bulbs. Laboratory measurements of the grouted material retrieved from the field showed at least a four order of magnitude reduction in permeability over the ungrouted material.

2511 (ORNL–6882) **Operating and life-cycle costs for uranium-contaminated soil treatment technologies.** Douthat, D.M. (Oak Ridge National Lab., TN (United States). Health Sciences Research Div.); Armstrong, A.Q.; Stewart, R.N. Oak Ridge National Lab., TN (United States). Sep 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006586. Source: OSTI; NTIS; INIS; GPO Dep.

The development of a nuclear industry in the US required mining, milling, and fabricating a large variety of uranium products. One of these products was purified uranium metal which was used in the Savannah River and Hanford Site reactors. Most of this feed material was produced at the US Department of Energy (DOE) facility formerly called the Feed Materials Production Center at Fernald, Ohio. During operation of this facility, soils became contaminated with uranium from a variety of sources. To avoid disposal of these soils in low-level radioactive waste burial sites, increasing emphasis has been placed on the remediating soils contaminated with uranium and other radionuclides. To address remediation and management of uranium-contaminated soils at sites owned by DOE, the DOE Office of Technology Development (OTD) evaluates and compares the versatility, efficiency, and economics of various technologies that may be combined into systems designed to characterize and remediate uranium-contaminated soils. Each technology must be able to (1) characterize the uranium in soil, (2) decontaminate or remove uranium from soil, (3) treat or dispose of resulting waste streams, (4) meet necessary state and federal regulations, and (5) meet performance assessment objectives. The role of the performance assessment objectives is to provide the information necessary to conduct evaluations of the technologies. These performance assessments provide the basis for selecting the optimum system for remediation of large areas contaminated with uranium. One of the performance assessment tasks is to address the economics of full-scale implementation of soil treatment technologies. The cost of treating contaminated soil is one of the criteria used in the decision-making process for selecting remedial alternatives.

2512 (ORNL–6884) **Site health and safety plan/work plan for further characterization of waste drums at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Abston, J.P.; Burman, S.N.; Jones, D.L. Oak Ridge National Lab., TN (United States). Oct 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006583. Source: OSTI; NTIS; INIS; GPO Dep.

The health and safety plan/work plan describes a strategy for characterizing the contents of 172 liquid waste and 33 solid waste drums. It also addresses the control measures that will be taken to (1) prevent or minimize any adverse impact on the environment or personnel safety and health and (2) meet standards that define acceptable management of hazardous and radioactive materials and wastes. When writing this document, the authors considered past experiences, recommendations, and best management practices to minimize possible hazards to human health or the environment from events such as fires, explosions, falls, mechanical hazards, or unplanned releases of hazardous or radioactive materials to air, soil, or surface water.

2513 (ORNL/ER–294) **Readiness review plan for the in situ vitrification demonstration of Seepage Pit 1 in Waste Area Grouping 7.** Oak Ridge National Lab., TN (United States). May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014002. Source: OSTI; NTIS; INIS; GPO Dep.

A treatability study is planned that encompasses the application of in situ vitrification (ISV) to at least two segments of the Oak Ridge National Laboratory Seepage Pit I during the third quarter of fiscal year 1995. Before the treatability study can be initiated, the proposed activity must be subjected to an Operational Readiness Review (ORR). ORR is a structured methodology of determining readiness to proceed as outlined in Martin Marietta Energy Systems, Inc. (Energy Systems), Environmental Restoration Waste Management Procedure ER/C-P1610, which provides Energy Systems organizations assurance that the work to be performed is consistent with management's expectations and that the subject activity is ready to proceed safely. The readiness review plan provides details of the review plan overview and the scope of work to be performed. The plan also identifies individuals and position responsibilities for implementing the activity. The management appointed Readiness Review Board (RRB) has been identified. A Field Readiness Review Team (FRT), a management appointed multidisciplinary group, has been established (1) to evaluate the ISV treatability study, (2) to identify and assemble supporting objective evidences of the readiness to proceed, and (3) to assist the team leader in presenting the evidences to the RRB. A major component of RRB is the formulation of readiness review criteria months before the operation. A comprehensive readiness review tree (a positive logic tree) is included, which identifies the activities required for the development of the readiness criteria. The readiness review tree serves as a tool to prevent the omission of an item that could affect system performance. All deficiencies identified in the review will be determined as prestart findings and must be resolved before the project is permitted to proceed. The final approval of the readiness to proceed will be the decision of RRB.

2514 (ORNL/ER–299) **Site characterization summary report for Waste Area Grouping 10 Wells at the Old Hydrofracture Facility, Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States). Mar 1995. 503p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012486. Source: OSTI; NTIS; INIS; GPO Dep.

The Oak Ridge National Laboratory (ORNL) in Oak Ridge, Tennessee, is operated for the Department of Energy (DOE) by Martin Marietta Energy Systems (Energy Systems). As part of its DOE mission, ORNL has pioneered waste disposal technologies throughout the years of site operations since World War II. In the late 1950s, efforts were made to develop a permanent disposal alternative to the surface impoundments at ORNL at the request of the National Academy of Sciences. One such technology, the hydrofracture process, involved forming fractures in an underlying geologic host formation (a low-permeability shale) at depths of up to 1000 ft and subsequently injecting a grout slurry containing low-level liquid waste, cement, and other additives at an injection pressure of about 2000 psi. The objective of the effort was to develop a grout slurry that could be injected as a liquid but would solidify after injection, thereby immobilizing the radioisotopes contained in the low-level liquid waste. The scope of this site characterization was the access, sampling, logging, and evaluation of observation wells near the Old Hydrofracture Facility (OHF) in preparation for plugging, recompletion, or other final disposition of the wells.

2515 (ORNL/ER–314) **Site Safety and Health Plan (Phase 3) for the treatability study for in situ vitrification at Seepage Pit 1 in Waste Area Grouping 7, Oak Ridge National Laboratory, Oak Ridge, TN.** Spalding, B.P.; Naney, M.T. Oak Ridge National Lab., TN (United States). Jun 1995. 187p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016173. Source: OSTI; NTIS; INIS; GPO Dep. Environmental Restoration Program.

This plan is to be implemented for Phase III ISV operations and post operations sampling. Two previous project phases involving site characterization have been completed and required their own site specific health and safety plans. Project activities will take place at Seepage Pit 1 in Waste Area Grouping 7 at ORNL, Oak Ridge, Tennessee. Purpose of this document is to establish standard health and safety procedures for ORNL project personnel and contractor employees in performance of this work. Site activities shall be performed in accordance with Energy Systems safety and health policies and procedures, DOE orders, Occupational Safety and Health Administration Standards 29 CFR Part 1910 and 1926; applicable United States Environmental Protection Agency requirements; and consensus standards. Where the word "shall" is used, the provisions of this plan are mandatory. Specific requirements of regulations and orders have been incorporated into this plan in accordance with applicability. Included from 29 CFR are 1910.120 Hazardous Waste Operations and Emergency Response; 1910.146, Permit Required - Confined Space; 1910.1200, Hazard Communication; DOE Orders requirements of 5480.4, Environmental Protection, Safety and Health Protection Standards; 5480.11, Radiation Protection; and N5480.6, Radiological Control Manual. In addition, guidance and policy will be followed as described in the Environmental Restoration Program Health and Safety Plan. The levels of personal protection and the procedures specified in this plan are based on the best information available from reference documents and site characterization data. Therefore, these recommendations represent the minimum health and safety requirements to be observed by all personnel engaged in this project.

2516 (ORNL/ER–327) **Surface radiological investigations along State Highway 95, Lagoon Road, and Melton Valley Drive, Oak Ridge Reservation, Oak Ridge, Tennessee.** Tiner, P.F.; Uziel, M.S.; Rice, D.E.; Williams, J.K. Oak Ridge National Lab., TN (United States). Aug 1995. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96007655. Source: OSTI; NTIS; INIS; GPO Dep.

The surface radiological investigation along State Highway 95, Lagoon Road, and Melton Valley Drive at the Oak Ridge Reservation was conducted as part of the Oak Ridge National Laboratory Environmental Restoration Program Surveillance and Maintenance activities. This report was prepared to document results of the investigation and subsequent remedial actions. The report details surface gamma radiation levels including gamma anomalies; surface beta radiation levels including beta anomalies; results of analysis of soil, water, and vegetation samples and smear samples collected from paved surfaces; remediation activities conducted as a result of the survey; and recommendations for further corrective measures.

2517 (ORNL/ER–329/V1) **Site investigation report for Waste Area Grouping 4 at Oak Ridge National Laboratory. Volume 1, Text: Environmental Restoration Program.** Oak Ridge National Lab., TN (United States). Aug 1995. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017189. Source: OSTI; NTIS; INIS; GPO Dep.

Waste Area Grouping (WAG) 4 is one of 17 WAGs within and associated with Oak Ridge National Laboratory (ORNL). WAG 4 is located south of the main facility along Lagoon Road. WAG 4 consists of three separate areas: Solid Waste Storage Area (SWSA) 4, a shallow-land-burial ground containing radioactive and potentially hazardous wastes; an experimental Pilot Pit Area, which includes a pilot-scale testing pit; and sections of two abandoned underground pipelines used for transporting liquid, low-level, radioactive waste. SWSA 4 is the largest site at WAG 4, covering approximately 23 acres. In the 1950s, SWSA 4 received a variety of low- and high-activity wastes, including transuranic wastes, all buried in trenches and auger holes. Recent surface water data, collected during monitoring of the tributary to White Oak Creek as part of WAG 2 investigations as well as during previous studies conducted at WAG 4, indicate that a significant amount of ^{90}Sr is being released from the old burial trenches in SWSA 4. This release represents a significant portion of the ORNL off-site risk (DOE 1993). With recent corrective measures the proportion of the release has increased in 1995. A detailed discussion of the site history and previous investigations is presented in the WAG 4 Preliminary Assessment Report, ORNL/ER-271 (Energy Systems 1994b). In an effort to control the sources of the ^{90}Sr release and to reduce the off-site risk, a site investigation was initiated to pinpoint those trenches that are the most prominent ^{90}Sr sources.

2518 (ORNL/ER–329/V2) **Site investigation report for Waste Area Grouping 4 at Oak Ridge National Laboratory. Volume 2, Appendixes: Environmental Restoration**

Program. Oak Ridge National Lab., TN (United States). Aug 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017190. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the UltraSonic Ranging and Data Systems (USRADS) survey conducted for radiological characterization of approximately 5 acres located at the Oak Ridge National Laboratory (ORNL) Waste Area Grouping (WAG) 4. The survey was conducted by Chemrad Tennessee Corporation under subcontract No. 7908-RS-00902 to CDM Federal Programs Corporation. The field survey began June 23, 1994 (Chemrad survey team was unable to actually enter field until June 24 awaiting sign-off of CDM plans by MMES) and was terminated on June 29, 1994. The designated survey area is located on the DOE X-10 facility and South of the main X-10 building complex. The entire north boundary of the site is adjacent to SWSA 4, with the Bath Tubbing Trench Seep Area (BTT) actually being a part of that SWSA (See Figure 1). Approximately one-third of the designated area was actually surveyed. The BTT area slopes moderately eastward toward a small stream in the WAG 4 area. The area is open and had recently been trimmed for the survey. The balance of the designated survey area lies along the small stream within WAG 4 and is densely wooded with heavy underbrush. The area had not been cleared or brushed. Survey reference points for the BTT area mere directly tied into the X-10 coordinate system while the t bale,ice of the designated survey area mere tied into an existing relative metric grid system. The designated area was surveyed for radiological characterization using near-surface gamma and beta detectors as well as an energy independent dosimeter. This report describes the survey method and presents the survey findings.

2519 (ORNL/ER–335) **Technical report for a fluidless directional drilling system demonstrated at Solid Waste Storage Area 6 shallow buried waste sites.** Oak Ridge National Lab., TN (United States). Sep 1995. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96007393. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the research was to demonstrate a fluidless directional drilling and monitoring system (FDD) specifically tailored to address environmental drilling concerns for shallow buried wasted. The major concerns are related to worker exposure, minimizing waste generation, and confining the spread of contamination. The FDD is potentially applicable to Environmental Restoration (ER) activities for the Oak Ridge National Laboratory Waste Area Grouping 6 (WAG 6) shallow buried waste disposed in unlined trenches. Major ER activities for directional drilling are to develop a drilling system for leachate collection directly beneath trenches, and to provide localized control over leachate release to the environment. Other ER FDD activities could include vadose zone and groundwater monitoring of contaminant transport. The operational constraints pointed the research in the direction of purchasing a steerable impact hammer, or mole, manufactured by Steer-Rite Ltd. of Racine, Wisconsin. This drill was selected due to the very low cost ($25,000) associated with procuring the drill, steering module, instrumentation and service lines. The impact hammer is a self propelled drill which penetrates the soil by compacting cut material along the sidewalls of the borehole. Essentially, it forces its way through the subsurface. Although the pneumatic hammer exhausts compressed air which must be handled at the borehole collar, it does not generate soil cuttings or liquids. This is the basis for the term fluidless. A stub casing muffler was attached to the entrance hole for controlling exhaust gas and any airborne releases. Other environmental compliance modifications made to the equipment included operating the tool without lubrication, and using water instead of hydraulic fluid to actuate the steering fins on the tool.

2520 (ORNL/ER–340) **Determination of the theoretical feasibility for the transmutation of europium isotopes from high flux isotope reactor control cylinders.** Elam, K.R.; Reich, W.J. Oak Ridge National Lab., TN (United States). Sep 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006673. Source: OSTI; NTIS; INIS; GPO Dep.

The High Flux Isotope Reactor (HFIR) at the Oak Ridge National Laboratory (ORNL) is a 100 MWth light-water research reactor designed and built in the 1960s primarily for the production of transuranic isotopes. The HFIR is equipped with two concentric cylindrical blade assemblies, known as control cylinders, that are used to control reactor power. These control cylinders, which become highly radioactive from neutron exposure, are periodically replaced as part of the normal operation of the reactor. The highly radioactive region of the control cylinders is composed of europium oxide in an aluminum matrix. The spent HFIR control cylinders have historically been emplaced in the ORNL Waste Area Grouping (WAG) 6. The control cylinders pose a potential radiological hazard due to the long lived radiotoxic europium isotopes ^{152}Eu, ^{154}Eu, and ^{155}Eu. In a 1991 health evaluation of WAG 6 (ERD 1991) it was shown that these cylinders were a major component of the total radioactivity in WAG 6 and posed a potential exposure hazard to the public in some of the postulated assessment scenarios. These health evaluations, though preliminary and conservative in nature, illustrate the incentive to investigate methods for permanent destruction of the europium radionuclides. When the cost of removing the control cylinders from WAG 6, performing chemical separations and irradiating the material in HFIR are factored in, the option of leaving the control cylinders in place for decay must be considered. Other options, such as construction of an engineered barrier around the disposal silos to reduce the chance of migration, should also be analyzed.

2521 (ORNL/ER–360/R1) **Site characterization summary report for the Old Hydrofracture Facility, Waste Area Grouping 5, at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Apr 1996. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96012610. Source: OSTI; NTIS; INIS; GPO Dep.

This site characterization summary report summarizes the operational history and other information on the Old Hydrofracture Facility located in the Waste Area Grouping 5 at the Oak Ridge National Laboratory. The Old Hydrofracture Facility was a waste disposal facility that operated from the 1960s until 1979. Intermediate-level radioactive waste was mixed with grout and injected deep underground for permanent disposal. Facilities at the site include various buildings, pipes, waste pits, and five underground storage tanks that contain liquid and sludge that have been characterized as low-level, hazardous, and mixed wastes.

2522 (ORNL/ER–361) **Treatability study operational testing program and implementation plan for the Gunite**

and Associated Tanks at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Oak Ridge National Lab., TN (United States); XL Associates, Inc., Oak Ridge, TN (United States). Mar 1996. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96009355. Source: OSTI; NTIS; INIS; GPO Dep.

This Treatability Study (TS) Operational Testing Program and Implementation Plan identifies operational testing to be performed to: (1) Demonstrate the technical feasibility of methods proposed for the removal of radiochemical sludge heels from the underground storage tanks located at Oak Ridge National Laboratory (ORNL), known as the Gunite and Associated Tanks (GAAT) Operable Unit (OU). (The bulk of the radiochemical waste, which was previously stored in the tanks, was removed during the 1980s, and only a sludge heel remains.) (2) Reduce the uncertainty in meeting the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) requirements for the GAAT OU. (3) Minimize the overall costs to accomplish the first two objectives. An initial Feasibility Study (FS) effort identified uncertainties in the evaluation of various alternatives for addressing the remediation of the GAAT OU. To support future decision making, the US. Department of Energy is performing a TS to identify cost-effective remediation approaches for the GAAT OU by providing information to reduce cost and technical uncertainty and better define acceptable remediation strategies. The testing activities will be initially conducted in a nonradioactive environment at the Tanks Technology Cold Test Facility (TTCTF) at ORNL. This will permit the design and initial performance testing and training activities to be completed while minimizing the risk, employee exposure, and costs associated with the testing effort. The component design and functional testing and initial system performance testing will be completed in the TTCTF. After the component and initial system performance testing have been completed, the operations testing will continue in the North Tank Farm (NTF). This testing has an associated higher cost and risk, but is necessary to provide results for actual waste heel removal.

2523 (ORNL/ER–363) **Waste Area Grouping 2 Remedial Investigation Phase 1 Seep Task data report: Contaminant source area assessment.** Hicks, D.S. Oak Ridge National Lab., TN (United States). Mar 1996. 176p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96009975. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the findings of the Waste Area Grouping (WAG) 2, Phase 1 Remedial Investigation (RI) Seep Task efforts during 1993 and 1994 at Oak Ridge National Laboratory (ORNL). The results presented here follow results form the first year of sampling, 1992, which are contained in the Phase 1 RI report for WAG 2 (DOE 1995a). The WAG 2 Seep Task efforts focused on contaminants in seeps, tributaries, and main streams within the White Oak Creek (WOC) watershed. This report is designed primarily as a reference for contaminants and a resource for guiding remedial decisions. Additional in-depth assessments of the Seep Task data may provide clearer understandings of contaminant transport from the different source areas in the WOC watershed. WAG 2 consists of WOC and its tributaries downstream of the ORNL main plant area, White Oak Lake, the White Oak Creek Embayment of the Clinch River, and the associated flood plains and subsurface environment. The WOC watershed encompasses ORNL and associated WAGs. WAG 2 acts as an integrator for contaminant releases from the contaminated sites at ORNL and as the conduit transporting contaminants to the Clinch River. The main objectives of the Seep Task were to identify and characterize seeps, tributaries and source areas that are responsible for the contaminant releases to the main streams in WAG 2 and to quantify their input to the total contaminant release from the watershed at White Oak Dam (WOD). Efforts focused on ^{90}Sr, ^{3}H, and ^{137}Cs because these contaminants pose the greatest potential human health risk from water ingestion at WOD. Bimonthly sampling was conducted throughout the WOC watershed beginning in March 1993 and ending in August 1994. Samples were also collected for metals, anions, alkalinity, organics, and other radionuclides.

2524 (ORNL/ER–367) **Waste area Grouping 2 Phase I remedial investigation: Sediment and Cesium-137 transport modeling report.** Clapp, R.B.; Bao, Y.S.; Moore, T.D.; Brenkert, A.L.; Purucker, S.T.; Reece, D.K.; Burgoa, B.B. Oak Ridge National Lab., TN (United States). Jun 1996. 238p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96012631. Source: OSTI; NTIS; INIS; GPO Dep.

This report is one of five reports issued in 1996 that provide follow-up information to the Phase I Remedial Investigation (RI) Report for Waste Area Grouping (WAG) 2 at Oak Ridge National Laboratory (ORNL). The five reports address areas of concern that may present immediate risk to public health at the Clinch River and ecological risk within WAG 2 at ORNL. A sixth report, on groundwater, in the series documenting WAG 2 RI Phase I results were part of project activities conducted in FY 1996. The five reports that complete activities conducted as part of Phase I of the Remedial Investigation (RI) for WAG 2 are as follows: (1) Waste Area Grouping 2, Phase I Task Data Report: Seep Data Assessment, (2) Waste Area Grouping 2, Phase I Task Data Report: Tributaries Data Assessment, (3) Waste Area Grouping 2, Phase I Task Data Report: Ecological Risk Assessment, (4) Waste Area Grouping 2, Phase I Task Data Report: Human Health Risk Assessment, (5) Waste Area Grouping 2, Phase I Task Data Report: Sediment and ^{137}Cs Transport Modeling In December 1990, the Remedial Investigation Plan for Waste Area Grouping 2 at Oak Ridge National Laboratory was issued (ORNL 1990). The WAG 2 RI Plan was structured with a short-term component to be conducted while upgradient WAGs are investigated and remediated, and a long-term component that will complete the RI process for WAG 2 following remediation of upgradient WAGs. RI activities for the short-term component were initiated with the approval of the Environmental Protection Agency, Region IV (EPA), and the Tennessee Department of Environment and Conservation (TDEC). This report presents the results of an investigation of the risk associated with possible future releases of ^{137}Cs due to an extreme flood. The results are based on field measurements made during storms and computer model simulations.

2525 (ORNL/ER–374) **Technical evaluation summary of the in situ vitrification melt expulsion at the Oak Ridge National Laboratory on April 21, 1996, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Jul 1996. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96012828. Source: OSTI; NTIS; INIS; GPO Dep.

On April 21, 1996, at 6:12 PM, about 20 tons of molten glass were expelled from a 216-ton body of molten (1600 C) radioactively contaminated soil (containing 2.4 Ci ^{137}Cs) at an ORNL site. This was caused by pressurized steam venting rapidly through, rather than around, the molten body.

During the previous 17 days, an old seepage pit was undergoing in situ vitrification to convert porous, leachable soil into an impermeable waste form. Analyses revealed that 0.13 μCi of ^{137}Cs could have been released and would have delivered a hypothetical, unmeasurable dose of 0.02 μrem to the nearest private residence outside the Oak Ridge Reservation. The expelled glass particles, having a uniform specific activity of 1.2E-08 Ci/g, contained no smearable or transferrable activity. Thus, the overall environmental impact was insignificant. Fire damage was completely limited to the off-gas hood. Techniques were identified to minimize the probability of future melt expulsions.

2526 (ORNL/ER–377) **Technical evaluation of the in situ vitrification melt expulsion at the Oak Ridge National Laboratory on April 21, 1996, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Aug 1996. 96p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96012820. Source: OSTI; NTIS; INIS; GPO Dep.

On April 21, 1996, at 6:12 p.m., approximately 20 tons of molten glass were expelled from a 216-ton body of molten (approximately 1600°C) radioactively contaminated soil (containing 2.4 Ci of ^{137}Cs) at a field site at the Oak Ridge National Laboratory in Oak Ridge, Tennessee. The melt expulsion was caused by pressurized steam venting rapidly through, rather than by the desired path around, the molten body. During the previous 17 days, an old seepage pit was undergoing in situ vitrification (ISV) to convert it from porous, leachable soil into a monolithic, impermeable vitreous waste form. Approximately 2 MW of electrical power was being delivered to the molten body, which was contained in the ground and covered with a stainless steel hood maintained under negative pressure to collect, filter, scrub, and monitor off-gas. Off-gas into the hood was rapidly heated by the melt expulsion from a typical operating temperature of 250°C to over 1000°C with an associated surge of pressure sufficient to lift the 15,000-lb hood approximately 12 in. off the ground. A small pool of molten glass was able to flow up to 3 ft outside the hood while it was raised off the ground. The escaping hot off-gas and molten glass ignited several small fires in combustible components near or attached to the external hood frame (e.g, wire insulation, plastic hose, fiberglass trays). Fire department personnel responded to the emergency notification within minutes but were not needed because the small fires self-extinguished within an hour. Four project personnel were performing tasks at the site at the time of the melt expulsion; none were injured or contaminated during the melt expulsion incident. Air samples taken from the hood perimeter near the small fires failed to detect any airborne contamination.

