The Office of Science
and Technology

Prepared by
Office of Scientific and
Technical Information

OSTI (Office of Scientific and Technical Information), located within the Office of Energy Research, is responsible for leading the Department of Energy's (DOE's) Technical Information Management Program and providing direction and coordination for the dissemination of scientific and technical information resulting from DOE research and development (R&D) and environmental programs.

OSTI supports the Department's and the Nation's energy goals related to basic and applied energy research, U.S. competitiveness, national security, and environment, safety, and health by providing information services to the Department, the national laboratories, and other contractors.

OSTI provides information to the U.S. public, industry, and educational institutions through a variety of outlets. DOE information is available to the public on Internet. Major DOE databases are available through commercial online services in the United States and other countries with which DOE has exchange agreements. Reports, periodicals, and information on CD-ROM, magnetic tape, and microfiche are available to the public through the National Technical Information Service and the U.S. Government Printing Office (GPO) Superintendent of Documents and Depository Library Program.

The Office of Environmental Management's Information For Decisions ONLINE

The Department of Energy's Office of Science and Technology (OST) within the Office of Environmental Management (EM) has established an information and communications program titled Information For Decisions (IFD). The objective of this program is to provide consistent information and communications products. These products are available to interested individuals and groups in two formats: hard copy and electronic.

The primary access to the online information is provided through Internet and, more specifically, World Wide Web (WWW). The IFD program has designed a WWW-compatible application that features information on the activities related to technical programs within OST. This WWW application provides direct access to a wide variety of information on EM-sponsored research and development programs and projects. The information that is available is presented within the context of a user's viewpoint, for example, among the groups of users that would access this information are DOE's staff and contractor personnel. By providing information within appropriate user parameters, this user group will have the information it needs provided in a thematic format that allows optimal use of the information available. The information is accessible at the following WWW Universal Resource Location (URL):

http://em-50.em.doe.gov

The IFD program is providing this information in formats compatible with the standard operating procedures of the DOE Office of Scientific and Technical Information (OSTI) which provides additional information in an online format.

DISCLAIMER

THE OFFICE OF ENVIRONMENTAL MANAGEMENT TECHNICAL REPORTS

ABOUT THIS BIBLIOGRAPHY

The Office of Environmental Management's (EM) technical reports bibliography is an annual publication that contains information on scientific and technical reports sponsored by the Office of Environmental Management added to the Energy Science and Technology Database from July 1, 1995 – Sept. 30, 1996. This information is divided into the following categories: **Focus Areas and Crosscutting Programs**. Support Programs, Technology Integration and International Technology Exchange, are now included in the General category. EM's Office of Science and Technology sponsors this bibliography. Questions regarding the content of the publication should be addressed to Diana Krop, Communications Program Manager, at 301-903-7918 or **Diana.Krop@em.doe.gov**

PROGRAM ACTIVITIES

The Office of Environmental Management within the Department of Energy (DOE) is responsible for environmental restoration, waste management, technology development and facility transition and management. This Office was created in 1989 to consolidate responsibility within DOE for environmental management activities. EM develops DOE policies and plans related to environmental restoration and waste management and is working to foster open communication with the public.

The Office of Science and Technology (OST) was established to conduct an aggressive, national program of applied research, development, demonstration, testing, and evaluation for environmental cleanup solutions that are safe and more time- and cost-effective than those currently available. OST brings together experts from academia, the Federal government, and private industry to conduct a wide range of research and development. Through these unique partnerships, OST leverages resources to develop equipment and methods to render waste management technologies less expensive, safe, and commercially applicable around the globe. In doing so, OST seeks to achieve the twin goals of sustaining our environment and creating economic prosperity.

AVAILABILITY

A searchable EM Technical Reports database is now available from OST's home page via the World Wide Web. The database contains information on scientific and technical reports included in this publication and is searchable by title, focus area, author, performing organization, DOE report number, publication date, and abstract. The Internet address is: **http://em-50.em.doe.gov** (under publications listed as EM Technical Reports Database).

DOE and DOE Contractors can obtain copies from the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information call, (423) 576-8401.

Public availability is from the U.S. Department of Commerce, Technology Administration, National Technical Information Service, Springfield, VA 22161. For further information call (703) 487-4650.

CONTENTS

How To Read A Citation

The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Date of publication.** If not known, a processing date is in brackets.
9. **Number of pages** or page range. Prices are based on total pages unless special pricing applies.
10. **Language** of document if non-English.
11. **Monograph title** if citation is an analytic (part. chapter. or paper) of a larger monograph.
12. **Sponsoring organization.**
13. **Contract or grant number.**
14. **Secondary identifying number;** may be a conference number.
15. **Conference title, location, and date,** if applicable.
16. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
17. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
18. **Drop note** or explanatory statement.
19. **Abstract.**
20. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

In Indoor air '90: The fifth international conference on indoor air quality and climate. Volume 1: Final report. 786p. Order Number DE90017786. Source: NTIS.

Air pollution in houses caused by combustion of coal is more serious than that by combustion of natural gas and methane (primarily by SO_2 and NO_2). The gas concentration after cooking is higher than that before cooking, and it is higher in kitchen than in bedroom and outdoor. There were mutations in the extract from TSP in 30m^2 air in the bedroom, kitchen and outdoor, where coal and natural gas were used. The supernatant saliva activity of children whose family uses coal is significantly lower than that of pumping streams.

How To Use the Indexes

Five indexes are provided for approaching the content of *The Office of Environmental Management Technical Reports.* Descriptions of entries in these indexes follow.

Corporate Author Index

The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index

Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index

This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index

DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**

Report Number Index

Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is shown.

DOE/ER/40438– T1 15:18494 NTIS, OSTI
E 1.99: DE89007246 MF-411

1 (ANL–95/46) **Minimum Additive Waste Stabilization (MAWS), Phase I: Soil washing final report.** Argonne National Lab., IL (United States). Aug 1995. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96012963. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of the U.S. Department of Energy's environmental restoration and technology development activities, GTS Duratek, Inc., and its subcontractors have demonstrated an integrated thermal waste treatment system at Fernald, OH, as part the Minimum Additive Waste Stabilization (MAWS) Program. Specifically, MAWS integrates soil washing, vitrification of mixed waste streams, and ion exchange to recycle and remediate process water to achieve, through a synergistic effect, a reduction in waste volume, increased waste loading, and production of a durable, leach-resistant, stable waste form suitable for disposal. This report summarizes the results of the demonstration/testing of the soil washing component of the MAWS system installed at Fernald (Plant 9). The soil washing system was designed to (1) process contaminated soil at a rate of 0.25 cubic yards per hour; (2) reduce overall waste volume and provide consistent-quality silica sand and contaminant concentrates as raw material for vitrification; and (3) release clean soil with uranium levels below 35 pCi/g. Volume reductions expected ranged from 50-80 percent; the actual volume reduction achieved during the demonstration reached 66.5 percent. The activity level of clean soil was reduced to as low as 6 pCi/g from an initial average soil activity level of 17.6 pCi/g (the highest initial level of soil provided for testing was 41 pCi/g). Although the throughput of the soil washing system was inconsistent throughout the testing period, the system was online for sufficient periods to conclude that a rate equivalent to 0.25 cubic yards per hour was achieved.

2 (ANL/CMT-ACL/CP–84790) **Laboratory performance evaluation reports for management.** Lindahl, P.C. (Argonne National Lab., IL (United States)); Hensley, J.E.; Bass, D.A.; Johnson, P.L.; Marr, J.J.; Streets, W.E.; Warren, S.W.; Newberry, R.W. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950498–1: 6. international environmental quality and waste management conference: managing for quality - meeting environmental challenges, Denver, CO (United States), 18-20 Apr 1995). Order Number DE95011794. Source: OSTI; NTIS; INIS; GPO Dep.

In support of the US DOE's environmental restoration efforts, the Integrated Performance Evaluation Program (IPEP) was developed to produce laboratory performance evaluation reports for management. These reports will provide information necessary to allow DOE headquarters and field offices to determine whether or not contracted analytical laboratories have the capability to produce environmental data of the quality necessary for the remediation program. This document describes the management report.

3 (ANL/CMT-ACL/CP–85835) **Development of the Integrated Performance Evaluation Program (IPEP) for the Department of Energy's Office of Environmental Management.** Lindahl, P. (Argonne National Lab., IL (United States)); Streets, E.; Bass, D.; Hensley, J.; Newberry, R.; Carter, M. Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950495–2: 7. national technology information exchange workshop, Cincinnati, OH (United States), 18-20 Apr 1995). Order Number DE95012929. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory (ANL) and DOE's Radiological and Environmental Sciences Laboratory (RESL), Environmental Measurements Laboratory (EML), and Grand Junction Project office (GJPO) are collaborating with DOE's Office of Environmental Management (EM), Analytical Services Division (ASD, EM-263) and the Environmental Protection Agency (EPA) to develop an Integrated Performance Evaluation Program (IPEP). The purpose of the IPEP is to integrate information from existing PE programs with expanded QA activities to develop information about the quality of radiological, mixed waste, and hazardous environmental sample analyses provided by all laboratories supporting EM programs. The IPEP plans to utilize existing PE programs when available and appropriate for use by DOE; new PE programs will be developed only when no existing program meets DOEs needs. Interagency Agreements have been developed between EPA and DOE to allow DOE to use major existing PE programs developed by EPA. In addition, the DOE radiological Quality Assessment Program (QAP) administered by EML is being expanded for use in EM work. RESL and GJPO are also developing the Mixed Waste Performance Evaluation Program (MAPEP) to provide radiological, inorganic, and organic analytes of interest to EM programs. The use of information from multiple PE programs will allow a more global assessment of an individual laboratory's performance, as well as providing a means of more fairly comparing laboratories' performances in a given analytical area. The EPEP will interact with other aspects of the ASD such as audit and methods development activities to provide an integrated system for assessment and improvement of data quality.

4 (ANL/CMT-ACL/CP–86061) **IPEP: The integrated performance evaluation program for the Department of Energy's Office of Environmental Management.** Lindahl, P.C. (and others); Streets, W.E.; Bass, D.A. Argonne National Lab., IL (United States). 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950868–6: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE95015649. Source: OSTI; NTIS; INIS; GPO Dep.

The quality of the analytical data being provided to DOE's Office of Environmental Management (EM) for environmental restoration activities and the extent to which these data meet the data quality objectives are critical in the decision-making process. One of several quality metrics that can be used in evaluating a laboratory is its performance in performance evaluation (PE) programs. In support of DOE's environmental restoration and waste management efforts, EM has been charged with developing and implementing a program to assess the performance of participating laboratories. Argonne National Laboratory (ANL) and DOE's Environmental Measurements Laboratory (EML) and Radiological and Environmental Sciences Laboratory (RESL) have been collaborating on the development and implementation of a comprehensive Integrated Performance Evaluation Program (IPEP) for DOE-wide implementation. The IPEP will use results from existing inorganic, organic, and radiological PE programs when these are available and appropriate for the analytes and matrices being determined for DOE's EM activities. Existing programs include the U.S. Environmental Protection Agency's (EPA's) Contract Laboratory Program (CLP), the Water Supply (WS) and Water Pollution (WP) PE studies for inorganic and organic analytes, and DOE's Quality Assessment Program (QAP) for radiological analytes. In addition, DOE has begun the development of the Mixed Analyte Performance Evaluation Program (MAPEP) to address the needs of the DOE Complex. These PE programs provide a spectrum of matrices and analytes covering the various inorganic, organic, and low-level radiologic categories found in routine environmental and waste samples. These PE programs already provide some assessment of laboratory performance; IPEP will expand these assessments by evaluating historical performance, as well as results from multiple PE programs, thereby providing an enhanced usage of the PE program information.

5 (ANL/CMT-ACL/CP–86080) **IPEP: Laboratory performance evaluation reports for management of DOE EM programs.** Hensley, J.E. (and others); Lindahl, P.C.; Streets, W.E. Argonne National Lab., IL (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950868–7: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE95015650. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental restoration program/project managers at DOE's Office of Environmental Management (EM) are making important decisions based on analytical data generated by contracted laboratories. The Analytical Services Division, EM-263, is developing the Integrated Performance Evaluation Program (IPEP) to assess the performance of those laboratories, based on results from Performance Evaluation (PE) programs. The IPEP reports will be used by the laboratories to foster self-assessment and improvement. In addition, IPEP will produce PE reports for three levels of EM management (Operations/Project Offices, Area Program Offices, and Deputy Assistant Secretary Office). These reports will be used to assess whether contracted analytical laboratories have the capability to produce environmental data of the quality necessary for making environmental restoration and waste management decisions.

6 (ANL/CMT-ACL/VU–83596) **Development of the Integrated Performance Evaluation Program (IPEP) for the Department of Energy's Office of Environmental Management.** Argonne National Lab., IL (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9410147–5-Vugraphs: 35. ORNL/DOE analytical chemistry in energy technology conference, Gatlinburg, TN (United States), 6-8 Oct 1994). Order Number DE95013496. Source: OSTI; NTIS; GPO Dep.

ASD's Quality Assurance Program assures production of credible environmental data. The Analytical Services Division (EM-263) is responsible for developing and implementing a comprehensive Integrated Performance Evaluation Program (IPEP) for laboratories providing analytical data in support of Environmental Management Programs. The Performance Evaluation Program describes a laboratory's ability to perform environmental analyses of radiochemical, hazardous chemical and mixed waste.

7 (ANL/CMT-ACL/VU–86798) **DOE's Integrated Performance Evaluation Program (IPEP) Laboratory Performance Reports for Sample Management Offices.** Lindahl, P.C. Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505263–VUGRAPHS: Sample and data management workshop, Richland, WA (United States), 23-24 May 1995). Order Number DE95014095. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes a program by the Analytical Services Division (EM-263) to develope and implement a comprehensive integrated performance evaluation program for laboratories providing analytical data in support of EM programs.

8 (ANL/CMT/CP–85474) **Thermal oxidation vitrification flue gas elimination system.** Kephart, W. (Foster-Wheeler Environmental Corp., Oak Ridge, TN (United States)); Angelo, F.; Clemens, M. Argonne National Lab., IL (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950542–2: 14. international symposium on thermal treatment technologies: incineration conference, Seattle, WA (United States), 8-12 May 1995). Order Number DE95013407. Source: OSTI; NTIS; INIS; GPO Dep.

With minor modifications to a Best Demonstrated Available Technology hazardous waste incinerator, it is possible to obtain combustion without potentially toxic emissions by using technology currently employed in similar applications throughout industry. Further, these same modifications will reduce waste handling over an extended operating envelope while minimizing energy consumption. Three by-products are produced: industrial grade carbon dioxide, nitrogen, and a final waste form that will exceed Toxicity Characteristics Leaching Procedures requirements and satisfy nuclear waste product consistency tests. The proposed system utilizes oxygen rather than air as an oxidant to reduce the quantities of total emissions, improve the efficiency of the oxidation reactions, and minimize the generation of toxic NO_x emissions. Not only will less potentially hazardous constituents be generated; all toxic substances can be contained and the primary emission, carbon dioxide – the leading "greenhouse gas" contributing to global warming – will be converted to an industrial by-product needed to enhance the extraction of energy feedstocks from maturing wells. Clearly, the proposed configuration conforms to the provisions for Most Achievable Control Technology as defined and mandated for the private sector by the Clear Air Act Amendments of 1990 to be implemented in 1997 and still lacking definition.

9 (ANL/DIS/CP-84269) **Development and use of consolidated criteria for evaluation of emergency preparedness plans for DOE facilities.** Lerner, K.; Kier, P.H.; Baldwin, T.E. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950430-9: 5. ANS topical meeting on emergency preparedness and response, Savannah, GA (United States), 18-21 Apr 1995). Order Number DE95013684. Source: OSTI; NTIS; INIS; GPO Dep.

Emergency preparedness at US Department of Energy (DOE) facilities is promoted by development and quality control of response plans. To promote quality control efforts, DOE has developed a review document that consolidates requirements and guidance pertaining to emergency response planning from various DOE and regulatory sources. The Criteria for Evaluation of Operational Emergency Plans (herein referred to as the Criteria document) has been constructed and arranged to maximize ease of use in reviewing DOE response plans. Although developed as a review instrument, the document also serves as a de facto guide for plan development, and could potentially be useful outside the scope of its original intended DOE clientele. As regulatory and DOE requirements are revised and added in the future, the document will be updated to stay current.

10 (ANL/EA/CP-84161) **Assessment of risks to individuals from the transportation of radioactive materials.** Biwer, B.M.; Monette, F.A.; LePoire, D.J.; Chen, S.Y. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950216-148: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95013392. Source: OSTI; NTIS; INIS; GPO Dep.

The radiological impacts to individuals from the transportation of radioactive materials must be assessed when evaluating alternatives for major federal actions as required by the National Environmental Policy Act. Public comments on past environmental impact statements indicate that the public is concerned about the risks of radiation exposure to individuals along a transport route from radioactive materials shipments. Individuals may be exposed during routine, incident-free, transport of radioactive materials or, potentially, as a result of transportation accidents. This paper discusses the computer model RISKIND, which was developed at Argonne National Laboratory to estimate the potential radiological risks to individuals and population subgroups from the transportation of radioactive materials. The code was designed to use site-specific data to provide a detailed analysis for each receptor location. This type of analysis complements the traditional collective population transportation risk analyses conducted for radiological transportation risk assessments.

11 (ANL/EA/CP-84766) **Facility accident considerations in the US Department of Energy Waste Management Program.** Mueller, C. Argonne National Lab., IL (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-941102-45: Winter meeting of the American Nuclear Society (ANS), Washington, DC (United States), 13-18 Nov 1994). Order Number DE95011818. Source: OSTI; NTIS; INIS; GPO Dep.

A principal consideration in developing waste management strategies is the relative importance of Potential radiological and hazardous releases to the environment during postulated facility accidents with respect to protection of human health and the environment. The Office of Environmental Management (EM) within the US Department of Energy (DOE) is currently formulating an integrated national program to manage the treatment, storage, and disposal of existing and future wastes at DOE sites. As part of this process, a Programmatic Environmental impact Statement (PEIS) is being prepared to evaluate different waste management alternatives. This paper reviews analyses that have been Performed to characterize, screen, and develop source terms for accidents that may occur in facilities used to store and treat the waste streams considered in these alternatives. Preliminary results of these analyses are discussed with respect to the comparative potential for significant releases due to accidents affecting various treatment processes and facility configurations. Key assumptions and sensitivities are described.

12 (ANL/EA/CP-85519) **Calculation of projected waste loads for transuranic waste management alternatives.** Hong, K.; Kotek, T.; Koebnick, B.; Wang, Y.; Kaicher, C. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950216-145: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95012938. Source: OSTI; NTIS; INIS; GPO Dep.

The level of treatment and the treatment and interim storage site configurations (decentralized, regional, or centralized) impact transuranic (TRU) waste loads at and en route to sites in the US Department of Energy (DOE) complex. Other elements that impact waste loads are the volume and characteristics of the waste and the unit operation parameters of the technologies used to treat it. Projected annual complexwide TRU waste loads under various TRU waste management alternatives were calculated using the WASTE_MGMT computational model. WASTE_MGMT accepts as input three types of data: (1) the waste stream inventory volume, mass, and contaminant characteristics by generating site and waste stream category; (2) unit operation parameters of treatment technologies; and (3) waste management alternative definitions. Results indicate that the designed capacity of the Waste Isolation Pilot Plant, identified under all waste management alternatives as the permanent disposal facility for DOE-generated TRU waste, is sufficient for the projected complexwide TRU waste load under any of the alternatives.

13 (ANL/EA/CP-85661) **Determining training needs from supervisors' assessment of staff proficiency in tasks and skills.** Young, C. (Argonne National Lab., IL (United States)); Hensley, J.; Lehr, J. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950216-144: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95012934. Source: OSTI; NTIS; GPO Dep.

To provide the basis for establishing training opportunities, this project investigated supervisors' views of three components of staff activities. The project established the tasks that staff perform, identified staffs level of effectiveness in performing these tasks, and investigated staffs level of proficiency in performing the skills underlying these tasks. Training opportunities were then determined in those areas where knowledge and skins could be improved for staff to perform their tasks more effectively. Staff currently perform their tasks sufficiently well. Furthermore, supervisors indicated that for the most part staff do perform the tasks they should perform. In carrying out these tasks, staff use primarily critical thinking, problem solving, and communication skills rather than discipline-specific skills. Although staff generally have working knowledge of most of these skills, additional training in critical thinking and problem solving, program and project management techniques, and communications is appropriate to further improve the organizations effectiveness.

14 (ANL/EA/CP--88164) **Facilitating relative comparisons of health impacts from postulated accidents in environmental impact statements.** Mueller, C.J. Argonne National Lab., IL (United States). [1996]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960648--5: 21. annual conference of the National Association of Environmental Professionals: practical environmental directions - a changing agenda, Houston, TX (United States), 2-6 Jun 1996). Order Number DE96010794. Source: OSTI; NTIS; INIS; GPO Dep.

Current US Department of Energy (DOE) guidance on the performance of accident analyses supported an environmental impact statement (EIS) stresses a graded approach that emphasizes the most important risks, calls for the evaluation of frequencies as well as consequences for severe accident scenarios, and discourages the use of bounding analyses that confound risk comparisons among EIS alternatives. This paper discusses methods in probabilistic risk analysis that were developed and applied in defining accidents and generating radiological source terms for the DOE Draft Waste Management Programmatic Environmental Impact Statement (WM PEIS); publication of the Final WM PEIS is due in late summer 1996. The strengths and shortcomings of the cited probabilistic risk analysis methods used to evaluate facility accidents are addressed, both as they relate to the WM PEIS and as they relate to more general EIS applications. Key guidance is discussed that was developed by DOE and used in shaping the techniques cited herein for application in an EIS. Related perceptions on accidents observed from the public comment process for the WM PEIS are cited. Finally, recommendations are made on the basis of needs as well as lessons learned in implementing the accident analysis for the WM PEIS.

15 (ANL/EA/CP--88442) **RISKIND: An enhanced computer code for National Environmental Policy Act transportation consequence analysis.** Biwer, B.M.; LePoire, D.J.; Chen, S.Y. Argonne National Lab., IL (United States). 1996. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960212--39: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006896. Source: OSTI; INIS; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); GPO Dep.

The RISKIND computer program was developed for the analysis of radiological consequences and health risks to individuals and the collective population from exposures associated with the transportation of spent nuclear fuel (SNF) or other radioactive materials. The code is intended to provide scenario-specific analyses when evaluating alternatives for environmental assessment activities, including those for major federal actions involving radioactive material transport as required by the National Environmental Policy Act (NEPA). As such, rigorous procedures have been implemented to enhance the code's credibility and strenuous efforts have been made to enhance ease of use of the code. To increase the code's reliability and credibility, a new version of RISKIND was produced under a quality assurance plan that covered code development and testing, and a peer review process was conducted. During development of the new version, the flexibility and ease of use of RISKIND were enhanced through several major changes: (1) a Windows™ point-and-click interface replaced the old DOS menu system, (2) the remaining model input parameters were added to the interface, (3) databases were updated, (4) the program output was revised, and (5) on-line help has been added. RISKIND has been well received by users and has been established as a key component in radiological transportation risk assessments through its acceptance by the U.S. Department of Energy community in recent environmental impact statements (EISs) and its continued use in the current preparation of several EISs.

16 (ANL/EA/CP--88945) **A comparative review of accident studies from recent environmental impact statements.** Mueller, C.; Folga, S.; Nabelssi, B. Argonne National Lab., IL (United States). 1996. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9606114--7: 6. annual Energy Facility Contractors Group (EFCOG) safety analysis workshop on doing the right thing, Knoxville, TN (United States), 5-7 Jun 1996). Order Number DE96009413. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) has recently prepared or is in the process of preparing a number of programmatic and site-specific environmental impact statements (EISs). This study was conducted for the purpose of reviewing the self-consistency of programmatic alternatives, associated relative impacts, and supporting data, methods, and assumptions in EISs prepared for related activities. The following EISs, which deal with waste management issues, are reviewed in this paper (the parenthetical acronyms are referred to in Table 1): (1) Final Environmental Impact Statement, Savannah River Site Waste Management, DOE/EIS-0217, Vol. II, July 1995. (SRS WM-EIS), (2) Draft Waste Management Programmatic Environmental Impact Statement for Managing Treatment, Storage, and Disposal of Radioactive and Hazardous Waste, DOE/EIS-0200-D, Vol. IV, Aug. 1995. (WM PEIS), (3) Final Environmental Impact Statement, Interim Management of Nuclear Materials at the Savannah River Site. DOE/EIS-0220, Oct. 1995. (IMNM EIS), (4) Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement, DOE/EIS-0203-F, April 1995. (INEL Site-Wide-EIS), (5) Draft Environmental Impact Statement, Disposition of Surplus Highly Enriched Uranium, DOE/EIS-0240-D, Oct. 1995. (HEU Disposition EIS), (6) Final Environmental Impact Statement, Safe Interim Storage of Hanford Tank Wastes, Hanford Site, Richland, Washington, DOE/EIS-0212, Oct. 1995. (SIS EIS). This study compares the facility accident analysis approaches used in these EISs vis-a-vis the National Environmental Policy Act (NEPA) guidance developed by DOE (Recommendations for the Preparation of Environmental Assessments and Environmental Impact Statements, Office of NEPA Oversight). The purpose of the comparative review of these approaches with NEPA guidance is to identify potential preferred paths for future EISs.

17 (ANL/EAD/TM–18-Draft) **Risk assessment for the on-site transportation of radioactive wastes for the U.S. Department of Energy Waste Management programmatic environmental impact statement.** Biwer, B.M.; Monette, F.A.; Chen, S.Y. Argonne National Lab., IL (United States). Apr 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017833. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the risk assessment performed for the on-site transportation of radioactive wastes in the U.S. Department of Energy (DOE) Waste Management (WM) Programmatic Environmental Impact Statement (PEIS). Risks for the routine shipment of wastes and the impacts from potential accidental releases are analyzed for operations at the Hanford Site (Hanford) near Richland, Washington. Like other large DOE sites, Hanford conducts waste management operations for all wastes types; consequently, the impacts calculated for Hanford are expected to be greater than those for smaller sites. The risk assessment conducted for on-site transportation is intended to provide an estimate of the magnitude of the potential risk for comparison with off-site transportation risks assessed for the WM PEIS.