2527 (ORNL/ER/Sub–87-99053/75) **Site characterization report for the Old Hydrofracture Facility at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States). Jan 1995. 219p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013228. Source: OSTI; NTIS; INIS; GPO Dep.

Several Old Hydrofracture Facility (OHF) structures (i.e., Building 7852, the bulk storage bins, the pump house, water tank T-5, and pump P-3) are surplus facilities at Oak Ridge National Laboratory (ORNL) slated for decontamination and decommissioning (D and D). OHF was constructed in 1963 to allow experimentation and operations with an integrated solids storage, handling, mixing, and grout injection facility. It was shut down in 1980 and transferred to ORNL's Surveillance and Maintenance Program. The hydrofracture process was a unique disposal method that involved injecting waste materials mixed with grout and additives under pumping pressures of 2,000 psi or greater into a deep, low-permeability shale formation. The injected slurry spread along fractures and bedding planes for hundreds of feet from the injection points, forming thin grout sheets (often less than 1/8 in. thick). The grout ostensibly immobilized and solidified the liquid wastes. Site characterization activities were conducted in the winter and spring of 1994 to collect information necessary to plan the D and D of OHF structures. This site characterization report documents the results of the investigation of OHF D and D structures, presenting data from the field investigation and laboratory analyses in the form of a site description, as-built drawings, summary tables of radiological and chemical contaminant concentrations, and a waste volume estimate. 25 refs., 54 figs., 17 tabs.

2528 (ORNL/GWPO–013) **Lockheed Martin Energy Systems, Inc., Groundwater Program Office. Annual report for fiscal year 1994.** Oak Ridge National Lab., TN (United States). 30 Sep 1994. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96002199. Source: OSTI; NTIS; INIS; GPO Dep.

This edition of the Lockheed Martin Energy Systems, Inc., (Energy Systems) Groundwater Program Annual Report summarizes the work carried out by the Energy Systems Groundwater Program Office (GWPO) for fiscal year (FY) 1994. The GWPO is responsible for coordination and oversight for all components of the groundwater programs at the three Oak Ridge facilities [Oak Ridge National Laboratory (ORNL), the Oak Ridge Y-12 Plant, and the Oak Ridge K-25 Site], as well as the Paducah and Portsmouth Gaseous Diffusion Plants (PGDP and PORTS, respectively.) This report describes the administrative framework of the GWPO including staffing, organization, and funding sources. In addition, summaries are provided of activities involving the Technical Support staff at the five facilities. Finally, the results of basic investigations designed to improve our understanding of the major processes governing groundwater flow and contaminant migration on the Oak Ridge Reservation (ORR) are reported. These investigations are conducted as part of the Oak Ridge Reservation Hydrology and Geology Studies (ORRHAGS) program. The relevance of these studies to the overall remediation responsibilities of Energy Systems is discussed.

2529 (ORNL/TM–12652) **The calibration and characterization of a research x-ray unit.** Johnson, C.M. Oak Ridge National Lab., TN (United States). Jun 1996. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96012445. Source: OSTI; NTIS; INIS; GPO Dep.

The proper characterization of an X-ray unit is necessary for the utilization of the source as a dosimetry calibration standard. Upon calibration, the X-ray unit can be used for X-ray calibrations of survey, diagnostic, and reference-class, instruments and for X-ray irradiations of personnel dosimeters. It was the goal of this research to provide the Radiation Calibration Laboratory at Oak Ridge National Laboratory with a characterized research X-ray unit that could be used in reference dosimetry. The energy spectra were characterized by performing half value layer measurements and by performing a spectral analysis. Two spectral reconstruction techniques were investigated and compared. One involved using a previously determined detector response matrix and a backstripping technique. The other reconstruction technique was developed for this research using neural computing. A neural network was designed and trained to reconstruct measured X-ray spectra from data collected with a high- purity germanium spectroscopy system. Five X-ray beams were successfully characterized and found to replicate the ANSI N13.11 and the National Institute of Standards Technology X-ray beam codes. As a result, these prepared X-ray beams have been used for reference dosimetry. It has been shown that a neural network can be used as a spectral reconstruction technique, which contributes less error to the lower energy portion of the spectrum than other techniques.

2530 (ORNL/TM–12790) **Third report on the Oak Ridge K-25 Site Biological Monitoring and Abatement Program for Mitchell Branch.** Hinzman, R.L. (ed.) (Oak Ridge National Lab., TN (United States)); Adams, S.M.; Ashwood, T.L. Oak Ridge National Lab., TN (United States); Oak Ridge K-25 Site, TN (United States). Aug 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96003220. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 4305.

As a condition of the modified National Pollutant Discharge Elimination System (NPDES) permit issued to the Oak Ridge Gaseous Diffusion Plant (ORGDP; now referred to as the Oak Ridge K-25 Site) on September 11, 1986, a Biological Monitoring and Abatement Program (BMAP) was developed for the receiving stream (Mitchell Branch or K-1700 stream). On October 1, 1992, a renewed NPDES permit was issued for the K-25 Site. A biological monitoring plan was submitted for Mitchell Branch, Poplar Creek, Poplar Creek Embayment of the Clinch River and any unnamed tributaries of these streams. The objectives of BMAP are to (1) demonstrate that the effluent limitations established for the Oak Ridge K-25 Site protect and maintain the use of Mitchell Branch for growth and propagation of fish and other aquatic life and (2) document the effects on stream biota resulting from operation of major new pollution abatement facilities, including the Central Neutralization Facility (CNF) and the Toxic Substances Control Act (TSCA) incinerator. The BMAP consists of four tasks: (1) toxicity monitoring; (2) bioaccumulation monitoring; (3) assessment of fish health; and (4) instream monitoring of biological communities, including benthic macroinvertebrates and fish. This document, the third in a series, reports on the results of the Oak Ridge K-25 Site BMAP; it describes studies that were conducted over various periods of time between June 1990 and December 1993, although monitoring conducted outside this time period is included, as appropriate.

2531 (ORNL/TM–12884) **Report on the biological monitoring program for Bear Creek at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee, 1989-1994.** Hinzman, R.L. (ed.) (and others); Beauchamp, J.J.; Cada, G.F.; Peterson, M.J. Oak Ridge National Lab., TN (United States). Apr 1996. 207p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96014271. Source: OSTI; NTIS; INIS; GPO Dep.

The Bear Creek Valley watershed drains the area surrounding several closed Oak Ridge Y-12 Plant waste disposal facilities. Past waste disposal practices in the Bear Creek Valley resulted in the contamination of Bear Creek and consequent ecological damage. Ecological monitoring by the Biological Monitoring and Abatement Program (BMAP) was initiated in the Bear Creek watershed in May 1984 and continues at present. Studies conducted during the first year provided a detailed characterization of the benthic invertebrate and fish communities in Bear Creek. The initial characterization was followed by a biological monitoring phase in which studies were conducted at reduced intensities.

2532 (ORNL/TM–12926) **Strategic Environmental Research and Development Project FY 1994: Assessing national remote sensing technologies for use in US Department of Energy Environmental Restoration Activities, Oak Ridge Solid Waste Storage Area 4 case study.** King, A.L.; Smyre, J.L.; Evers, T.K. Oak Ridge National Lab., TN (United States). Feb 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008962. Source: OSTI; NTIS; INIS; GPO Dep.

During FY 1994, the Oak Ridge Environmental Restoration (ER) Remote Sensing Program teamed with members of the Oak Ridge National Security Program Office (NSPO), the Environmental Research Institute of Michigan (ERIM) under contract to the National Exploitation Laboratory (NEL), the Oak Ridge Waste Area Group 4 (WAG 4) ER Program, and the US Department of Energy (DOE), Offices of Technology Development, Nonproliferation and National Security, and Environmental Restoration, to conduct a test and demonstration of the uses of national remote sensing technologies at DOE hazardous waste sites located in Oak Ridge, Tennessee. Objectives of the Oak Ridge study were to determine if national remote sensing technologies are useful in conducting prescreening, characterization, and/or monitoring activities to expedite the clean-up process at hazardous waste sites and to cut clean-up costs wherever possible. This project was sponsored by the Strategic Environmental Research and Development Project (SERDP).

2533 (ORNL/TM–12960) **Carbonate and citric acid leaching of uranium from uranium-contaminated soils: Pilot-scale studies (Phase II).** Wilson, J.H. (Oak Ridge National Lab., TN (United States)); Chernikoff, R.; DeMarco, W.D. Oak Ridge National Lab., TN (United States). Oct 1995. 198p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96002360. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to describe the results of the soil decontamination demonstration conducted at the Fernald Environmental Management Project (FEMP) site by the Fernald Environmental Restoration and Management Corporation (FERMCO) and the Oak Ridge National Laboratory (ORNL). This demonstration, which began in November 1993 and ended in October 1994, involved the removal of uranium from contaminated soil sampled from two FEMP sites. The demonstration was conducted so as to meet the requirements of the Fernald Site Integrated Demonstration program, as well as all environmental, safety, and health requirements of the site.

2534 (ORNL/TM–12985) **Cost results from the 1994 Fernald characterization field demonstration for uranium-contaminated soils.** Douthat, D.M.; Stewart, R.N.; Armstrong, A.Q. Oak Ridge National Lab., TN (United States). Apr 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012541. Source: OSTI; NTIS; INIS; GPO Dep.

One of the principal objectives of the US Department of Energy (DOE) Office of Technology Development is to develop an optimum integrated system of technologies for removing uranium substances from soil. This system of technologies, through demonstration, must be proven in terms of cost reduction, waste minimization, risk reduction, and user applicability. To evaluate the effectiveness of these technologies, a field demonstration was conducted at the Fernald site in the summer of 1994. Fernald was selected as the host site for the demonstration based on environmental problems stemming from past production of uranium metal for defense-related applications. The following six alternative technologies were developed and/or demonstrated by the principal investigators in the Characterization Task Group at the field demonstration: (1) beta scintillation detector by Pacific Northwest Laboratory (PNL), (2) in situ gamma detector by PNL, (3) mobile laser ablation-inductively coupled plasma/atomic emission spectrometry (LA-ICP/AES) laboratory by Ames Laboratory, (4) long-range alpha detector (LRAD) by Los Alamos National Laboratory (LANL), (5) passive radon monitoring by ORNL, and (6) electret ion chamber by ORNL.

2535 (ORNL/TM–13004) **Fixed capital investments for the uranium soils integrated demonstration soil treatment technologies.** Douthat, D.M. (Oak Ridge National Lab., TN (United States)); Armstrong, A.Q.; Stewart, R.N. Oak Ridge National Lab., TN (United States). May 1995. 89p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016126. Source: OSTI; NTIS; INIS; GPO Dep.

The development of a nuclear industry in the United States required mining, milling, and fabricating a large variety of uranium products. One of these products was purified uranium metal which was used in the Savannah River and Hanford Site reactors. Most of this feed material was produced at the United States Department of Energy (DOE) facility formerly called the Feed Materials Production Center at Fernald, Ohio. During operation of this facility, soils became contaminated with uranium from a variety of sources. To address remediation and management of uranium-contaminated soils at sites owned by DOE, the Uranium Soils Integrated Demonstration (USID) Program was formed to evaluate and compare the versatility, efficiency, and economics of various technologies that may be combined into systems designed to characterize and remediate uranium contaminated soils. The USID Program has five major tasks in developing and demonstrating these technologies. Each must be able to (1) characterize the uranium in soil, (2) decontaminate or remove uranium from soil, (3) treat or dispose of resulting waste streams, (4) meet necessary state and federal regulations, and (5) meet performance assessment objectives. The role of the performance assessment objectives is to provide the information necessary to conduct evaluations of the technologies. These performance assessments provide the basis for selecting the optimum system for remediation of large areas contaminated with uranium. One of the performance assessment tasks is to address the economics of full-scale implementation of soil treatment technologies developed by the USID Program. The cost of treating contaminated soil is one of the criteria used in the decision-making process for selecting remedial alternatives.

2536 (ORNL/TM–13029) **FY94 site characterization and multilevel well installation at a west Bear Creek Valley research site on the Oak Ridge Reservation.** Moline, G.R. (Oak Ridge National Lab., TN (United States). Environmental Sciences Div.); Schreiber, M.E. Oak Ridge National Lab., TN (United States). Mar 1996. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96010347. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication 4427.

The goals of this project are to collect data that will assist in determining what constitutes a representative groundwater sample in fractured shale typical of much of the geology underlying the ORR waste disposal sites, and to determine how monitoring-well construction and sampling methods impact the representativeness of the sample. This report details the FY94 field activities at a research site in west Bear Creek Valley on the Oak Ridge Reservation (ORR). These activities funded by the Energy Systems Groundwater Program Office through the Oak Ridge Reservation Hydrologic and Geologic Studies (ORRHAGS) task, focus on developing appropriate sampling protocols for the type of fractured media that underlies many of the ORR waste disposal sites. Currently accepted protocols were developed for porous media and are likely to result in nonrepresentative samples in fractured systems.

2537 (ORNL/TM–13033) **Wetland survey of selected areas in the K-24 Site Area of responsibility.** Rosensteel, B.A. (JAYCOR, Environmental Division, Oak Ridge, TN (United States)); Awl, D.J. Oak Ridge National Lab., TN (United States). Jul 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017194. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 4429.

In accordance with DOE Regulations for Compliance with Floodplain/Wetlands Environmental Review Requirements, wetland surveys were conducted in selected areas within the K-25 Area of Responsibility during the summer of 1994. These areas are Mitchell Branch, Poplar Creek, the K-770 OU, Duct Island Peninsula, the Powerhouse area, and the K-25 South Corner. Previously surveyed areas included in this report are the main plant area of the K-25 Site, the K-901 OU, the AVLIS site, and the K-25 South Site. Wetland determinations were based on the USACE methodology. Forty-four separate wetland areas, ranging in size from 0.13 to 4.23 ha, were identified. Wetlands were identified in all of the areas surveyed with the exception of the interior of the Duct Island Peninsula and the main plant area of the K-25 Site. Wetlands perform functions such as floodflow alteration, sediment stabilization, sediment and toxicant retention, nutrient transformation, production export, and support of aquatic species and wildlife diversity and abundance. The forested, scrub-shrub, and emergent wetlands identified in the K-25 area perform some or all of these functions to varying degrees.

2538 (ORNL/TM–13113) **W-12 valve pit decontamination demonstration.** Benson, C.E.; Parfitt, J.E.; Patton, B.D. Oak Ridge National Lab., TN (United States). Dec 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006671. Source: OSTI; NTIS; INIS; GPO Dep.

Waste tank W-12 is a tank in the ORNL Low-Level Liquid Waste (LLLW) system that collected waste from Building 3525. Because of a leaking flange in the discharge line from W-12 to the evaporator service tank (W-22) and continual inleakage into the tank from an unknown source, W-12 was removed from service to comply with the Federal Facilities Agreement requirement. The initial response was to decontaminate the valve pit between tank W-12 and the evaporator service tank (W-22) to determine if personnel could enter the pit to attempt repair of the leaking flange.

Preventing the spread of radioactive contamination from the pit to the environment and to other waste systems was of concern during the decontamination. The drain in the pit goes to the process waste system; therefore, if high-level liquid waste were generated during decontamination activities, it would have to be removed from the pit by means other than the available liquid waste connection. Remote decontamination of W-12 was conducted using the General Mills manipulator bridge and telescoping trolley and REMOTEC RM-10 manipulator. The initial objective of repairing the leaking flange was not conducted because of the repair uncertainty and the unknown tank inleakage. Rather, new piping was installed to empty the W-12 tank that would bypass the valve pit and eliminate the need to repair the flange. The radiological surveys indicated that a substantial decontamination factor was achieved.

2539 (ORNL/TM–13156) **Chemically enhanced mixed region vapor stripping of TCE-contaminated saturated peat and silty clay soils.** West, O.R.; Cameron, P.A.; Lucero, A.J.; Koran, L.J. Jr. Oak Ridge National Lab., TN (United States). Jan 1996. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006023. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this study was to conduct further testing of MRVS, chemically enhanced with calcium oxide conditioning, on field- contaminated soils collected from beneath the NASA Michoud Rinsewater Impoundment. In this study, residual soil VOC levels as a function of vapor stripping time were measured to quantify VOC removal rates. Physical and chemical soil parameters expected to affect MRVS efficiency were measures. The effects of varying the calcium oxide loadings as well as varying the vapor stripping flow rates on VOC removal were also evaluated. The results of this study will be used to determine whether acceptable removals can be achieved within reasonable treatment times, remediation costs being directly proportional to the latter. The purpose of this report is to document the experimental results of this study, as well as to address issues that were raised after completion of the previous Michoud treatability work.

2540 (PNL–6415-Rev.7) **Hanford Site National Environmental Policy Act (NEPA) characterization. Revision 7.** Cushing, C.E. (ed.) (and others); Baker, D.A.; Chamness, M.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95017595. Source: OSTI; NTIS; GPO Dep.

This seventh revision of the Hanford Site National Environmental Policy (NEPA) Characterization presents current environmental data regarding the Hanford Site and its immediate environs. This information is intended for use in preparing Site-related NEPA documentation. Chapter 4.0 summarizes up-to-date information on climate and meteorology, geology, hydrology, environmental monitoring, ecology, history and archaeology, socioeconomics, land use, and noise levels prepared by Pacific Northwest Laboratory (PNL) staff. More detailed data are available from reference sources cited or from the authors. Chapter 5.0 was not updated from the sixth revision (1994). It describes models, including their principal underlying assumptions, that are to be used in simulating realized or potential impacts from nuclear materials at the Hanford Site. Included are models of radionuclide transport in groundwater and atmospheric pathways, and of radiation dose to populations via all known pathways from known initial conditions. The updated Chapter 6.0 provides the preparer with the federal and state regulations, DOE Orders and permits, and environmental standards directly applicable to the NEPA documents on the Hanford Site, following the structure of Chapter 4.0. No conclusions or recommendations are given in this report. Rather, it is a compilation of information on the Hanford Site environment that can be used directly by Site contractors. This information can also be used by any interested individual seeking baseline data on the Hanford Site and its past activities by which to evaluate projected activities and their impacts.

2541 (PNL–7722-Rev.2-Add.1) **[DOE method for evaluating environmental and waste management samples: Revision 1, Addendum 1].** Goheen, S.C. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 385p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95014291. Source: OSTI; NTIS; INIS; GPO Dep.

The US Dapartment of Energy's (DOE's) environmental and waste management (EM) sampling and analysis activities require that large numbers of samples be analyzed for materials characterization, environmental surveillance, and site-remediation programs. The present document, DOE Methods for Evaluating Environmental and Waste Management Samples (DOE Methods), is a supplemental resource for analyzing many of these samples.

2542 (PNL–9224) **Initial field test of High-Energy Corona process for treating a contaminated soil-offgas stream.** Shah, R.R.; Garcia, R.E.; Jeffs, J.T.; Virden, J.W.; Heath, W.O. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010721. Source: OSTI; NTIS; INIS; GPO Dep.

The High-Energy Corona (HEC) technology for treating process offgases has been under development at Pacific Northwest Laboratory (PNL) since 1991. The HEC process uses high-voltage electrical discharges in air to ionize the air, forming a low-temperature plasma that would be expected to destroy a wide variety of organic compounds in air. The plasma contains strong oxidants, possibly including hydroxyl radicals, hydroperoxy radicals, superoxide radicals, various excited as well as ionized forms of oxygen, high-energy electrons, and ultraviolet (UV) light. Because the high-voltage plasma is produced near ambient temperatures and pressures, yet exhibits extremely rapid destruction kinetics with relatively low power requirements, the HEC technique appears promising as a low-cost treatment technique (Virden et al. 1992). As part of the Volatile Organic Compound (VOC) Nonarid Integrated Demonstration (ID) at the DOE Savannah River Site, research activities were initiated in December 1991 to develop a prototype HEC process for a small-scale field demonstration to treat a soil-offgas stream contaminated with trichloroethylene (TCE) and perchloroethylene (PCE) at varying concentrations. Over an 18-month period, the HEC technology was developed on a fast track, through bench and pilot scales into a trailer-mounted system that was tested at the Nonarid ID. Other national laboratories, universities, and private companies have also participated at the Nonarid ID to demonstrate a number of conventional, emerging and innovative approaches for treating the same soil-offgas stream.

2543 (PNL–10363) **Data fusion analysis of a surface direct-current resistivity and well pick data set.** Clayton, E.A.; Lewis, R.E. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000715. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory (PNL) has been tasked with testing, debugging, and refining the Hanford Site data fusion workstation (DFW), with the assistance of Coleman Research Corporation (CRC), before delivering the DFW to the environmental restoration client at the Hanford Site. Data fusion is the mathematical combination (or fusion) of disparate data sets into a single interpretation. The data fusion software used in this study was developed by CRC. This report discusses the results of evaluating a surface direct-current (dc) resistivity and well-pick data set using two methods: data fusion technology and commercially available software (i.e., RESIX Plus from Interpex Ltd., Golden, Colorado), the conventional method of analysis. The report compares the two technologies; describes the survey, procedures, and results; and includes conclusions and recommendations. The surface dc resistivity and well-pick data set had been acquired by PNL from a study performed in May 1993 at Eielson Air Force Base near Fairbanks, Alaska. The resistivity survey data were acquired to map the top of permafrost in support of a hydrogeologic study. This data set provided an excellent opportunity to test and refine the dc resistivity capabilities of the DFW; previously, the data fusion software was untested on dc resistivity data. The DFW was used to evaluate the dc resistivity survey data and to produce a 3-dimensional earth model of the study area.

2544 (PNL--10393) **Data fusion qualitative sensitivity analysis.** Clayton, E.A.; Lewis, R.E. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000810. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory was tasked with testing, debugging, and refining the Hanford Site data fusion workstation (DFW), with the assistance of Coleman Research Corporation (CRC), before delivering the DFW to the environmental restoration client at the Hanford Site. Data fusion is the mathematical combination (or fusion) of disparate data sets into a single interpretation. The data fusion software used in this study was developed by CRC. The data fusion software developed by CRC was initially demonstrated on a data set collected at the Hanford Site where three types of data were combined. These data were (1) seismic reflection, (2) seismic refraction, and (3) depth to geologic horizons. The fused results included a contour map of the top of a low-permeability horizon. This report discusses the results of a sensitivity analysis of data fusion software to variations in its input parameters. The data fusion software developed by CRC has a large number of input parameters that can be varied by the user and that influence the results of data fusion. Many of these parameters are defined as part of the earth model. The earth model is a series of 3-dimensional polynomials with horizontal spatial coordinates as the independent variables and either subsurface layer depth or values of various properties within these layers (e.g., compression wave velocity, resistivity) as the dependent variables.

2545 (PNL--10397) **Concentrations of radionuclides in terrestrial vegetation on the Hanford site of potential interest to Native Americans.** Poston, T.M. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010422. Source: OSTI; NTIS; INIS; GPO Dep.

Concentrations of ^{90}Sr and ^{137}Cs in Carey's balsamroot (Balsamorhiza careyana) and Gray's desert parsley (Lomatium grayi) were similar to concentrations observed in other plants collected on the Hanford Site and from offsite locations surrounding the Site as part of annual Hanford Site surveillance. Observed concentrations may be attributed to historic fallout more than to Hanford Site emissions, although the observation that 200 Area plants had slightly higher concentrations of ^{137}Cs than 100 Area plants is consistent with other monitoring data of radioactivity in soil and vegetation collected onsite. The present concentrations of ^{90}Sr and ^{137}Cs in balsamroot and parsley fluctuate around background levels with some of the higher observed concentrations of ^{90}Sr found on the Fitzner/Eberhardt Arid Lands Ecology (ALE) Reserve. Analytical results and summary statistics by species and location are presented in the appendixes.