18 (ANL/EAD/TM–21-Draft) **Risk assessment for the off-site transportation of high-level waste for the U.S. Department of Energy Waste Management Programmatic Environmental Impact Statement.** Monette, F.A. (Argonne National Lab., IL (United States). Environmental Assessment Div.); Biwer, B.M.; LePoire, D.J.; Chen, S.Y. Argonne National Lab., IL (United States). Apr 1995. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017827. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the human health risk assessment conducted for the transportation of high-level waste (HLW) in support of the US Department of Energy Waste Management Programmatic Environmental Impact Statement (WM PEIS). The assessment considers risks to collective populations and individuals under both routine and accident transportation conditions for truck and rail shipment modes. The report discusses the scope of the HLW transportation assessment, describes the analytical methods used for the assessment, defines the alternatives considered in the WM PEIS, and details important assessment assumptions. Results are reported for four alternatives. In addition, to aid in the understanding and interpretation of the results, specific areas of uncertainty are described, with an emphasis on how the uncertainties may affect comparisons of the alternatives. The number and scope of the WM PEIS HLW alternatives were revised after the preparation of this report. An addendum has been added to make this HLW transportation risk assessment consistent with that presented in the WM PEIS.

19 (ANL/EAD/TM–27-Draft) **Supplemental information related to risk assessment for the off-site transportation of transuranic waste for the U.S. Department of Energy Waste Management Programmatic Environmental Impact Statement.** Monette, F.A.; Biwer, B.M.; LePoire, D.J.; Chen, S.Y. Argonne National Lab., IL (United States). Apr 1995. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017828. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents supplemental information to support the human health risk assessment conducted for the transportation of transuranic waste (TRUW) in support of the US Department of Energy Waste Management Programmatic Environmental Impact Statement (WM PEIS). Detailed descriptions of the transportation health risk assessment method and results of the assessment are presented in Appendix E of the WM PEIS and are not repeated in this report. This report presents additional information that is not presented in Appendix E but is necessary to conduct the transportation risk assessment for Waste Management (WM) contact- and remote-handed (CH and RH) TRUW. Included are definitions of the TRUW alternatives considered in the WM PEIS, data related to the inventory and to the physical and radiological characteristics of CH and RH TRUW, and detailed results of the assessment for each WM TRUW case considered. After preparation of this report, the WM PEIS TRUW alternatives were revised as combinations of the cases presented herein. An addendum has been added to explain the revision and consolidate the impacts for each alternative for the WM PEIS TRUW transportation risk assessment.

20 (ANL/EAD/TM–28-Draft) **Risk assessment for the transportation of hazardous waste and hazardous waste components of low-level mixed waste and transuranic waste for the U.S. Department of Energy waste management programmatic environmental impact statement.** Lazaro, M.A. (and others); Policastro, A.J.; Hartmann, H.M. Argonne National Lab., IL (United States). Apr 1995. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017829. Source: OSTI; NTIS; INIS; GPO Dep.

This report, a supplement to Appendix E (Transportation Risk) of the U.S. Department of Energy Waste Management Programmatic Environmental Impact Statement (WM PEIS), provides additional information supporting the accident data for chemical risk assessment and health risk methodology described in that appendix (Part II), as well as providing the uncertainty analysis and on-site risk calculations. This report focuses on hazardous material truck accident rates, release probabilities, and release quantities; provides the toxicological values derived for each hazardous chemical assessed in the WM PEIS and further details on the derivation of health criteria; describes the method used in the transportation risk assessments to address potential additivity of health effects from simultaneous exposure to several chemicals and the method used to address transportation risks for maximally exposed individuals; presents an expanded discussion of the uncertainty associated with transportation risk calculations; and includes the results of the on-site transportation risk analysis. In addition, two addenda are provided to detail the risk assessments conducted for the hazardous components of low-level mixed waste (Addendum I) and transuranic waste (Addendum II).

21 (ANL/EAD/TM–35-Draft) **Supplemental information related to risk assessment for the off-site transportation of low-level mixed waste for the U.S. Department of Energy Waste Management programmatic environmental impact statement.** Monette, F.A. (and others); Biwer, B.M.; LePoire, D.J. Argonne National Lab., IL (United States). Apr 1995. 382p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017801. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides supplemental information to support the human health risk assessment conducted for the transportation of low-level mixed waste (LLMW) in support of the US Department of Energy Waste Management Programmatic Environmental Impact Statement (WM PEIS). The assessment considers both the radioactive and chemical hazards associated with LLMW transportation. Detailed descriptions of the transportation health risk assessment methods and results of the assessment are presented in Appendix E of the WM PEIS. This report presents additional information that is not included in Appendix E but is necessary to conduct the transportation risk assessment for Waste Management (WM) LLMW. Included are definitions of the LLMW alternatives considered in the WM PEIS; data related to the inventory and to the physical, chemical, and radiological characteristics of WM LLMW; an overview of the risk assessment methods; and detailed results of the assessment for each WM LLMW case considered.

22 (ANL/ER/CP–85412) **Performance specifications for technology development.** Erickson, M.D. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950209–9: 4. international symposium on field screening methods for hazardous wastes and toxic chemicals, Las Vegas, NV (United States), 22-24 Feb 1995). Order Number DE95012467. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of any instrument, technique, or method development project is to deliver needed and usable technologies to customers. To help the US Department of Energy's Office of Environmental Management and its investigators meet that goal, technology performance specifications are being developed for implementation in research and development and in documentation, testing, and evaluation projects. Technology performance specifications will be used to establish milestones, evaluate the status of ongoing projects, and determine the success of completed projects. Preliminary performance specifications will be required in proposals and will be highly weighted in the technical evaluation. The general performance specification approach is to document what currently exists or is nearing completion and compare that baseline to the customers' needs to identify the unmet requirements. These unmet requirements then form the basis for the technology development needs that OTD investigators must address. The process needs to be quantitative, where appropriate, to focus project goals away from vague generalities like "better" toward specifics "reduce detection limit from 50 μg/L to 100 ng/L", or from "cheaper" to "reduction of labor costs for step A from 4 hours to 0.5 hour."

23 (ANL/ET/CP–88519) **Development of value-added products from alumina industry mineral wastes using low-temperature-setting phosphate ceramics.** Wagh, A.S.; Jeong, Seung-Young; Singh, D. Argonne National Lab., IL (United States). Energy Technology Div. Jan 1996. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9606172–1: 4. international alumina quality workshop, Darwin (Australia), 2-7 Jun 1996). Order Number DE96010812. Source: OSTI; NTIS; GPO Dep.

A room-temperature process for stabilizing mineral waste streams has been developed, based on acid-base reaction between MgO and H3PO4 or acid phosphate solution. The resulting waste form sets into a hard ceramic in a few hours. In this way, various alumina industry wastes, such as red mud and treated potliner waste, can be solidified into ceramics which can be used as structural materials in waste management and construction industry. Red mud ceramics made by this process were low-porosity materials ($\approx$2 vol%) with a compression strength equal to portland cement concrete (4944 psi). Bonding mechanism appears to be result of reactions of boehmite, goethite, and bayerite with the acid solution, and also encapsulation of red mud particles in Mg phosphate matrix. Possible applications include liners for ponds and thickned tailings disposal, dikes for waste ponds, and grouts. Compatability problems arising at the interface of the liner and the waste are avoided.

24 (BHI–00066-Rev.2) **Hanford surplus facilities hazards identification document. Revision 2.** Egge, R.G. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005927. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides general safety information needed by personnel who enter and work in surplus facilities managed by Bechtel Hanford, Inc. (BHI). The purpose of the document is to enhance access control of surplus facilities, educate personnel on the potential hazards associated with these facilities prior to entry, and ensure that safety precautions are taken while in the facility. Questions concerning the currency of this information should be directed to the building administrator (as listed in BHI-FS-01, Field Support Administration, Section 1.1, "Access Control for ERC Surplus Facilities").

25 (BHI–00099) **Environmental Restoration Contractor Waste Minimization and Pollution Prevention Plan.** Lewis, R.A. Bechtel Hanford, Inc., Richland, WA (United States). Nov 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005058. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this plan is to establish the Environmental Restoration Contractor (ERC) Waste Minimization and Pollution Prevention (WMin/P2) Program and outline the activities and schedules that will be employed to reduce the quantity and toxicity of wastes generated as a result of restoration and remediation activities. It is intended to satisfy the US Department of Energy (DOE) and other legal requirements. As such, the Pollution Prevention Awareness program required by DOE Order 5400.1 is included with the Pollution Prevention Program. This plan is also intended to aid projects in meeting and documenting compliance with the various requirements for WMin/P2, and contains the policy, objectives, strategy, and support activities of the WMin/P2 program. The basic elements of the plan are pollution prevention goals, waste assessments of major waste streams, implementation of feasible waste minimization opportunities, and a process for reporting achievements. Various pollution prevention techniques will be implemented with the support of employee training and awareness programs to reduce waste and still meet applicable requirements. Information about the Hanford Site is in the Hanford Site Waste Minimization and Pollution Prevention Awareness Program Plan.

26 (BHI–00099-Rev.1) **Environmental Restoration Contractor Waste Minimization and Pollution Prevention Plan. Revision 1.** Lewis, R.A. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009064. Source: OSTI; NTIS; INIS; GPO Dep.

This plan contains the Environmental Restoration Contractor (ERC) Waste Minimization and Pollution Prevention (WMin/P2) Program. The plan outlines the activities and schedules developed by the ERC to reduce the quantity and toxicity of waste dispositioned as a result of restoration and remediation activities. This plan satisfies US Department of Energy (DOE) requirements including the Pollution Prevention Awareness program required by DOE Order 5400.1 (DOE 1988). This plan is consistent with Executive Order 12856 and Secretary O'Leary's pollution prevention Policy Statement of December 27, 1994, which set US and DOE pollution prevention policies, respectively. It is also consistent with the DOE Pollution Prevention Crosscut Plan, 1994, which provides guidance in meeting the DOE goals in pollution prevention. The purpose of this plan is to aid ERC projects in meeting and documenting compliance with requirements for WMin/P2. This plan contains the objectives, strategy, and support activities of the ERC Team WMin/P2 program. The basic elements of the plan are pollution prevention goals, waste assessments of major waste streams, implementation of feasible waste minimization opportunities, and a process for reporting achievements. Wherever appropriate, the ERC will integrate the pollution prevention activities in this plan into regular program activities rather than establishing separate WMin/P2 activities. Moreover, wherever possible, existing documents, procedures, and activities will be used to meet WMin/P2 requirements.

27 (BHI–00116-Rev.2) **216-B-3 Main Pond supplemental information to the Hanford Facility Contingency Plan (DOE/RL-93-75).** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012111. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a unit-specific contingency plan for the 216-B-3 Main Pond and is intended to be used as a supplement to DOE/RL-93-75, 'Hanford Facility Contingency Plan.' This unit-specific plan is to be used to demonstrate compliance with the contingency plan requirements of the Washington Administrative Code, Chapter 173-303 for certain Resource, Conservation and Recovery Act of 1976 waste management units. The 216-B-3 Main Pond is a surface impoundment that received dangerous waste from the Plutonium/Uranium Extraction Plant and other 200 Area operations from 1945 to 1952. The 216-B-3 Main Pond has been stabilized, backfilled, and permanently isolated from all liquid effluent sources. Dangerous waste management activities are no longer required at the 216-B-3 Main Pond. The 216-B-3 Main Pond does not present a significant hazard to adjacent units, personnel, or the environment. It is unlikely that any incidents presenting hazards to the public or the environment would occur at the 216-B-3 Main Pond.

28 (BHI–00118-Rev.2) **216-A-29 Ditch supplemental information to the Hanford Facility Contingency Plan (DOE/RL-93-75).** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012109. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a unit-specific contingency plan for the 216-A-29 Ditch and is intended to be used as a supplement to DOE/RL-93-75, Hanford Facility Contingency Plan (DOE-RL 1993). This unit-specific plan is to be used to demonstrate compliance with the contingency plan requirements of the Washington Administrative Code, Chapter 173-303 for certain Resource Conservation and Recovery Act of 1976 waste management units. The 216-A-29 Ditch is a surface impoundment that received nonregulated process and cooling water and other dangerous wastes primarily from operations of the Plutonium/Uranium Extraction Plant. Active between 1955 and 1991, the ditch has been physically isolated and will be closed. Because it is no longer receiving discharges, waste management activities are no longer required at the unit. The ditch does not present a significant hazard to adjacent units, personnel, or the environment. It is unlikely that any incidents presenting hazards to public health or the environment would occur at the 216-A-29 Ditch.

29 (BHI–00119-Rev.2) **216-A-10 Crib supplemental information to the Hanford Facility Contingency Plan (DOE/RL-93-75).** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012112. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a unit-specific contingency plan for the 216-A-10 Crib. The Crib is a landfill that received process condensate from the 202-A building Plutonium/Uranium Extraction Plant from 1956 to 1987. The crib has not received waste since March 1987 and will be closed under final facility standards. Waste management activities are no longer required at the crib, and it does not present significant hazard to adjacent units, personnel or the environment. It is unlikely that any incidents presenting hazards to the public health or the environment would occur at the 216-A-10 Crib.

30 (BHI–00120-Rev.2) **216-A-37-1 Crib supplemental information to the Hanford Facility Contingency Plan (DOE/RL-93-75).** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012113. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a unit-specific contingency plan for the 216-A-37-1- Crib and is intended to be used as a supplement to DOE/RL-93-75, 'Hanford Facility Contingency Plan'. This plan is to be used to demonstrate compliance with the contingency plan requirements of the Washington Administrative Code. The 216-A-37-1 Crib is a landfill used for percolation of the 242-A Evaporator process condensate from 1977 to 1989. Discharge to the 216-A-37-1 Crib was discontinued in April 1989, and it has been physically isolated and backfilled. The crib will be closed under final facility standards. Because the crib no longer receives discharge, waste management activities are no longer required. The crib does not present a significant hazard to public health or the environment.

31 (BHI–00121-Rev.2) **216-A-36B Crib supplemental information to the Hanford Facility Contingency Plan (DOE/RL-93-75).** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012114. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a unit-specific contingency plan for the 216-A-36B Crib and is intended to be used as a supplement to DOE/RL-93-75, Hanford Facility Contingency Plan (DOE-RL 1993). This unit-specific plan is to be used to demonstrate compliance with the contingency plan requirements of the Washington Administrative Code, Chapter 173-303 for certain Resource Conservation and Recovery Act of 1976 waste management units. The 216-A-36B Crib is a landfill that received ammonia scrubber waste from the 202-A Building (Plutonium/Uranium Extraction Plant) between 1966 and 1972. In 1982, the unit was reactivated to receive additional waste from Plutonium/Uranium Extraction operations. Discharges ceased in 1987, and the crib will be closed under final facility standards. Because the crib is not receiving discharges, waste management activities are no longer required. The crib does not present a significant hazard to adjacent units, personnel, or the environment. There is little likelihood that any incidents presenting hazards to public health or the environment would occur at the 216-A-36B Crib.

32 (BHI–00122-Rev.2) **216-S-10 Pond and Ditch supplemental information to the Hanford Facility Contingency Plan (DOE/RL-93-75).** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012115. Source: OSTI; NTIS; INIS; GPO Dep.

The 216-S-10 Pond and Ditch were used as disposal sites for the Chemical Engineering Laboratory between 1980 and 1983. The 216-S-10 Ditch last received a discharge October 1991. Both the pond and the ditch have been physically isolated, and the pond has been backfilled and decommissioned; both will be closed under final facility standards. Waste management activities are no longer required at the unit. The unit does not present and significant hazard to adjacent units, personnel, or the environment. It is unlikely that any incidents presenting hazards to public health or the environment would occur at the 215-S-10 Pond and Ditch.

33 (BHI–00123-Rev.2) **216-U-12 Crib supplemental information to the Hanford Facility Contingency Plan (DOE/RL-93-75).** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012116. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a unit-specific contingency plan for the 216-U-12 Crib and is intended to be used as a supplement to DOE/RL-93-75, Hanford Facility Contingency Plan (DOE-RL 1993). This unit-specific plan is to be used to demonstrate compliance with the contingency plan requirements of the Washington Administrative Code, Chapter 173- 303 for certain Resource Conservation and Recovery Act of 1976 waste management units. The 216-U-12 Crib is a landfill that received waste from the 291-U-1 Stack, 244-WR Vault, 244-U via tank C-5, and the UO_3Plant. The crib pipeline was cut and permanently capped in 1988, and the crib has been backfilled. The unit will be closed under final facility standards. Waste management activities are no longer required at the unit. The crib does not present a significant hazard to adjacent units, personnel, or the environment. It is unlikely that any incidents presenting hazards to public health or the environment would occur at the 216-U-12 Crib.

34 (BHI–00175) **Z plant aggregate area management study technical baseline report.** DeFord, D.H.; Carpenter, R.W. Bechtel Hanford, Inc., Richland, WA (United States). May 1995. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005835. Source: OSTI; NTIS; INIS; GPO Dep.

This document was prepared in support of the development of a Aggregate Area Management Study of Z Plant, 200 West Area, at the US Department of Energy (DOE) Hanford Site near Richland, Washington. It provides a technical description and operational history of the aggregate area and results from an environmental investigation undertaken by the Technical Baseline Section of the Environmental Engineering Group, Westinghouse Hanford Company (WHC) which is currently the Waste Site and Facility Research Office, Natural Resources, Bechtel Hanford, Inc. (BHI). It is based upon review and evaluation of numerous Hanford Site current and historical reports, drawings and photographs, supplemented with site inspections and employee interviews. No intrusive field investigations or sampling were conducted in support of this report.

35 (BHI–00217-Rev.1) **Environmental Restoration Contractor Resource Conservation and Recovery Act Permit Implementation Plan.** Lewis, R.A. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96013576. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the revised Environmental Restoration Contractor (ERC) Implementation Plan for compliance with the Dangerous Waste and Hazardous and Solid Waste Amendment portions of the Resource Conservation and Recovery Act (RCRA) Permit for the Treatment, Storage, and Disposal of Dangerous Waste (hereafter referred to as the "Permit"). The Permit became effective on September 28, 1994. The ERC has developed the Permit Implementation Plan to ensure that the Permit is properly implemented within the ERC project and functions. The plan contains a list of applicable permit conditions, descriptions, responsible organizations, and the status of compliance. The ERC's responsibilities for Permit implementation are identified within both project and functional organizations. Project Managers are responsible for complying with conditions specific to a particular treatment, storage, or disposal (TSD) unit. TSD-specific compliance in include items such as closure plan deliverables, reporting and record keeping requirements, or compliance with non-unit-specific tasks such as spill reporting and emergency response. Functional organizations are responsible for sitewide activities, such as coordinating Permit modifications and developing personnel training programs.

36 (BHI–00288-Rev.1) **Unit-specific contingency plan for the 183-H solar evaporation basins. Revision 1.** Zoric, J.P. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009919. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a supplement to the Hanford Facility Contingency Plan. It provides the unit-specific information needed to fully comply with the Washington Administrative Code, Chapter 173-303, "Dangerous Waste Regulations," for contingency plans. General emergency and response information is contained in the Hanford Facility Contingency Plan and is not repeated in this supplement. The 183-H solar evaporation basins are four concrete internal surfaces which contained radiologically- and hazardous-contaminated waste. The 183-H basins are currently empty, inactive and designated as a Resource Conservation and Recovery Act interim-status treatment, storage, and disposal unit undergoing closure. There is no dangerous waste management actively occurring. There is very little likelihood of any incidents that would present hazards to public health or the environment occurring at the 183-H basins.

37 (BHI–00412-Rev.1) **300 Area Process Trenches supplemental information to the Hanford Facility Contingency Plan (DOE/RL-93-75). Revision 1.** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012140. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a unit-specific contingency plan for the 300 Area Process Trenches and is intended to be used as a supplement to DOE/RL- 93-75, "Hanford Facility Contingency Plan." This unit-specific plan is to be used to demonstrate compliance with the contingency plan requirements of WAC 173-303 for certain Resource, Conservation and Recovery Act of 1976 waste management units. The 300 Area Process Trenches are surface impoundments used to receive routine discharges of nonregulated process cooling water from operations in the 300 Area, and dangerous waste from several research and development laboratories and the 300 Area Fuels Fabrication process. Discharges to the trenches ceased in 1994, and the trenches were physically isolated in 1995. These trenches will be closed under interim status. There are no waste management activities required at the 300 Area Process Trenches. The unit does not present any significant hazards to adjacent units, personnel, or the environment. It is unlikely that any incidents presenting hazards to public health or the environment would occur at the 300 Area Process Trenches.

38 (BHI–00627) **The Hanford Site N Reactor buildings task identification and evaluation of historic properties.** Stapp, D.C.; Marceau, T.E. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1996. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005870. Source: OSTI; NTIS; INIS; GPO Dep.

The New Production Reactor complex at Hanford (hereafter referred to as N Reactor) is proposed to be deactivated, decommissioned, and demolished in the coming years. Recognizing that the Hanford Site has been important to the nation, state, and local community, a task was funded to examine the effects that these activities may have on the historic properties of N Reactor. The objectives of the N Reactor buildings task were to identify potential historic properties at N Reactor, to complete Historic Property Inventory forms for all structures considered eligible and ineligible for listing in the National Register of Historic Places, and to prepare a Memorandum of Agreement that identifies the measures required to mitigate any adverse effects.

39 (BHI–00628) **Revegetation plan for the 116-C-1 site.** Weiss, S.G. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009903. Source: OSTI; NTIS; INIS; GPO Dep.

This is a demonstration revegetation project. Work should reflect what would be potentially feasible on a large-scale basis. That is, the methodology should be suitable for eventual use in restoring entire operable units–not just individual waste sites–to some level of habitat. The information gained from this demonstration project will be used to help determine the level of habitat restoration that is reasonably achievable in those areas. As such, labor-intensive or extremely expensive methods, for the most part, will not be used. The one exception to this is topsoil. A suitable amount of topsoil (a depth of 1 m [3 ft]) to restore all the waste sites in the entire 100 Areas may be not only extremely expensive but also cause unacceptable ecological damage to the borrow site(s). The 116-C-1 revegetation work in this plan will help demonstrate the results for a range of topsoil depths so that sound decisions can be made for the amount of topsoil that should be imported to achieve acceptable revegetation results.

40 (BHI–00635) **Environmental Analytical Laboratory quality assurance plan.** Stacey, C. Bechtel Hanford, Inc., Richland, WA (United States). Dec 1995. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96013568. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Analytical Laboratory (EAL) management's policy provides analytical data that meets the requirements of each client. The EAL management provides precise, accurate, and complete documentation that ensures concise understanding of the client's objectives. Management will ensure that facilities, staff, instruments, and documentation are used and maintained to maximize laboratory use and data integrity. This document outlines the organization and Quality Assurance (QA) function, describes and depicts lines of authority, and lists the duties within the organization. It also provides guidance for preparing standard operating procedures that outline the detailed methods of operations and analyses.

41 (BHI–00645-Rev.1) **BHI Purchase Card System user's guide.** Mehden, P. von der. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012138. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the purchase card system (P-Card System) is to apply enhanced acquisition tools for increased return on ERC internal resources, and to reduce the cost of off-the-shelf commercial items through the use of credit cards by authorized personnel. The P-Card may be used to make transactions either over the counter, by mail, or via telephone. For Project employees, the P-Card provides and easier, direct method of acquisition that requires less process time than requisitioning. The P-C eliminates the involvement of the procurement organization in low value-added acquisitions and low-risk transactions. Controller reduces the expenditure of resources in the support of low dollar value products and services acquisition. The P- Card System has been initiated in agreement with American Express Travel Related Services, Inc.; the credit card is and American Express Corporate Purchasing Card. The integrated network application for cardholder reconciliation and reallocation of costs was originally government furnished software developed by the U.S. DOE. Currently, the software application (version 3.0 and beyond) is copyrighted by a Bechtel Hanford, Inc. subcontractor.

42 (BHI–00714-Rev.1) **BHI purchase card system manager's guide. Revision 1.** Mehden, P. von der. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009063. Source: OSTI; NTIS; GPO Dep.

The purpose of the Purchase Card System (P-Card System) is to apply enhanced acquisition tools for increased return on ERC internal resources and to reduce the cost of standard off-the-shelf commercial items through the use of credit cards by authorized personnel. The P-Card may be used to make transactions either over the counter, by mail, or via telephone. The benefits of the System will be realized by: project employees–provides an easier, direct method of acquisition that requires less process time than requisitioning; procurement–eliminates the involvement of the Procurement organization in low value added acquisitions and low risk transactions; controller–reduces the expenditure of resources in the support of low dollar value products and services acquisition. This describes the P-Card system for procurements.

43 (BHI–00792) **Remedial action and waste disposal project - ERDF Readiness Evaluation Plan.** Casbon, M.A. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012129. Source: OSTI; NTIS; INIS; GPO Dep.

This Readiness Evaluation Plan presents the methodology used to assess the readiness of the Environmental Restoration and Disposal Facility. The scope of this plan includes and assessment of the facilities, organizations, procedures, and regulatory approvals necessary for the safe startup of the waste transportation to and disposal in the Environmental Restoration and Disposal Facility.

44 (BHI–00814-01) **Environmental restoration contract radiological controls performance indicator report for 1st Quarter '96.** Shea, K.R. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012132. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents Environmental Restoration Disposal Team performances as measured by selected performance indicators. This report addresses the first quarter of fiscal year 1996, and includes for comparison data from the second, third, and fourth quarters of fiscal year 1995.

45 (BHI–00816) **1996 N-reactor fuel storage basin administrative control level extension justification.** Nellesen, A.L.; Shockley, V.E. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96013573. Source: OSTI; NTIS; INIS; GPO Dep.

As provided for in Hanford Site Radiological Control Manual, Article 211 and BIR-SH-02, Vol. 1, Procedure 1.17, this document provides justification for extending the Administrative Control Level (ACL) of 500 mrem per year Total Effective Dose Equivalent (TEDE) to 1,500 mrem per year TEDE for workers involved with N-Reactor Basin Deactivation.

46 (BNL–63201) **Qualitative risk evaluation of environmental restoration programs at Brookhaven National Laboratory.** Morris, S.C. Brookhaven National Lab., Upton, NY (United States). May 1996. 114p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE96012423. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the evaluation of risks associated with environmental restoration activities at Brookhaven National Laboratory using two tools supplied by DOE to provide a consistent set of risk estimates across the DOE complex: Risk Data Sheets (RDS) and Relative Risk Ranking. The tools are described, the process taken characterized, results provided and discussed. The two approaches are compared and recommendations provided for continuing improvement of the process.