2546 (PNL--10450) **Description of source term data on contaminated sites and buildings compiled for the waste management programmatic environmental impact statement (WMPEIS).** Short, S.M.; Smith, D.E.; Hill, J.G.; Lerchen, M.E. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 500p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002670. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) and its predecessor agencies have historically had responsibility for carrying out various national missions primarily related to nuclear weapons development and energy research. Recently, these missions have been expanded to include remediation of sites and facilities contaminated as a result of past activities. In January 1990, the Secretary of Energy announced that DOE would prepare a Programmatic Environmental Impact Statement on the DOE's environmental restoration and waste management program; the primary focus was the evaluation of (1) strategies for conducting remediation of all DOE contaminated sites and facilities and (2) potential configurations for waste management capabilities. Several different environmental restoration strategies were identified for evaluation, ranging from doing no remediation to strategies where the level of remediation was driven by such factors as final land use and health effects. A quantitative assessment of the costs and health effects of remediation activities and residual contamination levels associated with each remediation strategy was made. These analyses required that information be compiled on each individual contaminated site and structure located at each DOE installation and that the information compiled include quantitative measurements and/or estimates of contamination levels and extent of contamination. This document provides a description of the types of information and data compiled for use in the analyses. Also provided is a description of the database used to manage the data, a detailed discussion of the methodology and assumptions used in compiling the data, and a summary of the data compiled into the database as of March 1995. As of this date, over 10,000 contaminated sites and structures and over 8,000 uncontaminated structures had been identified across the DOE complex of installations.

2547 (PNL--10534) **Uranium characterization at the St. Louis Airport Site.** Schilk, A.J. (Pacific Northwest Lab., Richland, WA (United States)); Hubbard, C.W.; Bowyer, T.W.; Reiman, R.T. Pacific Northwest Lab., Richland, WA (United States). May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012232. Source: OSTI; NTIS; INIS; GPO Dep.

In support of the Department of Energy/Office of Technology Development's Expedited Site Characterization (ESC) project (coordinated by Ames Laboratory), the Pacific Northwest Laboratory demonstrated two complementary technologies at the St. Louis Airport (SLAP) site that have been designed and optimized for the rapid, in situ quantification of radionuclide contamination in surface soils. The sensors are optimized for the detection of high-energy beta particles or gamma rays emitted from the decay of specific radionuclides of interest. These technologies were demonstrated by measuring the beta and gamma fluxes at several locations within the SLAP site. Measurements were converted to average contamination levels, using detector calibrations performed with spiked samples (beta) or sealed sources (gamma). Additionally, subsurface activity levels were derived from discrete soil samples (provided by the ESC field crew) via gamma-ray spectrometry in a controlled laboratory setting. Since the beta and gamma sensor technologies are intrinsically sensitive to different types of radiation and activity distributions (i.e., surface and shallow subsurface, respectively), the data obtained from the two detectors provide complementary information about the distribution of the contamination. The results reported here suggest that a number of locations within the SLAP site have elevated levels of ^{211}U, and the differences between the beta and gamma activities indicate that the contamination is largely located near the surface of the soil.

2548 (PNL–10550) **Environmental settings for selected US Department of Energy installations - support information for the programmatic environmental impact statement and the baseline environmental management report.** Holdren, G.R.; Glantz, C.S.; Berg, L.K.; Delinger, K.; Fosmire, C.J.; Goodwin, S.M.; Rustad, J.R.; Schalla, R.; Schramke, J.A. Pacific Northwest Lab., Richland, WA (United States). May 1995. 458p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012478. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the environmental setting information developed for 25 U.S. Department of Energy (DOE) installations in support of the DOE's Programmatic Environmental Impact Study (PEIS) and the Baseline Environmental Management Report (BEMR). The common objective of the PEIS and the BEMR is to provide the public with information about the environmental contamination problems associated with major DOE facilities across the country, and to assess the relative risks that radiological and hazardous contaminants pose to the public, onsite workers, and the environment. Environmental setting information consists of the site-specific data required to model (using the Multimedia Environmental Pollutant Assessment System) the atmospheric, groundwater, and surface water transport of contaminants within and near the boundaries of the installations. The environmental settings data describes the climate, atmospheric dispersion, hydrogeology, and surface water characteristics of the installations. The number of discrete environmental settings established for each installation was governed by two competing requirements: (1) the risks posed by contaminants released from numerous waste sites were to be modeled as accurately as possible, and (2) the modeling required for numerous release sites and a large number of contaminants had to be completed within the limits imposed by the PEIS and BEMR schedule. The final product is the result of attempts to balance these competing concerns in a way that minimizes the number of settings per installation in order to meet the project schedule while at the same, time providing adequate, if sometimes highly simplified, representations of the different areas within an installation. Environmental settings were developed in conjunction with installation experts in the fields of meteorology, geology, hydrology, and geochemistry.

2549 (PNL–10620) **Tritium radioluminescent devices, Health and Safety Manual.** Traub, R.J.; Jensen, G.A. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 133p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015815. Source: OSTI; NTIS; INIS; GPO Dep.

This document consolidates available information on the properties of tritium, including its environmental chemistry, its health physics, and safe practices in using tritium-activated RL lighting. It also summarizes relevant government regulations on RL lighting. Chapters are divided into a single-column part, which provides an overview of the topic for readers simply requiring guidance on the safety of tritium RL lighting, and a dual-column part for readers requiring more technical and detailed information.

2550 (PNL–10633) **Geologic, geochemical, microbiologic, and hydrologic characterization at the In Situ Redox Manipulation Test Site.** Vermeul, V.R. (and others); Teel, S.S.; Amonette, J.E. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 159p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015839. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents results from characterization activities at the In Situ Redox Manipulation (ISRM) Field Test Site which is located within the 100-HR-3 Operable Unit of the US Department of Energy's (DOE's) Hanford Site in Richland, Washington. Information obtained during hydrogeologic characterization of the site included sediment physical properties, geochemical properties, microbiologic population data, and aquifer hydraulic properties. The purpose of obtaining this information was to improve the conceptual understanding of the hydrogeology beneath the ISRM test site and provide detailed, site specific hydrogeologic parameter estimates. The resulting characterization data will be incorporated into a numerical model developed to simulate the physical and chemical processes associated with the field experiment and aid in experiment design and interpretation.

2551 (PNL–10635) **Review of alternative residual contamination guides for the 324 Building B-Cell Cleanout Project. Phase 1.** Vargo, G.J.; Durham, J.S.; Brackenbush, L.W. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000199. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a proposed residual contamination guide (RCG) for the 324 Building B-Cell Cleanout Project, Phase 1, at the Hanford Site. The RCG is expressed as a fraction of the amount of highly dispersible radioactive material that would result in offsite doses equal to the Pacific Northwest Laboratory radiological risk guidelines following the worst credible accident scenario for release of the holdup material. The proposed RCG is 10^{-1} to 10^{-2} of the PNL radiological risk guidelines. As part of the development of the RCG, a number of factors were considered. These include the need to provide an appropriate level of flexibility for other activities within the 324 Building that could contribute to the facility's overall radiological risk, uncertainties inherent in safety analyses, and the possible contribution of other 300 Area facilities to overall radiological risk. Because of these factors and the nature of the cleanout project, the RCG is expressed as a range rather than a point value. This report also provides guidance on determining conformance to the RCG, including inspection and measurement techniques, quality assurance requirements, and consideration of uncertainty.

2552 (PNL–10688) **Subsidence above in situ vitrification: Evaluation for Hanford applications.** Dershowitz, W.S. (Golder Associates, Inc., Redmond, WA (United States)); Plum, R.L.; Luey, J. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95017601. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory (PNL)is evaluating methods to extend the applicability of the in situ vitrification (ISV) process. One method being evaluated is the initiation of the ISV process in the soil subsurface rather than the traditional start from the surface. The subsurface initiation approach will permit extension of the ISV treatment depth beyond that currently demonstrated and allow selective treatment of contamination in a geologic formation. A potential issue associated with the initiation of the ISV process in the soil subsurface is the degree of subsidence and its effect on the ISV process. The reduction in soil porosity caused by the vitrification process will result in a volume decrease for the vitrified soils. Typical volume reduction observed for ISV melts initiated at the surface are on the order of 20% to 30% of the melt thickness. Movement of in-situ materials into the void space created during an ISV application in the soil subsurface could result in surface settlements that affect the ISV process and the processing equipment. Golder Associates, Inc., of Redmond, Washington investigated the potential for subsidence events during application of ISV in the soil subsurface. Prediction of soil subsidence above an ISV melt required the following analyses: the effect of porosity reduction during ISV, failure of fused materials surrounding the ISV melt, bulking of disturbed materials above the melt, and propagation of strains to the surface.

2553 (PNL–10692) **AREST-CT V1.0 software verification.** Chen, Y.; Engel, D.W.; McGrail, B.P.; Lessor, K.S. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95017596. Source: OSTI; NTIS; INIS; GPO Dep.

The Analyzer for Radionuclide Source-Term with Chemical Transport (AREST-CT) is a scientific computer code designed for performance assessments of engineered barrier system (EBS) concepts for the underground storage of nuclear waste, including high-level, intermediate, and low-level wastes. The AREST-CT code has features for analyzing the degradation of and release of radionuclides from the waste form, chemical reactions that depend on time and space, and transport of the waste and other products through the EBS. This document provides a description of the verification testing that has been performed on the initial version of ARESTCT (V1.0). Software verification is the process of confirming that the models and algorithms have been correctly implemented into a computer code. Software verification for V1.0 consisted of testing the individual modules (unit tests) and a test of the fully-coupled model (integration testing). The integration test was done by comparing the results from AREST-CT with the results from the reactive transport code CIRF.A. The test problem consisted of a 1-D analysis of the release, transport, and precipitation of $^{99}T_c$in an idealized LLW disposal system. All verification tests showed that AREST-CT works properly and in accordance with design specifications.

2554 (PNL–10754) **Sedimentation models.** Rector, D.R.; Bunker, B.C. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000748. Source: OSTI; NTIS; INIS; GPO Dep.

The nuclear wastes currently stored in tanks at the Hanford site contain complex mixtures of insoluble sludge particles, salts, and supernatant liquids. Treatment and ultimate disposal of these tank wastes will require that the complex solid-liquid mixtures be dispersed in aqueous solutions for retrieval and transport. The mixtures will then require pretreatment steps that will ultimately require the isolation of insoluble particles from supernatant liquids via solid-liquid separation steps such as settle-decant operations, centrifugation, or filtration. There is a perception that sludge treatment in general, and solid-liquid separations in particular, are relatively trivial operations that can easily be transferred to private industry to initiate tank cleanup. Experiences gained over the past few years at Hanford suggest that waste processing is not as trivial as it seems.

2555 (PNL–10765) **Removal of strontium and transuranics from Hanford waste via hydrothermal processing – FY 1994/95 test results.** Orth, R.J. (Pacific Northwest Lab., Richland, WA (United States)); Schmidt, A.J.; Elmore, M.R.; Hart, T.R.; Neuenschwander, G.G.; Gano, S.R.; Lehmann, R.W.; Momont, J.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000729. Source: OSTI; NTIS; INIS; GPO Dep.

Under the Tank Waste Remediation System (TWRS) Pretreatment Technology Development Project, Pacific Northwest Laboratory (PNL) is evaluating and developing organic destruction technologies that may be incorporated into the Initial Pretreatment Module (IPM) to treat Hanford tank waste. Organic (and ferrocyanide) destruction removes the compounds responsible for waste safety issues, and conditions the supernatant for low-level waste disposal by removing compounds that may be responsible for promoting strontium and transuranic (TRU) components solubility. Destruction or defunctionalization of complexing organics in tank wastes eliminates organic species that can reduce the efficiency of radionuclide (E.g., ^{90}Sr) separation processes, such as ion exchange, solvent extraction, and precipitation. The technologies being evaluated and tested for organic destruction are low-temperature hydrothermal processing (HTP) and wet air oxidation (WAO). Four activities are described: Batch HTP/WAO testing with Actual Tank Waste (Section 3.0), Batch HTP Testing with Simulant (Section 4.0), Batch WAO testing with Simulant (Section 5.0), and Continuous Bench-scale WAO Testing with Simulant (Section 6.0). For each of these activities, the objectives, test approach, results, status, and direction of future investigations are discussed. The background and history of the HTP/WAO technology is summarized below. Conclusions and Recommendations are provided in Section 2.0. A continuous HTP off-gas safety evaluation conducted in FY 1994 is included as Appendix A.

2556 (PNL–10800) **Calibration models for density borehole logging - construction report.** Engelmann, R.E.; Lewis, R.E.; Stromswold, D.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001888. Source: OSTI; NTIS; INIS; GPO Dep.

Two machined blocks of magnesium and aluminum alloys form the basis for Hanford's density models. The blocks provide known densities of 1.780 $\pm$ 0.002 g/cm^3 and 2.804 $\pm$ 0.002 g/cm^3 for calibrating borehole logging tools that measure density based on gamma-ray scattering from a source in the tool. Each block is approximately 33 x 58 x 91 cm (13 x 23 x 36 in.) with cylindrical grooves cut into the sides of the blocks to hold steel casings of inner diameter 15 cm (6 in.) and 20 cm (8 in.). Spacers that can be inserted between the blocks and casings can create air gaps of thickness 0.64, 1.3, 1.9, and 2.5 cm (0.25, 0.5, 0.75 and 1.0 in.), simulating air gaps that can occur in actual wells from hole enlargements behind the casing.

2557 (PNL–10801) **Calibration models for measuring moisture in unsaturated formations by neutron logging.** Engelman, R.E. (and others); Lewis, R.E.; Stromswold, D.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001804. Source: OSTI; NTIS; INIS; GPO Dep.

Calibration models containing known amounts of hydrogen have been constructed to simulate unsaturated earth formations for calibrating neutron well logging tools. The models are made of dry mixtures of hydrated alumina ($Al(OH)_3$) with either silica sand (SiO_2) or aluminum oxide (Al_2O_3). Hydrogen in the hydrated alumina replaces the hydrogen in water for neutron scattering, making it possible to simulate partially saturated formations. The equivalent water contents for the models are 5%, 12%, 20%, and 40% by volume in seven tanks that have a diameter of 1.5 m and a height of 1.8 m. Steel casings of inside diameter 15.4 cm (for three models) and diameter 20.3 cm (for four models) allow logging tool access to simulate logging through cased boreholes.

2558 (PNL-SA–23193) **A tube-excited x-ray fluorescence spectrometer for use in small-diameter boreholes.** Reeves, J.H.; Arthur, R.J.; Brodzinski, R.L.; Shepard, C.L. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940401–17: International conference on methods and applications of radioanalytical chemistry, Kona, HI (United States), 10-16 Apr 1994). Order Number DE95011411. Source: OSTI; NTIS; GPO Dep.

A portable in-situ x-ray fluorescence analytical system that uses an x-ray tube excitation source and a cooled Si(Li) spectrometer for detecting characteristic emission x rays has been developed for use in small-diameter wells and boreholes. The 15-watt, iron-anode x-ray tube operates up to 30 kV. Three wells at the Sandia National Laboratory Chemical Waste Landfill, lined with 76 μ thick polyethylene, were logged specifically for Cr contamination. Detection limits below 50 ppM were achieved with counting intervals of 600 seconds and with the Si(Li) detector operating at 450-eV resolution (full width at half maximum [FWHM] for the Mn K-alpha x ray).

2559 (PNL-SA–24280) **Deploying in situ bioremediation at the Hanford Site.** Truex, M.J.; Johnson, C.D.; Newcomer, D.R.; Doremus, L.A.; Hooker, B.S.; Peyton, B.M.; Skeen, R.S.; Chilakapati, A. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941124–23: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95014625. Source: OSTI; NTIS; INIS; GPO Dep.

An innovative in-situ bioremediation technology was developed by Pacific Northwest Laboratory (PNL) to destroy nitrate and carbon tetrachloride ($CC1_4$) in the Hanford ground water. The goal of this in-situ treatment process is to stimulate native microorganisms to degrade nitrate and CCl_4. Nutrient solutions are distributed in the contaminated aquifer to create a biological treatment zone. This technology is being demonstrated at the US Department of Energy's Hanford Site to provide the design, operating, and cost information needed to assess its effectiveness in contaminated ground water. The process design and field operations for demonstration of this technology are influenced by the physical, chemical, and microbiological properties observed at the site. A description of the technology is presented including the well network design, nutrient injection equipment, and means for controlling the hydraulics and microbial reactions of the treatment process.

2560 (PNL-SA–25501) **Radiation screening of excavated waste at Hanford's 118-B-1 burial site.** Stromswold, D.C. (Pacific Northwest Lab., Richland, WA (United States)); Alvarez, J.L.; Davis, A.I.; Duce, S.W.; Frain, J.; Ludowise, J.D. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950495–1: 7. national technology information exchange workshop, Cincinnati, OH (United States), 18-20 Apr 1995). Order Number DE95010724. Source: OSTI; NTIS; INIS; GPO Dep.

Radiation measurements on items excavated from a radioactive-waste burial ground were part of a field test of excavation, radiation screening, and waste sorting techniques being evaluated for the cleanup of Hanford burial sites. The radiation measurements investigated techniques for classifying bulk waste for placement into an environmental restoration disposal facility. Hand-held gamma-ray survey instruments measured exposure rates (mR/h) from contaminated dirt and radioactive objects as they were removed by heavy excavation equipment. Gamma-ray detectors mounted on the excavation equipment provided additional data that were transmitted by radio telemetry. Exposure rates from identifiable objects (e.g., specific reactor components) were compared with expected exposure rates calculated from site-disposal records and computer modeling. Selected objects were subjected to additional on-site measurements using a high-purity germanium detector. The germanium detector enabled specific radioisotope identification based on gamma-ray energies. It also provided a measure of the concentration of gamma-ray-emitting contaminants in soils and the activity of specific objects, based on prior calibration for both distributed and point sources. A large-area neutron detector checked for possible transuranic nuclides. Alpha and beta spectrometry also were tested, but their utility for this application was limited due to the short range of the particles and the difficulty of maintaining a repeatable measurement geometry in field measurements.

2561 (PNL-SA-25532) **Changing methodology for measuring airborne radioactive discharges from nuclear facilities.** Glissmeyer, J.A.; Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). May 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505101-8: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE95014184. Source: OSTI; NTIS; INIS; GPO Dep.

The US Environmental Protection Agency (USEPA) requires that measurements of airborne radioactive discharges from nuclear facilities be performed following outdated methods contained in the American National Standards Institute (ANSI) N13.1-1969 Guide to Sampling Airborne Radioactive Materials in Nuclear Facilities. Improved methods are being introduced via two paths. First, the ANSI standard is being revised, and second, EPA's equivalency granting process is being used to implement new technology on a case-by-case or broad basis. The ANSI standard is being revised by a working group under the auspices of the Health Physics Society Standards Committee. The revised standard includes updated methods based on current technology and a performance-based approach to design. The performance-based standard will present new challenges, especially in the area of performance validation. Progress in revising the standard is discussed. The US Department of Energy recently received approval from the USEPA for an alternate approach to complying with air-sampling regulations. The alternate approach is similar to the revised ANSI standard. New design tools include new types of sample extraction probes and a model for estimating line-losses for particles and radioiodine. Wind tunnel tests are being performed on various sample extraction probes for use at small stacks. The data show that single-point sampling probes are superior to ANSI-NI3.1-1969 style multiple-point sample extraction probes.

2562 (PNL-SA-25878) **Pollution prevention electronic design guideline: A tool for identifying pollution prevention in facility design.** Greitzer, F.L. (Pacific Northwest Lab., Richland, WA (United States)); Brown, B.W.; Dorsey, J.A.; Raney, E.A. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9508193-1: 4. American Defense Preparedness Association Air Force pollution prevention conference, San Antonio, TX (United States), 14-17 Aug 1995). Order Number DE96002493. Source: OSTI; NTIS; GPO Dep.

The Pacific Northwest Laboratory has developed a tool to assist in incorporating pollution prevention opportunities into the design of federal facilities. The Pollution Prevention Environmental Design Guide for Engineers (P2-EDGE) was developed for the US Department of Energy (prior to its release this summer it had been referred to as the P2 electronic design guideline. P2-EDGE contains a database of 267 opportunities intended to help a decisionmaker (designer, engineer, or project manager) evaluate the applicability and potential benefits of implementing pollution prevention in a particular project. The P2-EDGE database was derived from both DOE and non-DOE sources including pollution prevention literature, industrial design personnel, and federal, state, and DOE sources. A key feature of the tool is the integration of photos, illustrations, and documentation to provide easy access to technical information on specific waste minimization opportunities in design.

2563 (PNL-SA-25908) **Ultra wide band radar holographic imaging of buried waste at DOE sites.** Collins, H.D.; Gribble, R.P.; Hall, T.E.; Lechelt, W.M. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950450-12: 8. annual symposium on the application of geophysics to environmental and engineering problems, Orlando, FL (United States), 23-27 Apr 1995). Order Number DE95014618. Source: OSTI; NTIS; INIS; GPO Dep.

Ultra wideband linear array holography is a unique real-time imaging technique for in-situ inspection of buried waste at various DOE sites. The array can be mounted on various platforms such as crane booms, pickup trucks, ATVs, and scanned generating "3-D" subsurface images in real time. Inspection speeds are 0.5 to 2 meters/sec, if the image is viewed in real time, greater for off-line processing. The Ground Penetrating Holographic (GPH) system developed for inspection of DOE sites employs two 32element arrays of tapered-slot antenna operating at 5-GHz and 2.5-GHz center frequencies. The GPH system, which is mounted on a small trailer with a computer image processor, display, and power supply, is capable of imaging a wide swath (1 to 2 meters) with its linear arrays. The lower frequency array will be used at INEL (for greater depth penetration) because of high soil attenuation. Recent holographic "3-D" images of buried waste container lids and dielectrics obtained in Hanford sand and INEL soils at various depths graphically illustrate the unique image resolution capabilities of the system. Experimental results using the 5-GHz array will be presented showing the excellent holographic image quality of various subsurface targets in sand and INEL soil.

2564 (PNNL-10911) **Possible stakeholder concerns regarding volatile organic compound in arid soils integrated demonstration technologies not evaluated in the stakeholder involvement program.** Peterson, T. (Battelle Seattle Research Center, WA (United States)). Pacific Northwest Lab., Richland, WA (United States). Dec 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (BSRC-800/95/022). Order Number DE96006113. Source: OSTI; NTIS; INIS; GPO Dep.

The Volatile Organic Compounds in Arid Soils Integrated Demonstration (VOC-Arid ID) supported the demonstration of a number of innovative technologies, not all of which were evaluated in the integrated demonstration's stakeholder involvement program. These technologies have been organized into two categories and the first category ranked in order of priority according to interest in the evaluation of the technology. The purpose of this report is to present issues stakeholders would likely raise concerning each of the technologies in light of commentary, insights, data requirements, concerns, and recommendations offered during the VOC-Arid ID's three-year stakeholder involvement, technology evaluation program. A secondary purpose is to provide a closeout status for each of the technologies associated with the VOC-Arid ID. This report concludes with a summary of concerns and requirements that stakeholders have for all innovative technologies.

2565 (PNNL–10915) **Stakeholder acceptance analysis: Passive soil vapor extraction using borehole flux.** Peterson, T.S. Battelle Seattle Research Center, WA (United States). Dec 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (BSRC–800/95/018). Order Number DE96005843. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents evaluations, recommendations, and requirements concerning passive soil vapor extraction (PSVE) derived from a three-year program of stakeholder involvement. PSVE takes advantage of the naturally occurring tendency of soil vapor to leave the subsurface during periods of low barometric pressure. PSVE seeks to expedite the release of volatile contaminants through the use of boreholes and technological enhancements. This report is for technology developers and those responsible for making decisions about the use of technology to remediate contamination by volatile organic compounds. Stakeholders' perspectives help those responsible for technology deployment to make good decisions concerning the acceptability and applicability of PSVE to the remediation problems they face. The report provides: stakeholders' final evaluation of the acceptability of PSVE in light of the technology's field test; stakeholders' principal comments concerning PSVE; requirements that stakeholders have of any remediation technology. Technology decision makers should take these conclusions into account in evaluating the effectiveness and acceptability of any remedial method proposed for their site. In addition, the report presents data requirements for the technology's field demonstration defined by stakeholders associated with the Hanford site in Washington State, as well as detailed comments on PSVE from stakeholders from Sandia National Laboratory, Rocky Flats, Idaho National Engineering Laboratory, and Los Alamos National Laboratory.