47 (CONF-940815–119) **Development of an expert system for transportation of hazardous and radioactive materials.** Ferrada, J.J.; Michelhaugh, R.D.; Rawl, R.R. Oak Ridge National Lab., TN (United States). 20 May 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From SPECTRUM '94: international nuclear and hazardous waste management conference; Atlanta, GA (United States); 14-18 Aug 1994. Order Number DE96010033. Source: OSTI; NTIS; INIS; GPO Dep.

Under the sponsorship of the US Department of Energy's (DOE's) Transportation Management Division (EM-261), the Transportation Technologies Group at Oak Ridge National Laboratory (ORNL) has designed and developed an expert system prototype application of the hazardous materials transportation regulations. The objective of this task was to provide a proof-of-concept for developing a computerized expert system that will ensure straightforward, consistent, and error-free application of the hazardous materials transportation regulations. The expert system prototype entailed the analysis of what an expert in hazardous materials shipping information could/should do. From the analysis of the different features required for the expert system prototype, it was concluded that the developmental efforts should be directed to a Windows™ 3.1 hypermedia environment. Hypermedia technology usually works as an interactive software system that gives personal computer users the ability to organize, manage, and present information in a number of formats–text, graphics, sound, and full-motion video.

48 (CONF-9409325–) **Climate change in the four corners and adjacent regions: Implications for environmental restoration and land-use planning.** Waugh, W.J. (ed.). Rust Geotech, Inc., Grand Junction, CO (United States). Sep 1995. 199p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL96907. From Workshop on climate change in the four corners and adjacent regions: implications for environmental restoration and land-use planning; Grand Junction, CO (United States); 12-14 Sep 1994. Order Number DE96003275. Source: OSTI; NTIS; GPO Dep.

This document contains the workshop proceedings on Climate Change in the Four Corners and Adjacent Regions: Implications for Environmental Restoration and Land-Use Planning which took place September 12-14, 1994 in Grand Junction, Colorado. The workshop addressed three ways we can use paleoenvironmental data to gain a better understanding of climate change and its effects. (1) To serve as a retrospective baseline for interpreting past and projecting future climate-induced environmental change, (2) To differentiate the influences of climate and humans on past environmental change, and (3) To improve ecosystem management and restoration practices in the future. The papers presented at this workshop contained information on the following subjects: Paleoclimatic data from the Pleistocene and Holocene epochs, climate change and past cultures, and ecological resources and environmental restoration. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

49 (CONF-9409423–1) **An implementation of SAS® in an environmental information system.** James,

T. (Univ. of Tennessee, Knoxville, TN (United States)); Zygmunt, B.C. Oak Ridge National Lab., TN (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Southeastern SAS User Group conference; Charleston, SC (United States); 18-20 Sep 1994. Order Number DE96009586. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a software environmental database information system that uses SAS to process data and ORACLE® as the relational database management system (RDBMS). The hardware includes a network of UNIX-based servers and workstations. The relational database consists of large tables containing envionmental measurement data, as well as other smaller tables with reference, metadata and internal administrative information. The data come in a variety of formats and must be converted to conform to the system's standards. SAS/ACCESS® and PROC SQL are used extensively in the data processing.

50 (CONF-9504179–8) **The tracking of high level waste shipments-TRANSCOM system.** Johnson, P.E.; Joy, D.S.; Pope, R.B. Oak Ridge National Lab., TN (United States). 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. annual international conference on high level radioactive waste management; Las Vegas, NV (United States); 30 Apr - 5 May 1995. Order Number DE96009996. Source: OSTI; NTIS; INIS; GPO Dep.

The TRANSCOM (transportation tracking and communication) system is the U.S. Department of Energy's (DOE's) real-time system for tracking shipments of spent fuel, high-level wastes, and other high-visibility shipments of radioactive material. The TRANSCOM system has been operational since 1988. The system was used during FY1993 to track almost 100 shipments within the US.DOE complex, and it is accessed weekly by 10 to 20 users.

51 (CONF-9506115–9) **From public participation to stakeholder involvement: The rocky road to more inclusiveness.** Peelle, E. Oak Ridge National Lab., TN (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. National Association of Environmental Professionals annual conference and exposition: environmental challenges - the next twenty years; Washington, DC (United States); 10-13 Jun 1995. Order Number DE95014275. Source: OSTI; NTIS; GPO Dep.

Surviving always at the edge of extinction, public participation in environmental decision making has an uncertain and problematic history. From its emergence from the urban planning and delivery system efforts of the 1960s to many siting and non-siting uses today, it remains a battleground, with few successes and many failures. While some compelling structural, organizational and cultural explanations for this state of affairs exist, the author offers a further one—a too-limited definition and vision of public participation. One then can argue for a more inclusive process such as stakeholder involvement (SI) to enable a more viable approach to decision making. One can argue that the narrow conceptualization offered in the term public participation (PP) is partly responsible for the meager results of decades of efforts by earnest practitioners. Because of the limited, unique, and self-selected publics that respond to the major PP mechanisms such as public hearings, PP has become largely the province of organized activist groups and is largely accepted as such by most parties, including PP professionals. The author reviews the roles of Congress, federal agencies/proponents, local governments, activist groups and PP professionals in creating the current limited PP processes. She discusses trends and prospects for moving to broader based, more inclusive SI approaches. The emerging SI approach presents major methodological and organizational challenges, but offers the promise of outcomes more likely to be legitimated and potentially more lasting.

52 (CONF-9506199–Summ.) **Proceedings of pollution prevention and waste minimization tools workshop.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Pollution prevention and waste minimization tools workshop; Salt Lake City, UT (United States); 20-21 Jun 1995. Order Number DE96002402. Source: OSTI; NTIS; INIS; GPO Dep.

Pollution Prevention (P2) has evolved into one of DOE's sprime strategies to meet environmental, fiscal, and worker safety obligations. P2 program planning, opportunity identification, and implementation tools were developed under the direction of the Waste Minimization Division (EM-334). Forty experts from EM, DP, ER and DOE subcontractors attended this 2-day workshop to formulate the incentives to drive utilization of these tools. Plenary and small working group sessions were held both days. Working Group 1 identified incentives to overcoming barriers in the area of P2 program planning and resource allocation. Working Group 2 identified mechanisms to drive the completion of P2 assessments and generation of opportunities. Working Group 3 compiled and documented a broad range of potential P2 incentives that address fundamental barriers to implementation of cost effective opportunities.

53 (CONF-9507150–2) **On-site laboratory support of Oak Ridge National Laboratory environmental restoration field activities.** Burn, J.L.E. (Bechtel Environmental, Inc., Oak Ridge, Tennessee (United States)). Oak Ridge National Lab., TN (United States). Jul 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 11. annual waste testing and quality assurance symposium; Washington, DC (United States); 23-28 Jul 1995. Order Number DE95016346. Source: OSTI; NTIS; INIS; GPO Dep.

A remedial investigation/feasibility study has been undertaken at Oak Ridge National Laboratory (ORNL). Bechtel National, Inc. and partners CH2M Hill, Ogden Environmental and Energy Services, and PEER Consultants are contracted to Lockheed Martin Energy Systems, performing this work for ORNL's Environmental Restoration (ER) Program. An on-site Close Support Laboratory (CSL) established at the ER Field Operations Facility has evolved into a laboratory where quality analytical screening results can be provided rapidly (e.g., within 24 hours of sampling). CSL capabilities include three basic areas: radiochemistry, chromatography, and wet chemistry. Radiochemical analyses include gamma spectroscopy, tritium and carbon-14 screens using liquid scintillation analysis, and gross alpha and beta counting. Cerenkov counting and crown-ether-based separation are the two rapid methods used for radiostrontium determination in water samples. By extending count times where appropriate, method detection limits can match those achieved by off-site contract laboratories. Volatile organic compounds are detected by means of gas chromatography using either headspace or purge and trap sample introduction (based on EPA 601/602). Ionic content of water samples is determined using ion chromatography and alkalinity measurement. Ion chromatography is used to quantify both anions (based on

EPA 300) and cations. Wet chemistry procedures performed at the CSL include alkalinity, pH (water and soil), soil resistivity, and dissolved/suspended solids. Besides environmental samples, the CSL routinely screens health and safety and waste management samples. The cost savings of the CSL are both direct and indirect.

54 (CONF-950868–34) **A consolidated and standardized relational database for ER data.** Zygmunt, B.C. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From ER '95: environmental remediation conference: committed to results; Denver, CO (United States); 13-18 Aug 1995. Order Number DE96003041. Source: OSTI; NTIS; INIS; GPO Dep.

The three US Department of Energy (DOE) installations on the Oak Ridge Reservation (ORR) (Oak Ridge National Laboratory, Y-12, and K-25) were established during World War II as part of the Manhattan Project that "built the bomb." That research, and work in more recent years, has resulted in the generation of radioactive materials and other toxic wastes. Lockheed Martin Energy Systems manages the three Oak Ridge installations (as well as the Environmental Restoration (ER) programs at the DOE plants in Portsmouth, Ohio, and Paducah, Kentucky). DOE Oak Ridge Operations has been mandated by federal and state agreements to provide a consolidated repository of environmental data and is tasked to support environmental data management activities at all five installations. The Oak Ridge Environmental Information System (OREIS) was initiated to fulfill these requirements. The primary use of OREIS data is to provide access to project results by regulators. A secondary use is to serve as background data for other projects. This paper discusses the benefits of a consolidated and standardized database; reasons for resistance to the consolidation of data; implementing a consolidated database, including attempts at standardization, deciding what to include in the consolidated database, establishing lists of valid values, and addressing quality control (QC) issues; and the evolution of a consolidated database, which includes developing and training a user community, dealing with configuration control issues, and incorporating historical data. OREIS is used to illustrate these topics.

55 (CONF-9508197–1) **Natural physical and biological processes compromise the long-term performance of compacted soil caps.** Smith, E.D. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From NAS workshop on barriers for long term isolation; Denver, CO (United States); 13 Aug 1995. Order Number DE96003027. Source: OSTI; NTIS; INIS; GPO Dep.

Compacted soil barriers are components of essentially all caps placed on closed waste disposal sites. The intended functions of soil barriers in waste facility caps include restricting infiltration of water and release of gases and vapors, either independently or in combination with synthetic membrane barriers, and protecting other manmade or natural barrier components. Review of the performance of installed soil barriers and of natural processes affecting their performance indicates that compacted soil caps may function effectively for relatively short periods (years to decades), but natural physical and biological processes can be expected to cause them to fail in the long term (decades to centuries). This paper addresses natural physical and biological processes that compromise the performance of compacted soil caps and suggests measures that may reduce the adverse consequences of these natural failure mechanisms.

56 (CONF-9510321–1) **Electronic document management meets environmental restoration recordkeeping requirements: A case study.** Burnham, S.L. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 40. international ARMA annual conference; Nashville, TN (United States); 22-25 Oct 1995. Order Number DE96005493. Source: OSTI; NTIS; INIS; GPO Dep.

Efforts at migrating records management at five Department of Energy sites operated under management by Lockheed Martin Energy Systems, Inc. for Environmental Restoration (ER) business activities are described. The corporate environment, project definition, records keeping requirements are described first. Then an evaluation of electronic document management technologies and of internal and commercially available systems are provided. Finally adopted incremental implementation strategy and lessons learned are discussed.

57 (CONF-951203–30) **Computer calculations of wire-rope tiedown designs for radioactive materials packages.** Shappert, L.B. (Oak Ridge National Lab., TN (United States)); Ratledge, J.E.; Moore, R.S.; Dorsey, E.A. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From PATRAM '95: 11. international conference on packaging and transportation of radioactive materials; Las Vegas, NV (United States); 3-8 Dec 1995. Order Number DE96004940. Source: OSTI; NTIS; INIS; GPO Dep.

This Regulatory Compliance Guide (RCG) provides guidance on the use and selection of appropriate wire rope type package tiedowns. It provides an effective way to encourage and to ensure uniform implementation of regulatory requirements applicable to tiedowns. It provides general guidelines for securing packages weighing 5,000 pounds or greater that contain radioactive materials onto legal weight trucks (exclusive of packagings having their own trailer with trunnion type tiedown). This RCG includes a computerized Tiedown Stress Calculation Program (TSCP) which calculates the stresses in the wire-rope tiedowns and specifies appropriate sizes of wire rope and associated hardware parameters (such as turnback length, number of cable clips, etc.).

58 (CONF-951203–31) **Shimpent mobility accountability collection (SMAC).** Best, R.E. (Science Applications, Inc., Oak Ridge, TN (United States)); Hamberger, C.R.; Moerchen, M.F.; Maddigan, R.J.; Lester, P.B.; Shappert, L.B. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From PATRAM '95: 11. international conference on packaging and transportation of radioactive materials; Las Vegas, NV (United States); 3-8 Dec 1995. Order Number DE96004939. Source: OSTI; NTIS; INIS; GPO Dep.

SMAC[4] is the US Department of Energy's (DOE) information system that collects, stores, and analyzes information on all unclassified shipments to and from DOE facilities. SMAC is operated for and under the direction of DOE's Office of Environmental Management (EM) Transportation Management Division (TMD). Currently, SMAC serves DOE Headquarters, Operations offices, Field Offices, and 64 field locations. The system provides data and analysis services to DOE and its contractors, transportation managers, and specialists. It is used to collect data from the sources of transportation activities, screen the data to ensure their quality, train personnel who collect and report the data, analyze data elements, help users conduct their own analyses, and develop and present reports on DOE's transportation activities to DOE and contractor management.

59 (CONF-951203–32) **Offsite Shipment Campaign Readiness Assessment (OSCRA): A tool for offsite shipment campaigns.** Michelhaugh, R.D. (Oak Ridge National Lab., TN (United States)); Pope, R.B.; Bisaria, A. Oak Ridge National Lab., TN (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From PATRAM '95: 11. international conference on packaging and transportation of radioactive materials; Las Vegas, NV (United States); 3-8 Dec 1995. Order Number DE96004938. Source: OSTI; NTIS; INIS; GPO Dep.

The Offsite Shipment Campaign Readiness Assessment (OSCRA) tool is designed to assist program managers in identifying, implementing, and verifying applicable transportation and disposal regulatory requirements for specific shipment campaigns. OSCRA addresses these issues and provides the program manager with a tool to support planning for safe and compliant transportation of waste and other regulated materials. Waste transportation and disposal requirements must be identified and addressed in the planning phase of a waste management project. In the past, in some cases, transportation and disposal requirements have not been included in overall project plans. These planning deficiencies have led to substantial delays and cost impacts. Additionally, some transportation regulatory requirements have not been properly implemented, resulting in substantial fines and public embarrassment for the U.S. Department of Energy (DOE). If a material has been processed and packaged for onsite storage (prior to offsite disposal) in a package that does not meet transportation requirements, it must be repackaged in U.S. Department of Transportation (DOT)-compliant packaging for transport. This repackaging can result in additional cost, time, and personnel radiation exposure. The original OSCRA concept was developed during the Pond Waste Project at the K-25 Site in Oak Ridge, Tennessee. The continued development of OSCRA as a user-friendly tool was funded in 1995 by the DOE Office of Environmental Management, Transportation Management Division (TMD). OSCRA is designed to support waste management managers, site remediation managers, and transportation personnel in defining applicable regulatory transportation and disposal requirements for offsite shipment of hazardous waste and other regulated materials. The need for this tool stems from increasing demands imposed on DOE and the need to demonstrate and document safe and compliant packaging and shipment of wastes from various DOE sites.

60 (CONF-951203–44) **Hazardous Materials Transportation Expert System (HaMTES).** Michelhaugh, R.D.; Pope, R.B.; Ferrada, J.J.; Rawl, R.R. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From PATRAM '95: 11. international conference on packaging and transportation of radioactive materials; Las Vegas, NV (United States); 3-8 Dec 1995. Order Number DE96005662. Source: OSTI; NTIS; INIS; GPO Dep.

The Hazardous Materials Transportation Expert System (HaMTES) was developed to provide straightforward and error-free application of hazardous materials transportation regulations. The interactive system is designed to give users access to knowledge and skills that previously could be obtained only from a highly trained and experienced expert in the hazardous materials shipping regulations. The HaMTES, Version 1.0, was based on the 1995 regulations. HaMTES, Version 2.0, includes the US regulatory changes recently enacted to align the US regulations with 1985 International Atomic Energy Agency (IAEA) Safety Series (SS) 6. Version 2.0 also includes several other enhancements suggested during the beta testing of Version 1.0. As DOE funding allows, it is anticipated that HaMTES will be the core of the hazardous materials module of the Automated Transportation Management System (ATMS), which was developed to provide field offices and site contractors with the automated tools necessary for transacting the increasingly complex transportation management tasks. This paper describes the development of HaMTES, its operating environment and architecture, enhancements to HaMTES, and the use of HaMTES.

61 (CONF-951203–72) **A needs assessment for DOE's packaging and transportation activities - a look into the twenty-first century.** Pope, R. (Oak Ridge National Lab., TN (United States)); Turi, G.; Brancato, R.; Blalock, L.; Merrill, O. Oak Ridge National Lab., TN (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From PATRAM '95: 11. international conference on packaging and transportation of radioactive materials; Las Vegas, NV (United States); 3-8 Dec 1995. Order Number DE96010730. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) has performed a department-wide scoping of its packaging and transportation needs and has arrived at a projection of these needs for well into the twenty-first century. The assessment, known as the Transportation Needs Assessment (TNA) was initiated during August 1994 and completed in December 1994. The TNA will allow DOE to better prepare for changes in its transportation requirements in the future. The TNA focused on projected, quantified shipping needs based on forecasts of inventories of materials which will ultimately require transport by the DOE for storage, treatment and/or disposal. In addition, experts provided input on the growing needs throughout DOE resulting from changes in regulations, in DOE's mission, and in the sociopolitical structure of the United States. Through the assessment, DOE's transportation needs have been identified for a time period extending from the present through the first three decades of the twenty-first century. The needs assessment was accomplished in three phases: (1) defining current packaging, shipping, resource utilization, and methods of managing packaging and transportation activities; (2) establishing the inventory of materials which DOE will need to transport on into the next century and scenarios which project when, from where, and to where these materials will need to be transported; and (3) developing requirements and projected changes for DOE to accomplish the necessary transport safely and economically.

62 (CONF-960265–1) **Integration of biotechnology in remediation and pollution prevention activities.** Strong-Gunderson, J.M. (Oak Ridge National Lab., TN (United States). Environmental Sciences Div.). Oak Ridge National Lab., TN (United States). [1996]. 5p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Environmental quality, innovative technologies and sustainable economic development: a NAFTA perspective; Mexico City (Mexico); 7-10 Feb 1996. Order Number DE96005439. Source: OSTI; NTIS; INIS; GPO Dep.

The North American Free Trade Agreement/North American Agreement on Environmental Cooperation provides a mechanism for an international collaboration between the US, Canada, and Mexico to jointly develop, modify, or refine technologies that remediate or protect the environment. These countries have a vested interest in this type of collaboration because contaminants do not respect the boundaries of a manufacturing site, region, city, state, or country. The Environmental Sciences Division (ESD) at Oak Ridge National Laboratory (ORNL) consists of a diverse group of individuals who address a variety of environmental issues. ESD is involved in basic and applied research on the fate, transport, and remediation of contaminants; environmental assessment; environmental engineering; and demonstrations of advanced remediation technologies. The remediation and protection of the environment includes water, air, and soils for organic, inorganic, and radioactive contaminants. In addition to remediating contaminated sites, research also focuses on life-cycle analyses of industrial processes and the production of green technologies. The author focuses this discussion on subsurface remediation and pollution prevention; however, the research activities encompass water, soil and air and many of the technologies are applicable to all environments. The discussion focuses on the integration of biotechnology with remediation activities and subsequently linking these biological processes to other remediation technologies.

63 (CONF-9603148–1) **The ORNL Basemapping and Imagery Project: Data collection, processing and dissemination.** Tuttle, M.; Pace, P. Oak Ridge National Lab., TN (United States). 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From Geographic Information System (GIS) enviromental management conference; Reno, NV (United States); 13 Mar 1996. Order Number DE96008802. Source: OSTI; NTIS; INIS; GPO Dep.

Over the past three years, the GIS and Computer Modeling (GCM) Group at Oak Ridge National Laboratory (ORNL), has been engaged in creating a very comprehensive geospatial data base for Department of Energy (DOE) installations managed by the DOE Oak Ridge Operations Office (DOE-ORO). This effort encompasses topographic, planimetric, land use/land cover, flood plain, digital elevation, and digital imagery data for the Oak Ridge Reservation (ORR) and surrounding areas. The ORR covers approximately 34,800 acres and includes ORNL, the K-25 Site and the Y-12 Plant. The geographic extent of the Base Mapping and Imagery Project covers the ORR and surrounding area and two other DOE plants (Portsmouth, Ohio and Paducah, Kentucky) for a total of 166,000 acres. The resulting data represent a major improvement in the spatial accuracy and currency of data which are used as a foundation for environmental restoration, facility studies, and other GIS data applications. A GIS data server was also created in order to store and disseminate the new basemapping data. This paper describes the history of the Base Mapping and Imagery Project with emphasis on the logistical aspects of data quality assessment. data tracking, and data product work flow for a large comprehensive spatial data base. The paper then describes the evolution of the GIS data server including its design from an FTP server to a NetScape-based World Wide Web interface. This combination of data and data access provides the ORR environmental community with a carefully configured and managed GIS dataset.

64 (CONF-960477–7) **A new approach to interpretation of airborne magnetic and electromagnetic data.** Traynin, P. (Utah Univ., Salt Lake City, UT (United States). Dept. of Geology and Geophysics); Zhdanov, M.; Nyquist, J.; Beard, L.; Doll, W. Oak Ridge National Lab., TN (United States). [1996]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From 9. annual symposium on the application of geophysics to engineering and environmental problems; Denver, CO (United States); 15 Apr - 1 May 1996. Order Number DE96010641. Source: OSTI; NTIS; INIS; GPO Dep.

The airborne geophysical survey carried out at the Oak Ridge Reservation has shown that AEM can be used in evaluating details of waste areas. However, detection of small objects requires a flight altitude of 10-15 m which is impossible due to natural obstacles present in the Oak Ridge area. In these types of cases, data processing in the downward continuation allows to improve the survey resolution and a normalized gradient provides an additional information about the depth of buried objects.

65 (CONF-960648–1) **Measuring the success of public participation efforts associated with the U.S. Department of energy's environmental management activities.** Schweitzer, M.; Carnes, S.A.; Peelle, E.B.; Wolfe, A.K.; Munro, J.F. Oak Ridge National Lab., TN (United States). 2 Jun 1996. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From 21. annual conference of the National Association of Environmental Professionals: practical environmental directions - a changing agenda; Houston, TX (United States); 2-6 Jun 1996. Order Number DE96009890. Source: OSTI; NTIS; INIS; GPO Dep.

For the last several years, US DOE's Office of Environmental Restoration and Waste Management (EM) has actively pursued a policy of involving local stakeholders in the planning and implementation of environmental management activities at contaminated sites throughout the DOE complex. An ongoing ORNL study is focusing on how to measure the success of the public participation efforts. Five DOE facilities were selected for intensive site visits; 4 or 5 additional sites were covered by telephone interviews. Key stakeholder groups were interviewed. Based on the data collection and preliminary analysis, 17 definitions of success were developed for public participation programs. Objective and subjective indicators of the success of the public participation efforts are discussed.

66 (CONF-960648–3) **Factors favorable to public participation success.** Peelle, E.; Schweitzer, M.; Munro, J.; Carnes, S.; Wolfe, A. Oak Ridge National Lab., TN (United States). [1996]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From 21. annual conference of the National Association of Environmental Professionals: practical environmental directions - a changing agenda; Houston, TX (United States); 2-6 Jun 1996. Order Number DE96009635. Source: OSTI; NTIS; INIS; GPO Dep.

Categories of factors linked to successful public participation (PP) program outcomes include PP process, organizational context, sociopolitical context, strategic considerations and unique (special circumstances) factors. We re-order the long list factors according to how essential, important, and unique they are and discuss their significance and interrelationships. It is argued that bureacratic structure and operational modes are basically in conflict with features of successful PP programs (openness, two-way education, communication with nonexpert outsiders). If this is so, then it is not surprising that the factors essential for PP success in bureacracies involve extraordinary management efforts by agencies to bypass, compensate for, or overcome structural constraints. We conclude by speculating about the long-term viability of PP practices in the agency setting as well as the consequences for agencies that attempt the problematic task of introducing PP into their complex, mission-oriented organizations.

67 (CONF-960706-9) **Operations of the LR56 radioactive liquid cask transport system at U.S. Department of Energy sites.** Davidson, J.S. (Lockheed Martin Energy Systems, Oak Ridge, TN (United States)); Hornstra, D.J.; Sazawal, V.K.; Clement, G. Lockheed Martin Energy Systems, Inc., Oak Ridge, TN (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From American Society of Mechanical Engineers (ASME) pressure vessels and piping conference; Montreal (Canada); 21-26 Jul 1996. Order Number DE96009102. Source: OSTI; NTIS; INIS; GPO Dep.

The LR56 cask system is licensed for use in France under Certificate of Compliance F/309/B(U)F for transport of 4,000-liter volumes of radioactive liquids. Three LR56 cask systems (with modifications for use at Department of Energy (DOE) sites) have been purchased for delivery at the Hanford Site, Oak Ridge National Laboratory (ORNL), and Savannah River Site (SRS). The LR56 cask systems will be used for on-site transfers of Type B quantities of radioactive liquid waste. The ORNL unit will also be used as a Type A packaging for transfers of radioactive liquids between DOE sites. This paper discusses LR56 operating features and the use of the cask system at the three DOE sites.

68 (CONF-9607107-2) **Streamlined environmental remediation characterization using remote sensing techniques: Case studies for the US Department of Energy, Oak Ridge Operations.** Carden, D.M. (Department of Energy (DOE), TN (United States). Oak Ridge Operations); Smyre, J.L.; Evers, T.K.; King, A.L. Oak Ridge National Lab., TN (United States). 1996. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From 18. international Society for Photogrammetry and Remote Sensing's congress; Vienna (Austria); 9-19 Jul 1996. Order Number DE96012146. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides an overview of the DOE Oak Ridge Operations Remote Sensing Program and discusses how data from this program have assisted the environmental restoration program in streamlining site-characterization activities. Three case studies are described where remote sensing imagery has provided a more focused understanding of site problems with a resultant reduction in the need for costly and time-consuming, ground-based sampling approaches.

69 (CONF-960804-11) **Recent experience in planning, packaging and preparing non-commercial spent fuel for shipment within the United States.** Johnson, P.E. (Oak Ridge National Lab., TN (United States)); Shappert, L.B.; Turner, D.W. Oak Ridge National Lab., TN (United States). [1996]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From SPECTRUM '96: international conference on nuclear and hazardous waste management; Seattle, WA (United States); 18-23 Aug 1996. Order Number DE96009395. Source: OSTI; NTIS; INIS; GPO Dep.