2566 (PNNL–10944) **K-Basin spent nuclear fuel characterization data report 2.** Abrefah, J.; Gray, W.J.; Ketner, G.L.; Marschman, S.C.; Pyecha, T.D.; Thornton, T.A. Pacific Northwest National Lab., Richland, WA (United States). Mar 1996. 308p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96010452. Source: OSTI; NTIS; INIS; GPO Dep.

An Integrated Process Strategy has been developed to package, condition, transport, and store in an interim storage facility the spent nuclear fuel (SNF) currently residing in the K-Basins at Hanford. Information required to support the development of the condition process and to support the safety analyses must be obtained from characterization testing activities conducted on fuel samples from the Basins. Some of the information obtained in the testing was reported in PNL-10778, K-Basin Spent Nuclear Fuel Characterization Data Report (Abrefah et al. 1995). That report focused on the physical, dimensional, metallographic examinations of the first K-West (KW) Basin SNF element to be examined in the Postirradiation Testing Laboratory (PTL) hot cells; it also described some of the initial SNF conditioning tests. This second of the series of data reports covers the subsequent series of SNF tests on the first fuel element. These tests included optical microscopy analyses, conditioning (drying and oxidation) tests, ignition tests, and hydrogen content tests.

2567 (PNNL–10979) **Letter report: Evaluation of dryer/calciner technologies for testing.** Sevigny, G. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008026. Source: OSTI; NTIS; INIS; GPO Dep.

This letter report describes some past experiences on the drying and calcination of radioactive materials or corresponding simulants; and the information needed from testing. The report also includes an assessment of informational needs including possible impacts to a full-scale plant. This includes reliability, maintenance, and overall size versus throughput. Much of the material was previously compiled and reported by Mike Elliott of PNL "Melter Performance Assessment" and Larry Eisenstatt of SEG on contract to WHC in a letter to Rod Powell. Also, an annotated bibliography was prepared by Reagan Seymour of WHC. Descriptions of the drying and calciner technologies, development status, advantages and disadvantages of using a WFE or calciner, and recommendations for future testing are discussed in this report.

2568 (SAND–94-2611) **Identification of remediation needs and technology development focus areas for the Environmental Restoration (ER) Project at Sandia National Laboratories/New Mexico (SNL/NM).** Tucker, M.D. (Sandia National Labs., Albuquerque, NM (United States). Site Restoration Technology Program Office); Valdez, J.M.; Khan, M.A. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015010. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Restoration (ER) Project has been tasked with the characterization, assessment, remediation and long-term monitoring of contaminated waste sites at Sandia National Laboratories/New Mexico (SNL/NM). Many of these sites will require remediation which will involve the use of baseline technologies, innovative technologies that are currently under development, and new methods which will be developed in the near future. The Technology Applications Program (TAP) supports the ER Project and is responsible for development of new technologies for use at the contaminated waste sites, including technologies that will be used for remediation and restoration of these sites. The purpose of this report is to define the remediation needs of the ER Project and to identify those remediation needs for which the baseline technologies and the current development efforts are inadequate. The area between the remediation needs and the existing baseline/innovative technology base represents a technology gap which must be filled in order to remediate contaminated waste sites at SNL/NM economically and efficiently. In the first part of this report, the remediation needs of the ER Project are defined by both the ER Project task leaders and by TAP personnel. The next section outlines the baseline technologies, including EPA defined Best Demonstrated Available Technologies (BDATs), that are applicable at SNL/NM ER sites. This is followed by recommendations of innovative technologies that are currently being developed that may also be applicable at SNL/NM ER sites. Finally, the gap between the existing baseline/innovative technology base and the remediation needs is identified. This technology gap will help define the future direction of technology development for the ER Project.

2569 (SAND–95-2087) **Adaption of the Magnetometer Towed Array geophysical system to meet Department of Energy needs for hazardous waste site characterization.** Cochran, J.R. (Sandia National Labs., Albuquerque, NM (United States)); McDonald, J.R.; Russell, R.J.; Robertson, R.; Hensel, E. Sandia National Labs., Albuquerque, NM (United States). Oct 1995. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96004551. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents US Department of Energy (DOE)-funded activities that have adapted the US Navy's Surface Towed Ordnance Locator System (STOLS) to meet DOE needs for a "... better, faster, safer and cheaper ..." system for characterizing inactive hazardous waste sites. These activities were undertaken by Sandia National Laboratories (Sandia), the Naval Research Laboratory, Geo-Centers Inc., New Mexico State University and others under the title of the Magnetometer Towed Array (MTA).

2570 (SAND–95-2258C) **Preliminary analysis of NAPL behavior in soil-heated vapor extraction for in-situ environmental restoration.** Webb, S.W.; Phelan, J.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950828–21: 1995 National heat transfer conference, Portland, OR (United States), 5-9 Aug 1995). Order Number DE96000780. Source: OSTI; NTIS; INIS; GPO Dep.

Simulations of soil-heated vapor extraction have been performed to evaluate the NAPL removal performance as a function of borehole vacuum. The possibility of loss of NAPL containment, or NAPL migration into the unheated soil, is also evaluated in the simulations. A practical warning sign indicating migration of NAPL into the unheated zone is discussed.

2571 (SAND–95-3024) **1994 Fernald field characterization demonstration program data report.** Rautman, C.A. (Sandia National Labs., Albuquerque, NM (United States)); Cromer, M.V.; Newman, G.C.; Beiso, D.A. Sandia National Labs., Albuquerque, NM (United States). Dec 1995. 173p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96004549. Source: OSTI; NTIS; INIS; GPO Dep.

The 1994 Fernald field characterization demonstration program, hosted by Fernald Environmental Management Project, was established to investigate technologies that are applicable to the characterization and remediation of soils contaminated with uranium. An important part of this effort was evaluating field-screening tools potentially capable of acquiring high-resolution information on uranium contamination distribution in surface soils. Further-more, the information needed to be obtained in a cost- and time-efficient manner. Seven advanced field-screening technologies were demonstrated at a uranium-contaminated site at Fernald, located 29 kilometers northwest of Cincinnati, Ohio. The seven technologies tested were: (1) alpha-track detectors, (2) a high-energy beta scintillometer, (3) electret ionization chambers, (4) and (5) two variants of gamma-ray spectrometry, (6) laser ablation-inductively coupled plasma-atomic emission spectroscopy, and (7) long-range alpha detection. The goals of this field demonstration were to evaluate the capabilities of the detectors and to demonstrate their utility within the US Department of Energy's Environmental Restoration Program. Identical field studies were conducted using four industry-standard characterization tools: (1) a sodium-iodide scintillometer, (2) a low-energy FIDLER scintillometer, (3) a field-portable x-ray fluorescence detector, and (4) standard soil sampling coupled with laboratory analysis. Another important aspect of this program was the application of a cost/risk decision model to guide characterization of the site. This document is a compilation of raw data submitted by the technologies and converted total uranium data from the 1994 Fernald field characterization demonstration.

2572 (SAND–95-3062) **Characterization, monitoring, and sensor technology catalogue.** Matalucci, R.V. (ed.) (Sandia National Labs., Albuquerque, NM (United States)); Esparza-Baca, C.; Jimenez, R.D. Sandia National Labs., Albuquerque, NM (United States). Dec 1995. 290p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96004896. Source: OSTI; NTIS; INIS; GPO Dep.

This document represents a summary of 58 technologies that are being developed by the Department of Energy's (DOE's) Office of Science and Technology (OST) to provide site, waste, and process characterization and monitoring solutions to the DOE weapons complex. The information was compiled to provide performance data on OST-developed technologies to scientists and engineers responsible for preparing Remedial Investigation/Feasibility Studies (RI/FSs) and preparing plans and compliance documents for DOE cleanup and waste management programs. The information may also be used to identify opportunities for partnering and commercialization with industry, DOE laboratories, other federal and state agencies, and the academic community. Each technology is featured in a format that provides: (1) a description, (2) technical performance data, (3) applicability, (4) development status, (5) regulatory considerations, (6) potential commercial applications, (7) intellectual property, and (8) points-of-contact. Technologies are categorized into the following areas: (1) Bioremediation Monitoring, (2) Decontamination and Decommissioning, (3) Field Analytical Laboratories, (4) Geophysical and Hydrologic Characterization, (5) Hazardous Inorganic Contaminant Analysis, (6) Hazardous Organic Contaminant Analysis, (7) Mixed Waste, (8) Radioactive Contaminant Analysis, (9) Remote Sensing,(10)Sampling and Drilling, (11) Statistically Guided Sampling, and (12) Tank Waste.

2573 (SAND–96-0262) **Evaluation of measurement reproducibility using the standard-sites data, 1994 Fernald field characterization demonstration project.** Rautman, C.A. Sandia National Labs., Albuquerque, NM (United States). Feb 1996. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96006440. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy conducted the 1994 Fernald (Ohio) field characterization demonstration project to evaluate the performance of a group of both industry-standard and proposed alternative technologies in describing the nature and extent of uranium contamination in surficial soils. Detector stability and measurement reproducibility under actual operating conditions encountered in the field is critical to establishing the credibility of the proposed alternative characterization methods. Comparability of measured uranium activities to those reported by conventional, US Environmental Protection Agency (EPA)-certified laboratory methods is also required. The eleven (11) technologies demonstrated included (1) EPA-standard soil sampling and laboratory mass-spectroscopy analyses, and currently-accepted field-screening techniques using (2) sodium-iodide scintillometers, (3) FIDLER low-energy scintillometers, and (4) a field-portable x-ray fluorescence spectrometer. Proposed advanced characterization techniques included (5) alpha-track detectors, (6) a high-energy beta scintillometer, (7) electret ionization chambers, (8) and (9) a high-resolution gamma-ray spectrometer in two different configurations, (10) a field-adapted laser ablation-inductively coupled plasma-atomic emission spectroscopy (ICP-AES) technique, and (11) a long-range alpha detector. Measurement reproducibility and the accuracy of each method were tested by acquiring numerous replicate measurements of total uranium activity at each of two "standard sites" located within the main field demonstration area. Meteorological variables including temperature, relative humidity. and 24-hour rainfall quantities were also recorded in conjunction with the standard-sites measurements.

2574 (SAND–96-0582) **Three-dimensional electromagnetic modeling and inversion on massively parallel computers.** Newman, G.A. (Sandia National Labs., Albuquerque, NM (United States). Geophysics Dept.); Alumbaugh, D.L. Sandia National Labs., Albuquerque, NM (United States). Mar 1996. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96008728. Source: OSTI; NTIS; GPO Dep.

This report has demonstrated techniques that can be used to construct solutions to the 3-D electromagnetic inverse problem using full wave equation modeling. To this point great progress has been made in developing an inverse solution using the method of conjugate gradients which employs a 3-D finite difference solver to construct model sensitivities and predicted data. The forward modeling code has been developed to incorporate absorbing boundary conditions for high frequency solutions (radar), as well as complex electrical properties, including electrical conductivity, dielectric permittivity and magnetic permeability. In addition both forward and inverse codes have been ported to a massively parallel computer architecture which allows for more realistic solutions that can be achieved with serial machines. While the inversion code has been demonstrated on field data collected at the Richmond field site, techniques for appraising the quality of the reconstructions still need to be developed. Here it is suggested that rather than employing direct matrix inversion to construct the model covariance matrix which would be impossible because of the size of the problem, one can linearize about the 3-D model achieved in the inverse and use Monte-Carlo simulations to construct it. Using these appraisal and construction tools, it is now necessary to demonstrate 3-D inversion for a variety of EM data sets that span the frequency range from induction sounding to radar: below 100 kHz to 100 MHz. Appraised 3-D images of the earth's electrical properties can provide researchers opportunities to infer the flow paths, flow rates and perhaps the chemistry of fluids in geologic mediums. It also offers a means to study the frequency dependence behavior of the properties in situ. This is of significant relevance to the Department of Energy, paramount to characterizing and monitoring of environmental waste sites and oil and gas exploration.

2575 (SAND–96-8213) **Transpiring wall supercritical water oxidation test reactor design report.** Haroldsen, B.L. (Sandia National Labs., Livermore, CA (United States). Engineering for Transportation and Environment Dept.); Ariizumi, D.Y.; Mills, B.E.; Brown, B.G.; Rousar, D.C. Sandia National Labs., Livermore, CA (United States). Feb 1996. 32p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96009912. Source: OSTI; NTIS; INIS; GPO Dep.

Sandia National Laboratories is working with GenCorp, Aerojet and Foster Wheeler Development Corporation to develop a transpiring wall supercritical water oxidation reactor. The transpiring wall reactor promises to mitigate problems of salt deposition and corrosion by forming a protective boundary layer of pure supercritical water. A laboratory scale test reactor has been assembled to demonstrate the concept. A 1/4 scale transpiring wall reactor was designed and fabricated by Aerojet using their platelet technology. Sandia's Engineering Evaluation Reactor serves as a test bed to supply, pressurize and heat the waste; collect, measure and analyze the effluent; and control operation of the system. This report describes the design, test capabilities, and operation of this versatile and unique test system with the transpiring wall reactor.

2576 (UCRL-JC–119707) **Development of multianalyte sensor arrays for continuous monitoring of pollutants.** Milanovich, F.P. (Lawrence Livermore National Lab., CA (United States)); Richards, J.B.; Brown, S.B.; Healey, B.G.; Chadha, S.; Walt, D. Lawrence Livermore National Lab., CA (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950209–13: 4. international symposium on field screening methods for hazardous wastes and toxic chemicals, Las Vegas, NV (United States), 22-24 Feb 1995). Order Number DE96001728. Source: OSTI; NTIS; GPO Dep.

Industrial development has led to the release of numerous hazardous materials into the environment posing a potential threat to surrounding waters. Environmental analysis of sites contaminated by several chemicals calls for continuous monitoring of multiple analytes. Monitoring can be achieved by using imaging bundles (300–400 { micro} m in diameter), containing several thousand individual optical fibers for the fabrication of sensors. Multiple sensor sites are created at the distal end of the fiber by immobilizing different analyte-specific fluorescent dyes. By coupling these imaging fibers to a charge coupled device (CCD), one has the ability to spatially and spectrally discriminate the multiple sensing sites simultaneously and hence monitor analyte concentrations.

2577 (UCRL-JC–119959) **Waste characterization activities at the Lawrence Livermore National Laboratory.** Roberson, G.P. (and others); Martz, H.E.; Haskins, J.J. Lawrence Livermore National Lab., CA (United States). 28 Jun 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950787–85: 36. annual meeting of the Institute for Nuclear Materials Management, Palm Desert, CA (United States), 9-12 Jul 1995). Order Number DE96001322. Source: OSTI; NTIS; INIS; GPO Dep.

Radioactive and hazardous wastes are generated at many national laboratories, military sites, fuel fabrication and enrichment plants, reactors, and many other facilities. At all of these sites, wastes must be separated, categorized, possibly treated, and packed into containers for shipment to waste-storage or disposal sites. Prior to treatment, storage or, shipment, the containers must be characterized to determine the ultimate disposition of the contained waste. Comprehensive and accurate nondestructive evaluation (NDE) and nondestructive assay (NDA) methods can be used to characterize most waste containers in a safe and cost-effective manner without opening them. The Lawrence Livermore National Laboratory (LLNL) is investigating and developing the application of x-ray and γ-ray methods to nonintrusively characterize waste containers and/or items.

X-ray NDE methods are being investigated to determine whether they can be used to identify hazardous and nonconforming materials. A γ-ray NDA method is used to identify the radioactive sources within a container and to accurately quantify their strength. In this paper we describe five waste characterization projects being conducted at LLNL that apply both the NDE and NDA methods and present results.

2578 (UCRL-JC–121184) **Nondestructive assay of TRU waste using gamma-ray active and passive computed tomography.** Roberson, G.P.; Decman, D.; Martz, H.; Keto, E.R.; Johansson, E.M. Lawrence Livermore National Lab., CA (United States). 4 Oct 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-951091–13: 4. nondestructive assay and nondestructive examination waste characterization conference, Salt Lake City, UT (United States), 24-26 Oct 1995). Order Number DE96010712. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have developed an active and passive computed tomography (A and PCT) scanner for assaying radioactive waste drums. Here they describe the hardware components of their system and the software used for data acquisition, gamma-ray spectroscopy analysis, and image reconstruction. They have measured the performance of the system using "mock" waste drums and calibrated radioactive sources. They also describe the results of measurements using this system to assay a real TRU waste drum with relatively low Pu content. The results are compared with X-ray NDE studies of the same TRU waste drum as well as assay results from segmented gamma scanner (SGS) measurements.

2579 (UCRL-JC–123342) **Application of gamma-ray active and passive computed tomography to nondestructively assay TRU waste.** Martz, H.E.; Decman, D.J.; Roberson, G.P.; Johansson, E.M.; Keto, E.R. Lawrence Livermore National Lab., CA (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-960187–1: Nondestructive assay/nondestructive evaluation (NDA/NDE) program review, Pittsburgh, PA (United States), 23-26 Jan 1996). Order Number DE96009253. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have developed an active and passive computed tomography scanner for assaying radioactive waste drums. They describe the hardware and software components of the system used for data acquisition, gamma-ray spectroscopy analysis, and image reconstruction. They have measured the performance of the system using mock waste drums and calibrated radioactive sources. They describe the results of measurements using this system to assay a real TRU waste drum with relatively low Pu content.

2580 (WHC-EP–0125-7) **Summary of radioactive solid waste received in the 200 Areas during calendar year 1994.** Anderson, J.D.; Hagel, D.L. Westinghouse Hanford Co., Richland, WA (United States). Aug 1995. 356p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95017145. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Hanford Company manages and operates the Hanford Site 200 Area radioactive solid waste storage and disposal facilities for the US Department of Energy, Richland Field Office, under contract DE-AC06-87RL10930. These facilities include radioactive solid waste disposal sites and radioactive solid waste storage areas. This document summarizes the amount of radioactive material that has been buried and stored in the 200 Area radioactive solid waste storage and disposal facilities from startup in 1944 through calendar year 1994. This report does not include backlog waste: solid radioactive wastes in storage or disposed of in other areas or facilities such as the underground tank farms. Unless packaged within the scope of WHC-EP-0063, Hanford Site Solid Waste Acceptance Criteria (WHC 1988), liquid waste data are not included in this document.

2581 (WHC-EP–0466-2) **Facility effluent monitoring plan for 242-A evaporator facility.** Crummel, G.M.; Gustavson, R.D. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 204p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008793. Source: OSTI; NTIS; INIS; GPO Dep.

A facility effluent monitoring plan is required by the U.S. Department of Energy in DOE Order 5400.1 for any operations that involve hazardous materials and radioactive substances that could affect employee or public safety or the environment. A facility effluent monitoring plan determination was performed during Calendar Year 1991 and the evaluation showed the need for a facility effluent monitoring plan. This document is prepared using the specific guidelines identified in A Guide for Preparing Hanford Site Facility Effluent Monitoring Plans, WHC-EP-0438-1. This facility effluent monitoring plan assesses effluent monitoring systems and evaluates whether they are adequate to ensure the public health and safety as specified in applicable federal, state, and local requirements. This facility effluent monitoring plan shall ensure long-range integrity of the effluent monitoring systems by requiring an update whenever a new process or operation introduces new hazardous materials or significant radioactive materials. This document must be reviewed annually even if there are no operational changes, and it must be updated, as a minimum, every three years.

2582 (WHC-EP–0497-Rev.1) **Facility effluent monitoring plan for K Area Spent Fuel. Revision 1.** Hunacek, G.S. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001604. Source: OSTI; NTIS; INIS; GPO Dep.

The scope of this document includes program plans for monitoring and characterizing radioactive and nonradioactive hazardous materials discharged in the K Area effluents. This FEMP includes complete documentation for both airborne and liquid effluent monitoring systems that monitor radioactive and nonradioactive hazardous pollutants that could be discharged to the environment under routine and/or upset conditions. This documentation is provided for each K Area facility that uses, generates, releases, or manages significant quantities of radioactive and nonradioactive hazardous materials that could impact public and employee safety and the environment. This FEW describes the airborne and liquid effluent paths and the associated sampling and monitoring systems of the K Area facilities. Sufficient information is provided on the effluent characteristics and the effluent monitoring systems so that a compliance assessment against requirements may be performed. Adequate details are supplied such that radioactive and hazardous material source terms may be related to specific effluent streams which are, in turn, related to discharge points and finally compared to the effluent monitoring system capability.

2583 (WHC-EP–0527-4) **Environmental releases for calendar year 1994.** Gleckler, B.P. Westinghouse Hanford Co., Richland, WA (United States). Jul 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95017146. Source: OSTI; NTIS; INIS; GPO Dep.

This report fulfills the annual environmental release reporting requirements of US Department of Energy (DOE) Orders. This report provides supplemental information to the Hanford Site Environmental Report. The Hanford Site Environmental Report provides an update on the environmental status of the entire Hanford Site. The sitewide annual report summarizes the degree of compliance of the Hanford Site with applicable environmental regulations and informs the public about the impact of Hanford operations on the surrounding environment. Like the Hanford Site Environmental Report, this annual report presents a summary of the environmental releases from facilities managed by the Westinghouse Hanford Company (WHC) and monitored by Bechtel Hanford, Incorporated (BHI). In addition to the summary data, this report also includes detailed data on air emissions, liquid effluents, and hazardous substances released to the environment during calendar year 1994 from these facilities.

2584 (WHC-EP–0528-Rev.2) **Effluent monitoring Quality Assurance Project Plan for radioactive airborne emissions data. Revision 2.** Frazier, T.P. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96005138. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Project Plan addresses the quality assurance requirements for compiling Hanford Site radioactive airborne emissions data. These data will be reported to the U.S. Environmental Protection Agency, the US Department of Energy, and the Washington State Department of Health. Effluent Monitoring performs compliance assessments on radioactive airborne sampling and monitoring systems. This Quality Assurance Project Plan is prepared in compliance with interim guidelines and specifications. Topics include: project description; project organization and management; quality assurance objectives; sampling procedures; sample custody; calibration procedures; analytical procedures; monitoring and reporting criteria; data reduction, verification, and reporting; internal quality control; performance and system audits; corrective actions; and quality assurance reports.

2585 (WHC-EP–0536-2) **Quality assurance program plan for radionuclide airborne emissions monitoring.** Boom, R.J. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 205p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010579. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Program Plan identifies quality assurance program requirements and addresses the various Westinghouse Hanford Company organizations and their particular responsibilities in regards to sample and data handling of airborne emissions. The Hanford Site radioactive airborne emissions requirements are defined in National Emissions Standards for Hazardous Air Pollutants (NESHAP), Code of Federal Regulations, Title 40, Part 61, Subpart H (EPA 1991a). Reporting of the emissions to the US Department of Energy is performed in compliance with requirements of US Department of Energy, Richland Operations Office Order 5400.1, General Environmental Protection Program (DOE-RL 1988). This Quality Assurance Program Plan is prepared in accordance with and to the requirements of QAMS-004/80, Guidelines and Specifications for Preparing Quality Assurance Program Plans (EPA 1983). Title 40 CFR Part 61, Appendix B, Method 114, Quality Assurance Methods (EPA 1991b) specifies the quality assurance requirements and that a program plan should be prepared to meet the requirements of this regulation. This Quality Assurance Program Plan identifies NESHAP responsibilities and how the Westinghouse Hanford Company Environmental, Safety, Health, and Quality Assurance Division will verify that the methods are properly implemented.

2586 (WHC-EP–0536-3) **Quality assurance program plan for radionuclide airborne emissions monitoring.** Boom, R.J. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96005139. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Program Plan identifies quality assurance program requirements and addresses the various Westinghouse Hanford Company organizations and their particular responsibilities in regards to sample and data handling of radiological airborne emissions. This Quality Assurance Program Plan is prepared in accordance with and to written requirements.

2587 (WHC-EP–0538-2) **Operational Environmental Monitoring Program Quality Assurance Project Plan.** Perkins, C.J. Westinghouse Hanford Co., Richland, WA (United States). Aug 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95017143. Source: OSTI; NTIS; GPO Dep.

This Quality Assurance Project Plan addresses the quality assurance requirements for the activities associated with the preoperational and operational environmental monitoring performed by Westinghouse Hanford Company as it implements the Operational Environmental Monitoring program. This plan applies to all sampling and monitoring activities performed by Westinghouse Hanford Company in implementing the Operational Environmental Monitoring program at the Hanford Site.

2588 (WHC-EP–0573-3) **Westinghouse Hanford Company operational environmental monitoring annual report, calendar year 1994.** Schmidt, J.; Fassett, J.W.; Johnson, A.R.; Johnson, V.G.; Markes, B.M.; McKinney, S.M.; Moss, K.J.; Perkins, C.J.; Richterich, L.R. Westinghouse Hanford Co., Richland, WA (United States). Aug 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001069. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the results of the Westinghouse Hanford Company near-facility operational environmental monitoring for 1994 in the 100, 200/600, and 300/400 Areas of the Hanford Site, in south-central Washington State. Surveillance activities included sampling and analyses of ambient air surface water, groundwater, soil, sediments, and biota. Also, external radiation measurements and radiological surveys were taken at waste disposal sites, radiologically controlled areas, and roads. These activities were conducted to assess and control the effects of nuclear facilities and waste sites on the local environment. In addition, diffuse sources were monitored to determine compliance with Federal, State, and/or local regulations. In general, although effects from nuclear facilities are still seen on the Hanford Site and radiation levels are slightly elevated when compared to offsite locations, the differences are less than in previous years.

2589 (WHC-EP-0835-1) **Statement of work for services provided by the Waste Sampling and Characterization Facility for Effluent Monitoring during Calendar Year 1996.** Gleckler, B.P. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006833. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents radionuclide air emissions from the Hanford Site and the resulting effective dose equivalent to any member of the public from those emissions. This report complies with the reporting requirements of the Code of Federal Regulations, Title 40, "Protection of the Environment," Part 61, "National Emissions Standards for Hazardous Air Pollutants," Subpart H, "National Emission Standards for Emissions of Radionuclides Other Than Radon From Department of Energy Facilities" (40 CFR 61 Subpart H) and Chapter 246-247 of the Washington Administrative Code (WAC 246-247).

2590 (WHC-EP-0883) **Variability and scaling of hydraulic properties for 200 Area soils, Hanford Site.** Khaleel, R.; Freeman, E.J. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96004634. Source: OSTI; NTIS; INIS; GPO Dep.

Over the years, data have been obtained on soil hydraulic properties at the Hanford Site. Much of these data have been obtained as part of recent site characterization activities for the Environmental Restoration Program. The existing data on vadose zone soil properties are, however, fragmented and documented in reports that have not been formally reviewed and released. This study helps to identify, compile, and interpret all available data for the principal soil types in the 200 Areas plateau. Information on particle-size distribution, moisture retention, and saturated hydraulic conductivity (K_s) is available for 183 samples from 12 sites in the 200 Areas. Data on moisture retention and K_s are corrected for gravel content. After the data are corrected and cataloged, hydraulic parameters are determined by fitting the van Genuchten soil-moisture retention model to the data. A nonlinear parameter estimation code, RETC, is used. The unsaturated hydraulic conductivity relationship can subsequently be predicted using the van Genuchten parameters, Mualem's model, and laboratory-measured saturated hydraulic conductivity estimates. Alternatively, provided unsaturated conductivity measurements are available, the moisture retention curve-fitting parameters, Mualem's model, and a single unsaturated conductivity measurement can be used to predict unsaturated conductivities for the desired range of field moisture regime.

2591 (WHC-EP-0894) **Hanford Site radionuclide national emission standards for hazardous ari pollutants registered and and unregistered stack (powered exhaust) source assessment.** Davis, W.E. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 157p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006834. Source: OSTI; NTIS; INIS; GPO Dep.

On February 3, 1993, US DOE Richland Operations Office received a Compliance Order and Information Request from the Director of the Air and Toxics Div. of US EPA, Region X. The compliance order requires the Richland Operations Office to evaluate all radionuclide emission points at the Hanford site to determine which are subject to the continuous emission measurement requirements in Title 40, Code of Federal Regulations (CFR), Part 61, Subpart H, and to continuously measure radionuclide emissions in accordance with 40 CFR 61.93. The Information Request required The provision of a written compliance plan to meet the requirements of the compliance order. A compliance plan was submitted to EPA, Region X, on April 30, 1993. It set as one of the milestones, the complete assessment of the Hanford Site 84 stacks registered with the Washington State Department of Health, by December 17, 1993. This milestone was accomplished. The compliance plan also called for reaching a Federal Facility Compliance Agreement; this was reached on February 7, 1994, between DOE Richland Operations and EPA, Region X. The milestone to assess the unregistered stacks (powered exhaust) by August 31, 1994, was met. This update presents assessments for 72 registered and 22 unregistered stacks with potential emissions > 0.1 mrem/yr.

2592 (WHC-MR-0496) **Comparison of airborne and surface particulate size distributions in specific Hanford Nuclear Facilities.** Ottley, D.B. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 145p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003329. Source: OSTI; NTIS; INIS; GPO Dep.

Settled dust from nuclear operations may be contaminated with radionuclides and become resuspended and subsequently breathed. This is the predominate radionuclide inhalation hazard scenario in nuclear facilities that have been deactivated and no longer have liquid in their process systems that may become directly airborne in accident situations. Comparisons were made between indoor ambient airborne particulate size distribution and that of resuspended dust that could become contaminated and subsequently airborne during decommissioning operations at selected nuclear facilities on the Hanford Site. Results indicate that only 5% of the particles, by count, above the breathing zone are greater than ten (10) μm in size and that the particulates that could be resuspended into the breathing zone had a mean aerodynamic equivalent diameter of four (4) μm or less.

2593 (WHC-MR-0505) **Type C investigation of electrical fabrication projects in ICF Kaiser shops.** Huckfeldt, R.A. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015810. Source: OSTI; NTIS; INIS; GPO Dep.

A Type C Investigation Board was convened to investigate an electrical miswiring problem found during the operation of the electrical distribution trailer for the TWRS Rotary Mode Core Sampling Truck #2. The trailer was designed by WHC and fabricated ICF KH on site for use in the Characterization Program. This problem resulted in a serious safety hazard since the support truck frame/chassis became electrically energized. This final report provides results of the "Type C Investigation, Electrical Fabrication Projects in ICF KH Shops, June, 1995." It contains the investigation scope, executive summary, relevant facts, analysis, conclusions and corrective actions. DOE Order 5484.1, "Environmental Protection, Safety and Health Protection Information Reporting Requirements," was followed in preparation of this report. Because the incident was electrical in nature and involved both Westinghouse Hanford Company and ICF Kaiser Hanford organizations, the board included members from both contractors and members with considerable electrical expertise.

2594 (WHC-SA–2861) **A method to improve spectral resolution in planar semiconductor gamma-ray detectors.** Keele, B.D. (International Technology Hanford Company, Richland, WA (United States)); Addleman, R.S.; Troyer, G.L. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951073–6: IEEE nuclear science symposium and medical imaging conference, San Francisco, CA (United States), 23-28 Oct 1995). Order Number DE95011635. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes an empirically derived algorithm to compensate for charge trapping in CdTe, CdZnTe, and other planar semiconductor detectors. The method is demonstrated to be an improvement over available systems and application to experimental data is shown.

2595 (WHC-SA–2925-FP) **Evaluation of chromium speciation and transport characteristics in the Hanford Site 100D and 100H areas.** Thornton, E.C. (and others); Amonette, J.E.; Olivier, J. Westinghouse Hanford Co., Richland, WA (United States). Aug 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9508172–1: 1. symposium on the hydrogeology of Washington state, Olympia, WA (United States), 28-30 Aug 1995). Order Number DE96001102. Source: OSTI; NTIS; INIS; GPO Dep.

Field and laboratory investigations have been conducted to define the fate and transport characteristics of chromium contamination present in the 100D/H Areas of the Hanford Site. This information is relevant to assessing the impact of the release of hexavalent chromium to the Columbia River. Included in this study was the determination of the concentration and aqueous speciation of chromium in the unconfined acquifer and an assessment of potential changes in speciation as groundwater passes through the river/acquifer transition zone and mixes with the Columbia River. The results of this study indicate that chromium present within the Hanford acquifer is predominantly in the oxidized hexavalent state. Chromium is apparently stable in the oxidized form owing to its lack of organic matter within the acquifer. A portion of the chromium is removed as groundwater passes through the transition zone due to reduction and precipitation associated with sediment/water interaction processes. Chemical data collected from seep water samples, however, suggests, that most of the hexavalent chromium ultimately discharges into the Columbia River. Dilution of hexavalent chromium subsequently occurs during the mixing of groundwater and river water, with relatively little change taking place in speciation.

2596 (WHC-SA–2971) **Dose rate visualization of radioisotope thermoelectric generators.** Schwarz, R.A.; Kessler, S.F.; Tomaszewski, T.A. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960109–6: STAIF 96: space technology and applications international forum, Albuquerque, NM (United States), 7-11 Jan 1996). Order Number DE96002798. Source: OSTI; NTIS; INIS; GPO Dep.

Advanced visualization techniques can be used to investigate gamma ray and neutron dose rates around complex dose rate intensive operations. A method has been developed where thousands of dose points are calculated using the MCNP(Monte Carlo N-Particle) computer code and then displayed to create color contour plots of the dose rate for complex geometries. Once these contour plots are created, they are sequenced together creating an animation to dynamically show how the dose rate changes with changes in the geometry or source over time.

2597 (WHC-SD-610-ATR–002) **Project B610 process control configuration acceptance test report.** Silvan, G.R. Westinghouse Hanford Co., Richland, WA (United States). 27 Jun 1995. 182p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015651. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this test is to verify the Westinghouse configuration of the MICON A/S Distributed Control System for project B610. The following will be verified: (1) proper assignment and operation of all field inputs to and outputs from the MICON Termination panels; (2) proper operation of all display data on the operators' console; (3) proper operation of all required alarms; and (4) proper operation of all required interlocks. This test only verifies the proper operation of the Westinghouse control configuration (or program). It will not be responsible for verifying proper operation of the MICON hardware or operating software. Neither does it test any of the B610 instrument. The MICON hardware and software has been tested as part of the equipment procurement. Instrumentation and wiring installed under project B620 will be tested under a separate functional test. In some cases, precise transmitter ranges, alarm setpoints, and controller tuning parameters are not available at this time. Therefore, approximate values are used during the test. This should not affect the proper operation of the configuration or the validity of this test. Final values will be assigned during operability testing.

2598 (WHC-SD-CP-OTP–153) **Operability test procedure for PFP wastewater sampling facility.** Hirzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 27 Apr 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011654. Source: OSTI; NTIS; INIS; GPO Dep.

Document provides instructions for performing the Operability Test of the 225-WC Wastewater Sampling Station which monitors the discharge to the Treated Effluent Disposal Facility from the Plutonium Finishing Plant. This Operability Test Procedure (OTP) has been prepared to verify correct configuration and performance of the PFP Wastewater sampling system installed in Building 225-WC located outside the perimeter fence southeast of the Plutonium Finishing Plant (PFP). The objective of this test is to ensure the equipment in the sampling facility operates in a safe and reliable manner. The sampler consists of two Manning Model S-5000 units which are rate controlled by the Milltronics Ultrasonic flowmeter at manhole No.C4 and from a pH measuring system with the sensor in the stream adjacent to the sample point. The intent of the dual sampling system is to utilize one unit to sample continuously at a rate proportional to the wastewater flow rate so that the aggregate tests are related to the overall flow and thereby eliminate isolated analyses. The second unit will only operate during a high or low pH excursion of the stream (hence the need for a pH control). The major items in this OTP include testing of the Manning Sampler System and associated equipment including the pH measuring and control system, the conductivity monitor, and the flow meter.

2599 (WHC-SD-SNF-ATR–005) **105-KE Isolation Barrier Leak Rate Acceptance Test Report.** McCracken, K.J. Westinghouse Hanford Co., Richland, WA (United States). 14 Jun 1995. 182p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015655. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Report (ATR) contains the completed and signed Acceptance Procedure (ATP) for the 105-KE Isolations Barrier Leak Rate Test. The Test Engineer's log, the completed sections of the ATP in the Appendix for Repeat Testing (Appendix K), the approved WHC J-7s (Appendix H), the data logger files (Appendices T and U), and the post test calibration checks (Appendix V) are included.

2600 (WHC-SD-SNF-DGS–001) **K-Basins design guidelines.** Roe, N.R.; Mills, W.C. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 138p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015820. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the design guidelines is to enable SNF and K Basin personnel to complete fuel and sludge removal, and basin water mitigation by providing engineering guidance for equipment design for the fuel basin, facility modifications (upgrades), remote tools, and new processes. It is not intended to be a purchase order reference for vendors. The document identifies materials, methods, and components that work at K Basins; it also Provides design input and a technical review process to facilitate project interfaces with operations in K Basins. This document is intended to compliment other engineering documentation used at K Basins and throughout the Spent Nuclear Fuel Project. Significant provisions, which are incorporated, include portions of the following: General Design Criteria (DOE 1989), Standard Engineering Practices (WHC-CM-6-1), Engineering Practices Guidelines (WHC 1994b), Hanford Plant Standards (DOE-RL 1989), Safety Analysis Manual (WHC-CM-4-46), and Radiological Design Guide (WHC 1994f). Documents (requirements) essential to the engineering design projects at K Basins are referenced in the guidelines.

2601 (WHC-SD-SNF-DTP–001) **Test procedure for the Master-Lee and the modified Champion four inch hydraulic cutters.** Crystal, J.B. Westinghouse Hanford Co., Richland, WA (United States). 2 May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012569. Source: OSTI; NTIS; INIS; GPO Dep.

The Master-Lee and the modified Champion 4 Inch hydraulic cutters are being retested to gather and document information related to the following: determine if the Master-Lee cutters will cut the trunnions of an Aluminum fuel canister and a Stainless Steel fuel canister; determine if the Master-Lee cutters will cut $1\frac{1}{2}$ inch diameter fire hose; determine if the modified Champion 4 inch blade will cut sections of piping; and determine the effectiveness of the centering device for the Champion 4 Inch cutters. Determining the limitations of the hydraulic cutter will aid in the process of debris removal in the K-Basin. Based on a previous test, the cutters were returned to the manufacturer for modifications. The modifications to the Champion 4 Inch Cutter and further testing of the Master-Lee Cutter are the subjects of these feature tests.

2602 (WHC-SD-SNF-PLN–007) **Plan for characterization of K Basin spent nuclear fuel and sludge.** Lawrence, L.A.; Marschman, S.C. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015586. Source: OSTI; NTIS; INIS; GPO Dep.

This plan outlines a characterization program that supports the accelerated Path Forward scope and schedules for the Spent Nuclear Fuel stored in the Hanford K Basins. This plan is driven by the schedule to begin fuel transfer by December 1997. The program is structured for 4 years and is limited to in-situ and laboratory examinations of the spent nuclear fuel and sludge in the K East and K West Basins. The program provides bounding behavior of the fuel, and verification and acceptability for three different sludge disposal pathways. Fuel examinations are based on two shipping campaigns for the K West Basin and one from the K East Basin. Laboratory examinations include physical condition, hydride and oxide content, conditioning testing, and dry storage behavior.

2603 (WHC-SD-SNF-TRP–007) **105K West Isolation Barrier Acceptance Test results.** McCracken, K.J. (ICF Kaiser Hanford Co., Richland, WA (United States)); Irwin, J.J. ICF Kaiser Hanford Co., Richland, WA (United States). 18 May 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013343. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this document is to report and interpret the findings of the isolation barrier acceptance tests performed in 105KW/100K. The tests were performed in accordance with the test plan and acceptance test procedure. The test report contains the test data. This document compares the test data against the criteria. A discussion of the leak rate analytical characterization describes how the flow characteristics flow rate will be determined using the test data from the test report. Two modes of water loss were considered; basin and/or discharge chute leakage, and evaporation. An initial test established baseline leakage data and instrumentation performance. Test 2 evaluated the sealing performance of the isolation barrier by inducing an 11 in. (27.9 cm) level differential across the barrier. The leak rate at this 11 in. (27.9 cm) level is extrapolated to the 16 ft. (4.9 m) level differential postulated in the DBE post seismic event. If the leak rate, adjusted for evaporation and basin leakage (determined from Test 1), is less than the SAR limit of 1,500 gph (5,680 lph) at a 16 ft (4.9 m) level differential, the barriers pass the acceptance test.

2604 (WHC-SD-W007H-OTR–001) **Operability test report for the TK-900 beta/gamma liquid effluent monitoring system.** Weissenfels, R.D. Westinghouse Hanford Co., Richland, WA (United States). 10 Apr 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010810. Source: OSTI; NTIS; INIS; GPO Dep.

This operability test report will verify that the 221-B beta/gamma liquid effluent monitoring system installed near the east end of the six inch chemical sewer header, functions as intended by design. An off-line, skid mounted, beta/gamma radiation monitor and pH monitor was installed near stairwell three in the 221-B electrical gallery by Project W-007H. The skid mounted monitoring system includes two radiation detectors and a pH meter, both with local digital displays. Output signals from each monitor are also received and displayed by the Facility Process Monitor and Control System (FPMCS). Pumps, motors, gauges, valves and transport lines complement the skid monitoring system. The system is part of BAT/AKART for the BCE liquid effluent system.

2605 (WHC-SD-WM-ATP–129) **Void fraction instrument software, Version 1.2: Acceptance test procedure.** Gimera, M. Westinghouse Hanford Co., Richland, WA (United States). 9 May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013325. Source: OSTI; NTIS; INIS; GPO Dep.

This provides the procedures for the void fraction acceptance test software, Version 1.2. The void fraction instrument will collect data to calculate the amount of gas trapped in Tank 101-SY.

2606 (WHC-SD-WM-ATR–120) **Acceptance Test Report for the 241-AN-107 Enraf Advanced Technology Gauges.** Dowell, J.L.; Enderlin, V.R. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 89p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050100. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Report covers the results of the execution of the Acceptance Test Procedure for the 241-AN-107 Enraf Advanced Technology Gauges. The test verified the proper operation of the gauges to measure waste density and level in the 241-AN-107 tank.

2607 (WHC-SD-WM-DA–200) **Analysis of the Retained Gas Sample (RGS) Extruder Assembly.** Coverdell, B.L. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050107. Source: OSTI; NTIS; INIS; GPO Dep.

In order for the Retained Gas Sample (RGS) Extruder Assembly to be safely used it was determined by the cognizant engineer that analysis was necessary. The use of the finite-element analysis (FEA) progarm COSMOS/M version 1.71 permitted a quick, easy, and detailed stress analysis of the RGS Extruder Assembly. The FEA model is a three dimensional model using the SHELL4T element type. From the results of the FEA, the cognizant engineer determined that the RGS extruder would be rated at 10,000 lbf and load tested to 12,000 lbf. The respective input and output files for the model are EXTR02.GFM and EXTR02.OUT and can be found on the attached tape.

2608 (WHC-SD-WM-DRD–002) **Design Requirements Document (DRD) for Surface Moisture Measurement System (SMMS).** Stokes, T. (Westinghouse Hanford Co., Richland, WA (United States)); Watson, T.; Gimera, M.; Russell, J.; Dabiri, A.; Holslin, D.; Johansen, F. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050110. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the design requirements for the surface moisture measurement system currently under development in the 306E facility.

2609 (WHC-SD-WM-ETP–159) **Improving sample recovery.** Blanchard, R.J. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050206. Source: OSTI; NTIS; INIS; GPO Dep.

This Engineering Task Plan (ETP) describes the tasks, i.e., tests, studies, external support and modifications planned to increase the recovery of the recovery of the waste tank contents using combinations of improved techniques, equipment, knowledge, experience and testing to better the recovery rates presently being experienced.

2610 (WHC-SD-WM-FRD–024) **Functions and requirements for a waste dislodging and conveyance system for the Gunite and Associated Tanks Treatability Study at Oak Ridge National Laboratory.** Potter, J.D.; Mullen, O.D. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050211. Source: OSTI; NTIS; INIS; GPO Dep.

Functions and requirements for the Waste Dislodging and Conveyance System to be deployed in Gunite and Associated Tanks (GAAT) and tested and evaluated as a candidate tank waste retrieval technology by the GAAT Treatability Study (GAAT TS).

2611 (WHC-SD-WM-RPT–116) **Summary of FY 1994 Raman spectroscopy technology cold test activities.** Lopez, T. Westinghouse Hanford Co., Richland, WA (United States). 6 Apr 1995. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010566. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the development, optimization, and feature testing of a Raman Spectroscopy Characterization Tool in a cold cell environment. The LLNL supplied Raman system was used to evaluate fiber optic probes and to obtain spectra from tank waste simulants.

2612 (WHC-SD-WM-TI–700) **296-B-13 stack monitoring and sampling system: Annual system assessment report.** Ridge, T.M. Westinghouse Hanford Co., Richland, WA (United States). 16 May 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012825. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the annual system assessment of the air pollution monitoring and sampling system for the 296-13 stack at the Hanford site. Topics discussed include; system description, system status, system aging, spare parts considerations, long term maintenance plan, trends, and items requiring action.

2613 (WHC-SD-WM-TP–169) **Liquid Effluent Monitoring Information System test plans releases 2.0 and 3.0.** Guettler, D.A. Westinghouse Hanford Co., Richland, WA (United States). 26 May 1995. 590p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014427. Source: OSTI; NTIS; INIS; GPO Dep.

The Liquid Effluent Monitoring Information System (LEMIS) is being developed as the organized information repository facility in support of the liquid effluent monitoring requirements of the Tri-Party Agreement. It is necessary to provide an automated repository into which the results from liquid effluent sampling will be placed. This repository must provide for effective retention, review, and retrieval of selected sample data by authorized persons and organizations. This System Architecture document is the aggregation of the DMR P+ methodology project management deliverables. Together they represent a description of the project and its plan through four Releases, corresponding to the definition and prioritization of requirements defined by the user.

2614 (WHC-SD-WM-TRP-237) **Laboratory testing of geomembrane for waste containment EPA Method 9090, March 1995. Final report.** Whitlock, R.W. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); TRI/Environmental, Inc., Austin, TX (United States). 15 May 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012589. Source: OSTI; NTIS; GPO Dep.

This report describes the work performed by TRI/ Environmental, Inc. (TRI) to determine the chemical compatibility of one geomembrane and one seamed geomembrane with four synthetically generated leachates. The objective was to determine the resistance of the geomembrane to changes caused by exposure to the leachates. Changes in physical and mechanical properties were measured after exposure to the leachates at 23 C and 50 C for 30, 60, 90 and 120 days. Exposures were performed in accordance with the exposure regimen specified in US Environmental Protection Agency (EPA) Method 9090A. Methods, results and discussion are provided. Test results are also provided in the Tables of Results which accompany this report.

2615 (WHC-SP-0665-16) **Quarterly environmental radiological survey summary: First quarter 1995 100, 200, 300, and 600 Areas.** McKinney, S.M. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011571. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a summary of the radiological surveys performed in support of the operational environmental monitoring program at the Hanford Site. The surveys included in this program consist of inactive waste sites; outdoor radiological control areas; tank farm perimeters and associated diversion boxes, lift stations, and vent stations; perimeters of active or uncovered waste sites such as burial grounds, retention basins, ponds, process trenches, and ditches; and road and rail surfaces. This report provides a summary of the radiological surveys performed during the First Quarter of 1995. The status of corrective actions required from current and past reports are also discussed.