US DOE orders dictate that the aluminium clad fuels now stored at ORNL will be shipped to the Savannah River Site. A number of activities had to be carried out in order to ready the fuel for shipping, including choosing a cask capable of transporting the fuel, repackaging the fuel, developing a transportation plan, identifying the appropriate routes, and carrying out a readiness self assessment. These tasks have been successfully completed and are discussed herein.

70 (CONF-960804-12) **Potential benefits and impacts on the CRWMS transportation system of filling spent fuel shipping casks with depleted uranium silicate glass.** Pope, R.B.; Forsberg, C.W.; DeHart, M.D.; Childs, K.W.; Tang, J.S. Oak Ridge National Lab., TN (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From SPECTRUM '96: international conference on nuclear and hazardous waste management; Seattle, WA (United States); 18-23 Aug 1996. Order Number DE96009394. Source: OSTI; NTIS; INIS; GPO Dep.

A new technology, the Depleted Uranium Silicate COntainer Fill System (DUSCOFS), is proposed to improve the performance and reduce the uncertainties of geological disposal of spent nuclear fuel (SNF), thus reducing both radionuclide release rates from the waste package and the potential for repository nuclear criticality events. DUSCOFS may also provide benefits for SNF storage and transport if it is loaded into the container early in the waste management cycle. Assessments have been made of the benefits to be derived by placing depleted uranium silicate (DUS) glass into SNF containers for enhancing repository performance assessment and controlling criticality over geologic times in the repository. Also, the performance, benefits, and impacts which can be derived if the SNF is loaded into a multipurpose canister with DUS glass at a reactor site have been assessed. The DUSCOFS concept and the benefits to the waste management cycle of implementing DUSCOFS early in the cycle are discussed in this paper.

71 (DOE/EIS-0218D-Summ.) **Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel. Summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 62p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012336. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy and United States Department of State are jointly proposing to adopt a policy to manage spent nuclear fuel from foreign research reactors. Only spent nuclear fuel containing uranium enriched in the United States would be covered by the proposed policy. The purpose of the proposed policy is to promote U.S. nuclear weapons nonproliferation policy objectives, specifically by seeking to reduce highly-enriched uranium from civilian commerce. This is a summary of the Draft Environmental Impact Statement. Environmental effects and policy considerations of three Management Alternative approaches for implementation of the proposed policy are assessed. The three Management Alternatives analyzed are: (1) acceptance and management of the spent nuclear fuel by the Department of Energy in the United States, (2) management of the spent nuclear fuel at one or more foreign facilities (under conditions that satisfy United States nuclear weapons nonproliferation policy objectives), and (3) a combination of components of Management Alternatives 1 and 2 (Hybrid Alternative). A No Action Alternative is also analyzed. For each Management Alternative, there are a number of alternatives for its implementation. For Management Alternative 1, this document addresses the environmental effects of various implementation alternatives such as varied policy durations, management of various quantities of spent nuclear fuel, and differing financing arrangements. Environmental impacts at various potential ports of entry, along truck and rail transportation routes, at candidate management sites, and for alternate storage technologies are also examined. For Management Alternative 2, this document addresses two subalternatives: (1) assisting foreign nations with storage; and (2) assisting foreign nations with reprocessing of the spent nuclear fuel.

72 (DOE/EIS–0218D-Vol.1) **Draft Environmental Impact Statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel. Volume 1.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 444p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012337. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy and United States Department of State are jointly proposing to adopt a policy to manage spent nuclear fuel from foreign research reactors. Only spent nuclear fuel containing uranium enriched in the United States would be covered by the proposed policy. The purpose of the proposed policy is to promote U.S. nuclear weapons nonproliferation policy objectives, specifically by seeking to reduce highly-enriched uranium from civilian commerce. Environmental effects and policy considerations of three Management Alternative approaches for implementation of the proposed policy are assessed. The three Management Alternatives analyzed are: (1) acceptance and management of the spent nuclear fuel by the Department of Energy in the United States, (2) management of the spent nuclear fuel at one or more foreign facilities (under conditions that satisfy United States nuclear weapons nonproliferation policy objectives), and (3) a combination of components of Management Alternatives 1 and 2 (Hybrid Alternative). A No Action Alternative is also analyzed. For each Management Alternative, there are a number of alternatives for its implementation. For Management Alternative 1, this document addresses the environmental effects of various implementation alternatives such as varied policy durations, management of various quantities of spent nuclear fuel, and differing financing arrangements. Environmental impacts at various potential ports of entry, along truck and rail transportation routes, at candidate management sites, and for alternate storage technologies are also examined. For Management Alternative 2, this document addresses two subalternatives: (1) assisting foreign nations with storage; and (2) assisting foreign nations with reprocessing of the spent nuclear fuel. Management Alternative 3 analyzes a hybrid alternative. This document is Vol. 1 of 2 plus summary volume.

73 (DOE/EIS–0218D-Vol.2-App.A) **Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix A, environmental justice analysis. Volume 2.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 50p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012338. Source: OSTI; NTIS; INIS; GPO Dep.

This is Appendix A to a draft Environmental Impact Statement on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. This appendix addresses environmental justice for the acceptance of foreign research reactor spent nuclear fuel containing uranium enriched in the United States. Analyses of environmental justice concerns are provided in three areas: (1) potential ports of entry, (2) potential transportation routes from candidate ports of entry to interim management sites, and (3) areas surrounding potential interim management sites. These analyses lead to the conclusion that the alternatives analyzed in this Environmental Impact Statement (EIS) would result in no disproportionate adverse effects on minority populations or low-income communities surrounding the candidate ports, transport routes, or interim management sites.

74 (DOE/EIS–0218D-Vol.2-App.B) **Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix B, foreign research reactor spent nuclear fuel characteristics and transportation casks. Volume 2.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 61p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012339. Source: OSTI; NTIS; INIS; GPO Dep.

This is Appendix B of a draft Environmental Impact Statement (EIS) on a Proposed Nuclear Weapons Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. It discusses relevant characterization and other information of foreign research reactor spent nuclear fuel that could be managed under the proposed action. It also discusses regulations for the transport of radioactive materials and the design of spent fuel casks.

75 (DOE/EIS–0218D-Vol.2-App.C) **Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix C, marine transport and associated environmental impacts. Volume 2.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 43p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012340. Source: OSTI; NTIS; INIS; GPO Dep.

This is Appendix C to a Draft Environmental Statement on a Proposed Nuclear Weapon Nonproliferation Policy Concerning Foreign Research Reactor Spent Nuclear Fuel. Shipment of any material via ocean transport entails risks to both the ship's crew and the environment. The risks result directly from transportation-related accidents and, in the case of radioactive or other hazardous materials, also include exposure to the effects of the material itself. This appendix provides a description of the approach used to assess the risks associated with the transport of foreign research reactor spent nuclear fuel from a foreign port to a U.S. port(s) of entry. This appendix also includes a discussion of the shipping configuration of the foreign research reactor spent nuclear fuel, the possible types of vessels that could be used to make the shipments, the risk assessment methodology (addressing both incident-free and accident risks), and the results of the analyses. Analysis of activities in the port(s) is described in Appendix D. The incident-free and accident risk assessment results are presented in terms of the per shipment risk and total risks associated with the basic implementation of Management Alternative 1and other implementation alternatives. In addition, annual risks from incident-free transport are developed.

76 (DOE/EIS–0218D-Vol.2-App.D) **Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix D, selection and evaluation of potential ports of entry. Volume 2.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 303p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012341. Source: OSTI; NTIS; INIS; GPO Dep.

This is an appendix to a draft Environmental Impact Statement (EIS) on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel. This appendix describes the process used by the Department of Energy in selecting the potential ports of entry analyzed in this EIS. In addition the appendix provides the basic information required to evaluate ports and port activities, and the potential environmental impacts (incident-free and accidents) associated with the receipt and handling of foreign research reactor spent nuclear fuel from vessels to intermodal transport in ports.

77 (DOE/EIS–0218D-Vol.2-App.E) **Draft environmental impact statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Volume 2, Appendix E, Evaluation of human health effects of overland transportation.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 228p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012342. Source: OSTI; NTIS; INIS; GPO Dep.

This Appendix provides an overview of the approach used to assess the human health risks that may result from the overland transportation of foreign research reactor spent nuclear fuel. The Appendix includes discussion of the scope of the assessment, analytical methods used for the risk assessment (i.e., computer models), important assessment assumptions, determination of potential transportation routes, and presents the results of the assessment. In addition, to aid in the understanding and interpretation of the results, specific arm of uncertainty are described, with an emphasis an how the uncertainties may affect comparisons of the alternatives. he approach used in this Appendix is modeled after that used in the Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Draft Environmental Impact Statement (SNF&INEL Draft EIS) (DOE, 1994b). The SNF&INEL Draft EIS did not perform as detailed an analysis on the specific actions taken for foreign research reactor spent nuclear fuel because of the breadth necessary to analyze the entire spent fuel management program. However, the fundamental assumptions used in this analysis are consistent with those used in the SNF & INEL Draft EIS (DOE, 1994b), and the same computer codes and generic release and accident data are used. The risk assessment results are presented in this Appendix in terms of "Per-shipment" risk factors, as well as for the total risks associated with each alternative. Per-shipment risk factors provide an estimate of the risk from a single spent nuclear fuel shipment between a specific origin and destination. They are calculated for all possible origin and destination pairs for each spent nuclear fuel type. The total risks for a given alternative are found by multiplying the expected number of shipments by the appropriate per-shipment risk factors. This approach provides maximum flexibility for determining the risks for a large number of potential alternatives.

78 (DOE/EIS–0218D-Vol.2-App.F) **Draft environmental impact statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Volume 2, Appendix F, Description and impacts of storage technology alternatives.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 326p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012343. Source: OSTI; NTIS; INIS; GPO Dep.

This appendix presents a description and evaluation of currently available spent nuclear fuel storage technologies, and their applicability to foreign research reactor spent nuclear fuel. These technologies represent the range of alternatives dW would be available to implement the proposed action. Some of these technologies are currently in use at US Department of Energy (DOE) facilities. Several dry storage cask and/or building designs have been licensed by the US Nuclear Regulatory Commission (NRC) and are operational with commercial nuclear power plant spent fuel at several locations. This appendix also discusses potential storage sites and impacts of foreign research reactor spent nuclear fuel storage at these locations.

79 (DOE/EIS–0218D-Vol.2-App.G) **Draft environmental impact statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Volume 2, Appendix G, Background documents.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 21p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012344. Source: OSTI; NTIS; INIS; GPO Dep.

This appendix contains background documents, including a fact sheet, memoranda, and a policy proposal.

80 (DOE/EM–0235) **Technology catalogue. Second edition.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. Apr 1995. 315p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011541. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy's (DOE's) Office of Environmental Management (EM) is responsible for remediating DOE contaminated sites and managing the DOE waste inventory in a safe and efficient manner. EM's Office of Technology Development (OTD) supports applied research and demonstration efforts to develop and transfer innovative, cost-effective technologies to its site clean-up and waste-management programs within EM. The purpose of the Technology Catalogue is to: (a) provide performance data on OTD-developed technologies to scientists and engineers responsible for preparing Remedial Investigation/Feasibility Studies (RI/FSs) and other compliance documents for the DOE's clean-up and waste-management programs; and (b) identify partnering and commercialization opportunities with industry, other federal and state agencies, and the academic community.

81 (DOE/EM–0239) **Cost quality management assessment for the Savannah River Site. Final report.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Engineering

and Cost Management. Jun 1995. 130p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014141. Source: OSTI; NTIS; INIS; GPO Dep.

The Office of Engineering and Cost Management (EM-24) conducted the Round I Cost Quality Management Assessment at the Savannah River Operations Office on February 3–14, 1992. Since the Round I CQMA, the mission of DOE-SR changed from production of nuclear materials (T_2, Pu) to environmental restoration. Transition of DOE-SR from defense programs to environmental management started in January 1995. The Round II CQMA at the Savannah River Site, conducted April 23–May 5, 1995, reviewed DOE-SR's cost and cost-related management practices against performance objectives and criteria. SRS has made progress in cost-management practices since Round I and is adopting a more cost-conscious culture.

82 (DOE/EM–0240) **Cost Quality Management Assessment for the Idaho Operations Office. Final report.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Engineering and Cost Management. Jun 1995. 151p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014140. Source: OSTI; NTIS; INIS; GPO Dep.

The Office of Engineering and Cost Management (EM-24) conducted a Cost Quality Management Assessment of EM-30 and EM-40 activities at the Idaho National Engineering Laboratory on Feb. 3–19, 1992 (Round I). The CQMA team assessed the cost and cost-related management activities at INEL. The Round II CQMA, conducted at INEL Sept. 19–29, 1994, reviewed EM-30, EM-40, EM-50, and EM-60 cost and cost-related management practices against performance objectives and criteria. Round II did not address indirect cost analysis. INEL has made measurable progress since Round I.

83 (DOE/EM–0245) **Cost quality management assessment for the Rocky Flats Field Office. Final report.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of the Deputy Assistant Secretary for Compliance and Program Coordination. Jul 1995. 132p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014895. Source: OSTI; NTIS; GPO Dep.

Office of Engineering and Cost Management conducted Round I Cost Quality Management Assessment (CQMA) of the Rocky Flats Field Office (RFFO) on March 16-26, 1992. Since then, the mission of RFFO has changed from production of nuclear weapons to environmental restoration, and at the time of Round II, RFFO was transitioning from a Management & Operating Contractor to a Performance Based Integrating Contractor. This will necessitate a re-evaluation of the way RFFO conducts business. The Round II CQMA, conducted March 6-17, 1995, reviewed RFFO's cost and management practices against performance objectives and criteria (POCs). RFFO has made progress since Round I. Of the 48 relevant POCs assessed in Round I, 4 were met, 33 were partially met, and 11 were not met; in Round II, RFFO meets 42 and partially meets 6. RFFO has a cost/productivity improvement program that has saved $100M in FYs 1993 and 1994. Planned savings are expected from accelerated cleanup projects, re-engineering the waste management process, and sealing materials within pipe segments. RFFO's relationship with regulators and other stakeholders has been improved. Cost- and schedule-estimating procedures have also been improved. Regulations, DOE orders, and other directives are being implemented in an overly conservative manner at Rocky Flats Environmental Technology Site.

84 (DOE/EM–0256) **Fiscal Year 1994 progress in implementing Section 120 of the Comprehensive Environmental Rresponse, Compensation, and Liability Act. Eighth annual report to Congress.** USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1995. 120p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95017758. Source: OSTI; NTIS; INIS; GPO Dep.

Congress passed the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) (Public Law 96-510), commonly known as Superfund, in 1980. The Superfund Amendments and Reauthorization Act (SARA) (Public Law 99-499), which amended CERCLA in 1986, added Section 120 regarding the cleanup of contaminated sites at Federal facilities. Under Section 120(e)(5) of CERCLA, each department, agency, or instrumentality of the Federal government responsible for compliance with Section 120 must submit an annual report to Congress concerning its progress in implementing the requirements of Section 120. The report must include information on the progress in reaching Interagency Agreements (IAGs), conducting Remedial Investigation and Feasibility Studies (RI/FSs), and performing remedial actions. Federal agencies that own or operate facilities on the National Priorities List (NPL) are required to begin an RI/FS for these facilities within 6 months after being placed on the NPL. Remediation of these facilities is addressed in an IAG between the Federal agency, the U.S. Environmental Protection Agency (EPA), and in some instances the state within which the facility is located. This report, prepared by the U.S. Department of Energy's (DOE's) Office of Environmental Management, is being submitted to Congress in accordance with Section 120(e)(5) of CERCLA. It is DOE's Eighth Annual Report to Congress and provides information on DOE's progress in implementing CERCLA Section 120 in Fiscal Year 1994 (FY 94), i.e., from October 1, 1993, to September 30, 1994. In this report the words "site" and "facility" are used interchangeably.

85 (DOE/EM–0257) **Environmental Restoration Strategic Plan. Remediating the nuclear weapons complex.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Aug 1995. 19p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016164. Source: OSTI; NTIS; INIS; GPO Dep.

With the end of the cold war, the US has a reduced need for nuclear weapons production. In response, the Department of Energy has redirected resources from weapons production to weapons dismantlement and environmental remediation. To this end, in November 1989, the US Department of Energy (DOE) established the Office of Environmental Restoration and Waste Management (renamed the Office of Environmental Management in 1994). It was created to bring under a central authority the management of radioactive and hazardous wastes at DOE sites and inactive or shut down facilities. The Environmental Restoration Program, a major component of DOE's Environmental Management Program, is responsible for the remediation and management of contaminated environmental media (e.g., soil, groundwater, sediments) and the decommissioning of facilities and structures at 130 sites in over 30 states and territories.

86 (DOE/EM–0258) **The transportation external coordination working group.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). 1995. 2p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96000262. Source: OSTI; NTIS; GPO Dep.

In an effort to improve coordinated interactions between the United States Department of Energy (DOE) and external groups interested in transportation activities, DOE established the Transportation External Coordination Working Group (TEC/WG). Membership includes representatives from State, Tribal and local governments, industry, and professional organizations. All DOE programs with significant transportation programs participate.

87 (DOE/EM–0263) **US - Former Soviet Union environmental management activities.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Sep 1995. 33p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96002785. Source: OSTI; NTIS; INIS; GPO Dep.

The Office of Environmental Management (EM) has been delegated the responsibility for US DOE's cleanup of nuclear weapons complex. The nature and the magnitude of the waste management and environmental remediation problem requires the identification of technologies and scientific expertise from domestic and foreign sources. This booklet makes comparisons and describes coordinated projects and workshops between the USA and the former Soviet Union.

88 (DOE/EM–0266) **Closing the circle on the splitting of the atom: The environmental legacy of nuclear weapons production in the United States and what the Department of Energy is doing about it.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Jan 1996. 106p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96009985. Source: OSTI; NTIS; INIS; GPO Dep.

In the grand scheme of things we are a little more than halfway through the cycle of splitting the atom for weapons purposes. If we visualize this historic cycle as the full sweep of a clockface, at zero hour we would find the first nuclear chain reaction by Enrico Fermi, followed immediately by the Manhattan Project and the explosion of the first atomic bombs. From two o'clock until five, the United States built and ran a massive industrial complex that produced tens of thousands of nuclear weapons. At half past, the Cold War ended, and the United States shut down most of its nuclear weapons factories. The second half of this cycle involves dealing with the waste and contamination from nuclear weapons production - a task that had, for the most part, been postponed into the indefinite future. That future is now upon us. Dealing with the environmental legacy of the Cold War is in many ways as big a challenge for us today as the building of the atomic bomb was for the Manhattan Project pioneers in the 1940s. Our challenges are political and social as well as technical, and we are meeting those challenges. We are reducing risks, treating wastes, developing new technologies, and building democratic institutions for a constructive debate on our future course.

89 (DOE/EM–0274) **Cost management improvement in the Office of Environmental Management 1991-1995. Progress report.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Engineering and Cost Management. Dec 1995. 39p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96003786. Source: OSTI; NTIS; GPO Dep.

The Department of Energy's (DOE's) Office of Environmental Management (EM) has been proactive in meeting the cost management challenges of environmental management activities. EM recognized the need for defining and establishing good cost management practices and has, during the first half of the 1990s, initiated more than a dozen major cost-management-related activities that have resulted in: Measureable improvement in cost-and cost-related management practices; Improved communication between field and Headquarters and among field sites; Development of cost management tools; Hiring of cost professionals; Involving regulators and stakeholders early in the planning process. The purposes of this progress report are to summarize EM's cost management initiatives, report on the results of its proactive approach to cleaning up the environment at reasonable cost, and identify future cost management needs.

90 (DOE-EM-STD–5505-96) **DOE limited standard: Operations assessments.** USDOE, Washington, DC (United States). May 1996. 195p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96009462. Source: OSTI; NTIS; GPO Dep.

Purpose of this standard is to provide DOE Field Element assessors with a guide for conducting operations assessments, and provide DOE Field Element managers with the criteria of the EM Operations Assessment Program. Sections 6.1 to 6.21 provide examples of how to assess specific areas; the general techniques of operations assessments (Section 5) may be applied to other areas of health and safety (e.g. fire protection, criticality safety, quality assurance, occupational safety, etc.).

91 (DOE/EW/50625–T22) **Environmental Hazards Assessment Program quarterly report, January–March 1995.** Medical Univ. of South Carolina, Charleston, SC (United States). 30 Apr 1995. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE95012199. Source: OSTI; NTIS; INIS; GPO Dep.

The objectives of the Environmental Hazards Assessment Program (EHAP) stated in the proposal to DOE are to: develop a holistic, national basis for risk assessment, risk management, and risk communication that recognizes the direct impact of environmental hazards on the health and well-being of all; develop a pool of talented scientists and experts in cleanup activities, especially in human health aspects; and identify needs and develop programs addressing the critical shortage of well-educated, highly-skilled technical and scientific personnel to address the health oriented aspects of environmental restoration and waste management. This report describes activities and reports on progress for the third quarter (January–March) of the third year of the grant. It reports progress against these grant objectives and the Program Implementation Plan published at the end of the first year of the grant. Questions, comments, or requests for further information concerning the activities under this grant can be forwarded to Jack Davis in the EHAP office of the Medical University of South Carolina at (803) 727-6450.

92 (DOE/EW/50625–T23) **Environmental hazards assessment program. Annual report, July 1, 1994–June 30, 1995.** Medical Univ. of South Carolina, Charleston, SC (United States). 31 Jul 1995. 106p. Sponsored by USDOE,

Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE95016210. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes activities and reports on progress for the third year of the DOE grant to support the Environmental Hazards Assessment Program (EHAP). It reports progress against grant objectives and the Program Implementation Plan published at the end of the first year of the grant. As the program has evolved, more projects have been funded and many existing projects have become more complex. Thus, to accomplish better the objectives over the years and retain a solid focus on the total mission, we have reorganized the grant effort from three to five majoe elements: Public and professional outreach; Clinical programs; Science programs; Information systems; and, Program management.

93 (DOE/EW/50625–T24) **Environmental Hazards Assessment Program. Quarterly report, April–June 1995.** Medical Univ. of South Carolina, Charleston, SC (United States). 31 Jul 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE95016211. Source: OSTI; NTIS; GPO Dep.

The objectives of this report are to: (1) develop a holistic, national basis for risk assessment, risk management, and risk communication that recognizes the direct impact of environmental hazards, both chemical and radiation, on the health and well-being of all; (2) develop a pool of talented scientists and experts in cleanup activities, especially in human health aspects; and (3) identify needs and develop programs addressing the critical shortage of well-educated, highly-skilled technical and scientific personnel to address the health oriented aspects of environmental restoration and waste management. This report describes the progress made this quarter in the following areas: public and professional outreach; science programs; clinical programs; and information support and access systems.

94 (DOE/EW/50625–T25) **Summer Undergraduate Research Program: Environmental studies.** McMillan, J. (ed.). Medical Univ. of South Carolina, Charleston, SC (United States). 1994. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE95016555. Source: OSTI; NTIS; GPO Dep.

The purpose of the summer undergraduate internship program for research in environmental studies is to provide an opportunity for well-qualified students to undertake an original research project as an apprentice to an active research scientist in basic environmental research. The students are offered research topics at the Medical University in the scientific areas of pharmacology and toxicology, epidemiology and risk assessment, environmental microbiology, and marine sciences. Students are also afforded the opportunity to work with faculty at the University of Charleston, SC, on projects with an environmental theme. Ten well-qualified students from colleges and universities throughout the eastern United States were accepted into the program.

95 (DOE/EW/50625–T27) **Environmental Hazards Assessment Program. Quarterly report, July–September 1995.** Medical Univ. of South Carolina, Charleston, SC (United States). 31 Oct 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE96001996. Source: OSTI; NTIS; GPO Dep.

This report describes activities and reports on progress for the first quarter (July–September) of the fourth year of the grant to support the Environmental Hazards Assessment Program (EHAP) at the Medical University of South Carolina. It reports progress against the grant objectives and the Program Implementation Plan published at the end of the first year of the grant. The objectives of EHAP stated in the proposal to DOE are to: (1) develop a holistic, national basis for risk assessment, risk management, and risk communication that recognizes the direct impact of environmental hazards on the health and well-being of all; (2) develop a pool of talented scientists and experts in cleanup activities, especially in human health aspects; and (3) identify needs and develop programs addressing the critical shortage of well-educated, highly-skilled technical and scientific personnel to address the health-oriented aspects of environmental restoration and waste management.

96 (DOE/EW/50625–T29) **Environmental hazards assessment program. Quarterly report, October–December 1995.** Medical Univ. of South Carolina, Charleston, SC (United States). 31 Jan 1996. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE96006068. Source: OSTI; NTIS; GPO Dep.

This document is a quarterly report on the Environmental Hazards Assessment Program (EHAP). The highlights discussed include the following: work on immunogenic epidemiology of scleroderma; symposium on the environmental Risk Assessment: does it work for the community based family physician?; project report on low-dose rate radiation health effects; meeting to review case study presentations for an international Risk Assessment/Risk Mangement Forum; and an updated core curriculum computer program models for occupational and environmental medicine.

97 (DOE/EW/50625–T30) **Environmental Hazards Assessment Program quarterly report: January–March 1996.** Medical Univ. of South Carolina, Charleston, SC (United States). 30 Apr 1996. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE96010198. Source: OSTI; NTIS; GPO Dep.

The objectives of the Environmental Hazards Assessment Program are to: (1) develop a holistic, national basis for risk assessment, risk management, and risk communication that recognizes the direct impact of environmental hazards on the health and well-being of all; (2) develop a pool of talented scientists and experts in cleanup activities, especially in human health aspects; and (3) identify needs and develop programs addressing the critical shortage of well-educated, highly-skilled technical and scientific personnel to address the health-oriented aspects of environmental restoration and waste management. This report describes activities and reports on progress for the third quarter (January–March) of the fourth year of the grant.

98 (DOE/EW/50625–T31) **Environmental Hazards Assessment Program: Quarterly report, April–June, 1996.** Medical Univ. of South Carolina, Charleston, SC (United States). 31 Jul 1996. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE96013626. Source: OSTI; NTIS; GPO Dep.