2616 (WHC-SP-0665-18) **Quarterly environmental radiological survey summary. Third quarter 1995 100, 200, 300, and 600 Areas.** McKinney, S.M.; Markes, B.M. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003335. Source: OSTI; NTIS; INIS; GPO Dep.

Routine radiological surveys are part of the near-facility environmental monitoring program which monitors and helps direct the reduction of the radiologically controlled areas at the Hanford Site. The routine radiological surveys are performed by the Southern Area Remediation Support Group and the Site Surveillance Radiological Control Group as directed by Near-Field Monitoring. The surveys included in this program consist of inactive waste sites; outdoor radiological control areas; tank farm perimeters and associated diversion boxes, lift stations, and vent stations; perimeters of active or uncovered waste sites such as burial grounds, retention basins, ponds, process trenches, and ditches; and road and rail surfaces. This report provides a summary of the radiological surveys performed during the Third Quarter of 1995. The status of corrective actions required from current and past reports are also discussed.

2617 (WHC-SP-0665-19) **Quarterly environmental radiological survey summary. Fourth quarter, 1995 100, 200, 300, and 600 Areas.** McKinney, S.M.; Markes, B.M. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006851. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a summary of the radiological surveys performed in support of the operational environmental monitoring program at the Hanford Site. The Fourth Quarter 1995 survey results and the status of actions required from current and past reports are described.

2618 (WSRC-MS-95-0502) **SRS environmental technology development field test platform.** Riha, B.D. (and others); Rossabi, J.; Eddy-Dilek, C.A. Westinghouse Savannah River Co., Aiken, SC (United States). 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950163-5: 3. international on-site analysis conference, Houston, TX (United States), 22-25 Jan 1995). Order Number DE95017486. Source: OSTI; NTIS; INIS; GPO Dep.

A critical and difficult step in the development and implementation of new technologies for environmental monitoring and characterization is successfully transferring these technologies to industry and government users for routine assessment and compliance activities. The Environmental Sciences Section of the DOE Savannah River Technology Center provides a forum for developers, potential users, and regulatory organizations to evaluate new technologies in comparison with baseline technologies in a well characterized field test bed. The principal objective of this project is to conduct comprehensive, objective field tests of monitoring and characterization technologies that are not currently used in EPA standard methods and evaluate their performance during actual operating conditions against baseline methods. This paper provides an overview of the field test site and a description of some of the technologies demonstrated at the site including their field applications.

2619 (WSRC-MS-96-0005) **Characterization of the Burma Road Rubble Pit at the Savannah River Site, Aiken, South Carolina.** Ward, K.G. (Westinghouse Savannah River Co., Aiken, SC (United States)); Frazier, W.L.; McAdams, T.D.; McFalls, S.L.; Rabin, M.; Voss, L. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960212-87: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96009644. Source: OSTI; NTIS; INIS; GPO Dep.

The Burma Road Rubble Pit (BRRP) is located at the Savannah River Site (SRS). The BRRP unit consists of two unlined earthen pits dug into surficial soil and filled with various waste materials. It was used from 1973–1983 for the disposal of dry inert rubble such as metal, concrete, lumber, poles, light fixtures, and glass. No record of the disposal of hazardous substances at the BRRP has been found. In

1983, the BRRP was closed by covering it with soil. In September 1988, a Ground Penetrating Radar survey detected three disturbed areas of soil near the BRRP, and a detailed and combined RCRA Facility Investigation/ Remedial Investigation was conducted from November 1993 to February 1994 to determine whether hazardous substances were present in the subsurface, to evaluate the nature and extent of contamination, and to evaluate the risks posed to the SRS facility due to activities conducted at the BRRP site. Metals, semi-volatile organic compounds, volatile organic compounds, radionuclides and one pesticide (Aldrin) were detected in soil and groundwater samples collected from seventeen BRRP locations. A baseline risk assessment (BRA) was performed quantitatively to evaluate whether chemical and radionuclide concentrations detected in soil and groundwater at the BRRP posed an unacceptable threat to human health and the environment. The exposure scenarios identifiable for the BRRP were for environmental researchers, future residential and occupational land use. The total site noncancer hazard indices were below unity, and cancer risk levels were below 1.0E-06 for the existing and future case environmental researcher scenario. The future case residential and occupational scenarios showed total hazard and risk levels which exceeded US EPA criterion values relative to groundwater scenarios. For the most part, the total carcinogenic risks were within the 1.0E-04 to 1.0E-06 risk range. Only the future adult residential scenario was associated with risks exceeding 1.0E-04.

2620 (WSRC-MS–96-0022) **Physical sampling for site and waste characterization.** Bonnough, T.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960421–46: 7. annual international high-level radioactive waste management conference, Las Vegas, NV (United States), 29 Apr - 3 May 1996). Order Number DE96012425. Source: OSTI; NTIS; INIS; GPO Dep.

Physical sampling plays a basic role in high-level radioactive waste management program effort. The term “physical sampling” used here means collecting tangible, physical samples of soil, water, air, waste streams, or other materials. The industry defines the term “physical sampling” broadly to include measurements of physical conditions such as temperature, wind conditions, and pH, which are also often taken in a sample collection effort. Most environmental compliance actions are supported by the results of taking, recording, and analyzing physical samples and the measurements of physical conditions taken in association with sample collecting. Therefore, the when and how to take samples is needed to be known and planned.

2621 (WSRC-TR–94-0344) **Characterization and reclamation assessment for the central shops diesel storage facility at Savannah River Site.** Fliermans, C.B.; Hazen, T.C.; Bledsoe, H.W. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95017470. Source: OSTI; NTIS; INIS; GPO Dep.

The contamination of subsurface terrestrial environments by organic contaminants is a global phenomenon. The remediation of such environments requires innovative assessment techniques and strategies for successful cleanups. Using innovative approaches, the central Shops Diesel Storage Facility at the Savannah River Site (SRS) was characterized to determine the extent of subsurface diesel fuel contamination. Effective bioremediation techniques for cleaning up of the contaminant plume were established.

2622 (WSRC-TR–95-0183) **Soil washing technology evaluation.** Suer, A. Westinghouse Savannah River Co., Aiken, SC (United States). Apr 1995. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96001693. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration Engineering (ERE) continues to review innovative, efficient, and cost effective technologies for SRS soil and/or groundwater remediation. As part of this effort, this technical evaluation provides review and the latest information on the technology for SRS soil remediation. Additional technology evaluation reports will be issued periodically to update these reports. The purpose of this report is to review the soil washing technology and its potential application to SRS soil remediation. To assess whether the Soil Washing technology is a viable option for SRS soil remediation, it is necessary to review the technology/ process, technology advantages/limitations, performance, applications, and cost analysis.

2623 (WSRC-TR–95-0206) **Conceptual Thermal Treatment Technologies Feasibility Study.** Suer, A. Westinghouse Savannah River Co., Aiken, SC (United States). 28 Feb 1996. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960437–2: 8. national technology information exchange workshop, Santa Fe, NM (United States), 16-18 Apr 1996). Order Number DE96060038. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a conceptual Thermal Treatment Technologies Feasibility Study (FS) for the Savannah River Site (SRS) focusing exclusively on thermal treatment technologies for contaminated soil, sediment, or sludge remediation projects.

2624 (WSRC-TR–95-0232) **Magnetic survey of the Risher Road Open Metal Pit Waste Unit.** Cumbest, R.J. Westinghouse Savannah River Co., Aiken, SC (United States). Jul 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96002954. Source: OSTI; NTIS; INIS; GPO Dep.

The Risher Road Waste Unit is located at the base of a small bluff (approximately 30 ft high) composed of sand and gravel. Due to collapse of the face of the bluff a steep slope of colluvium has formed at the base. The area of investigation is located on the slope of colluvium, and is marked by the presence of two pin flags spaced approximately 25 ft apart parallel to the bluff face. In order to investigate the presence of buried metallic material that might indicate waste containers or other wash beneath the colluvial slope a magnetometer survey was conducted in and around the vicinity of the pin flags. The survey consisted of a 5-ft by 5-ft square grid node pattern in a 40-ft by 60-ft rectangle. Magnetic field and gradient anomalies were detected in the locations of the pin flags and can be attributed to the ferric composition of the pin flag shafts. Other magnetic field and gradient variations are at background levels and do not indicate the presence of buried ferric objects of any significant size.

2625 (Y/ER–237) **Value engineering study report on Lower East Fork Poplar Creek Project. Alternative No. 3.** Oak Ridge Y-12 Plant, TN (United States). Aug 1995. 113p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC05-84OR21400. Order Number DE96003712. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration Program.

The project under study is Alternative No. 3 as identified in the Feasibility Study dated August 1994. This alternative is identified as Excavation and Disposal of Commercial/ DOE, Other, and Residential Remedial Unit Soil. The assumptions used for generating baseline costs are discussed in site associated costs. It is further described as follows: Soils with mercury concentrations greater than 200 ppM in the Commercial/DOE and Other Remedial Units and greater than 180 ppM in the Residential Remedial Unit [41,300m^3 (54,000yd^3 a volume equivalent to approximately 6,750 dump truck loads)] would be excavated and disposed of in an approved, lined landfill at Y-12 with leachate collection and possible pretreatment of the leachate before discharge. Because 0.6 ha (1.5 acres) of wetland would be destroyed, wetlands banking would occur, whereby a 1.8-ha (4.5-acre) wetland would be constructed on DOE-owned land near K-25. Borrow soil would be obtained from the Y-12 West End Borrow Area or from excess soil located at Y-12 landfills to fill the excavation. It is estimated that 7.3 ha (18.2 acres, and area about the size of 17 football fields) of habitat would be adversely affected. This alternative would use BMPs to minimize any adverse affects and to comply substantively with regulatory requirements.

EFFICIENT SEPARATIONS

2626 (ANL–95/34) **Aqueous biphasic extraction of uranium and thorium from contaminated soils. Final report.** Chaiko, D.J.; Gartelmann, J.; Henriksen, J.L.; Krause, T.R.; Deepak; Vojta, Y.; Thuillet, E.; Mertz, C.J. Argonne National Lab., IL (United States). Jul 1995. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE96002931. Source: OSTI; NTIS; INIS; GPO Dep.

The aqueous biphasic extraction (ABE) process for soil decontamination involves the selective partitioning of solutes and fine particulates between two immiscible aqueous phases. The biphase system is generated by the appropriate combination of a water-soluble polymer (e.g., polyethlene glycol) with an inorganic salt (e.g., sodium carbonate). Selective partitioning results in 99 to 99.5% of the soil being recovered in the cleaned-soil fraction, while only 0.5 to 1% is recovered in the contaminant concentrate. The ABE process is best suited to the recovery of ultrafine, refractory material from the silt and clay fractions of soils. During continuous countercurrent extraction tests with soil samples from the Fernald Environmental Management Project site (Fernald, OH), particulate thorium was extracted and concentrated between 6- and 16-fold, while the uranium concentration was reduced from about 500 mg/kg to about 77 mg/kg. Carbonate leaching alone was able to reduce the uranium concentration only to 146 mg/kg. Preliminary estimates for treatment costs are approximately $160 per ton of dry soil. A detailed flowsheet of the ABE process is provided.

2627 (ANL/CMT/CP–85955) **Metal separations using aqueous biphasic partitioning systems.** Chaiko, D.J. (Argonne National Lab., IL (United States). Chemical Technology Div.); Zaslavsky, B.; Rollins, A.N.; Vojta, Y.; Gartelmann, J.; Mego, W. Argonne National Lab., IL (United States). [1996]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960631–2: Engineering Foundation conference on emerging separation technologies, Kona, HI (United States), 16-21 Jun 1996). Order Number DE96010815. Source: OSTI; NTIS; INIS; GPO Dep.

Aqueous biphasic extraction (ABE) processes offer the potential for low-cost, highly selective separations. This countercurrent extraction technique involves selective partitioning of either dissolved solutes or ultrafine particulates between two immiscible aqueous phases. The extraction systems that the authors have studied are generated by combining an aqueous salt solution with an aqueous polymer solution. They have examined a wide range of applications for ABE, including the treatment of solid and liquid nuclear wastes, decontamination of soils, and processing of mineral ores. They have also conducted fundamental studies of solution microstructure using small angle neutron scattering (SANS). In this report they review the physicochemical fundamentals of aqueous biphase formation and discuss the development and scaleup of ABE processes for environmental remediation.

2628 (BHI–00739) **Subproject plan for demonstration of 3M technology for treatment of N Basin water.** Plastino, J.C. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008044. Source: OSTI; NTIS; INIS; GPO Dep.

A dissolved radionuclides removal demonstration is being conducted at the 105-N Basin as part of the 100-N Area Projects' policy of aggressively integrating innovative technologies to achieve more cost effective, faster, and/or safer deactivation operations. This subproject plan demonstrates new technology (marketed by the 3M™ Company) that absorbs specific ions from water. The demonstration will take place at the spent fuel basin at the N Reactor facility. The 105-N Basin contains 1 million gal of water consisting of approximately 32 Ci of dissolved ^{90}Sr at a concentration of 8.4 uCi/L and 7.3 Ci of dissolved ^{137}Cs at a concentration of 1.92 uCi/L. The Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement [Ecology et al. 1990]) Milestone M-16-01E-T2 requires the initiation of pretreatment and removal of all N Reactor fuel storage basin waters by September 30, 1996, pursuant to the N Reactor Deactivation Program Plan (WHC 1993). 105-N Basin dewatering is on the critical path for overall deactivation of N Reactor by March 1997. The 105-N Basin Deactivation Program Plan (BHI 1995) includes removing debris, hardware, algae and sediment from the basin, followed by pretreatment (filtration) and removal of the 1005-N Basin water. Final water removal is currently scheduled for September 30, 1996. The recommended method of the 105-N Basin water is the treatment of the water at the Effluent Treatment Facility (ETF) in the 200 East Area. The demonstration of the 3M technology could be a feasible treatment alternative to the ETF if the ETF is not available to meet the project schedule or if additional pretreatment is needed to reduce the inventory of radioactive species to be handled at the ETF. Demonstration of this technology could be of value for other fuel basins at the Hanford Site and possibly other US Department of Energy (DOE) sites and non- DOE nuclear power plants.

2629 (CONF-9505101–6) **Removal of technetium from alkaline nuclear-waste media by a solvent-extraction process using crown ethers.** Bonnesen, P.V.

(Oak Ridge National Lab., TN (United States). Chemical and Analytical Sciences Div.); Presley, D.J.; Haverlock, T.J.; Moyer, B.A. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on challenges and innovations in the management of hazardous waste; Washington, DC (United States); 10-12 May 1995. Order Number DE95014200. Source: OSTI; NTIS; INIS; GPO Dep.

Crown ethers dissolved in suitably modified aliphatic kerosene diluents can be employed to extract technetium as pertechnetate anion (TcO_4^-) with good extraction ratios from realistic simulants of radioactive alkaline nitrate waste. The modifiers utilized are non-halogenated and non-volatile, and the technetium can be removed from the solvent by stripping using water. The crown ethers bis-4,4′(5′)[(tert-butyl)cyclohexano]-18-crown-6 (di-t-BuCH18C6) and dicyclohexano-18-crown-6 (DCH18C6) provide stronger TcO_4^- extraction than dicyclohexano-21-crown-7 and 4-tert-butylcyclohexano 15-crown-5. Whereas DCH18C6 provides somewhat higher TcO_4^- extraction ratios than the more lipophilic di-t-BuCH18C6 derivative, the latter was selected for further study owing to its lower distribution to the aqueous phase. Particularly good extraction and stripping results were obtained with di-t-BuCH 18C6 at 0.02 M in a 2:1 vol/vol blend of tributyl phosphate and Isopar® M. Using this solvent, 98.9% of the technetium contained (at 6×10^{-5} M) in a Double-Shell Slurry Feed (DSSF) Hanford tank waste simulant was removed following two cross-current extraction contacts. Two cross-current stripping contacts with deionized water afforded removal of 99.1% of the technetium from the organic solvent.

2630 (CONF-9507119–9) **Mercury separation from aqueous wastes.** Taylor, P.A.; Klasson, K.T.; Corder, S.L. Oak Ridge National Lab., TN (United States). Jul 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Summer national meeting of the American Institute of Chemical Engineers; Boston, MA (United States); 30 Jul - 2 Aug 1995. Order Number DE96003778. Source: OSTI; NTIS; INIS; GPO Dep.

This project is providing an assessment of new sorbents for removing mercury from wastes at US Department of Energy sites. Four aqueous wastes were chosen for lab-scale testing; a high-salt, acidic waste currently stored at Idaho National Engineering Laboratory (INEL); a high-salt, alkaline waste stored at the Savannah River Site (SRS); a dilute lithium hydroxide solution stored at the Oak Ridge Y-12 Plant; and a low-salt, neutral groundwater generated at the Y-12 Plant. Eight adsorbents have been identified for testing, covering a wide range of cost and capability. Screening tests have been completed, which identified the most promising adsorbents for each waste stream. Batch isotherm tests have been completed using the most promising adsorbents, and column tests are in progress. Because of the wide range of waste compositions tested, no one adsorbent is effective in all of these waste streams. Based on loading capacity and compatibility with the waste solutions. the most effective adsorbents identified to date are SuperLig 618 for the INEL tank waste stimulant; Mersorb followed by Ionac SR-3 for the SRS tank waste stimulant; Durasil 70 and Ionac SR-3) for the LIOH solution; and Ionac SR-3 followed by Ionac SR-4 and Mersorb for the Y-12 groundwater.

2631 (CONF-951180–3) **Present and future roles of solvent extraction in treatment of nuclear wastes.** Watson, J.S. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual meeting of the American Institute of Chemical Engineers; Miami Beach, FL (United States); 12-17 Nov 1995. Order Number DE96005464. Source: OSTI; NTIS; INIS; GPO Dep.

Solvent extraction has played a major role in development of the nuclear industry and has recovered much of the uranium from raw materials and essentially all of the plutonium and uranium from spent fuels. These operations produced a wide variety of radioactive wastes as well as the uranium and plutonium products. Solvent extraction worked well in the earlier nuclear facilities and should play a significant role in future cleanup operations.

2632 (CONF-960158–4) **Development and testing of inorganic sorbents made by the internal gelation process for radionuclide and heavy metal separations.** Egan, B.Z. (Oak Ridge National Lab., TN (United States). Chemical Technology Div.); Collins, J.L.; Anderson, K.K.; Chase, C.W. Oak Ridge National Lab., TN (United States). 29 Nov 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Efficient separations and processing crosscutting program 1996 technical meeting; Gaithersburg, MD (United States); 16-19 Jan 1996. Order Number DE96005660. Source: OSTI; NTIS; INIS; GPO Dep.

The objectives of this task are to develop, prepare, and test microspheres and granular forms of inorganic ion exchangers to remove radionuclides and heavy metals from waste streams occurring at various sites. Several inorganic materials, such as hexacyanoferrates, titanates, phosphates, and oxides have high selectivities and efficiencies for separating and removing radionuclides such as uranium, technetium, cesium, and strontium, and metals such as cobalt, silver, zinc, and zirconium from aqueous waste streams. However, these sorbents frequently exist only as powders and consequently are not readily adaptable to continuous processing such as column chromatography. Making these inorganic ion exchangers as microspheres or granular forms improves the flow dynamics for column operations and expands their practical applications. Microspheres of several materials have been prepared at ORNL, and the effectiveness of zirconium monohydrogen phosphate and hydrous titanium oxide microspheres for removing radionuclides from hot cell waste solutions has been demonstrated.

2633 (CONF-960314–3) **Solvent extraction of technetium from alkaline waste media using bis-4,4′(5′)[(tert-butyl)cyclohexano]-18-crown-6.** Bonnesen, P.V.; Presley, D.J.; Moyer, B.A. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International solvent extraction conference; Melbourne (Australia); 17-21 Mar 1996. Order Number DE95013989. Source: OSTI; NTIS; INIS; GPO Dep.

The crown ether bis-4,4′(5′)[(tert-butyl)cyclohexano]-18-crown-6 can be utilized in a solvent-extraction process for the removal of technetium as pertechnetate ion, TcO_4^- from solutions simulating highly radioactive alkaline defense wastes ("tank wastes") stored at several sites in the United States. The process employs non-halogenated and non-volatile diluents and modifiers and includes an efficient stripping procedure using only water. More than 95% of the pertechnetate present at 6×10^{-5} M in Melton Valley (Oak Ridge, TN) and Hanford (Washington) tank-waste simulants was removed following two cross-current extraction contacts using 0.02 M bis-4,4′(5′)[(tertbutyl)cyclohexano]- 18-crown-6 in 2:1 vol/vol TBP/Isopar® M diluent at 25 C. Similarly, for both simulants, more than 98% of the pertechnetate contained in the solvent was back-extracted following two cross-current stripping contacts using deionized water.

2634 (DOE/EM–0249) **Efficient Separations and Processing Crosscutting Program. Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Jun 1995. 101p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016004. Source: OSTI; NTIS; INIS; GPO Dep.

The Efficient Separations and Processing (ESP) Crosscutting Program was created in 1991 to identify, develop, and perfect separations technologies and processes to treat wastes and address environmental problems throughout the DOE Complex. The ESP funds several multi-year tasks that address high-priority waste remediation problems involving high-level, low-level, transuranic, hazardous, and mixed (radioactive and hazardous) wastes. The ESP supports applied research and development (R and D) leading to demonstration or use of these separations technologies by other organizations within DOE-EM. Treating essentially all DOE defense wastes requires separation methods that concentrate the contaminants and/or purify waste streams for release to the environment or for downgrading to a waste form less difficult and expensive to dispose of. Initially, ESP R and D efforts focused on treatment of high-level waste (HLW) from underground storage tanks (USTs) because of the potential for large reductions in disposal costs and hazards. As further separations needs emerge and as waste management and environmental restoration priorities change, the program has evolved to encompass the breadth of waste management and environmental remediation problems.

2635 (DOE/EM–0294) **Efficient separations & processing crosscutting program.** USDOE Office of Science and Technology, Washington, DC (United States). Office of Program Analysis. Aug 1996. 155p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013517. Source: OSTI; NTIS; INIS; GPO Dep.

The Efficient Separations and Processing Crosscutting Program (ESP) was created in 1991 to identify, develop, and perfect chemical and physical separations technologies and chemical processes which treat wastes and address environmental problems throughout the DOE complex. The ESP funds several multiyear tasks that address high-priority waste remediation problems involving high-level, low-level, transuranic, hazardous, and mixed (radioactive and hazardous) wastes. The ESP supports applied research and development (R & D) leading to the demonstration or use of these separations technologies by other organizations within the Department of Energy (DOE), Office of Environmental Management.

2636 (DOE/MC/29105–5199) **Conceptual design for a full-scale VAC*TRAX vacuum thermal desorption unit. Final report, September 1992–December 1995.** Palmer, C.R. Rust Federal Services, Inc., Anderson, SC (United States). Apr 1996. 135p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29105. Order Number DE96004480. Source: OSTI; NTIS; GPO Dep.

Rust Federal Services is pleased to present this topical report on the results of our Phase II conceptual design work of the PRDA VAC*TRAX^{SM} mobile vacuum thermal desorption technology demonstration program. Through the present Phase II conceptual design activities, Rust has developed an equipment design and permitting strategy that retains the flexibility of a mobile treatment system with the long term value and ease of access of a central facility. The process is designed to remove volatile matter from solid matrices by thermal desorption. The system is also designed with superior emission controls, making it an ideal system for the treatment of radioactive wastes.

2637 (INEL–94/0028) **Removal of cesium from a high-level calcined waste by high temperature volatilization.** Del Debbio, J.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002943. Source: OSTI; NTIS; INIS; GPO Dep.

Pyrochemical methods are being evaluated for the separation of actinides and fission products from inert material in high-level waste calcine. Separation processes have the potential of reducing waste disposal costs by reducing the volume of high-level waste requiring final disposal in a repository. Tests were conducted to evaluate high temperature volatilization for removing ^{137}Cs from four types of calcines. The results for pilot plant calcines indicate greater than 99% cesium removal for alumina and fluorinel/sodium calcines heated at 1000°C and 99% removal for zirconia calcine heated at 1100°C. Tests with actual calcine generated at the New Waste Calcining Facility (NWCF) from a blend of aluminium, sodium and zirconium/fluorinel wastes resulted in 96% cesium removal at 1000°C and greater than 99% removal at 1170°C.

2638 (INEL–94/0040) **The use of selective extraction chromatographic columns as an alternative to solvent extraction for the separation of uranium followed by the use of Arsenazo III as a calorimetric reagent for uranium determination.** Miller, C.J.; Del Mastro, J.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Oct 1994. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002849. Source: OSTI; NTIS; INIS; GPO Dep.

The use of U/TEVA® Spec columns as an alternative to solvent extraction for separation of uranium prior to its determination by various techniques (calorimetric, phosphorescence, and mass spectroscopy) was investigated. U/TEVA® Spec columns have several advantages over the widely used 4-methyl-2-pentanone solvent extraction method. Among the advantages are: (1) no hazardous liquid organic waste, that creates regulatory waste disposal problems, is generated; (2) a clean separation of U from Zr, F, and fission products is obtained; (3) the sample preparation time is reduced; and (4) the exposure of analysts to ionizing radiation is reduced because the entire procedure may be performed in a hot cell using remote operations. This study also investigated the use of Arsenazo III (1,8-dihydroxynapthalene-3,6-disulfonic acid-2,7-bis [<-azo-2>-phenylarsonic acid]) as a calorimetric reagent to determine uranium concentrations over a wide range in waste streams and product streams at the Idaho Chemical Processing Plant. Process and waste stream samples were passed through a U/TEVA® Spec column to selectively remove the uranium. The uranium bearing fraction is compatible with the pH range for color development with Arsenazo III. Arsenazo III may be added to the uranium fraction, at a 3:1 mole ratio (Arsenazo:Uranium) at the high end of the method (10 μ/mL). Arsenazo III forms a highly stable complex with uranium. Stability tests from this and other studies show that the colored complex of Arsenazo III with U(VI) forms within one minute and remains stable for several hours. The complex with U(VI) varies in color with pH. However, with excess reagent, the color is varying shades of purple. Since the samples were passed through a highly selective extraction chromatographic column prior to adding the calorimetric reagent, no interferences were observed.

2639 (INEL–95/00241) **Mercury extraction by the TRUEX process solvent: I. Kinetics, extractable species, dependence on nitric acid concentration and stoichiometry.** Herbst, R.S.; Brewer, K.N.; Tranter, T.J.; Todd, T.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-81ID12345. (CONF-9505164–1: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE96002524. Source: OSTI; NTIS; INIS; GPO Dep.

Mercury extraction from acidic aqueous solutions by the TRUEX process solvent (0.2 M CMPO, 1.4 M TBP in n-dodecane) has not extensively been examined. Research at the Idaho Chemical Processing Plant is currently in progress to evaluate the TRUEX process for actinide removal from several acidic waste streams, including liquid sodium-bearing waste (SBW), which contains significant quantities of mercury. Preliminary experiments were performed involving the extraction of Hg^{203}, added as $HgCl_2$, from 0.01 to 10 M HNO_3 solutions. Mercury distribution coefficients (D_{Hg}) range between 3 and 60 from 0.01 M to 2 M HNO_3. At higher nitric acid concentrations, i.e. 5 M HNO_3 or greater, D_{Hg} significantly decreases to values less than 1. These results indicate mercury is extracted from acidic solutions $\leq\sim$2 M HNO_3 and stripped with nitric acid solutions $\geq\sim$5 M HNO_3. Experimental results indicate the extractable species is $HgCl_2$ from nitrate media, i.e., chloride must be present in the nitrate feed to extract mercury. Extractions from $Hg(NO_3)_2$ solutions indicated substantially reduced distribution ratios, typically $D_{Hg} < 1$, for the range of nitric acid concentrations examined (0.01 to 8 M HNO_3). Extraction of mercury, as $HgCl_2$, by the individual components of the TRUEX solvent was also examined from 2 M HNO_3. The diluent, n-dodecane, does not measurably extract mercury. With a 1.4 M TBP/n-dodecane solvent, D_{Hg} ~3.4 compared with D_{Hg} ~7 for the TRUEX solvent. Classical slope analysis techniques were utilized to evaluate the stoichiometric coefficients of Hg extraction independently for both CMPO and TBP.

2640 (INEL–95/00243) **Selective partitioning of mercury from co-extracted actinides in a simulated acidic ICPP waste stream.** Brewer, K.N. (and others); Herbst, R.S.; Tranter, T.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-81ID12345. (CONF-9505164–2: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE96002523. Source: OSTI; NTIS; INIS; GPO Dep.

The TRUEX process is being evaluated at the Idaho Chemical Processing Plant (ICPP) as a means to partition the actinides from acidic sodium-bearing waste (SBW). The mercury content of this waste averages 1 g/l. Because the chemistry of mercury has not been extensively evaluated in the TRUEX process, mercury was singled out as an element of interest. Radioactive mercury, ^{203}Hg, was spiked into a simulated solution of SBW containing 1 g/l mercury. Successive extraction batch contacts with the mercury spiked waste simulant and successive scrubbing and stripping batch contacts of the mercury loaded TRUEX solvent (0.2 M CMPO-1.4 M TBP in dodecane) show that mercury will extract into and strip from the solvent. The extraction distribution coefficient for mercury, as $HgCl_2$ from SBW having a nitric acid concentration of 1.4 M and a chloride concentration of 0.035 M was found to be 3. The stripping distribution coefficient was found to be 0.5 with 5 M HNO_3 and 0.077 with 0.25 M Na_2CO_3. An experimental flowsheet was designed from the batch contact tests and tested counter-currently using 5.5 cm centrifugal contactors. Results from the counter-current test show that mercury can be removed from the acidic mixed SBW simulant and recovered separately from the actinides.

2641 (INEL–95/0248) **Cesium removal from liquid acidic wastes with the primary focus on ammonium molybdophosphate as an ion exchanger: A literature review.** Miller, C.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Mar 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001350. Source: OSTI; NTIS; INIS; GPO Dep.

Many articles have been written concerning the selective removal of cesium from both acidic and alkaline defense wastes. The majority of the work performed for cesium removal from defense wastes involves alkaline feed solutions. Several different techniques for cesium removal from acidic solutions have been evaluated such as precipitation, solvent extraction, and ion exchange. The purpose of this paper is to briefly review various techniques for cesium removal from acidic solutions. The main focus of the review will be on ion exchange techniques, particularly those involving ammonium molybdophosphate as the exchanger. The pertinent literature sources are condensed into a single document for quick reference. The information contained in this document was used as an aid in determining techniques to evaluate cesium removal from the acidic Idaho Chemical Processing Plant waste matrices. 47 refs., 2 tabs.

2642 (INEL–95/00516) **Cesium absorption from acidic solutions using ammonium molybdophosphate on a polyacrylonitrile support (AMP-PAN).** Miller, C.J.; Olson, A.L.; Johnson, C.K. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951057–1: 9. symposium on separation science and technology for energy applications, Gatlinburg, TN (United States), 22-26 Oct 1995). Order Number DE96002512. Source: OSTI; NTIS; INIS; GPO Dep.

Recent efforts at the Idaho Chemical Processing Plant (ICPP) have included evaluation of cesium removal technologies as applied to ICPP acidic radioactive waste streams. Ammonium molybdophosphate (AMP) immobilized on a polyacrylonitrile support (AMP-PAN) has been studied as an ion exchange agent for cesium removal from acidic waste solutions. Capacities, distribution coefficients, elutability, and kinetics of cesium-extraction have been evaluated. Exchange breakthrough curves using small columns have been determined from 1M HNO_3 and simulated waste solutions. The theoretical capacity of AMP is 213 g Cs/kg AMP. The average experimental capacity in batch contacts with various acidic solutions was 150 g Cs/kg AMP. The measured cesium distribution coefficients from actual waste solutions were 3287 mL/g for dissolved zirconia calcines, and 2679 mL/g for sodium-bearing waste. The cesium in the dissolved alumina calcines was analyzed for; however, the concentration was below analytical detectable limits resulting in inconclusive results. The reaction kinetics are very rapid (2-10 minutes). Cesium absorption appears to be independent of acid concentration over the range tested (0.1 M to 5 M HNO_3).

2643 (INEL–96/0021) **Actinide partitioning studies using dihexyl-N,N-diethycarbamolymehtyl phosphonate and dissolved zirconium calcine.** Brewer, K.N.; Herbst, R.S.; Law, J.D.; Garn, T.G.; Tillotson, R.D.; Todd, T.A. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jan 1996. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96007525. Source: OSTI; NTIS; INIS; GPO Dep.

A baseline flowsheet capable of partitioning the transuranic (TRU) elements from dissolved zirconium calcines has been developed. The goal of the TRU partitioning process is to remove the TRUs from solutions of dissolved zirconium calcines to below the 10 CFR 61.55 Class A waste limit of 10 nCi/g. Extraction, scrub, strip, and wash distribution coefficients for several elements, including the actinides, were measured in the laboratory by performing equal volume batch contacts. A solvent containing diheyl-N, N- diethylcarbamoylmethyl phosphonate (CMP), tributylphosphate (TBP), and a branched chain hydrocarbon as the diluent were used to develop this process. A non-radioactive zirconium pilot-plant calcine was spiked with the TRUs, U, Tc, or a radioactive isotope of zirconium to simulate the behavior of these elements in actual dissolved zirconium calcine feed. Distribution coefficient data obtained from laboratory testing were used to recommend: (1) solvent composition, (2) scrub solutions capable of selectively removing extracted zirconium while minimizing actinide recycle, (3) optimized strip solutions which quantitatively recover extracted actinides, and (4) feed adjustments necessary for flowsheet efficiency. Laboratory distribution coefficients were used in conjunction with the Generic TRUEX Model (GTM) to develop and recommend a flowsheet for testing in the 5.5-cm Centrifugal Contractor Mockup. GTM results indicate that the recommended flowsheet should remove the actinides from dissolved zirconium calcine feed to below the Class A waste limit of 10 nCi/g. Less than 0.01 wt% of the extracted zirconium will report to the high- activity waste (HAW) fraction using the 0.05 M $H_2C_2O_4$ in 3.0 M HNO_3 scrub, and greater than 99% of the extracted actinides are recovered with 0.001 M HEDPA.

2644 (INEL–96/0229) **Application of ultrasound in solvent extraction of nickel and gallium.** Pesic, B. Aerojet Nuclear Co., Idaho Falls, ID (United States). Idaho National Engineering Lab. Jul 1996. 88p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96014095. Source: OSTI; NTIS; GPO Dep.

The effects of ultrasound on the rate of solvent extraction of nickel with Lix 65N and Lix 70, and gallium with Kelex 100 were investigated. These solvent extraction systems are noted by their sluggish nature. Low frequency (20 kHz) ultrasound increased the rates of extraction of nickel by factors of four to seven. The ultrasound had no effect on the final chemical equilibrium. Gallium extraction rates were enhanced with the use of ultrasound by as much as a factor of 15. Again, the ultrasound had no effect on extraction equilibrium. For both nickel and gallium, the enhanced rates were attributed to increased interfacial surface area associated with ultrasonically induced cavitation and microdroplet formation. The stability of the microdroplets permitted intermittent application of ultrasound with corresponding decreases in ultrasonic energy requirements. The lowest energy consumption was observed with short (0.25 to 5 s) bursts of high power (41 to 61 W) ultrasonic inputs. The study also provided insight into the factors that affect the complex extraction of gallium from sodium aluminate solutions. The rate controlling step was found to be the dehydration of the gallate ion, Ga(OH)4, and the first complex formation between gallium and Kelex 100. Sodium was found to enhance the extraction rate up to a point, beyond which increased concentration was detrimental. Increasing aluminum concentration was found to slow extraction rates. Modifiers and diluents were shown to markedly affect extraction rates even without ultrasound. Ketone modifiers, particularly 2-undecanone, when used with Kermac 470B or Escaid 200 diluents enhanced extraction rates of gallium to the point that the use of ultrasound provided no additional benefits. The positive effects of ketone modifiers for the solvent extraction of gallium had not been previously reported.

2645 (LA-UR–95-1868) **Design, synthesis, and evaluation of polyhydroxamate chelators for selective complexation of actinides.** Gopalan, A. (New Mexico State Univ., Las Cruces, NM (United States)); Jacobs, H.; Koshti, N.; Stark, P.; Huber, V.; Dasaradhi, L.; Caswell, W.; Smith, P.; Jarvinen, G. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9504135–3: 5. annual waste-management education and research consortium (WERC) technology development conference, Las Cruces, NM (United States), 18-20 Apr 1995). Order Number DE95016429. Source: OSTI; NTIS; INIS; GPO Dep.

Specific chelating polymers targeted for actinides have much relevance to problems involving remediation of nuclear waste. Goal is to develop polymer supported, ion specific extraction systems for removing actinides and other hazardous metal ions from wastewaters. This is part of an effort to develop chelators for removing actinide ions such as Pu from soils and waste streams. Selected ligands are being attached to polymeric backbones to create novel chelating polymers. These polymers and other water soluble and insoluble polymers have been synthesized and are being evaluated for ability to selectively remove target metal ions from process waste streams.

2646 (ORNL/TM–12938) **Evaluation of selected ion exchangers for the removal of cesium from MVST W-25 supernate.** Collins, J.L.; Egan, B.Z.; Anderson, K.K.; Chase, C.W.; Mrochek, J.E.; Bell, J.T.; Jernigan, G.E. Oak Ridge National Lab., TN (United States). Apr 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013798. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this batch-test equilibration study was to evaluate the effectiveness of certain ion exchangers for removing cesium from supernate taken from tank W-25 of the Melton Valley Storage Tank (MVST) Facility located at the Oak Ridge National Laboratory (ORNL). These exchangers were selective for removing cesium from alkaline supernatant solutions with high salt concentrations. Since the supernates of evaporator concentrates stored in tanks at the MVST facility have compositions similar to some of those stored in tanks at Hanford, the data generated in this study should prove useful in the overall evaluation of the ion exchangers for applications to Hanford and other US Department of Energy (USDOE) sites. A goal of the waste processing effort at Hanford is to remove enough cesium to ensure that the resulting LLW will meet the Nuclear Regulatory Commission (NRC) 10 CFR 61 class A limit for ^{137}Cs (1 Ci/m^3 or 1 μCi/mL). The separated cesium may be concentrated and vitrified for disposal in the high-level waste repository. The decontaminated effluent would be solidified for near-surface disposal.

2647 (ORNL/TM–13201) **Evaluation of the ACT*DE*CON^{SM} process for treating gunite tank sludge.** Spencer, B.B.; Chase, C.W.; Egan, B.Z. Oak Ridge National Lab., TN (United States). May 1996. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96014273. Source: OSTI; NTIS; INIS; GPO Dep.

A test was conducted to evaluate this process for selectively removing actinides from Gunite tank sludge. Mixed waste sludge from Gunite tank W-6 was subjected to the ACT*DE*CON selective leaching process. (Nearly all the TRU content was attributed to Pu.) The sludge sample was first washed with 0.01M NaOH to remove excess sodium and nitrate in the interstitial liquid supernatant. The washed wet solids were treated with the ACT*DE*CON solvent (aqueous carbonate solution containing a chelating agent and an oxidant), using a ratio of 20 ml solvent per gram wet solids. Sludge and solvent were separated by centrifugation, and the ACT*DE*CON treatment was repeated twice. Analyses showed that 71% of the solids in the sludge were dissolved while 80% of the TRU-waste components dissolved. Low separation of the TRU-waste components from other components of the sludge mixture is indicated. Almost all the U and Ca were removed from the sludge. For sludges where most of the TRU content is Pu, the ACT*DE*CON process as tested is not effective in rendering the sludge a non-TRU waste. It is recommended that ACT*DE*CON be optimized for this specific application and that other processes using different chelating and oxidizing agents be tested. Also, the ACT*DE*CON process should be tested on TRU mixed waste in which most of the TRU elements are not Pu.

2648 (ORNL/TM–13241) **Alkaline-side extraction of technetium from tank waste using crown ethers and other extractants.** Bonnesen, P.V.; Moyer, B.A.; Presley, D.J.; Armstrong, V.S.; Haverlock, T.J.; Counce, R.M.; Sachleben, R.A. Oak Ridge National Lab., TN (United States). Jun 1996. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96012272. Source: OSTI; NTIS; INIS; GPO Dep.

The chemical development of a new crown-ether-based solvent-extraction process for the separation of (Tc) from alkaline tank-waste supernate is ready for counter-current testing. The process addresses a priority need in the proposed cleanup of Hanford and other tank wastes. This need has arisen from concerns due to the volatility of Tc during vitrification, as well as ^{99}Tc's long half-life and environmental mobility. The new process offers several key advantages that direct treatability–no adjustment of the waste composition is needed; economical stripping with water; high efficiency–few stages needed; non-RCRA chemicals–no generation of hazardous or mixed wastes; co-extraction of ^{90}Sr; and optional concentration on a resin. A key concept advanced in this work entails the use of tandem techniques: solvent extraction offers high selectivity, while a subsequent column sorption process on the aqueous stripping solution serves to greatly concentrate the Tc. Optionally, the stripping solution can be evaporated to a small volume. Batch tests of the solvent-extraction and stripping components of the process have been conducted on actual melton Valley Storage Tank (MVST) waste as well as simulants of MVST and Hanford waste. The tandem process was demonstrated on MVST waste simulants using the three solvents that were selected the final candidates for the process. The solvents are 0.04 M bis-4,4′(5′)[(tert-butyl)cyclohexano]-18-crown-6 (abbreviated di-t-BuCH18C6) in a 1:1 vol/vol blend of tributyl phosphate and Isopar® M (an isoparaffinic kerosene); 0.02 M di-t-BuCH18C6 in 2:1 vol/vol TBP/Isopar M and pure TBP. The process is now ready for counter-current testing on actual Hanford tank supernates.

2649 (PNL–10460) **Inorganic ion exchange evaluation and design: Silicotitanate ion exchange waste conversion.** Balmer, M.L.; Bunker, B.C. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95011683. Source: OSTI; NTIS; INIS; GPO Dep.

Ion exchange materials are being evaluated for removing Cs, SR from tank waste. Thermal conversion of a variety of compositions within the Cs_2O-TiO_2-SiO_2 phase diagram yielded both glass and crystalline materials, some of which show low leach rates and negligible Cs losses during heat treatment. A new material, $CsTiSi_20_6$, with a structure isomorphous to pollucite ($CsAlSi_20_6$) has been identified. This material represents a new class of crystalline zeolite materials which contain large amounts of titanium. Direct conversion of Cs loaded silicotitanate ion exchangers to $CsTiSi_2O_6$ is an excellent alternative to dissolving the Cs-loaded or Cs-eluted exchangers in borosilicate glass because: $CsTiSi_2O_6$ is formed using a simple, one step heat treatment. The unique crystalline pollucite-like structure of $CsTiSi_2O_6$ traps Cs, and exhibits extremely low Cs leach rates. $CsTiSi_2O_6$ is converted to solid waste at a low processing temperature of 700 to 800 C (nominal melter operating temperatures are 1150 C). $CsTiSi_20_6$ concentrates the waste, thus generating lower volumes of expensive HLW. Cs losses due to volatilization during processing of $CsTiSi_2O_6$ are extremely low.

2650 (PNL–10750) **Efficient separations and processing crosscutting program: Develop and test sorbents.** Bray, L.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000807. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes work performed during FY 1995 under the task "Develop and Test Sorbents," the purpose of which is to develop high-capacity, selective solid extractants to recover cesium, strontium, and technetium from nuclear wastes. This work is being done for the Efficient Separations and Processing Crosscutting Program (ESP), operated by the U.S. Department of Energy's Office of Environmental Management's Office of Technology Development. The task is under the direction of staff at Pacific Northwest Laboratory (PNL) with key participation from industrial and university staff at 3M, St. Paul, Minnesota; IBC Advanced Technologies, Inc., American Forks, Utah; AlliedSignal, Inc., Des Plaines, Illinois, and Texas A&M University, College Station, Texas. 3M and IBC are responsible for ligand and membrane technology development; AlliedSignal and Texas A&M are developing sodium titanate powders; and PNL is testing the materials developed by the industry/university team members. Major accomplishments for FY 1995 are summarized in this report.

2651 (PNL–10767) **Radiation testing of organic ion exchange resins.** Carlson, C.D. (and others); Bray, L.A.; Bryan, S.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002212. Source: OSTI; NTIS; INIS; GPO Dep.

A number of ion exchange materials are being evaluated as part of the Tank Waste Remediation System (TWRS) Pacific Northwest Laboratory (PNL) Pretreatment Project for the removal of ^{137}Cs from aqueous tank wastes. Two of these materials are organic resins; a phenol-formaldehyde resin (Duolite CS-100) produced by Rohm and Haas Co. (Philadelphia, Pennsylvania) and a resorcinol-formaldehyde (RF) resin produced by Boulder Scientific Co. (Mead, Colorado). One of the key parameters in the assessment of the organic based ion exchange materials is its useful lifetime in the radioactive and chemical environment that will be encountered during waste processing. The focus of the work presented in this report is the radiation stability of the CS-100 and the RF resins. The scope of the testing included one test with a sample of the CS-100 resin and testing of two batches of the RF resin (BSC-187 and BSC-210). Samples of the exchangers were irradiated with a ^{60}Co source to a total absorbed dose of 10^9 R over a period of 5 months in a static (no flow) and a flowing configuration with neutralized current acid waste (NCAW) simulant as a feed. Based on a maximum concentration of ^{137}Cs on the resin that would result from processing NCAW, this dose represents an operational period of at least 150 days for the RF resin and at least 1260 days for the CS-100 resin. Gas generation in the static experiment was continuously monitored and G values (molecules of gas per 100 eV) were determined for each species. Resin samples were obtained periodically and the equilibrium behavior of the resins was assessed by determining the distribution coefficients (K_ds). Structural information was also obtained by ^{13}C cross polarization magic angle (CPMAS) nuclear magnetic resonance (NMR) spectrometry and Fourier Transform Infrared (FTIR) spectroscopy so that changes to the chemical structure could be correlated with changes in K_d.

2652 (PNL–10920) **Comparison of organic and inorganic ion exchangers for removal of cesium and strontium from simulated and actual Hanford 241-AW-101 DSSF tank waste.** Brown, G.N. (and others); Bray, L.A.; Carlson, C.D. Pacific Northwest Lab., Richland, WA (United States). Jan 1996. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96005840. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest National Laboratory (Northwest National Laboratory) conducted this study as a joint effort between the "Develop and Test Sorbents" task for the Efficient Separations and Processing Cross-Cutting Program (ESP) and the "Batch Testing of Crystalline Silico-Titanates (CSTs)" subtask, which is part of the Northwest National Laboratory Tank Waste Remediation System (TWRS) Pretreatment Technology Development Project. The objective of the study is to investigate radionuclide uptake of the newly produced CST materials under a variety of solution conditions and to compare the results obtained for this material with those obtained for other commercial and experimental exchangers.