The objectives of the Environmental Hazards Assessment Program (EHAP) are to: (1) develop a holistic, national basis for risk assessment, risk management, and risk communication that recognizes the direct impact of environmental hazards on the health and well-being of all; (2) develop a pool of talented scientists and experts in cleanup activities, especially in human health aspects; and (3) identify needs and develop programs addressing the critical shortage of well-educated, highly-skilled technical and scientific personnel to address the health-oriented aspects of environmental restoration and waste management. This report describes activities and reports for the fourth quarter (April–June) of the fourth year of the grant. It reports progress against these grant objectives and the Program Implementation Plan.

99 (DOE/EW/50625–T32) **Environmental Hazards Assessment Program: Annual report, July 1, 1995–June 30, 1996.** Medical Univ. of South Carolina, Charleston, SC (United States). 31 Jul 1996. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE96013627. Source: OSTI; NTIS; INIS; GPO Dep.

The objectives of the Environmental Hazards Assessment Program (EHAP) are to: (1) develop a holistic, national basis for risk assessment, risk management, and risk communication that recognizes the direct impact of environmental hazards on the health and well-being of all; (2) develop a pool of talented scientists and experts in cleanup activities, especially in human health aspects; and (3) identify needs and develop programs addressing the critical shortage of well-educated, highly-skilled technical and scientific personnel to address the health-oriented aspects of environmental restoration and waste management. This report describes activities and reports on progress for the fourth year of the grant. It reports progress against these grant objectives and the Program Implementation Plan.

100 (DOE/EW/53023–T11) **Tulane/Xavier University hazardous materials in aquatic environments of the Mississippi River Basin. Quarterly progress report, April 1, 1995–June 30, 1995.** Tulane Univ., New Orleans, LA (United States). [1995]. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-93EW53023. Order Number DE95016068. Source: OSTI; NTIS; GPO Dep.

Brief summaries of individual investigators participating in the Tulane/Xavier University Hazardous Materials in Aquatic Ecosystems are provided.

101 (DOE/EW/53023–T13) **Tulane/Xavier Universities hazardous materials in aquatic environments of the Mississippi River Basin. Quarterly progress report, October 1, 1995–December 31, 1995.** Tulane Univ., New Orleans, LA (United States). [1995]. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-93EW53023. Order Number DE96005713. Source: OSTI; NTIS; INIS; GPO Dep.

This quarterly report briefly describes research projects ongoing in this program.

102 (DOE/EW/53023–T14) **Tulane/Xavier University hazardous materials in aquatic environments of the Mississippi River Basin. Annual technical report, January 1–December 31, 1995.** Tulane Univ., New Orleans, LA (United States). Center for Bioenvironmental Research. 2 May 1996. 129p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-93EW53023. Order Number DE96010145. Source: OSTI; NTIS; GPO Dep.

Tulane and Xavier Universities have singled out the environment as a major strategic focus for research and training for now and beyond the year 2000. In 1989, the Tulane/Xavier Center for Bioenvironmental Research (CBR) was established as the umbrella organization which coordinates environmental research at both universities. In December, 1992, the Tulane/Xavier CBR was awarded a five year grant to study pollution in the Mississippi River system. The Hazardous Materials in Aquatic Environments of the Mississippi River Basin project is a broad research and education program aimed at elucidating the nature and magnitude of toxic materials that contaminate aquatic environments of the Mississippi River Basin. Studies include defining the complex interactions that occur during the transport of contaminants, the actual and potential impact on ecological systems and health, and the mechanisms through which these impacts might be remediated. The Mississippi River Basin represents a model system for analyzing and solving contamination problems that are found in aquatic systems world-wide. Summaries which describe objectives, goals, and accomplishments are included on ten collaborative cluster projects, two education projects, and six initiation projects. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

103 (DOE/EW/53023–T15) **Tulane/Xavier University hazardous materials in aquatic environments of the Mississippi River basin. Quarterly progress report, January 1–March 31, 1996.** Tulane Univ., New Orleans, LA (United States). Center for Bioenvironmental Research. 17 May 1996. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-93EW53023. Order Number DE96010294. Source: OSTI; NTIS; GPO Dep.

The objectives of this report are to provide the necessary administrative support to assure that the scientific and educational goals of the project are obtained and to assure that all Department of Energy reporting requirements and requests are fulfilled. The grant reporting is divided into three aspects: Collaborative Cluster projects, Initiation projects and Education projects. A cluster project is one or more closely related collaborative, multidisciplinary research projects in which a group of investigators employs a synergistic approach to the solution of problems in the same general area of research. The accomplishments this quarter of eleven cluster projects are presented. An initial project typically involves a single investigator. The purpose of the project is to undertake pilot work, lasting no more than one year, which will lead to the successful submission of an externally-funded proposal or the development of a collaborative cluster project. The accomplishments this quarter of eleven initiation projects are presented. The education projects are designed to develop courses with emphasis on environmental studies and/or to train students in areas of environmental research.

104 (DOE/EW/53023–T16) **Hazardous materials in aquatic environments of the Mississippi River Basin Project management. Technical quarterly progress report, April 1, 1996–June 30, 1996.** McLachlan, J.; Ide, C.F.; O'Connor, S. Tulane Univ., New Orleans, LA (United States). 1996. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-93EW53023. Order Number DE96013670. Source: OSTI; NTIS; GPO Dep.

This quarterly report summarizes accomplishments for the Project examining hazardous materials in aquatic environments of the Mississippi River Basin. Among the many research areas summarized are the following: assessment of mechanisms of metal-induced reproductive toxicity in aquatic species as a biomarker of exposure; hazardous wastes in aquatic environment;ecological sentinels of aquatic contamination in the lower Mississippi River System; remediation of selected contaminants; rapid on-site immunassay for heavy metal contamination; molecular mechanisms of developmental toxicity induced by retinoids and retinoid-like molecules; resuseable synthetic membranes for the removal of aromatic and halogenated organic pollutants from waste water; Effects of steroid receptor activation in neurendocrine cell of the mammalian hypothalamus; modeling and assessment of environmental quality of louisiana bayous and swamps; enhancement of environmental education. The report also contains a summary of publications resulting from this project and an appendix with analytical core protocals and target compounds and metals.

105 (DOE/EW/54069-T1) **A review of the Department of Energy classification policy and procedure.** National Academy of Sciences - National Research Council, Washington, DC (United States). [1995]. 113p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC01-94EW54069. Source: National Academy Press, 2101 Constitution Avenue, N.W., Box 285, Washington, D.C. 20055.

This book presents a discussion on the context for the Department of Energy classification system, current operations, principles behind regulatory changes, information policy, and methods to improve the classification systems.

106 (DOE/ID-10474-Rev.2) **Idaho National Engineering Laboratory (INEL) Environmental Restoration (ER) Program Baseline Safety Analysis File (BSAF).** EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002356. Source: OSTI; NTIS; INIS; GPO Dep.

The Baseline Safety Analysis File (BSAF) is a facility safety reference document for the Idaho National Engineering Laboratory (INEL) environmental restoration activities. The BSAF contains information and guidance for safety analysis documentation required by the U.S. Department of Energy (DOE) for environmental restoration (ER) activities, including: Characterization of potentially contaminated sites. Remedial investigations to identify and remedial actions to clean up existing and potential releases from inactive waste sites Decontamination and dismantlement of surplus facilities. The information is INEL-specific and is in the format required by DOE-EM-STD-3009-94, Preparation Guide for U.S. Department of Energy Nonreactor Nuclear Facility Safety Analysis Reports. An author of safety analysis documentation need only write information concerning that activity and refer to BSAF for further information or copy applicable chapters and sections. The information and guidance provided are suitable for: • Nuclear facilities (DOE Order 5480-23, Nuclear Safety Analysis Reports) with hazards that meet the Category 3 threshold (DOE-STD-1027-92, Hazard Categorization and Accident Analysis Techniques for Compliance with DOE Order 5480.23, Nuclear Safety Analysis Reports) • Radiological facilities (DOE-EM-STD-5502-94, Hazard Baseline Documentation) Nonnuclear facilities (DOE-EM-STD-5502-94) that are classified as "low" hazard facilities (DOE Order 5481.1B, Safety Analysis and Review System). Additionally, the BSAF could be used as an information source for Health and Safety Plans and for Safety Analysis Reports (SARs) for nuclear facilities with hazards equal to or greater than the Category 2 thresholds, or for nonnuclear facilities with "moderate" or "high" hazard classifications.

107 (DOE/ID-10511) **Validation of the transportation computer codes HIGHWAY, INTERLINE, RADTRAN 4, and RISKIND.** Maheras, S.J.; Pippen, H.K. Science Applications International Corp., Idaho Falls, ID (United States). May 1995. 370p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-92ID13208. Order Number DE96001332. Source: OSTI; NTIS; INIS; GPO Dep.

The computer codes HIGHWAY, INTERLINE, RADTRAN 4, and RISKIND were used to estimate radiation doses from the transportation of radioactive material in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement. HIGHWAY and INTERLINE were used to estimate transportation routes for truck and rail shipments, respectively. RADTRAN 4 was used to estimate collective doses from incident-free transportation and the risk (probability × consequence) from transportation accidents. RISKIND was used to estimate incident-free radiation doses for maximally exposed individuals and the consequences from reasonably foreseeable transportation accidents. The purpose of this analysis is to validate the estimates made by these computer codes; critiques of the conceptual models used in RADTRAN 4 are also discussed. Validation is defined as "the test and evaluation of the completed software to ensure compliance with software requirements." In this analysis, validation means that the differences between the estimates generated by these codes and independent observations are small (i.e., within the acceptance criterion established for the validation analysis). In some cases, the independent observations used in the validation were measurements; in other cases, the independent observations used in the validation analysis were generated using hand calculations. The results of the validation analyses performed for HIGHWAY, INTERLINE, RADTRAN 4, and RISKIND show that the differences between the estimates generated using the computer codes and independent observations were small. Based on the acceptance criterion established for the validation analyses, the codes yielded acceptable results; in all cases the estimates met the requirements for successful validation.

108 (DOE/ID/12584-230) **Commercial Environmental Cleanup - The products and services directory. Treatment, characterization and extraction/delivery/materials handling technologies.** Rust Geotech, Inc., Grand Junction, CO (United States); USDOE Grand Junction Projects Office, CO (United States). Nov 1995. 1200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86ID12584. (GJPO-120). Order Number DE96004909. Source: OSTI; NTIS; INIS; GPO Dep.

This directory is patterned after the telephone Yellow Pages and is designed as a reference tool to those who may seek commercial remedies for their environmental cleanup problems. It offers the user the opportunity to survey 325 environmental cleanup businesses that currently market their products and services through 1,134 applications of commercially available technologies. Like the Yellow Pages, the Directory furnishes the user with points-of-contact to investigate the capabilities of the listed companies to perform within acceptable standards, practices, and costs and to meet a user's specific needs. The three major sections of the Directory are organized under the broad headings of Treatment, Characterization, and Extraction/Delivery/Materials Handling. Within each section, information is grouped according to the applicable contaminant medium and companies are listed alphabetically under each medium heading. Not all vendors in the environmental cleanup business are included in this first edition of the Directory. Future editions will more completely reflect the status of the industry. The database of the commercial cleanup products and services Directory will be offered on the Internet in the future and will be available on the Homepage www.doe.gjpo.com.

109 (DOE/ID/12735–T35) **Projects at the Western Environmental Technology Office. Quarterly technical progress report, January 1–March 31, 1995.** MSE, Inc., Butte, MT (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88ID12735. Order Number DE95013077. Source: OSTI; NTIS; GPO Dep.

This quarterly report briefly describes recent progress in eight projects. The projects are entitled Biomass Remediation Project; Heavy Metal-Contaminated Soil Project; MHD Shutdown; Mine Waste Technology Program; Plasma Projects; Resource Recovery Project; Spray Casting Project; and Watervliet Arsenal Project.

110 (DOE/ID/13167–T22) **Integration/coordination contractor support to Environmental Restoration Program and Program Support Office. Contract status report, September 1, 1995–September 30, 1995.** Jason Associates Corp., Idaho Falls, ID (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AM07-92ID13167. Order Number DE96001019. Source: OSTI; NTIS; GPO Dep.

This status report updates activities on the following tasks: Environmental restoration task planning; Waste management task planning; Waste management project support; CPP stakeholder involvement; EM site specific advisory board - Idaho National Engineering Laboratory; and, Hypermedia document. A summary status assessment and forecast of all tasks is provided and A cost management report is included.

111 (DOE/ID/13220–T5) **Magnetically controlled deposition of metals using gas plasma. Quarterly progress report, July 1995–September 1995.** Idaho Univ., Moscow, ID (United States). Dept. of Mechanical Engineering. 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-93ID13220. Order Number DE96002992. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to develop a method of spraying materials on a substrate in a controlled manner to eliminate waste inherent in present plating processes. The process will utilize a standard spray gun with the addition of magnetic fields to focus and control the plasma.

112 (DOE/MC/27346–5098) **Economic evaluation and market analysis for natural gas utilization. Topical report.** Hackworth, J.H.; Koch, R.W.; Rezaiyan, A.J. K and M Engineering and Consulting Corp., Washington, DC (United States). Apr 1995. 170p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-90MC27346. Order Number DE96000631. Source: OSTI; NTIS; INIS; GPO Dep.

During the past decade, the U.S. has experienced a surplus gas supply. Future prospects are brightening because of increased estimates of the potential size of undiscovered gas reserves. At the same time, U.S. oil reserves and production have steadily declined, while oil imports have steadily increased. Reducing volume growth of crude oil imports was a key objective of the Energy Policy Act of 1992. Natural gas could be an important alternative energy source to liquid products derived from crude oil to help meet market demand. The purpose of this study was to (1) analyze three energy markets to determine whether greater use could be made of natural gas or its derivatives and (2) determine whether those products could be provided on an economically competitive basis. The following three markets were targeted for possible increases in gas use: transportation fuels, power generation, and chemical feedstock. Gas-derived products that could potentially compete in these three markets were identified, and the economics of the processes for producing those products were evaluated. The processes considered covered the range from commercial to those in early stages of process development. The analysis also evaluated the use of both high-quality natural gas and lower-quality gases containing CO_2 and N_2 levels above normal pipeline quality standards.

113 (DOE/MC/29109–5173) **Road transportable analytical laboratory (RTAL) system. Quarterly report, August–October 1995.** Engineering Computer Optecnomics, Inc., Annapolis, MD (United States). Nov 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29109. Order Number DE96004435. Source: OSTI; NTIS; GPO Dep.

Goal is the development and demonstration of a system to meet DOE needs for rapid, accurate analysis of a wide variety of hazardous and radioactive contaminants in soil, groundwater, and surface waters. The system consists of a set of individual laboratory modules. This report documents progress on Phase II, which is a transition to Maturity Level 5, Full-Scale Demonstration.

114 (DOE/MC/31179–96/CO618) **The GETE approach to facilitating the commercialization and use of DOE-developed environmental technologies.** Harvey, T.N. Global Environment and Technology Foundation, Annandale, VA (United States). 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-94MC31179. (CONF-9510108–36: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003668. Source: OSTI; NTIS; INIS; GPO Dep.

The Global Environmental Technology Enterprise (GETE) was conceived to develop and implement strategies to facilitate the commercialization of innovative, cost-effective Department of Energy (DOE)-developed environmental technologies. These strategies are needed to aid DOE's clean-up mission; to break down barriers to commercialization; and to build partnerships between the federal government and private industry in order to facilitate the development and use of innovative environmental technologies.

115 (DOE/MC/31388–96/CO624) **Environmental management technology demonstration and commercialization.** Daly, D.J. (and others); Erickson, T.A.; Groenewold, G.H. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-94MC31388. (CONF-9510108–29: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003683. Source: OSTI; NTIS; INIS; GPO Dep.

The Energy & Environmental Research Center (EERC), a contract-supported organization focused on technology research, development, demonstration, and commercialization (RDD&C), is entering its second year of a Cooperative

Agreement with the U.S. Department of Energy (DOE) Morgantown Energy Technology Center (METC) to facilitate the development, demonstration, and commercialization of innovative environmental management (EM) technologies in support of the activities of DOE's Office of Environmental Science and Technology (EM-50) under DOE's EM Program. This paper reviews the concept and approach of the program under the METC-EERC EM Cooperative Agreement and profiles the role the program is playing in the commercialization of five EM technologies.

116 (DOE/MC/32112–96/CO632) **Electrodialysis-ion exchange for the separation of dissolved salts.** Baroch, C.J.; Grant, P.J. Wastren, Inc., Idaho Falls, ID (United States). 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32112. (CONF-9510108–31: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003688. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy generates and stores a significant quantity of low level, high level, and mixed wastes. As some of the DOE facilities are decontaminated and decommissioned, additional and possibly different forms of wastes will be generated. A significant portion of these wastes are aqueous streams containing acids, bases, and salts, or are wet solids containing inorganic salts. Some of these wastes are quite dilute solutions, whereas others contain large quantities of nitrates either in the form of dissolved salts or acids. Many of the wastes are also contaminated with heavy metals, radioactive products, or organics. Some of these wastes are in storage because a satisfactory treatment and disposal processes have not been developed. This report describes the process of electrodialysis-ion exchange (EDIX) for treating aqueous wastes streams consisting of nitrates, sodium, organics, heavy metals, and radioactive species.

117 (DOE/OR–01-1347/V4) **Oak Ridge Reservation Federal Facility Agreement. Quarterly report for the Environmental Restoration Program. Volume 4, July 1995–September 1995.** Oak Ridge National Lab., TN (United States). Oct 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96001774. Source: OSTI; NTIS; INIS; GPO Dep.

This quarterly progress report satisfies requirements for the Environmental Restoration (ER) Program that are specified in the Oak Ridge Reservation Federal Facility Agreement (FFA) established between the U.S. Department of Energy (DOE), the U.S. Environmental Protection Agency (EPA), and the Tennessee Department of Environment and Conservation (TDEC). The reporting period covered herein is July through September 1995 (fourth quarter of FY 1995). Sections 1.1 and 1.2 provide respectively the milestones scheduled for completion during the reporting period and a list of documents that have been proposed for transmittal during the following quarter but have not been approved as FY 1995 commitments.

118 (DOE/OR–01-1393/V3&D1) **Remedial investigation/feasibility study for the Clinch River/Poplar Creek operable unit. Volume 3. Appendix E.** Oak Ridge National Lab., TN (United States). Sep 1995. 437p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–315/V3&D1). Order Number DE96010203. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains Appendix E: Toxicity Information and Uncertainty Analysis, description of methods, from the combined Remedial Investigation/Feasibility Study Report for the Clinch River/Poplar Crack (CR/PC) Operable Unit (OU). The CR/PC OU is located in Anderson and Roane Counties, Tennessee and consists of the Clinch River and several of its embayments in Melton Hill and Watts Bar Reservoirs. These waters have received hazardous substances released over a period of 50 years from the US Department of Energy's Oak Ridge Reservation (ORR), a National Priority List site established under the Comprehensive Environmental Response, Compensation, and Liability Act. A remedial investigation has been conducted to determine the current nature and extent of any contamination and to assess the resulting risk to human health and the environment. The feasibility study evaluates remedial action alternatives to identify any that are feasible for implementation and that would effectively reduce risk. Historical studies had indicated that current problems would likely include ^{137}Cs in sediment of the Clinch River, mercury in sediment and fish of Poplar Creek and PCBs and pesticides in fish from throughout the OU. Peak releases of mercury and ^{137}Cs occurred over 35 years ago, and current releases are low. Past releases of PCBs from the ORR are poorly quantified, and current releases are difficult to quantify because levels are so low. The site characterization focused on contaminants in surface water, sediment, and biota. Contaminants in surface water were all found to be below Ambient Water Quality Criteria. Other findings included the following: elevated metals including cesium 137 and mercury in McCoy Branch sediments; PCBs and chlordane elevated in several fish species, presenting the only major human health risk, significant ecological risks in Poplar Creek but not in the Clinch River.

119 (DOE/OR–01-1407-D1) **Preliminary assessment of the ecological risks to wide-ranging wildlife species on the Oak Ridge Reservation.** Sample, B.E.; Baron, L.A.; Jackson, B.L. Oak Ridge National Lab., TN (United States). Aug 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017552. Source: OSTI; NTIS; INIS; GPO Dep.

Historically, ecological risk assessment at CERCLA sites [such as the Oak Ridge Reservation (ORR)], has focused on species that may be definitively associated with a contaminated area or source operable unit. Consequently the species that are generally considered are those with home ranges small enough such that multiple individuals or a distinct population can be expected to reside within the boundaries of the contaminated site. This approach is adequate for sites with single, discrete areas of contamination that only provide habitat for species with limited requirements. This approach is not adequate however for large sites with multiple, spatially separated contaminated areas that provide habitat for wide-ranging wildlife species. Because wide-ranging wildlife species may travel between and use multiple contaminated sites they may be exposed to and be at risk from contaminants from multiple locations. Use of a particular contaminated site by wide-ranging species will be dependent upon the amount of suitable habitat available at that site. Therefore to adequately evaluate risks to wide-ranging species at the ORR-wide scale, the use of multiple contaminated sites must be weighted by the amount of suitable habitat on OUs. This reservation-wide ecological risk assessment is intended to identify which endpoints are significantly at risk; which contaminants are responsible for this risk; and which OUs significantly contribute to risk.

120 (DOE/OR–01-1441/V2) **Oak Ridge Reservation Federal Facility Agreement: Quarterly report for the Environmental Restoration Program. Volume 2, January–March 1996.** Department of Energy, Oak Ridge, TN (United States). Oak Ridge Operations Office. Apr 1996. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96009976. Source: OSTI; NTIS; GPO Dep.

This report provides information about ER Program activities conducted on the Oak Ridge Reservation under the Federal Facility Agreement (FFA). Specifically, it includes information on milestones scheduled for completion during the reporting period as well as scheduled for completion during the next reporting period (quarter), accomplishments of the ER Program, concerns related to program work, and scheduled activities for the next quarter. It also provides a listing of the identity and assigned tasks of contractors performing ER Program work under the FFA.

121 (DOE/OR–01-1445-D1) **US Department of Energy Oak Ridge Operations Environmental Management Public Involvement Plan for the Oak Ridge Reservation.** Oak Ridge National Lab., TN (United States); Science Applications International Corp., Oak Ridge, TN (United States). Mar 1996. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96008331. Source: OSTI; NTIS; INIS; GPO Dep.

This document was prepared in accordance with CERCLA requirements for writing community relations plans. It includes information on how the DOE Oak Ridge Operations Office prepares and executes Environmental Management Community relations activities. It is divided into three sections: the public involvement plan, public involvement in Oak Ridge, and public involvement in 1995. Four appendices are also included: environmental management in Oak Ridge; community and regional overview; key laws, agreements, and policy; and principal contacts.

122 (DOE/OSTI–3411/1) **The Office of Environmental Management technical reports: A bibliography.** USDOE Office of Scientific and Technical Information (OSTI), Oak Ridge, TN (United States). Jan 1996. 1044p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96001666. Source: OSTI; NTIS; INIS; GPO Dep.

The Office of Environmental Management's (EM) technical reports bibliography is an annual publication that contains information on scientific and technical reports sponsored by the Office of Environmental Management added to the Energy Science and Technology Database from July 1, 1994 through June 30, 1995. This information is divided into the following categories: Focus Areas, Cross-Cutting Programs, and Support Programs. In addition, a category for general information is included. EM's Office of Science and Technology sponsors this bibliography.

123 (DOE/RL–91-45-Rev.3) **Hanford Site Risk Assessment Methodology. Revision 3.** Bechtel National, Inc., Richland, WA (United States). May 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017531. Source: OSTI; NTIS; INIS; GPO Dep.

This methodology has been developed to prepare human health and ecological evaluations of risk as part of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) remedial investigations (RI) and the Resource conservation and Recovery Act of 1976 (RCRA) facility investigations (FI) performed at the Hanford Site pursuant to the hanford Federal Facility Agreement and Consent Order (Ecology et al. 1994), referred to as the Tri-Party Agreement. Development of the methodology has been undertaken so that Hanford Site risk assessments are consistent with current regulations and guidance, while providing direction on flexible, ambiguous, or undefined aspects of the guidance. The methodology identifies site-specific risk assessment considerations and integrates them with approaches for evaluating human and ecological risk that can be factored into the risk assessment program supporting the Hanford Site cleanup mission. Consequently, the methodology will enhance the preparation and review of individual risk assessments at the Hanford Site.

124 (DOE/RL–93-33) **Focused feasibility study of engineered barriers for waste management units in the 200 areas.** Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 245p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96013560. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) at the Hanford Site in Washington State is organized into numerically designated operational areas consisting of the 100, 200, 300, 400, 600, and 1100 Areas. In November 1989, the U.S. Environmental Protection Agency (EPA) included the 200 Areas (as well as the 100, 300, and 1,100 Areas) of the Hanford Site on the National Priorities List (NPL) under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). Inclusion on the NPL initiates the remedial investigation (RI) and feasibility study (FS) process to characterize the nature and extent of contamination, assess risks to human health and the environment, and select remedial actions. The Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement) was developed and signed by representatives from the EPA, Washington State Department of Ecology (Ecology), and DOE in May 1989 to provide a framework to implement and integrate cleanup activities. The scope of the agreement covers CERCLA past-practice, Resource Conservation and Recovery Act of 1976 (RCRA) past-practice, and RCRA treatment, storage, and disposal (TSD) activities on the Hanford Site. The 1991 revision to the Tri-Party Agreement required that an aggregate area approach be implemented in the 200 Areas based on the Hanford Site Past-Practice Strategy (HPPS) and established a milestone (M-27-00) to complete 10 Aggregate Area Management Study (AAMS) Reports in 1992.

125 (DOE/RL–93-66) **Hanford Remedial Action Environmental Impact Statement, Richland, Washington. Implementation Plan.** USDOE Richland Operations Office, WA (United States). Jun 1995. 167p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014919. Source: OSTI; NTIS; INIS; GPO Dep.

This implementation plan was prepared in compliance in compliance with 10 CFR 1021. It includes the following sections: introduction; purpose and need for departmental action; scope, content, and alternatives for the HRA EIS; public participation process; schedule for preparation of the HRA EIS; anticipated environmental reviews and consultations; and contractor disclosure statement. The following appendices are also included: notice of intent, federal register notice for extension of public scoping period, proposed annotated outline for the draft HRA EIS, summary of final report for the Hanford Future Site Uses Working Group, and summary of comments and responses from the public scoping process.

126 (DOE/RL–93-69-Rev.2) **Tri-party agreement databases, access mechanism and procedures. Revision 2.** Brulotte, P.J. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96005134. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the information required for the Washington State Department of Ecology (Ecology) and the U.S. Environmental Protection Agency (EPA) to access databases related to the Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement). It identifies the procedure required to obtain access to the Hanford Site computer networks and the Tri-Party Agreement related databases. It addresses security requirements, access methods, database availability dates, database access procedures, and the minimum computer hardware and software configurations required to operate within the Hanford Site networks. This document supersedes any previous agreements including the Administrative Agreement to Provide Computer Access to U.S. Environmental Protection Agency (EPA) and the Administrative Agreement to Provide Computer Access to Washington State Department of Ecology (Ecology), agreements that were signed by the U.S. Department of Energy (DOE), Richland Operations Office (RL) in June 1990, Access approval to EPA and Ecology is extended by RL to include all Tri-Party Agreement relevant databases named in this document via the documented access method and date. Access to databases and systems not listed in this document will be granted as determined necessary and negotiated among Ecology, EPA, and RL through the Tri-Party Agreement Project Managers. The Tri-Party Agreement Project Managers are the primary points of contact for all activities to be carried out under the Tri-Party Agreement. Action Plan. Access to the Tri-Party Agreement related databases and systems does not provide or imply any ownership on behalf of Ecology or EPA whether public or private of either the database or the system. Access to identified systems and databases does not include access to network/system administrative control information, network maps, etc.

127 (DOE/RL–94-61-Vol.1) **100 Area source operable unit focused feasibility study. Volume 1.** USDOE Richland Operations Office, WA (United States). Jun 1995. 896p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95014150. Source: OSTI; NTIS; INIS; GPO Dep.

The 100 Area is one of four Hanford areas placed on the National Priority List of waste sites in 1989 under CERCLA authority. Purpose of this focused feasibility study (FFS) is to provide decision makers sufficient information to select interim remedial alternatives for IRM (interim remedial measures) candidate waste sites within the 100 Areas. Scope covers high-priority source waste sites (sites at which there was direct disposal of wastes or a direct release of hazardous substances). This FFS contains three major components; the first major component, Sections 1.0-7.0 and Appendices A, B, and C, is the Process Document, which describes the Remedial Alternatives developed for remediation of the 100 Area source waste sites, evaluates these alternatives against CERCLA and other environmental criteria, and compares the alternatives against each other. The Process Document addresses 10 logical groupings of individual waste sites. It evaluates remedial alternatives for each waste site group assuming their groundwater should be protected as a potential drinking water source and the remediated areas will be used for recreational or other occasional use. A second major component of this report, the Sensitivity Analysis (Appendix D), evaluates how the analysis might change for different exposure scenarios. The third major component comprises the operableunit specific FFSs prepared for the 100-HR-1, 100-BC-1, and 100-DR-1 Operable Units (Appendices E, F, and G).

128 (DOE/RL–94-69) **Strategic plan for Hanford site information management.** USDOE Richland Operations Office, WA (United States). Sep 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006358. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site missions are to clean up the Site, to provide scientific knowledge and technology to meet global needs, and to partner in the economic diversification of the region. To achieve these long-term missions and increase confidence in the quality of the Site's decision making process, a dramatically different information management culture is required, consistent with US Department of Energy (DOE) mandates on increased safety, productivity, and openness at its sites. This plan presents a vision and six strategies that will move the Site toward an information management culture that will support the Site missions and address the mandates of DOE.

129 (DOE/RL–94-96-Rev.1) **Hanford Site Pollution Prevention Plan progress report, 1994. Revision 1.** Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001068. Source: OSTI; NTIS; INIS; GPO Dep.

This report tracks progress made during 1994 against the goals stated in DOE/RL-92-62, Executive Summary, Hanford Site Pollution Prevention Plan. The Executive Summary of the plan was submitted to the Washington State Department of Ecology (Ecology) in September 1992. The plan, Executive Summary, and the progress reports are elements of a pollution prevention planning program that is required by WAC 173-307, "Plans," for all hazardous substance users and/or all hazardous waste generators regulated by Ecology. These regulations implement RCW 70.95C, "Waste Reduction," an act relating to hazardous waste reduction. The act encourages voluntary efforts to redesign industrial processes to help reduce or eliminate hazardous substances and hazardous waste byproducts, and to maximize the in-process reuse or reclamation of valuable spent material. The Hanford Site is voluntarily complying with this state regulatory-mandated program. All treatment, storage, or disposal (TSD) facilities are exempt from participating; the Hanford Site is classified as a TSD.

130 (DOE/RL–94-140) **Close-out report Fitzner-Eberhardt Arid Lands Ecology Reserve remedial action, Hanford, Washington.** Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 16p. Sponsored by USDOE,

Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96013574. Source: OSTI; NTIS; INIS; GPO Dep.

The Fitzner-Eberhardt Arid Lands Ecology (ALE) Reserve consists of 312 km^2 (120 mi^2) of shrub-steppe land on the western edge of the Hanford Site. It is located south of Highway 240 and east of the point where the Yakima River borders the site. The land was set aside as a natural research area in 1967 by the Atomic Energy Commission. Historically tribal land, the area was homesteaded by pioneers before it was taken by the federal government in 1943 as a security buffer to protect the Hanford Site defense production facilities. One antiaircraft artillery battery (latter converted to a Nike missile site) was located on this land; plutonium production plants or storage facilities were never built there. A more complete account can be found in the Preliminary Assessment Screening (PAS) Report for the Arid Lands Ecology Reserve, Hanford. With the recent change in mission at the Hanford Site from plutonium production to environmental cleanup, much attention has been given to releasing clean tracts of land for other uses. The ALE Reserve is one such tract of land. The existing areas of contamination in the ALE Reserve were considered to be small. In March 1993, the U.S. Department of Energy (DOE), the Environmental Protection Agency (EPA), and the Washington State Department of Ecology (Ecology) signed and Agreement in Principle in which they agreed to expedite cleanup of the ALE Reserve. Cleanup activities and a draft close-out report were to be completed by October 1994. Additionally, DOE proposed to mitigate hazards that may pose a physical threat to wildlife or humans.

131 (DOE/RL--95-17-Vol.1-Pt.1) **Hanford Site annual dangerous waste report: Volume 1, Part 1, Generator dangerous waste report, dangerous waste.** USDOE Richland Operations Office, WA (United States). 1994. 457p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012346. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains information on hazardous wastes at the Hanford Site. Information consists of shipment date, physical state, chemical nature, waste description, waste number, weight, and waste designation.

132 (DOE/RL--95-17-Vol.1-Pt.2) **Hanford Site annual dangerous waste report: Volume 1, Part 2, Generator dangerous waste report, dangerous waste.** USDOE Richland Operations Office, WA (United States). 1994. 495p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012347. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains information on hazardous materials at the Hanford Site. Information consists of shipment date, physical state, chemical nature, waste description, waste number, weight, and waste designation.

133 (DOE/RL--95-24-Rev.1) **Mitigation action plan for the environmental restoration disposal facility.** Bechtel Hanford, Inc., Richland, WA (United States). Jan 1996. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008047. Source: OSTI; NTIS; INIS; GPO Dep.

This Mitigation Action Plan describes the mitigation actions for the Environmental Restoration Disposal Facility (ERDF). "Mitigation" is defined in the Council on Environmental Quality (CEQ) regulations implementing the National Environmental Policy Act (NEPA) in the Code of Federal Regulations (CFR) Section 1508.20, Part 40, as including one or more of the following actions: (1) Avoiding the impact by not taking a certain action or parts of an action, (2) Minimizing impacts by limiting the degree or magnitude of the action and its implementation, (3) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment, (4) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action, and (5) Compensating for the impact by replacing or providing substitute resources or environments. This Mitigation Action Plan addresses potential impacts to human health and safety and the environment, as identified in the ERDF Record of Decision (ROD), and includes potential impacts to worker safety, air and water quality, noise, and biological and cultural resources because of the construction and operation of the ERDF. Mitigation measures will be planned and executed throughout the operational life of the ERDF. Certain mitigation measures can only be determined as operations are initiated, because there are still uncertainties regarding how the facility will be administered and operated. The evaluation of potential mitigation options affecting natural resources will be coordinated with the natural resources Trustees. This Mitigation Action Plan discusses the bounding requirements with which the facility must comply, regardless of operational circumstances.

134 (DOE/RL--95-43) **Needs assessment activity report: April 1995.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Apr 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96000683. Source: OSTI; NTIS; INIS; GPO Dep.

As part of a US Department of Energy Headquarters task (DOE-HQ), the Packaging Operations and Development Group within Westinghouse Hanford Company (WHC) has assessed the packaging needs of many DOE sites. These assessments have involved site visits and meetings with personnel involved with transportation and packaging of hazardous materials. By March 1995, 20 DOE facilities had been visited. As a result, these sites been informed of some of the packaging activities that DOE has sponsored and is sponsoring, have been apprised of the affects of upcoming changes to transportation regulations, have discussed their short-term packaging needs, and have shared unique packaging they have developed which may be of use to other DOE facilities. Program successes include discovery of a need for a reusable Type A liquid sample packaging and its development within another DOE task, establishing communications pathways between DOE sites that have similar transportation and packaging needs, and starting to establish a centralized packaging clearinghouse that will coordinate DOE Complex needs and improve the cost-effectiveness of transportation and packaging activities.

135 (DOE/RL--95-49) **Radionuclide air emissions report for the Hanford site, Calendar year 1994.** Gleckler, B.P. (Westinghouse Hanford Co., Richland, WA (United States)); Diediker, L.P.; Jette, S.J.; Rhoads, K.; Soldat, S.K. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 139p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016483. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents radionuclide air emissions from the Hanford Site in 1994, and the resulting effective dose equivalent to the maximally exposed member of the public, referred to as the "MEI." The report has been prepared and will be submitted in accordance with reporting requirements in the Code of Federal Regulations, title 40, Protection of the Environment, Part 61, "National Emissions Standards for Hazardous Air Pollutants," Subpart H, "National Emission Standards for Emissions of Radionuclides Other than Radon from Department of Energy Facilities."

136 (DOE/RL–95-53) **Nonradioactive air emissions notice of construction for the Environmental Analytical Laboratory.** Bechtel National, Inc., Richland, WA (United States). May 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017511. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents emissions from the Environmental Analytical Laboratory (EAL). The facility was originally designed and built by Westinghouse Hanford Company to perform radiological and nonradiological screening and soils analysis on a quick turnaround basis in support of the Comprehensive Environmental Response, Compensation, and Liability, Act of 1980 (CERCLA) operable units. The facility would like to broaden its analytical capabilities by providing both radiological and nonradiological screening and sample analysis for Resource Conservation and Recovery Act of 19 76 (RCRA) inactive treatment storage, and disposal (TSD) units contained within the CERCLA operable units. The EAL will be conducting both soil and water analysis. Air emissions will be generated from the laboratory standards (analytes and reagents) used for calibration. The EAL will be considered a toxic air pollution emission unit. The air emissions from the EAL are based on the chemical quantities processed annually. Quantities of standards and reagents used during analysis were obtained from the laboratory inventory list. The EAL inventory is listed in Table 1 of this document. Each sample will be prepared, screened, labeled, and controlled in the field prior to acceptance into the EAL. The samples are then transferred to MO-425 and MO-426 (trailers) that are designated for that particular type of analysis.

137 (DOE/RL–95-56-Rev.2) **100-BC-1 Excavation Demonstration Project Plan. Revision 2.** Bechtel National, Inc., Richland, WA (United States). Sep 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017499. Source: OSTI; NTIS; INIS; GPO Dep.

The US Environmental Protection Agency (EPA) and the Washington State Department of Ecology (Ecology) have requested that the US Department of Energy (DOE), through the Environmental Restoration Contractor (ERC), perform removal actions at waste sites within the 100-BC-1 Operable Unit (OU) at the Hanford Site. To accelerate removal actions, the EPA (lead regulatory agency), Ecology (support regulatory agency), and DOE (responsible agency) have chosen an expedited response action (ERA) pathway for these removal actions. These removal actions will be non-time critical, and will follow the applicable sections of 40 CFR 300 Subpart E, and the Comprehensive Environmental Response, Compensation, and Recovery Act of 1980 (CERCLA). The Resource Conservation and Recovery Act of 1976 and the Washington State Model Toxics Control Act Cleanup Regulations (MTCA) are key sources of applicable or relevant and appropriate requirements (ARAR) for the removal actions. Section 7.0 of this plan details the ARARS. This document provides information and guidance on the strategy planned to carry out the removal actions and meet all the project objectives. This document provides the objectives, site selection, subsystems, and phasing (Sections 2.0 through 5.0) of the project. Section 6.0 ties together the previous sections and details the strategy and data needs required to meet the project objectives while performing the removal actions. This strategy is applicable to all sites that will be addressed by this removal action project.

138 (DOE/RL–95-75) **Pollution Prevention Successes Database (P2SDb) user guide.** Westinghouse Hanford Co., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). Jul 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001822. Source: OSTI; NTIS; INIS; GPO Dep.

When Pollution Prevention Opportunity Assessments (P2OAs) were launched at the Hanford Site during the summer of 1994, the first comment received from those using them expressed the desire for a method to report assessments electronically. As a temporary measure, macros were developed for use on word processing systems, but a more formal database was obviously needed. Additionally, increased DOE and Washington state reporting requirements for pollution prevention suggested that a database system would streamline the reporting process. The Pollution Prevention Group of Westinghouse Hanford Company (WHC) contracted with the Data Automation Engineering Department from ICF Kaiser Hanford Company (ICFKH) to develop the system. The scope was to develop a database that will track P2OAs conducted by the facilities and contractors at the Hanford Site. It will also track pollution prevention accomplishments that are not the result of P2OAs and document a portion of the Process Waste Assessments conducted in the past. To accommodate the above criteria, yet complete the system in a timely manner, the Pollution Prevention Successes Database (P2SDb) is being implemented in three phases. The first phase will automate the worksheets to provide both input and output of the data associated with the worksheets. The second phase will automate standard summary reports and ad hoc reports. The third phase will provide automated searching of the database to facilitate the sharing of pollution prevention experiences among various users. This User's Guide addresses only the Phase 1 system.

139 (DOE/RL–95-82) **Inventory of miscellaneous streams.** Lueck, K.J. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001634. Source: OSTI; NTIS; INIS; GPO Dep.

On December 23, 1991, the US Department of Energy, Richland Operations Office (RL) and the Washington State Department of Ecology (Ecology) agreed to adhere to the provisions of the Department of Ecology Consent Order. The Consent Order lists the regulatory milestones for liquid effluent streams at the Hanford Site to comply with the permitting requirements of Washington Administrative Code. The RL provided the US Congress a Plan and Schedule to discontinue disposal of contaminated liquid effluent into the soil column on the Hanford Site. The plan and schedule document contained a strategy for the implementation of alternative treatment and disposal systems. This strategy included prioritizing the streams into two phases. The Phase 1 streams were considered to be higher priority than the Phase 2 streams. The actions recommended for the Phase 1 and 2 streams in the two reports were incorporated in the Hanford Federal Facility Agreement and Consent Order. Miscellaneous Streams are those liquid effluents streams identified within the Consent Order that are discharged to the ground but are not categorized as Phase 1 or Phase 2 Streams. This document consists of an inventory of the liquid effluent streams being discharged into the Hanford soil column.

140 (DOE/RL–95-84) **1994 Annual report on waste generation and waste minimization progress as required by DOE Order 5400.1, Hanford Site.** USDOE Richland Operations Office, WA (United States). Sep 1995. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001813. Source: OSTI; NTIS; INIS; GPO Dep.

Many Waste Minimization/Pollution Prevention successes at the Hanford Site occur every day without formal recognition. A few of the successful projects are: T-Plant helps facilities reuse equipment by offering decontamination services for items such as gas cylinders, trucks, and railcars, thus saving disposal and equipment replacement costs. Custodial Services reviewed its use of 168 hazardous cleaning products, and, through a variety of measures, replaced them with 38 safer substitutes, one for each task. Scrap steel contaminated with low level radioactivity from the interim stabilization of 107-K and 107-C was decontaminated and sold to a vendor for recycling. Site-wide programs include the following: the Pollution Prevention Opportunity Assessment (P2OA) program at the Hanford site was launched during 1994, including a training class, a guidance document, technical assistance, and goals; control over hazardous materials purchased was achieved by reviewing all purchase requisitions of a chemical nature; the Office Supply Reuse Program was established to redeploy unused or unwanted office supply items. In 1994, pollution prevention activities reduced approximately 274,000 kilograms of hazardous waste, 2,100 cubic meters of radioactive and mixed waste, 14,500,000 kilograms of sanitary waste, and 215,000 cubic meters off liquid waste and waste water. Pollution Prevention activities also saved almost \$4.2 million in disposal, product, and labor costs. Overall waste generation increased in 1994 due to increased work and activity typical for a site with an environmental restoration mission. However, without any Waste Minimization/Pollution Prevention activities, solid radioactive waste generation at Hanford would have been 25% higher, solid hazardous waste generation would have been 30% higher, and solid sanitary waste generation would have been 60% higher.

141 (DOE/RL–95-94) **Needs assessment activity report: Fiscal year 1995.** Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001633. Source: OSTI; NTIS; INIS; GPO Dep.

The Needs Assessment program has assessed the packaging requirements of many U.S. Department of Energy (DOE) sites. These assessments have involved site visits and meetings with personnel involved with transportation and packaging of hazardous materials. By September 1995, 24 DOE facilities had been visited, with 14 site visits occurring in fiscal year 1995. As a result, these sites have been informed of some of the packaging activities that DOE has sponsored and is sponsoring, have been apprised of the affects of upcoming changes to transportation regulations, have discussed their near-term packaging needs, and have shared unique packaging they have developed, which may be of use to other DOE facilities. Program successes include discovery of a need for a reusable Type A liquid sample packaging and its development within another DOE task and establishing communications pathways between DOE sites that have similar transportation and packaging needs. This report recommends that the Needs Assessment activity continue to pursue the strategy of visiting DOE sites to meet with their transportation and packaging personnel. These visits will ensure that DOE needs are met, communications pathways between DOE sites are established and cultivated, and redundant packaging development is identified. The site visits should be expanded to include meetings with the long-range and strategic planners at each site, and at the DOE-Headquarters level, to ensure that all future transportation and packaging needs are identified early enough to allow adequate transportation assessment and packaging development. This activity could become a permanent conduit for information and will ensure that all future DOE transportation and packaging needs are satisfied in a cost-effective, timely, and efficient manner.

142 (DOE/RL–95-103) **Hanford site guide for preparing and maintaining generator group pollution prevention program documentation.** Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96005133. Source: OSTI; NTIS; INIS; GPO Dep.

This manual provides the necessary guidance to contractor generator groups for developing and maintaining documentation of their pollution prevention (P2) program activities. Preparation of program documentation will demonstrate compliance with contractor and U.S. Department of Energy (DOE) requirements, as well as state and federal regulations. Contractor waste generator groups are no longer required to prepare and update facility waste minimization plans. Developing and maintaining program documentation replace this requirement.

143 (DOE/RL–96-09-Rev.1) **Richland Environmental Restoration Project management action process document.** USDOE Richland Operations Office, WA (United States). Apr 1996. 200p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013567. Source: OSTI; NTIS; INIS; GPO Dep.

A critical mission of the U.S. Department of Energy (DOE) is the planning, implementation, and completion of environmental restoration programs at DOE facilities. An integral part of this mission involves the safe and cost-effective environmental restoration of the Hanford Site. For over 40 years the Hanford Site supported United States national defense programs, largely through the production of nuclear materials. One legacy of historical Hanford Site operations is a significant waste inventory of radioactive and/or regulated chemical materials. Releases of these materials have, in some cases, contaminated the Hanford Site environment. The DOE Richland Operations Office (RL) is responsible for protecting human health and the environment from potential Hanford Site environmental hazards by identifying, assessing, and mitigating risks posed by contaminated sites.

144 (DOE/RL–96-16-c-Vol.1) **Data for the screening assessment. Volume 1: Text, Columbia River Comprehensive Impact Assessment.** Miley, T.B.; O'Neil, T.K.; Gilbert, R.O.; Klevgard, L.A.; Walters, T.B. Pacific Northwest National Lab., Richland, WA (United States). Jun 1996. 60p. Sponsored by USDOE, Washington, DC (United States);Environmental Protection Agency, Washington, DC (United States);Washington State Government, Olympia, WA (United States). DOE Contract AC06-76RL01830.

(PNNL–11208-Vol.1). Order Number DE96012244. Source: OSTI; NTIS; INIS; GPO Dep.

The Columbia River is a critical resource for residents of the Pacific Northwest. This resource drew the Manhattan Project's planners to the site now called Hanford to produce nuclear weapon materials. Production of those materials has left behind a legacy of chemical and radioactive contamination and materials that have, are, and will continue to pose a threat to the Columbia river for the foreseeable future. To evaluate the impact to the river from this Hanford-derived contamination, the US Department of Energy, US Environmental Protection Agency, and State of Washington Department of Ecology (the Tri-Party agencies) initiated a study referred to as the Columbia River Comprehensive Impact Assessment (CRCIA). To address concerns about the scope and direction of CRCIA as well as enhance regulator, stakeholder, tribal, and public involvement, the CRCIA Management Team was formed in August 1995. A major CRCIA Team decision was to organize CRCIA into phases, with additional phases to be identified as warranted after completion of the initial phase. The initial phase is comprised of two parts: (1) a screening assessment to evaluate the current impact to the river resulting from Hanford-derived contamination and (2) identification of requirements considered necessary by the CRCIA Management Team for a comprehensive assessment of impact to the river. The purpose of the screening assessment is to support cleanup decisions. The scope of the screening assessment is to evaluate the current risk to humans and the environment resulting from Hanford-derived contaminants. The screening assessment has the primary components of: identifying contaminants to be assessed; identifying a variety of exposure scenarios to evaluate human contaminant exposure; identifying a variety of other species to evaluate ecological contaminant exposure; and assessing risks posed by exposure of humans and other species to the contaminants.

145 (DOE/RL–96-16-c-Vol.2) **Data for the screening assessment. Volume 2: Appendices, Columbia River Comprehensive Impact Assessment.** Miley, T.B.; O'Neil, T.K.; Gilbert, R.O.; Klevgard, L.A.; Walters, T.B. Pacific Northwest National Lab., Richland, WA (United States). Jun 1996. 462p. Sponsored by USDOE, Washington, DC (United States);Environmental Protection Agency, Washington, DC (United States);Washington State Government, Olympia, WA (United States). DOE Contract AC06-76RL01830. (PNNL–11208-Vol.2). Order Number DE96012239. Source: OSTI; NTIS; INIS; GPO Dep.

Contains computer diskettes.

The Columbia River is a critical resource for residents of the Pacific Northwest. This resource drew the Manhattan Project's planners to the site now called Hanford to produce nuclear weapon materials. Production of those materials has left behind a legacy of chemical and radioactive contamination and materials that have, are, and will continue to pose a threat to the Columbia river for the foreseeable future. To evaluate the impact to the river from this Hanford-derived contamination, the US Department of Energy, US Environmental Protection Agency, and State of Washington Department of Ecology (the Tri-Party agencies) initiated a study referred to as the Columbia River Comprehensive Impact Assessment (CRCIA). To address concerns about the scope and direction of CRCIA as well as enhance regulator, stakeholder, tribal, and public involvement, the CRCIA Management Team was formed in August 1995. A major CRCIA Team decision was to organize CRCIA into phases, with additional phases to be identified as warranted after completion of the initial phase. The initial phase is comprised of two parts: (1) a screening assessment to evaluate the current impact to the river resulting from Hanford-derived contamination and (2) identification of requirements considered necessary by the CRCIA Management Team for a comprehensive assessment of impact to the river. The purpose of the screening assessment is to support cleanup decisions. The scope of the screening assessment is to evaluate the current risk to humans and the environment resulting from Hanford-derived contaminants. The screening assessment has the primary components of: identifying contaminants to be assessed; identifying a variety of exposure scenarios to evaluate human contaminant exposure; identifying a variety of other species to evaluate ecological contaminant exposure; and assessing risks posed by exposure of humans and other species to the contaminants. This volume compiles the data from this study.

146 (DOE/RL–107) **Fiscal year 1996 U.S. Department of Energy, Richland Operations Office Site summary baseline.** Johndro-Collins, A. USDOE Richland Operations Office, WA (United States). Oct 1995. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006852. Source: OSTI; NTIS; INIS; GPO Dep.

The technical baseline is a hierarchical description of the Hanford Site cleanup mission. This technical baseline does not address the science, technology, or economic transition missions. It begins with a definition of the existing conditions at the Hanford Site, provides a description of the end product or mission accomplishments at completion, presents a statement of the major requirements and constraints that must be observed during the performance of the mission, and provides a statement of the top-level strategic approach to accomplish the mission. Mission-level interfaces are also described. This information is further defined hierarchically in increasing levels of detail. This definition is composed of the following major elements: functions that are key task descriptions; requirements that are the measurable standards to which the functions must be performed; architectures which are specific engineering solutions or systems that perform the functions described earlier; and verification ensuring the system satisfies the requirements and fulfills the functions. The above information is supplemented with the following: interface data; risk analyses and watch lists; assumptions; and required analyses.

147 (DOE/SR/18233–4) **South Carolina Department of Health and Environmental Control federal facility agreement. Annual progress report, fiscal year 1995.** Hucks, R.L. South Carolina Dept. of Health and Environmental Control, Columbia, SC (United States). 30 Jan 1996. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-91SR18233. Order Number DE96009662. Source: OSTI; NTIS; GPO Dep.

South Carolina Department of Health and Environmental Control (SCDHEC) reviewed 105 primary documents during fiscal year 1995 (October 1, 1994 through September 30, 1995). The primary documents reviewed consisted of 27 RCRA Facility Investigation/Remedial Investigation (RFI/RI) workplans, 13 RFI/RI Reports, 12 Baseline Risk Assessments (BRA's), 27 Site Evaluation (SE) Reports, 8 Proposed Plans, 5 Record of Decisions (ROD's), 6 Remedial Design Workplans, 6 Remedial Action Workplans and 10 miscellaneous primary documents. Numerous other administrative duties were conducted during the reporting period that are not accounted for above. These included, but were not limited to, extension requests, monitoring well approvals, and Treatability Studies. The list of outgoing correspondence from SCDHEC to the Department of Energy (DOE) and Westinghouse Savannah River Company (WSRC) is attached.

148 (DOE/SR/18233–T1) **Oversight and implementation of Federal Facility Agreement. Annual progress report, FY 1993.** Hucks, R.L. South Carolina Dept. of Health and Environmental Control, Columbia, SC (United States). 27 Jul 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-91SR18233. Order Number DE95016156. Source: OSTI; NTIS; GPO Dep.