2653 (PNL-SA–25603) **Proceedings of the Efficient Separations and Processing Cross-Cutting Program Annual Technical Exchange Meeting.** Pacific Northwest Lab., Richland, WA (United States). [1995]. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950171–: Efficient Separations and Processing Integrated Program (ESPIP) technical integration and exchange (TIE) meeting, Gaithersburg, MD (United States), 24-26 Jan 1995). Order Number DE95007261. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains summaries of technology development presented at the 1995 Efficient Separations and Processing Cross-Cutting Program (ESP) Annual Technical Exchange Meeting. The ESP is sponsored by the US Department of Energy's Office of Environmental Management (EM), Office of Technology Development. The meeting is held annually to promote a free exchange of ideas among technology developers, potential users (for example, EM focus areas), and other interested parties within EM. During this meeting, developers of ESP-funded technologies describe the problems and needs addressed by their technologies; the technical approach, accomplishments, and resolution of issues; the strategy and schedule for commercialization; and evolving potential applications. Presenters are asked to address the following areas: Target waste management problem, waste stream, or data need; scientific background and technical approach; technical accomplishments and resolution of technical issues; schedule and strategy for commercializing and implementing the technology or acquiring needed data; potential alternate applications of the technology or data, including outside of DOE/EM. The meeting is not a program review of the individual tasks or subtasks; but instead focuses on the technical aspects and implementation of ESP-sponsored technology or data. The meeting is also attended by members of the ESP Technical Review Team, who have the opportunity at that time to review the ESP as a whole.

2654 (PNNL–11121) **Assessment of commercially available ion exchange materials for cesium removal from highly alkaline wastes.** Brooks, K.P.; Kim, A.Y.; Kurath, D.E. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96011241. Source: OSTI; NTIS; INIS; GPO Dep.

Approximately 61 million gallons of nuclear waste generated in plutonium production, radionuclide removal campaigns, and research and development activities is stored on the Department of Energy's Hanford Site, near Richland, Washington. Although the pretreatment process and disposal requirements are still being defined, most pretreatment scenarios include removal of cesium from the aqueous streams. In many cases, after cesium is removed, the dissolved salt cakes and supernates can be disposed of as LLW. Ion exchange has been a leading candidate for this separation. Ion exchange systems have the advantage of simplicity of equipment and operation and provide many theoretical stages in a small space. The organic ion exchange material Duolite™ CS-100 has been selected as the baseline exchanger for conceptual design of the Initial Pretreatment Module (IPM). Use of CS-100 was chosen because it is considered a conservative, technologically feasible approach. During FY 96, final resin down-selection will occur for IPM

Title 1 design. Alternate ion exchange materials for cesium exchange will be considered at that time. The purpose of this report is to conduct a search for commercially available ion exchange materials which could potentially replace CS-100. This report will provide where possible a comparison of these resin in their ability to remove low concentrations of cesium from highly alkaline solutions. Materials which show promise can be studied further, while less encouraging resins can be eliminated from consideration.

2655 (PNNL–11124) **Initial evaluation of two organic resins and their ion exchange column performance for the recovery of cesium from Hanford alkaline wastes.** Bray, L.A.; Carson, K.J.; Elovich, R.J.; Carlson, C.D.; DeSchane, J.R.; Kurath, D.E. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96011240. Source: OSTI; NTIS; INIS; GPO Dep.

The contents of Hanford's 177 underground storage tanks include a mixture of sludge, salt cake and alkaline supernatant liquids. Most of the cesium is expected to be in the aqueous liquids and it is these solutions that are the focus of the cesium ion exchange removal process. This process is being designed with the goal of removing enough cesium so that the resulting low-level waste (LLW) will meet the NRC 10CFR61 class A limits for ^{137}Cs (1 Ci/m^3). The overall objective of the WHC program is (1) to evaluate ion exchange materials for the recovery of cesium from alkaline wastes, (2) to determine their loading and elution capacities, (3) to determine the physical life cycle (including radiation and chemical stability) for selected ion exchangers, (4) to determine if basic ion exchange data can be applied to a broad range of tank wastes, and (5) to provide credible laboratory data for engineering-scale evaluation and ion exchange media selection. The goal will be to provide the technology to produce a Class A waste. The results presented in this document provide initial test cesium loading and elution results for ion exchange column operations for two selected ion exchange resins under a limited range of conditions. Data in this report can be found in PNL laboratory record books BNW 54705 and BNW 55026.

2656 (PNNL-SA–27105) **Efficient separations and processing crosscutting program 1996 technical exchange meeting. Proceedings.** Pacific Northwest Lab., Richland, WA (United States). [1996]. 143p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-960158–: Efficient separations and processing crosscutting program 1996 technical meeting, Gaithersburg, MD (United States), 16-19 Jan 1996). Order Number DE96005494. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains summaries of technology development presented at the 1996 Efficient Separations and Processing Crosscutting Program Technical Exchange Meeting. This meeting is held annually to promote a free exchange of ideas among technology developers, potential users and other interested parties within the EM community. During this meeting the following many separation processes technologies were discussed such as ion exchange, membrane separation, vacuum distillation, selective sorption, and solvent extraction. Other topics discussed include: waste forms; testing or inorganic sorbents for radionuclide and heavy metal removal; selective crystallization; and electrochemical treatment of liquid wastes. This is the leading abstract, individual papers have been indexed separately for the databases.

2657 (SAND–95-1601C) **Development and design of a high pressure carbon dioxide system for the separation of hazardous contaminants from non-hazardous debris.** Adkins, C.L.J. (Sandia National Labs., Albuquerque, NM (United States)); Russick, E.M.; Smith, H.M.; Olson, R.B. Sandia National Labs., Albuquerque, NM (United States); Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000 ; AC04-76DP00613. (KCP–613-5649; CONF-951033–14: 27. international technical conference of the Society for the Advancement of Material and Process Engineering (SAMPE): diversity into the next century, Albuquerque, NM (United States), 9-12 Oct 1995). Order Number DE95015431. Source: OSTI; NTIS; INIS; GPO Dep.

Under the Department of Energy (DOE)/United States Air Force (USAF) Memorandum of Understanding, a system is being designed that will use high pressure carbon dioxide for the separation of oils, greases, and solvents from non-hazardous solid waste. The contaminants are dissolved into the high pressure carbon dioxide and precipitated out upon depressurization. The carbon dioxide solvent can then be recycled for continued use. Excellent extraction capability for common manufacturing oils, greases, and solvents has been measured. It has been observed that extraction performance follows the dilution model if a constant flow system is used. The solvents tested are extremely soluble and have been extracted to 100% under both liquid and mild supercritical carbon dioxide conditions. These data are being used to design a 200 liter extraction system.

2658 (SAND–95-2379C) **SNL-1, a highly selective inorganic crystalline ion exchange material for Sr^{2+} in acidic solutions.** Nenoff, T.M.; Thoma, S.G.; Miller, J.E.; Trudell, D.E. Sandia National Labs., Albuquerque, NM (United States). 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951155–2: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96002120. Source: OSTI; NTIS; INIS; GPO Dep.

A new inorganic ion exchange material, called SNL-1, has been prepared at Sandia National Laboratories. Developmental samples of SNL-1 have been determined to have high selectivity for the adsorption of Strontium from highly acidic solutions (1 M HNO_3). This paper presents results obtained for the material in batch ion exchange tests conducted at various solution pH values and in the presence of a number of competing cations. Results from a continuous flow column ion exchange experiment are also presented.

2659 (SAND–95-2729) **Evaluation of polyacrylonitrile (PAN) as a binding polymer for absorbers used to treat liquid radioactive wastes.** Sebesta, F. (Czech Technical University in Prague (Czech Republic). Dept. of Nuclear Chemistry); John, J.; Motl, A.; Stamberg, K. Sandia National Labs., Albuquerque, NM (United States). Nov 1995. 50p. Sponsored by USDOE, Washington, DC (United States);Florida State Univ., Tallahassee, FL (United States). DOE Contract AC04-94AL85000. Order Number DE96004122. Source: OSTI; NTIS; INIS; GPO Dep.

The chemical and radiation stability of polyacrylonitrile (PAN) in the form of beads (B-PAN), similar to the beads of composite absorbers, and one selected composite absorber (ammonium molybdophosphate, the active component in PAN binder [AMP-PAN], a prospective candidate for the treatment of acidic wastes) were studied. Aqueous 1M HNO_3 + 1M $NaNO_3$, 1M NaOH + 1M $NaNO_3$, and 1M NaOH were chosen as simulants of DOE acidic and alkaline wastes. In addition,radiation stability was determined indistilled water. The chemical stability of B-PAN and AMP-PAN beads was tested for a period up to one month of contact with the solution at ambient temperature. The radiation stability of the beads was checked in a radiation dose range 10^3–10^6 Gy (10^5–10^8 rads). In acidic solutions the stability of PAN binder was proved not to be limited by either chemical or radiation decomposition. PAN binder may thus be used for preparing composite absorbers for treatment of acid wastes from DOE facilities. The same conclusion is valid for alkaline solutions with pH up to 13. In highly alkaline solutions (concentration of NAOH higher than I M) and in the presence of $NaNO_3$, the stability of the tested polyacrylonitrile polymer was sufficient for applications not extending over 10 days. Cross-linking of the polymer caused by ionizing radiation was found to have a positive influence on chemical stability. This effect enables a longer period of applicability of PAN-based composite absorbers. Because of the high sorption rate achievable with PAN-based absorbers, the stability achieved is sufficient for most applications in the DOE complex. The chemical stability of binding polymer may also be further improved by testing another, more suitable type of polymer from the broad family of polyacrylonitrile polymers.

2660 (SAND–96-0656C) **Ion exchange performance of commercial crystalline silicotitanates for cesium removal.** Braun, R. (and others); Dangieri, T.J.; Fennelly, D.J. Sandia National Labs., Albuquerque, NM (United States). 1996. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212–65: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006974. Source: OSTI; NTIS; INIS; GPO Dep.

A new class of inorganic ion exchangers called crystalline silicotitanates (CST), invented by researchers at Sandia National Laboratories and Texas A&M University, has been commercialized in a joint Sandia-UOP effort. The original developmental materials exhibited high selectivity for the ion exchange of cesium, strontium, and several other radionuclides from highly alkaline solutions containing molar concentrations of Na^+. The materials also showed excellent chemical and radiation stability. Together, the high selectivity and stability of the CSTs made them excellent candidates for treatment of solutions such as the Hanford tank supernates and other DOE radwastes. Sandia National Laboratories and UOP have teamed under a Cooperative Research and Development Agreement (CRADA) to develop CSTs in the powdered form and in an engineered form suitable for column ion exchange use. A continuous-flow, column ion exchange process is expected to be used to remove Cs and other radionuclides from the Hanford supernatant. The powder material invented by the Sandia and Texas A&M team consists of submicron-size particles. It is not designed for column ion exchange but may be used in other applications.

2661 (WHC-SD-CP-TC–033) **Test procedure for anion exchange testing with Argonne 10-L solutions.** Compton, J.A. Westinghouse Hanford Co., Richland, WA (United States). 17 May 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013350. Source: OSTI; NTIS; INIS; GPO Dep.

Four anion exchange resins will be tested to confirm that they will sorb and release plutonium from/to the appropriate solutions in the presence of other cations. Certain cations need to be removed from the test solutions to minimize adverse behavior in other processing equipment. The ion exchange resins will be tested using old laboratory solutions from Argonne National Laboratory; results will be compared to results from other similar processes for application to all plutonium solutions stored in the Plutonium Finishing Plant.

2662 (WHC-SD-CP-TP–085) **Test plan for anion exchange testing with Argonne 10-L solutions.** Compton, J.A. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012579. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this test plan is to determine the performance characteristics of four anion exchange resins. This information is required to scale up an ion exchange process for removing undesirable chemicals from calciner feed at PFP. The performance characteristics will be judged by comparing the total exchange capacity, the sorption and desorption of plutonium, the distribution coefficient, and other operating information in the presence of various complexing anions. The results will be compared to a similar process using organic extractants to determine the best way of removing the undesirable chemicals from the plutonium solutions.

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in ETDE/PUB-3 (Rev.1), *International Energy: Research Organizations 1988–1992.* Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, also abbreviated; and (3) the language of the document if non-English (R;CA;In French). Author affiliations are not listed in this index.

Waste Management Facilities cost information for mixed low-level waste. Revision 1, 96:860 (R;US)
Waste management facilities cost information for hazardous waste. Revision 1, 96:861 (R;US)
Waste streams that preferentially corrode 55-gallon steel storage drums, 96:2462 (R;US)
Zirconia solubility in boroaluminosilicate glass, 96:1309 (R;US)

Lockheed Martin Energy Systems, Inc., Oak Ridge, TN (United States)
Effective use of risk assessments and the public comment process to achieve acceptable remediation goals for mercury-contaminated sites, 96:710 (R;US)
Environmental restoration risk-based prioritization work package planning and risk ranking methodology. Revision 2, 96:153 (R;US)
Function analysis for waste information systems, 96:160 (R;US)
Operations of the LR56 radioactive liquid cask transport system at U.S. Department of Energy sites, 96:67 (R;US)
Remedial investigation/feasibility study of the Clinch River/Poplar Creek operable unit. Volume 5, 96:2406 (R;US)

Lockheed Martin Specialty Components, Inc., Largo, FL (United States)
Pinellas Plant Annual Site Environmental Report for calendar year 1994, 96:2160 (R;US)

Lockwood Greene Engineering, Oak Ridge, TN (United States)
Feasibility analysis of recycling radioactive scrap steel, 96:751 (R;US)

Los Alamos National Lab., NM (United States)
94-1 Research and Development Project Lead laboratory support. Status report, October 1–December 31, 1995, 96:202 (R;US)
A high temperature pulsed corona plasma reactor, 96:935 (R;US)
A new computationally-efficient computer program for simulating spectral gamma-ray logs, 96:2494 (R;US)
A process for treating radioactive water-reactive wastes, 96:929 (R;US)
A process for treating uranium chips and turnings, 96:928 (R;US)
A process for treatment of mixed waste containing chemical plating wastes, 96:930 (R;US)
A self-directing elastic backscatter lidar system for debris cloud tracking and characterization, 96:2506 (R;US)
A source release model with application to the LANL LLRW disposal site performance assessment, 96:938 (R;US)
Above and beyond basic public participation, 96:208 (R;US)
Acoustic imaging of underground storage tank wastes: A feasibility study. Final report, 96:1335 (R;US)
Aerodynamics of the Large-Volume, Flow-Through Detector System. Final report, 96:2488 (R;US)
Air modelling as an alternative to sampling for low-level radioactive airborne releases, 96:933 (R;US)
Air quality impacts analysis for area G. Final report, 96:2489 (R;US)
Airborne radioactive contamination monitoring, 96:2497 (R;US)
Alpha contamination assessment for D&D activities: Monitoring inside glove boxes and vessels, 96:2148 (R;US)
Alpha contamination assessment for D&D activities: Monitoring concrete surfaces, 96:2149 (R;US)
Alpha contamination assessment for D&D activities: Technology overview, 96:2150 (R;US)
Alpha contamination assessment for D&D activities: Monitoring pipe interiors, 96:2151 (R;US)
Alpha detection for decontamination and decommissioning: Results and possibilities, 96:2153 (R;US)
Ambient monitoring of volatile organic compounds at Los Alamos National Laboratory in technical area 54, areas G and L. Final report, 96:926 (R;US)
Application of cryogenic grinding to achieve homogenization of transuranic wastes, 96:917 (R;US)
Applying modular concepts to process and authorization basis issues for plutonium residue stabilization, 96:1967 (R;US)
Area G perimeter surface-soil and single-stage water sampling: Environmental surveillance for fiscal year 1993, 96:2483 (R;US)
Assessment of remote sensing technologies to discover and characterize waste sites, 96:2485 (R;US)
Assessment of remote sensing technologies to discover and characterize waste sites, 96:2484 (R;US)
Baseline radionuclide concentrations in soils and vegetation around the proposed Weapons Engineering Tritium Facility and the Weapons Subsystems Laboratory at TA-16, 96:201 (R;US)
Bioreduction amenability testing of actinide contaminated soils. The systems: Am^{241}-Pu^{238}, Am^{241}-$Pu^{239/40}$, U, 96:924 (R;US)
Cesium sorption and desorption on selected Los Alamos soils, 96:528 (R;US)
Characterization and immobilization of cesium-137 in soil at Los Alamos National Laboratory, 96:2503 (R;US)
Characterization of mixed waste for shipment to TSD Facilities Program, 96:942 (R;US)
Characterization of waste streams and suspect waste from largest Los Alamos National Laboratory generators, 96:2493 (R;US)
Chemical Exposure Assessment Program at Los Alamos National Laboratory: A risk based approach, 96:211 (R;US)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, ETDE/PUB–2(Rev.1), *International Energy: Subject Thesaurus.* In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

See references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

Health Hazards

nitrite mixtures and a simulated organic waste, 96:1352 (R;US)
Overview of the Savannah River Site high level waste storage tank structural qualification program, 96:1918 (R;US)
Quarterly report on the Ferrocyanide Safety Program for the period ending September 30, 1995, 96:1585 (R;US)
Removal of strontium and transuranics from Hanford tank waste via addition of metal cations and chemical oxidant: FY 1995 test results, 96:1432 (R;US)
Scoring methods and results for qualitative evaluation of public health impacts from the Hanford high-level waste tanks. Integrated Risk Assessment Program, 96:1419 (R;US)
Seismic design evaluation guidelines for buried piping for the DOE HLW Facilities, 96:1198 (R;US)
Soil structure interaction analysis of buried tank subjected to vertical excitations, 96:1618 (R;US)
TWRS privatization bibliography, 96:238 (R;US)
Tank Waste Remediation System Guide, 96:1390 (R;US)
Tank Waste Remediation System fiscal year 1996 multi-year program plan WBS 1.1. Revision 1, Volume 1, 96:1908 (R;US)
Tank Waste Remediation System fiscal year 1996 multi-year program plan WBS 1.1. Revision 1, Appendix A, 96:1907 (R;US)
Tank leak detection using electrical resistance methods, 96:1582 (R;US)
Tanks focus area multiyear program plan - FY96-FY98, 96:1405 (R;US)
Technical liaison with the Institute of Physical Chemistry (Russian Academy of Science), 96:301 (R;US)
The chemistry of sludge washing and caustic leaching processes for selected Hanford tank wastes, 96:1513 (R;US)
Underground nuclear waste containments, 96:1199 (R;US)
Validation Analysis for the Calculation of a Turbulent Free Jet in Water Using CFDS-FLOW 3-D and FLUENT, 96:1930 (R;US)
Value-based performance measures for Hanford Tank Waste Remedition System (TWRS) Program, 96:1472 (R;US)
Vapor space characterization of waste Tank 241-U-106: Results from samples collected on March 7, 1995. Waste Tank Vapor Program, 96:1391 (R;US)
WVNS Tank Farm Process Support: Experimental evaluation of an inert gas (nitrogen) to mitigate external corrosion of high-level waste storage tanks, 96:1479 (R;US)
Work plan for the identification of techniques for in-situ sensing of layering/interfaces of Hanford high level waste tanks, 96:1901 (R;US)
Work plan for the identification of techniques for in-situ sensing of layering/interfaces of Hanford high level waste tank, 96:1902 (R;US)

Vitrification

324 Building Compliance Project: Selection and evaluation of alternatives for the removal of solid remote-handled mixed wastes from the 324 Building, 96:981 (R;US)
A bench scale study of a one-step dissolution process for treating contaminated fiberglass filters, 96:1141 (R;US)
ANL technical support program for DOE Office of Environmental Management. Annual report, October 1994–September 1995, 96:1153 (R;US)
ANL technical support program for DOE environmental restoration and waste management. Annual report, October 1993–September 1994, 96:1151 (R;US)
Chemical durability of simulated nuclear glasses containing water, 96:1465 (R;US)
Chemistry and kinetics of waste glass corrosion, 96:1173 (R;US)
Colloid formation during waste glass corrosion, 96:1175 (R;US)
Comparison of simulants to actual neutralized current acid waste: Process and product testing of three NCAW core samples from Tanks 101-AZ and 102-AZ, 96:1515 (R;US)
Detailed design data package: 3.1a-Film cooler pressure drop data; Item 3.2a - SBS packing selection; Item 3.2b, 3.2c - Pressure drop data for SBS distribution plate; and Item 3.2e - SBS distribution plate and liquid risers. PHTD pilot-scale melter testing system cost account milesonte 1.2.2.04.15A, 96:1507 (R;US)
Development of models and software for liquidus temperatures of glasses of HWVP products. Final report, 96:1502 (R;US)
Effect of composition and temperature on the properties of High-Level Waste (HLW) glasses melting above 1200°C (Draft), 96:1486 (R;US)
Evaluation of HWVP feed preparation chemistry for an NCAW simulant – Fiscal Year 1991: Evaluation of offgas generation, reductant requirements and thermal stability: Technical report, 96:1499 (R;US)
Evaluation of HWVP feed preparation chemistry for an NCAW simulant – Fiscal year 1993: Effect of noble metals concentration on offgas generation and ammonia formation, 96:1354 (R;US)
Evaluation of Hanford high level waste vitrification chemistry for an NCAW simulant – FY 1994: Potential exothermic reactions in the presence of formic acid, glycolic acid, and oxalic acid, 96:1384 (R;US)
Evaluation of alternative chemical additives for high-level waste vitrification feed preparation processing, 96:1872 (R;US)
Evaluation of high-level waste vitrification feed preparation chemistry for an NCAW simulant, FY 1994: Alternate flowsheets (DRAFT), 96:1490 (R;US)
Feed specification for the double-shell tank/single shell tank waste blend for high-level waste vitrification process and melter testing, 96:1487 (R;US)
Glass formulation for phase 1 high-level waste vitrification, 96:1518 (R;US)
Glass science tutorial: Lecture No. 7, Waste glass technology for Hanford, 96:1603 (R;US)
HWVP NCAW melter feed rheology FY 1993 testing and analyses: Letter report, 96:1504 (R;US)
HWVP feed preparation chemistry for an NCAW simulant, fiscal year 1992: Evaluation of offgas generation and ammonia formation, 96:1365 (R;US)
HWVP submerged bed scrubber waste treatment by ion exchange at high pH, 96:1500 (R;US)
Hanford Waste Vitrification Plant hydrogen generation, 96:1482 (R;US)
Hanford waste vitrification plant hydrogen generation study: Preliminary evaluation of alternatives to formic acid, 96:1483 (R;US)
High level waste at Hanford: Potential for waste loading maximization, 96:1466 (R;US)
Laboratory testing of West Valley reference 6 glass, 96:1155 (R;US)
Long-term test results from a West Valley actinide-doped reference glass, 96:1158 (R;US)
Minor component study for simulated high-level nuclear waste glasses (Draft), 96:1491 (R;US)
NCAW feed chemistry: Effect of starting chemistry on melter offgas and iron redox, 96:1383 (R;US)
OWL models update and use for TWRS strategy development, 96:1501 (R;US)
Offgas characterization from the radioactive NCAW core sample (102-AZ-C1) and simulant during HWVP feed preparation testing: Letter report, 96:1506 (R;US)
PNL vitrification technology development project high-waste loaded high-level waste glasses for high-temperature melter: Letter report, 96:1484 (R;US)
Performance of high plutonium-containing glasses for the immobilization of surplus fissile materials, 96:1945 (R;US)
Performance testing of West Valley Reference 6 glass, 96:1156 (R;US)
Permitting plan for the high level waste vitrification plant, 96:1823 (R;US)
Quantitative SEM/EDS analysis of high-level waste glasses, 96:1164 (R;US)
Report for Westinghouse Hanford Company: Makeup procedures and characterization data for modified DSSF and modified remaining inventory simulated tank waste, 96:1510 (R;US)
Reproduction of natural corrosion by accelerated laboratory testing methods, 96:1174 (R;US)

Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

Report Number	Abstract Number	Source of Availability	GPO Dep.	Order Number	Distribution Category
83809	96:616	OSTI; NTIS; INIS; GPO Dep.	E 1.99:	DE95011797	MF-2020

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 2 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) OSTI prices are based on total pages unless special pricing applies. The public should order from NTIS or from one of the other agencies listed in the citation. NTIS price codes may continue to appear in some records. To expedite processing, an order form is provided in the back of this publication.

NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

GPO Superintendent of Documents