South Carolina Department of Health and Environmental Control (SCDHEC) reviewed 57 primary documents during fiscal year 1993 (October 1, 1992 through September 30, 1993). The primary documents reviewed consisted of 24 RCRA Facility Investigation/Remedial Investigation (RFI/RI) workplans, 26 Site Evaluation (SE) reports, 3 Proposed Plans, 1 Record of Decision (ROD), and 3 miscellaneous primary documents. Numerous other administrative duties were conducted during the reporting period that are not accounted for above. These included, but are not limited to, extension requests, monitoring well approvals, treatability studies, and site visit reports.

149 (EML–581) **Semi-annual report of the Department of Energy, Office of Environmental Management, Quality Assessment Program.** Sanderson, C.G.; Greenlaw, P. USDOE Environmental Measurements Lab., New York, NY (United States). Environmental Studies Div. 1 Jul 1996. 315p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96012328. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results from the analysis of the 44th set of environmental quality assessment samples (QAP XLIV) that were received on or before June 3, 1996. The QAP is designed to test the quality of environmental measurements being reported to the Department of Energy by it's contractors. Since 1976, samples have been prepared and analyzed by the Environmental measurements Laboratory.

150 (EML–582) **Report of the Department of Energy, Office of Environmental Management, Quality Assessment Program, inorganic intercomparison study.** Greenlaw, P.D. USDOE Environmental Measurements Lab., New York, NY (United States). Environmental Studies Div. 1 Jul 1996. 20p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96012329. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents results from the soil inorganic analysis of the 44th set of environmental quality assessment samples, of the quality assessment program, that were received on or before June 3, 1996. The samples were analyzed for RCRA metals.

151 (ES/ER/TM–33/R2) **Approach and strategy for performing ecological risk assessments for the US Department of Energy's Oak Ridge Reservation: 1995 revision.** Suter, G.W. II; Sample, B.E.; Jones, D.S.; Ashwood, T.L.; Loar, J.M. Oak Ridge National Lab., TN (United States). Sep 1995. 210p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96007746. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to provide guidance for planning and performing ecological risk assessments (ERAs) on the Oak Ridge Reservation (ORR). It is the third such document prepared for this purpose. The first ecorisk strategy document described the ERA process and presented a tiered approach to ERAs appropriate to complex sites. The first revision was necessitated by the considerable progress that has been made by the parties to the Federal Facilities Agreement (FFA) for the ORR in resolving specific issues relating to ERA as a result of a series of data quality objectives (DQOs) meetings. The tiered approach to ERAs as recommended in the first document was implemented, generic conceptual models were developed, and a general approach for developing ecological assessment endpoints and measurement endpoints was agreed upon. This revision is necessitated by comments from the US Environmental Protection Agency's Region IV and the Tennessee Department of Environment and Conservation (TDEC) which clarified and modified the positions taken during the DQO process. In particular, support for the collection of data that would support ERAs for all OUs on the ORR have been withdrawn. Therefore, the work plan developed to fill the reservation-wide data needs identified in the DQO process has also been withdrawn, and portions that are still relevant have been incorporated into this document. The reader should be aware that this guidance is complex and lengthy because it attempts to cover all the reasonable contingencies that were considered to be potentially important to the FFA parties.

152 (ES/ER/TM–106) **Preliminary remediation goals for use at the U.S. Department of Energy Oak Ridge Operations Office.** Oak Ridge National Lab., TN (United States). Jun 1995. 610p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013998. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents Preliminary Remediation Goals (PRGs) for use in human health risk assessment efforts under the United States Department of Energy, Oak Ridge Operations Office Environmental Restoration (ER) Division. Chemical-specific PRGs are concentration goals for individual chemicals for specific medium and land use combinations. The PRGs are referred to as risk-based because they have been calculated using risk assessment procedures. Risk-based calculations set concentration limits using both carcinogenic or noncarcinogenic toxicity values under specific exposure pathways. The PRG is a concentration that is derived from a specified excess cancer risk level or hazard quotient. This report provides the ER Division with standardized PRGs which are integral to the Remedial Investigation/Feasibility Study process. By managing the assumptions and systems used in PRG derivation, the Environmental Restoration Risk Assessment Program will be able to control the level of quality assurance associated with these risk-based guideline values.

153 (ES/ER/TM–112/R2) **Environmental restoration risk-based prioritization work package planning and risk ranking methodology. Revision 2.** Dail, J.L.; Nanstad, L.D.; White, R.K. Lockheed Martin Energy Systems, Inc., Oak Ridge, TN (United States). Jun 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95015374. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration Program.

This document presents the risk-based prioritization methodology developed to evaluate and rank Environmental Restoration (ER) work packages at the five US Department of Energy, Oak Ridge Field Office (DOE-ORO) sites [i.e., Oak Ridge K-25 Site (K-25), Portsmouth Gaseous Diffusion Plant (PORTS), Paducah Gaseous Diffusion Plant (PGDP), Oak Ridge National Laboratory (ORNL), and the Oak Ridge Y-12 Plant (Y-12)], the ER Off-site Program, and Central ER. This prioritization methodology was developed to support the increased rigor and formality of work planning in the overall conduct of operations within the DOE-ORO ER Program. Prioritization is conducted as an integral component of the fiscal ER funding cycle to establish program budget priorities. The purpose of the ER risk-based prioritization methodology is to provide ER management with the tools and processes needed to evaluate, compare, prioritize, and justify fiscal budget decisions for a diverse set of remedial action, decontamination and decommissioning, and waste management activities. The methodology provides the ER Program with a framework for (1) organizing information about identified DOE-ORO environmental problems, (2) generating qualitative assessments of the long- and short-term risks posed by DOE-ORO environmental problems, and (3) evaluating the benefits associated with candidate work packages designed to reduce those risks. Prioritization is conducted to rank ER work packages on the basis of the overall value (e.g., risk reduction, stakeholder confidence) each package provides to the ER Program. Application of the methodology yields individual work package "scores" and rankings that are used to develop fiscal budget requests. This document presents the technical basis for the decision support tools and process.

154 (ES/ER/TM–137) **Results of the user survey of functional requirements for the Oak Ridge Environmental Information System.** Oak Ridge National Lab., TN (United States). Mar 1995. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013299. Source: OSTI; NTIS; GPO Dep.

Environmental Restoration Program.

The Oak Ridge Environmental Information System (OREIS) user survey of functional requirements was conducted in the spring and summer of 1994 to allow representatives of the OREIS user community to review and confirm the functionality of the OREIS system and to provide a method to document user acceptance of the system. The results of the survey confirm that the OREIS system meets data and functional requirements of the users. It further emphasizes that the user community is quite diverse, with many different needs for and perspectives about OREIS, and with varying needs for access and use of software tools. To meet the needs of a diverse and potentially changing user community, OREIS staff will survey the user community periodically to obtain input on changes to user requirements for future versions of the system.

155 (ES/ER/TM–145) **Technical specification for transferring ambient air monitoring data to the Oak Ridge Environmental Information System (OREIS).** Oak Ridge Environmental Information System (OREIS) Program, TN (United States). Jun 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014026. Source: OSTI; NTIS; GPO Dep.

In September 1994, a team was formed to develop, document, and implement technical specifications for transmitting ambient air environmental compliance and monitoring data to the Oak Ridge Environmental Information System (OREIS). The approach used to transmit this data is documented in the "Plan for Integrating Environmental Compliance and Monitoring Data into OREIS." This plan addresses the consolidated data requirements defined by the Federal Facility Agreement (FFA) and the Tennessee Oversight Agreement (TOA) as they pertain to environmental compliance and monitoring data maintained by Energy Systems' Oak Ridge Environmental Management organizations. Ibis document describes. the requirements, responsibilities, criteria, and format for transmitting ambient air compliance and monitoring data to OREIS.

156 (ES/ER/TM–152) **Terrestrial mapping of the Oak Ridge Reservation: Phase 1. Environmental Restoration Program.** Washington-Allen, R.A. (Oak Ridge National Lab., TN (United States)); Ashwood, T.L.; Christensen, S.W.; Offerman, H.; Scarbrough-Luther, P. Oak Ridge National Lab., TN (United States). Jun 1995. 125p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012979. Source: OSTI; NTIS; GPO Dep.

This report presents the results of the first phase in development of a habitat map of the terrestrial ecosystem on the Oak Ridge Reservation (ORR). During this phase, a satellite image of the ORR was classified into land use/land cover types, the classified image was incorporated into a geographic information system map of the ORR, and the accuracy of the map was assessed. A habitat map is a critical foundation for evaluation of the potential impact of historical (or ongoing) contamination on terrestrial biota of the ORR. The abundance and distribution of wildlife species and plant communities of concern are intrinsically linked to the abundance and distribution of habitat on which those species and communities rely. Thus, the impact of spatially discrete patches of contamination on those biota is directly proportional to the degree of overlap between habitat and contamination. Landsat 5 Thematic Mapper satellite imagery was used to create the land use/land cover map. A Thematic Mapper image consists of seven images of the same point on the earth produced by seven separate sensors, each of which detects a unique part of the electromagnetic spectrum. Separately and in various combinations, these spectral images can be correlated with vegetation type or other land cover type. The image selected for this map was from April 13, 1994, and covers 189,000 ha.

157 (ES/ER/TM–189) **Technical specification for transferring tank construction data to the Oak Ridge Environmental Information System (OREIS).** Oak Ridge Environmental Information System (OREIS) Program, TN (United States). Jun 1996. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96011655. Source: OSTI; NTIS; INIS; GPO Dep.

The primary goal of this technical specification is to meet the consolidated environmental data requirements defined by the Federal Facility Agreement (FFA) and the Tennessee Oversight Agreement as they pertain to tank construction data maintained in Oak Ridge, Tennessee, by the US Department of Energy's Maintenance and Operations contractor Lockheed Martin Energy Systems, Inc., and prime contractors to the Department of Energy. This technical specification describes the organizational responsibilities for loading tank construction data into OREIS, describes the logical and physical data transfer files, addresses business rules and submission rules, addresses configuration control of this technical specification, and addresses required changes to the current OREIS data base structure based on site requirements. This technical specification addresses the tank construction data maintained by the Y-12, K-25, and ORNL sites that will be sent to OREIS. The initial submission of data will include only inactive Environmental Restoration tanks as specified by the FFA.

158 (ES/WM-30) **Oak Ridge Reservation Waste Management Plan.** Turner, J.W. (ed.). Oak Ridge National Lab., TN (United States). Feb 1995. 247p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/M-4090). Order Number DE95012970. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the waste management plan for the Oak Ridge Reservation facilities. The primary purpose is to convey what facilities are being used to manage wastes, what forces are acting to change current waste management systems, and what plans are in store for the coming fiscal year.

159 (ES/WM-49) **Waste treatment at the La Hague and Marcoule sites.** Oak Ridge National Lab., TN (United States); Societe Generale pour les Techniques Nouvelles (SGN), 78 - Saint-Quentin-en-Yvelines (France); CEA Agence Nationale pour la Gestion des Dechets Radioactifes (ANDRA), 92 - Fontenay-aux-Roses (France); Numatec, Inc., Bethesda, MD (United States). Apr 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. 1AK-EGJ68V. (ORNL/M-4616). Order Number DE95015372. Source: OSTI; NTIS; INIS; GPO Dep.

Waste Management Program.

In this report, an overview of waste treatment and solidification facilities located at the La Hague and Marcoule sites, which are owned and/or operated by Cogema, provided. The La Hague facilities described in this report include the following: The STE3 liquid effluent treatment facility (in operation); the AD2 solid waste processing facility (also in operation); and the UCD alpha waste treatment facility (under construction). The Marcoule facilities described in this report, both of which are in operation, include the following: The STEL-EVA liquid effluent treatment facilities for the entire site; and the alpha waste incinerator of the UPI plant. This report is organized into four sections: this introduction, low-level waste treatment at La Hague, low-level waste treatment at Marcoule, and new process development. including the solvent pyrolysis process currently in the development stage for Cogema's plants.

160 (ES/WM-81) **Function analysis for waste information systems.** Sexton, J.L.; Neal, C.T.; Heath, T.C.; Starling, C.D. Lockheed Martin Energy Systems, Inc., Oak Ridge, TN (United States). Apr 1996. 246p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96011533. Source: OSTI; NTIS; INIS; GPO Dep.

This study has a two-fold purpose. It seeks to identify the functional requirements of a waste tracking information system and to find feasible alternatives for meeting those requirements on the Oak Ridge Reservation (ORR) and the Portsmouth (PORTS) and Paducah (PGDP) facilities; identify options that offer potential cost savings to the US government and also show opportunities for improved efficiency and effectiveness in managing waste information; and, finally, to recommend a practical course of action that can be immediately initiated. In addition to identifying relevant requirements, it also identifies any existing requirements that are currently not being completely met. Another aim of this study is to carry out preliminary benchmarking by contacting representative companies about their strategic directions in waste information. The information obtained from representatives of these organizations is contained in an appendix to the document; a full benchmarking effort, however, is beyond the intended scope of this study.

161 (FEMP-2363B) **Effective management of regulator RI/FS comments.** Wolinsky, S.M.; Lojek, D.; George, R.D.; Houser, S.M.; Strimbu, M.J. Fluor Daniel Environmental Restoration Management Corp., Fernald, OH (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950868-36: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96004701. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a successful strategy that facilitates regulatory approval of CERCLA documents required by compliance agreement and CERCLA, based on the experience of Operable Unit 1, Waste Storage Area, of the Fernald Environmental Management Project (FEMP). This strategy, which has become the site standard at the FEMP, was instrumental in obtaining regulator approval of the OU1 RI and FS, and early approval of the Record of Decision during a very tight compliance agreement-driven schedule. This strategy can be applied at any DOE Superfund site, especially where there is need to recover lost schedule, an incentive to meet milestones early, a need to improve the relationship between the DOE and the regulators, or where the regulatory agencies have historically provided a large volume of comments on CERCLA documents. The strategy focuses on early identification and resolution of issues relating to draft RI/FS documents, as raised in regulatory agency review comments. This pro-active strategy has the potential for schedule and cost savings, as well as for improved communication between DOE and the regulators. The strategy includes preparation of a separate comment response document, integration of comment responses with RI/FS documents, development of a database of agency comments and their resolution, and sharing lessons learned with preparers of subsequent RI/FS documents. The paper provides background on the FEMP and describes the FEMP comment response strategy; DOE and regulator interface; the Sitewide Comment Database; networked electronic file management; the process for classifying, analyzing, and responding to comments; integration with base RI/FS documents; and a conclusion.

162 (FEMP-2425) **The Fernald wet records recovery project: A case history.** Sterling, H.J. (Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States)); Devir, B.R.; Hawley, R.A.; Freesmeyer, M.T. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). 22 Jun 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950669-1: DOE records management conference: Camino Real to the year 2000, Albuquerque, NM (United States), 27-30 Jun 1995). Order Number DE95013795. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses a project performed to recover wet records discovered in January 1995 at the Fernald Environmental Management Project (FEMP). This paper discusses the emergency and record recovery phases of the project, the technical options considered for records recovery, and special measures which were required due to radiological contamination of the records. Also, the root causes and lessons learned from the incident, and path forward for future records management operations at Fernald, are discussed.

163 (FEMP–2441) **1994 Site environmental report.** Fluor Daniel Environmental Restoration Management Corp., Fernald, OH (United States). Jul 1995. 221p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. Order Number DE96004201. Source: OSTI; NTIS; INIS; GPO Dep.

The Fernald site is a Department of Energy (DOE)-owned facility that produced high-quality uranium metals for military defense for nearly 40 years. DOE suspended production at the site in 1989 and formally ended production in 1991. Although production activities have ceased, the site continues to examine the air and liquid pathways as possible routes through which pollutants from past operations and current remedial activities may leave the site. The Site Environmental Report (SER) is prepared annually in accordance with DOE Order 5400.1, General Environmental Protection Program. This 1994 SER provides the general public as well as scientists and engineers with the results from the site's ongoing Environmental Monitoring Program. Also included in this report is information concerning the site's progress toward achieving full compliance with requirements set forth by DOE, U.S. Environmental Protection Agency (USEPA), and Ohio EPA (OEPA). For some readers, the highlights provided in this Executive Summary may provide sufficient information. Many readers, however, may wish to read more detailed descriptions of the information than those which are presented here. All information presented in this summary is discussed more fully in the main body of this report.

164 (FEMP–2516) **Remediation activities at the Fernald Environmental Management Project (FEMP).** Walsh, T.J. (FERMCO, Cincinnati, OH (United States)); Danner, R. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. 1996. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-9606125–10: Air and Waste Management (AWM) annual meeting, Nashville, TN (United States), 23-28 Jun 1996). Order Number DE96012142. Source: OSTI; NTIS; INIS; GPO Dep.

The Fernald Environmental Management Project (FEMP) is a United States Department of Energy (DOE) facility located in southwestern Ohio. The facility began manufacturing uranium products in the early 1950's and continued processing uranium ore concentrates until 1989. The facility used a variety of chemical and metallurgical processes to produce uranium metals for use at other DOE sites across the country. Since the facility manufactured uranium metals for over thirty years, various amounts of radiological contamination exists at the site. Because of the chemical and metallurgical processes employed at the site, some hazardous wastes as defined by the Resource Conservation and Recovery Act (RCRA) were also generated at the site. In 1989. the FEMP was placed on the National Priorities List (NPL) requiring cleanup of the facility's radioactive and chemical contamination under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This paper discusses the proposed remediation activities at the five Operable Units (OUs) designated at the FEMP. In addition, the paper also examines the ongoing CERCLA response actions and RCRA closure activities at the facility.

165 (INEL–94/0115-Rev.2) **Waste management facilities cost information: System cost model product description. Revision 2.** Lundeen, A.S.; Hsu, K.M.; Shropshire, D.E. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Feb 1996. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96009568. Source: OSTI; NTIS; INIS; GPO Dep.

Formerly EGG-WM–11352.

In May of 1994, Lockheed Idaho Technologies Company (LITCO) in Idaho Falls, Idaho and subcontractors developed the System Cost Model (SCM) application. The SCM estimates life-cycle costs of the entire US Department of Energy (DOE) complex for designing; constructing; operating; and decommissioning treatment, storage, and disposal (TSD) facilities for mixed low-level, low-level, transuranic, and mixed transuranic waste. The SCM uses parametric cost functions to estimate life-cycle costs for various treatment, storage, and disposal modules which reflect planned and existing facilities at DOE installations. In addition, SCM can model new facilities based on capacity needs over the program life cycle. The SCM also provides transportation costs for DOE wastes. Transportation costs are provided for truck and rail and include transport of contact-handled, remote-handled, and alpha (transuranic) wastes. The user can provide input data (default data is included in the SCM) including the volume and nature of waste to be managed, the time period over which the waste is to be managed, and the configuration of the waste management complex (i.e., where each installation's generated waste will be treated, stored, and disposed). Then the SCM uses parametric cost equations to estimate the costs of pre-operations (designing), construction costs, operation management, and decommissioning these waste management facilities.

166 (INEL–95/00057) **ICPP radiological and toxicological sabotage analysis.** Kubiak, V.R.; Mortensen, F.G. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950787–87: 36. annual meeting of the Institute for Nuclear Materials Management, Palm Desert, CA (United States), 9-12 Jul 1995). Order Number DE96001618. Source: OSTI; NTIS; INIS; GPO Dep.

In June of 1993, the Department of Energy (DOE) issued Notice 5630.3A, "Protection of Departmental Facilities Against Radiological and Toxicological Sabotage," which states that all significant radiological and toxicological hazards at Department facilities must be examined for potential sabotage. This analysis has been completed at the Idaho Chemical Processing Plant (ICPP). The ICPP radiological and toxicological hazards include spent government and commercial fuels, Special Nuclear Materials (SNM), high-level liquid wastes, high-level solid wastes, and process and decontamination chemicals. The analysis effort included identification and assessment of quantities of hazardous materials present at the facility; identification and ranking of hazardous material targets; development of worst case scenarios detailing possible sabotage actions and hazard releases; performance of vulnerability assessments using table top and computer methodologies on credible threat targets; evaluation of potential risks to the public, workers, and the environment; evaluation of sabotage risk reduction options; and selection of cost effective prevention and mitigation options.

167 (INEL–95/0166) **Comparative economics for DUCRETE spent fuel storage cask handling, transportation, and capital requirements.** Powell, F.P. (Sierra Nuclear Corp., Roswell, GA (United States)). Idaho National Engineering Lab., Idaho Falls, ID (United States). Apr 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96014147. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes economic differences between a DUCRETE spent nuclear fuel storage cask and a conventional concrete storage cask in the areas of handling, transportation, and capital requirements. The DUCRETE cask is under evaluation as a new technology that could substantially reduce the overall costs of spent fuel and depleted U disposal. DUCRETE incorporates depleted U in a Portland cement mixture and functions as the cask's primary radiation barrier. The cask system design includes insertion of the US DOE Multi-Purpose Canister inside the DUCRETE cask. The economic comparison is from the time a cask is loaded in a spent fuel pool until it is placed in the repository and includes the utility and overall US system perspectives.

168 (INEL–95/0167) **Conceptual design report for a transportable DUCRETE spent fuel storage cask system.** Hopf, J.E. (Sierra Nuclear Corp., Scotts Valley, CA (United States)). Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Aug 1995. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95017516. Source: OSTI; NTIS; INIS; GPO Dep.

A conceptual design has been developed for a spent fuel dry storage cask that employs depleted uranium concrete (DUCRETE) in place of ordinary concrete. DUCRETE, which uses depleted uranium oxide rocks rather than gravel as the concrete's heavy aggregate, is a more efficient overall radiation shield (gamma and neutron) than either steel or ordinary concrete. Thus, it allows the cask weight and size to be substantially reduced. Also, using DUCRETE as shielding avoids, or at least defers, disposal of the depleted uranium as waste. This report focuses on DUCRETE cask transportation issues. The approach studied involves placing the storage cask into a simple steel transportation overpack. Preliminary analyses were performed to demonstrate the transportation system's ability to meet the structural, thermal, and shielding transportation criteria. Conservative manual calculations were performed to demonstrate the adequacy of the DUCRETE transportation overpack with respect to structural requirements. Two-dimensional thermal analyses were performed on the system (the DUCRETE storage cask inside the steel overpack) using the ANSYS thermal analysis code. Two-dimensional shielding analyses were performed on the system with the MCNP code. Effects of the fuel axial burnup profile and solar radiation are considered. The analyses show that the proposed system can meet the transportation structural criteria and can easily meet the transportation shielding criteria. The thermal criteria are not as easy to meet because when the storage cask is placed horizontally in the transportation overpack, the DUCRETE storage cask's ventilation duct becomes an insulating dead air space. The maximum allowable temperature for the DUCRETE, which is not yet known, will be the limiting factor.

169 (INEL–95/00175) **Hazardous solvent substitution.** Twitchell, K.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9507191–1: Electric Power Research Institute radwaste workshop, Orlando, FL (United States), 14 Jul 1995). Order Number DE96002050. Source: OSTI; NTIS; INIS; GPO Dep.

Eliminating hazardous solvents is good for the environment, worker safety, and the bottom line. However, even though we are motivated to find replacements, the big question is 'What can we use as replacements for hazardous solvents?'You, too, can find replacements for your hazardous solvents. All you have to do is search for them. Search through the vendor literature of hundreds of companies with thousands of products. Ponder the associated material safety data sheets, assuming of course that you can obtain them and, having obtained them, that you can read them. You will want to search the trade magazines and other sources for product reviews. You will want to talk to users about how well the product actually works. You may also want to check US Environmental Protection Agency (EPA) and other government reports for toxicity and other safety information. And, of course, you will want to compare the product's constituent chemicals with the many hazardous constituency lists to ensure the safe and legal use of the product in your workplace.

170 (INEL–95/0185) **Idaho National Engineering Laboratory radiological control performance indicator report. Fourth quarterly calendar year 1994.** Aitken, S.B. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001340. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a report and analysis of the Radiological Control Program through the fourth quarter of calendar year 1994 (CY-1994) at the Idaho National Engineering Laboratory (INEL) under the direction of Lockheed Idaho Technologies Company (LITCO). The Radiological Performance Indicator Report is provided in accordance with Article 133 of the INEL Radiological Control Manual.

171 (INEL–95/00193) **Material monitoring.** Kotter, W.; Zirker, L.; Hancock, J.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9504207–3: Hazardous waste and materials conference, Pocatello, ID (United States), 17-19 Apr 1995). Order Number DE96004001. Source: OSTI; NTIS; INIS; GPO Dep.

Waste Reduction Operations Complex (WROC) facilities are located at the Idaho National Engineering Laboratory (INEL). The overall goal for the Pollution Prevention/Waste Minimization Unit is to identify and establish the correct amount of waste generated so that it can be reduced. Quarterly, the INEL Pollution Prevention (P2) Unit compares the projected amount of waste generated per process with the actual amount generated. Examples of waste streams that would be addresses for our facility would include be are not limited to: Maintenance, Upgrades, Office and Scrap Metal. There are three potential sources of this variance: inaccurate identification of those who generate the waste; inaccurate identification of the process that generates the waste; and inaccurate measurement of the actual amount generated. The Materials Monitoring Program was proposed to identify the sources of variance and reduce the variance to an acceptable level. Prior to the implementation of the Material Monitoring Program, all information that was gathered and recorded was done so through an informal estimation of waste generated by various personnel concerned with each processes. Due to the inaccuracy of the prior information gathering system, the Material Monitoring Program was established. The heart of this program consists of two main parts. In the first part potential waste generators provide information on projected waste generation process. In the second part, Maintenance, Office, Scrap Metal and Facility Upgrade wastes from given processes is disposed within the appropriate bin dedicated to that process. The Material Monitoring Program allows for the more accurate gathering of information on the various waste types that are being generated quarterly.

172 (INEL–95/00228) **A general theory to explain the relatively high cost of environmental restoration at DOE facilities.** Sullivan, W.H. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950868–22: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96001925. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration costs for Department of Energy (DOE) facilities have been the subject of much scrutiny and concern for several years. General opinion is that DOE clean-up costs are as much as three times higher than costs for similar clean-up projects in the private sector. Consequently, DOE Environmental Restoration professionals are continually under pressure to do more with less, which, ironically, can lead to additional inefficiencies in the system. This paper proposes a general theory as to why DOE costs are higher, explains the reasons why current conditions will make it difficult to realize any pervasive or significant decreases in clean-up costs, and presents some general changes that need to take place in the DOE system in order to bring about conditions that will allow more efficient clean-up to occur. The theory is based on a simple economic model that describes the balance between the resources spent for risk avoidance and the corresponding changes in overall productivity as a function of risk. The elementary concepts illustrated with the economic model, when refined and specifically applied, have the potential to become the catalyst for significant change-change that is absolutely necessary if we truly intend to conduct environmental clean-up with the same efficiencies as private industry.

173 (INEL–95/00234) **Development of a cumulative risk assessment for the Idaho National Engineering Laboratory's waste area group 2.** Burns, D.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950868–26: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96001933. Source: OSTI; NTIS; INIS; GPO Dep.

In 1989, the Idaho National Engineering Laboratory (INEL) was added to the Environmental Protection Agency's (EPA) National Priorities List of Superfund sites. A Federal Facility Agreement and Consent Order (FFA/CO) for the INEL was signed by the Department of Energy, Idaho Operations Office (DOE-ID), EPA, and the State of Idaho in December 1991. The goal of this agreement is to ensure that potential or actual INEL releases of hazardous substances to the environment are thoroughly investigated in accordance with the National Contingency Plan (NCP) and that appropriate response actions are taken as necessary to protect human health and the environment. The Test Reactor Area (TRA) is included as Waste Area Group (WAG) 2 of ten INEL WAGs identified in the FFA/CO. WAG 2 consists of 13 operable units (OUs) which include pits, tanks, rubble piles, ponds, cooling towers, wells, french drains, perched water and spill areas. OU 2-13 is the Comprehensive Remedial Investigation/Feasibility Study (RI/FS) for WAG 2. The study presented here is a preliminary evaluation of the comprehensive risk for WAG-2. This investigation will be used as the basis of the WAG-2 comprehensive baseline risk assessment (BRA), and it will serve as a model for other INEL comprehensive risk assessments. The WAG-2 preliminary risk evaluation consisted of two broad phases. These phases were (1) a site and contaminant screening that was intended to support the identification of COPCs and risk assessment data gaps, and (2) an exposure pathway analysis that evaluated the comprehensive human health risks associated with WAG-2. The primary purposes of the investigation were to screen WAG-2 release sites and contaminants, and to identify risk assessment data gaps, so the investigation will be referred to as the WAG-2 Screening and Data Gap Analysis (SDGA) for the remainder of this report.

174 (INEL–95/0255(94)) **1994 Environmental monitoring drinking water and nonradiological effluent programs annual report.** Andersen, B.D.; Brock, T.A.; Meachum, T.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Oct 1995. 350p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003484. Source: OSTI; NTIS; INIS; GPO Dep.

EG&G Idaho, Inc., initiated monitoring programs for drinking water in 1988 and for nonradiological parameters and pollutants in liquid effluents in 1985. These programs were initiated for the facilities operated by EG&G Idaho for the US Department of Energy at the Idaho National Engineering Laboratory. On October 1, 1994, Lockheed Idaho Technologies Company (LITCO) replaced EG&G Idaho as the prime contractor at the INEL and assumed responsibility for these programs. Section I discusses the general site characteristics, the analytical laboratories, and sampling methodology general to both programs. Section 2, the Drinking Water Program, tracks the bacteriological, chemical, and radiological parameters required by State and Federal regulations. This section describes the drinking water monitoring activities conducted at 17 LITCO-operated production wells and 11 distribution systems. It also contains all of the drinking water parameters detected and the regulatory limits exceeded during calendar year 1994. In addition, groundwater quality is discussed as it relates to contaminants identified at the wellhead for LITCO production wells. Section 3 discusses the nonradiological liquid effluent monitoring results for 27 liquid effluent streams. These streams are presented with emphasis on calendar year 1994 activities. All parameter measurements and concentrations were below the Resource Conservation and Recovery Act toxic characteristics limits.

175 (INEL–95/0273) **System cost model user's manual, version 1.2.** Shropshire, D. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1995. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001354. Source: OSTI; NTIS; INIS; GPO Dep.

The System Cost Model (SCM) was developed by Lockheed Martin Idaho Technologies in Idaho Falls, Idaho and

MK-Environmental Services in San Francisco, California to support the Baseline Environmental Management Report sensitivity analysis for the U.S. Department of Energy (DOE). The SCM serves the needs of the entire DOE complex for treatment, storage, and disposal (TSD) of mixed low-level, low-level, and transuranic waste. The model can be used to evaluate total complex costs based on various configuration options or to evaluate site-specific options. The site-specific cost estimates are based on generic assumptions such as waste loads and densities, treatment processing schemes, existing facilities capacities and functions, storage and disposal requirements, schedules, and cost factors. The SCM allows customization of the data for detailed site-specific estimates. There are approximately forty TSD module designs that have been further customized to account for design differences for nonalpha, alpha, remote-handled, and transuranic wastes. The SCM generates cost profiles based on the model default parameters or customized user-defined input and also generates costs for transporting waste from generators to TSD sites.

176 (INEL–95/0274(1stQTR)) **Idaho National Engineering Laboratory Radiological Control performance indicator report: First quarter, calendar year 1995.** Aitken, S.B. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jul 1995. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001580. Source: OSTI; NTIS; INIS; GPO Dep.

The INEL Radiological Control Performance Indicator Report is provided quarterly, inaccordance with Article 133 of the INEL Radiological Control Manual. Indicators are used as a measure of performance of the Radiological Control Program and as a motivation for improvement, not as a goal in themselves. These indicators should be used by management to assist in focusing priorities and attention and adherence to As-Low-As-Reasonably-Achievable (ALARA) practices. The ALARA Committees establish ALARA goals for the INEL based on forecasts and goals provided by each facility organizational manager or supervisor.Performance goals are realistic and measurable. Stringent goals are set at least annually to reflect expected workloads and improvement of radiological performance. Goals higher than previous goals may occasionally be set due to changes in work scope or mission. The INEL Radiological Control Performance Indicators consist of: Collective dose in person-rem; average worker dose, maximum dose to a worker, and maximum neutron dose to a worker;the number of skin and clothing contaminations, including the number of contaminated wounds and facial contaminations; the number of radioactive material intakes; the area of Contamination, High Contamination, and Airborne Radioactivity Areas in square feet; and airborne radioactivity events and spills.

177 (INEL–95/0274(3rdQTR)) **Idaho National Engineering Laboratory Radiological Control Performance Indicator Report. Third quarter, calendar year 1995.** Reavis, R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Dec 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96004528. Source: OSTI; NTIS; GPO Dep.

The INEL Radiological Control Performance Indicator Report is provided quarterly, in accordance with Article 133 of the INEL Radiological Control Manual. Indicators are used as a measure of performance of the Radiological Control Program and as a motivation for improvement, not as a goal in themselves. These indicators should be used by management to assist in focusing priorities and attention and adherence to As-Low-As-Reasonably-Achievable (ALARA) practices. The INEL Radiological Control Performance Indicators consist of: collective dose in person-rem; average work dose, maximum dose to a worker, and maximum neutron dose to a worker; the number of skin and clothing contaminations, including the number of contaminated wounds and facial contaminations; the number of radioactive material intakes resulting in a dose assessment of 10 mrem or more; the area of contamination, high contamination, and airborne radioactivity areas in square feet; and airborne radioactivity events and spills.

178 (INEL–95/0300-Rev.1) **Waste management facilities cost information for transportation of radioactive and hazardous materials.** Feizollahi, F.; Shropshire, D.; Burton, D. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1995. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (DOE/ID/12701–1-EX.SUMM.). Order Number DE96002295. Source: OSTI; NTIS; INIS; GPO Dep.

Formerly EGG-WM-10877.

This report contains cost information on the U.S. Department of Energy (DOE) Complex waste streams that will be addressed by DOE in the programmatic environmental impact statement (PEIS) project. It describes the results of the task commissioned by DOE to develop cost information for transportation of radioactive and hazardous waste. It contains transportation costs for most types of DOE waste streams: low-level waste (LLW), mixed low-level waste (MLLW), alpha LLW and alpha MLLW, Greater-Than-Class C (GTCC) LLW and DOE equivalent waste, transuranic (TRU) waste, spent nuclear fuel (SNF), and hazardous waste. Unit rates for transportation of contact-handled (<200 mrem/hr contact dose) and remote-handled (>200 mrem/hr contact dose) radioactive waste are estimated. Land transportation of radioactive and hazardous waste is subject to regulations promulgated by DOE, the U.S. Department of Transportation (DOT), the U.S. Nuclear Regulatory Commission (NRC), and state and local agencies. The cost estimates in this report assume compliance with applicable regulations.

179 (INEL–95/00303) **Experimental validation of lead cross sections for scale and MCNP.** Henrikson, D.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9509100–131: 5. international conference on nuclear criticality safety, Albuquerque, NM (United States), 17-22 Sep 1995). Order Number DE96002522. Source: OSTI; NTIS; INIS; GPO Dep.

Moving spent nuclear fuel between facilities often requires the use of lead-shielded casks. Criticality safety that is based upon calculations requires experimental validation of the fuel matrix and lead cross section libraries. A series of critical experiments using a high-enriched uranium-aluminum fuel element with a variety of reflectors, including lead, has been identified. Twenty-one configurations were evaluated in this study. The fuel element was modelled for KENO V.a and MCNP 4a using various cross section sets. The experiments addressed in this report can be used to validate lead-reflected calculations. Factors influencing calculated k_{eff} which require further study include diameters of styrofoam inserts and homogenization.

180 (INEL–95/0312) **ICPP environmental monitoring report CY-1994.** Lockheed Idaho Technologies Co.,

Idaho Falls, ID (United States). May 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001550. Source: OSTI; NTIS; INIS; GPO Dep.

Summarized in this report are the data collected through Environmental Monitoring programs conducted at the Idaho Chemical Processing Plant (ICPP) by the Environmental Protection Department. The ICPP is responsible for complying with all applicable Federal, State, Local and DOE Rules, Regulations and Orders. Radiological effluent and emissions are regulated by the DOE in accordance with the Derived Concentration Guides (DCGs) as presented in DOE Order 5400.5. The State of Idaho regulates nonradiological waste resulting from the ICPP operations including airborne, liquid, and solid waste. The Environmental Department updated the Quality Assurance (QA) Project Plan for Environmental Monitoring activities during the third quarter of 1992. QA activities have resulted in the ICPP's implementation of the Environmental Protection Agency (EPA) rules and guidelines pertaining to the collection, analyses, and reporting of environmentally related samples. Where no EPA methods for analyses existed for radionuclides, LITCO methods were used.

181 (INEL–95/00347) **Activities of the INEL Sample Management Office: Resulting in efficiency at the INEL.** Watkins, C.S.; Hoiland, S.A. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. 182 (INEL–95/0422) **Idaho Chemical Processing Plant failure rate database.** Alber, T.G.; Hunt, C.R.; Fogarty, S.P.; Wilson, J.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001367. Source: OSTI; NTIS; INIS; GPO Dep.

This report represents the first major upgrade to the Idaho Chemical Processing Plant (ICPP) Failure Rate Database. This upgrade incorporates additional site-specific and generic data while improving on the previous data reduction techniques. In addition, due to a change in mission at the ICPP, the status of certain equipment items has changed from operating to standby or off-line. A discussion of how this mission change influenced the relevance of failure data also has been included. This report contains two data sources: the ICPP Failure Rate Database and a generic failure rate database. A discussion is presented on the approaches and assumptions used to develop the data in the ICPP Failure Rate Database. The generic database is included along with a short discussion of its application. A brief discussion of future projects recommended to strengthen and lend credibility to the ICPP Failure Rate Database also is included.

183 (INEL–95/00426) **Consensus standard requirements and guidance.** Putman, V.L. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951006–24: Winter meeting of the American Nuclear Society (ANS), San Francisco, CA (United States), 29 Oct - 1 Nov 1995). Order Number DE96002533. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents information from the ANS Criticality Alarm System Workshop relating to the consensus standard requirements and guidance. Topics presented include: definition; nomenclature; requirements and recommendations; purpose of criticality alarms; design criteria; signal characteristics; reliability, dependability and durability; tests; and emergency preparedness and planning.

184 (INEL–95/0455) **User's and reference guide to the INEL RML/analytical radiochemistry sample tracking database version 1.00.** Femec, D.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002186. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the sample tracking database in use at the Idaho National Engineering Laboratory (INEL) by the Radiation Measurements Laboratory (RML) and Analytical Radiochemistry. The database was designed in-house to meet the specific needs of the RML and Analytical Radiochemistry. The report consists of two parts, a user's guide and a reference guide. The user's guide presents some of the fundamentals needed by anyone who will be using the database via its user interface. The reference guide describes the design of both the database and the user interface. Briefly mentioned in the reference guide are the code-generating tools, CREATE-SCHEMA and BUILD-SCREEN, written to automatically generate code for the database and its user interface. The appendices contain the input files used by the these tools to create code for the sample tracking database. The output files generated by these tools are also included in the appendices.

185 (INEL–95/00480) **Proposed criteria for the stability in earthquakes of nuclear-material shipping casks.** Morrow, W.M.; Uldrich, E.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9511128–9: 5. Department of Energy (DOE) natural phenomena hazards mitigation symposium, Denver, CO (United States), 13-17 Nov 1995). Order Number DE96002510. Source: OSTI; NTIS; INIS; GPO Dep.

A criterion based on the ratio of potential energy required to tip over the cask to the kinetic energy that a cask would obtain in an earthquake is proposed. The kinetic energy is estimated from the equation of motion for an inverted pendulum, the design basis ground velocities, and design basis spectral velocities. The previously known scaling effect which shows that larger structures that larger structures are more stable than smaller ones of the same geometry is demonstrated.

186 (INEL–95/00486) **The INEL approach: Environmental Restoration Program management and implementation methodology.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960212–31: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96007282. Source: OSTI; NTIS; INIS; GPO Dep.

The overall objectives of the INEL Environmental Restoration (ER) Program management approach are to facilitate meeting mission needs through the successful implementation of a sound, and effective project management philosophy. This paper outlines the steps taken to develop the ER program, and explains further the implementing tools and processes used to achieve what can be viewed as fundamental to a successful program. The various examples provided will demonstrate how the strategies for implementing these operating philosophies are actually present and at work throughout the program, in spite of budget drills and organizational changes within DOE and the implementing contractor. A few of the challenges and successes of the INEL Environmental Restoration Program have included: a) completion of all enforceable milestones to date, b) acceleration of enforceable milestones, c) managing funds to reduce uncosted obligations at year end by utilizing greater than 99% of FY-95 budget, d) an exemplary safety record, e) developing a strategy for partial Delisting of the INEL by the year 2000, f) actively dealing with Natural Resource Damages Assessment issues, g) the achievement of significant project cost reductions, h) and implementation of a partnering charter and application of front end quality principles.

187 (INEL–95/00558) **Using the baseline environmental management report (BEMR) to examine alternate program scenarios.** Kristofferson, K. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951209–6: 17. low-level radioactive waste management conference, Phoenix, AZ (United States), 12-14 Dec 1995). Order Number DE96003115. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy's (DOE) Office of Environmental Management (EM) released the first Baseline Environmental Management Report (BEMR) in March, 1995. The Congressionally-mandated report provides life-cycle cost estimates, tentative schedules, and projected activities necessary to complete DOE's Environmental Management Program. This "base case" estimate is based on current program assumptions and the most likely set of activities. However, since the future course of the Environmental Management Program depends upon a number of fundamental technical and policy choices, alternate program scenarios were developed. These alternate cases show the potential cost impacts of changing assumptions in four key areas: future land use, program funding and scheduling, technology development, and waste management configurations. Several cost and program evaluation tools were developed to support the analysis of these alternate cases. The objective of this paper is to describe the analytical tool kit developed to support the development of the 1995 Baseline Report and to discuss the application of these tools to evaluate alternate program scenarios.

188 (INEL–95/0576) **Idaho National Engineering Laboratory materials in inventory natural and enriched uranium management and storage costs.** Nebeker, R.L. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Nov 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96004135. Source: OSTI; NTIS; INIS; GPO Dep.

On July 13, 1994, the Office of Environmental Management (EM) was requested to develop a planning process that would result in management policies for dealing with nuclear materials in inventory. In response to this request, EM launched the Materials In Inventory (MIN) Initiative. A Headquarters Working Group was established to develop the broad policy framework for developing MIN management policies. MIN activities cover essentially all nuclear materials within the DOE complex, including such items as spent nuclear fuel, depleted uranium, plutonium, natural and enriched uranium, and other materials. In August 1995, a report discussing the natural and enriched uranium portion of the Initiative for the Idaho National Engineering Laboratory (INEL) was published. That report, 'Idaho National Engineering Laboratory Materials-in-Inventory, Natural and Enriched Uranium'.' identified MIN under the control of Lockheed Idaho Technologies Company at the INEL. Later, additional information related to the costs associated with the storage of MIN materials was requested to supplement this report. This report provides the cost information for storing, disposing, or consolidating the natural and enriched uranium portion of the MIN materials at the INEL. The information consists of eight specific tables which detail present management costs and estimated costs of future activities.

189 (INEL–95/00602) **Estimating and understanding DOE waste management costs'.** Kang, J.S. (USDOE, Washington, DC (United States)); Sherick, M.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951209–7: 17. low-level radioactive waste management conference, Phoenix, AZ (United States), 12-14 Dec 1995). Order Number DE96003510. Source: OSTI; NTIS; INIS; GPO Dep.

This paper examines costs associated with cleaning up the US Department of Energy's (DOE's) nuclear facilities, with particular emphasis on the waste management program. Life-cycle waste management costs have been compiled and reported in the DOE Baseline Environmental Management Report (BEMR). Waste management costs are a critical issue for DOE because of the current budget constraints. The DOE sites are struggling to accomplish their environmental management objectives given funding scenarios that are well below anticipated waste management costs. Through the BEMR process, DOE has compiled complex-wide cleanup cost estimates and has begun analysis of these costs with respect to alternative waste management scenarios and policy strategies. From this analysis, DOE is attempting to identify the major cost drivers and prioritize environmental management activities to achieve maximum utilization of existing funding. This paper provides an overview of the methodology DOE has used to estimate and analyze some waste management costs, including the key data requirements and uncertainties.

190 (INEL–95/0619) **Evaluation of retrieval activities and equipment for removal of containers from the transuranic storage area retrieval enclosure.** Bannister, R. (BNFL, Inc., Englewood, CO (United States)); Rhoden, G.; Davies, G.B. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States); BNFL, Inc., Englewood, CO (United States). Sep 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003994. Source: OSTI; NTIS; INIS; GPO Dep.

Since 1970, the Radioactive Waste Management Complex at the Idaho National Engineering Laboratory has accepted over 55,000 cubic meters of Transuranic contaminated hazardous waste for interim storage. The waste has been neatly stored in "cell" configurations on adjoining, above ground asphalt pads at the Transuranic Storage Area (TSA). A number of reports have been supplied for review and comment describing the methodology and equipment proposed for retrieval of drums and boxes from a storage facility at the INEL site. The contract for this review requires two main issues to be addressed. First, the adequacy of equipment and methodology for the retrieval of containers which have been breached, lost structural integrity, or are otherwise damaged, Second, to review the strategies and equipment for retrieval of intact waste containers. These issues are presented in the following report along with additional detail in the methodology to complete the description of the operations required for retrieval under most operational scenarios. The documentation reviewed is considered to be at an interim stage and is therefore expected to be subject to the development of the methodology from the existing level of detail with input from the facility operators. This review aims to anticipate some of this development by providing suggested detailed methods of retrieval and equipment for both normal and abnormal operations.

191 (INEL–96/00005) **Measurement of ^{222}Rn flux, ^{222}Rn emanation and ^{226}Ra concentration from injection well pipe scale.** Rood, A.S. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Kendrick, D.T. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States);American Petroleum Inst., Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960110–2: 29. midyear topical meeting of the Health Physics Society: naturally occuring and accelerator produced radioactive material - regulation and risk assessment, Scottsdale, AZ (United States), 7-10 Jan 1996). Order Number DE96007275. Source: OSTI; NTIS; INIS; GPO Dep.

The presence of Naturally Occurring Radioactive Material (NORM) has been recognized since the early 1930s in petroleum reservoirs and in oil and gas production and processing facilities. NORM was typically observed in barite scale that accumulated on the interior of oil production tubing and in storage tank and heater-treater separation sludge. Recent concern has been expressed over the health impacts from the uncontrolled release of NORM to the public. There are several potential exposure pathways to humans from oil-field NORM. Among these is inhalation of radon gas and its daughter products. For this exposure pathway to be of any significance, radon must first be released from the NORM matrix and diffuse in free air. The radon emanation fraction refers to the fraction of radon atoms produced by the decay of radium, that migrate from the bulk material as free gaseous atoms. The purpose of this investigation was to characterize the radon release rates from NORM-scale contaminated production tubing being stored above ground, characterize the radon emanation fraction of the bulk scale material when removed from the tubing, and characterize the radium concentrations of the scale. Accurate characterization of ^{222}Rn emanation fractions from pipe scale may dictate the type of disposal options available for this waste. Characterization of radon release from stored pipes will assist in determining if controls are needed for workers or members of the public downwind from the source. Due to the sensitive nature of this data, the location of this facility is not disclosed.

192 (INEL–96/0012) **Analysis of ICPP fuel storage rack inner tie and corner tie substructures.** Nitzel, M.E.; Rahl, R.G. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jan 1996. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96007523. Source: OSTI; NTIS; INIS; GPO Dep.

Finite element models were developed and analyses performed for the tie plate, inner tie block assembly, and corner tie block assembly of a 25 port fuel rack assembly designed for installation in Pool 1 of Building 666 at the Idaho Chemical Processing Plant. These models were specifically developed to investigate the adequacy of certain welds joining components of the fuel storage rack assembly. The work scope for the task was limited to an investigation of the stress levels in the subject subassemblies when subjected to seismic loads. Structural acceptance criteria used for the elastic calculations performed were as found in the overall rack design report as issued by the rack's designer, Holtec International. Structural acceptance criteria used for the plastic calculations performed as part of this effort were as defined in Subsection NF and Appendix F of the ASME Boiler & Pressure Vessel Code. The results of the analyses will also apply to the 30 port fuel storage rack design that is also scheduled for installation in Pool 1 of ICPP 666. The results obtained from the analyses performed for this task indicate that the welds joining the inner tie block and corner tie block to the surrounding rack structure meet the acceptance criteria. Further, the structural members (plates and blocks) were also found to be within the allowable stress limits established by the acceptance criteria. The separate analysis performed on the inner tie plate confirmed the structural adequacy for both the inner tie plate, corner tie plate, and tie block bolts. The analysis results verified that the inner tie and corner tie block should be capable of transferring the expected seismic load without structural failure.

193 (INEL–96/00034) **Development of waste chargeback systems at the Idaho National Engineering Laboratory (INEL).** Piscitella, R.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Feb 1996. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960212–15: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96007274. Source: OSTI; NTIS; INIS; GPO Dep.

Includes vugraphs.

Chargeback systems have been discussed (and cussed), tried, modified, and in some cases, successfully implemented in the DOE complex over the years. With the current emphasis on "Doing business like a private company," there has been renewed interest at the Idaho National Engineering Laboratory (INEL) in implementing chargeback systems for waste management activities. The most recent activities relating to chargeback at the INEL started the summer of 1995 with direction from waste operations management to develop and pilot test a chargeback system. This paper presents the results of this effort to date.

194 (INEL–96/0053) **Idaho Chemical Processing Plant Process Efficiency improvements.** Griebenow, B. Idaho National Engineering Lab., Idaho Falls, ID (United States). Mar 1996. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96010359. Source: OSTI; NTIS; INIS; GPO Dep.

In response to decreasing funding levels available to support activities at the Idaho Chemical Processing Plant (ICPP) and a desire to be cost competitive, the Department of Energy Idaho Operations Office (DOE-ID) and Lockheed

Idaho Technologies Company have increased their emphasis on cost-saving measures. The ICPP Effectiveness Improvement Initiative involves many activities to improve cost effectiveness and competitiveness. This report documents the methodology and results of one of those cost cutting measures, the Process Efficiency Improvement Activity. The Process Efficiency Improvement Activity performed a systematic review of major work processes at the ICPP to increase productivity and to identify nonvalue-added requirements. A two-phase approach was selected for the activity to allow for near-term implementation of relatively easy process modifications in the first phase while obtaining long-term continuous improvement in the second phase and beyond. Phase I of the initiative included a concentrated review of processes that had a high potential for cost savings with the intent of realizing savings in Fiscal Year 1996 (FY-96.) Phase II consists of implementing long-term strategies too complex for Phase I implementation and evaluation of processes not targeted for Phase I review. The Phase II effort is targeted for realizing cost savings in FY-97 and beyond.

195 (INEL–96/0054) **Hazard classification of environmental restoration activities at the INEL.** Peatross, R.G. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Apr 1996. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96013303. Source: OSTI; NTIS; INIS; GPO Dep.

The following documents require that a hazard classification be prepared for all activities for which US Department of Energy (DOE) has assumed environmental, safety, and health responsibility: the DOE Order 5481.1B, Safety Analysis and Review System and DOE Order 5480.23, Nuclear Safety Analysis Reports. A hazard classification defines the level of hazard posed by an operation or activity, assuming an unmitigated release of radioactive and nonradioactive hazardous material. For environmental restoration activities, the release threshold criteria presented in Hazard Baseline Documentation (DOE-EM-STD-5502-94) are used to determine classifications, such as Radiological, Nonnuclear, and Other Industrial facilities. Based upon DOE-EM-STD-5502-94, environmental restoration activities in all but one of the sites addressed by the scope of this classification (see Section 2) can be classified as "Other Industrial Facility". DOE-EM-STD-5502-94 states that a Health and Safety Plan and compliance with the applicable Occupational Safety and Health Administration (OSHA) standards are sufficient safety controls for this classification.

196 (INEL–96/0101) **Environmental management requirements/defensible costs project. Final report.** Idaho National Engineering Lab., Idaho Falls, ID (United States). Feb 1996. 114p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96010362. Source: OSTI; NTIS; INIS; GPO Dep.

Lockheed Idaho Technologies Company (LITCO) used a systems engineering approach to develop the first formal requirements baseline for Idaho National Engineering Laboratory (INEL) Environmental Management (EM) Programs. The recently signed Settlement Agreement with the State of Idaho (Batt Agreement), along with dramatically reduced EM funding targets from Department of Energy (DOE) headquarters, drove the immediacy of this effort. Programs have linked top-level requirements to work scope to cost estimates. All EM work, grouped by decision units, was scrubbed by INEL EM programs and by an independent "Murder Board." Direct participation of upper level management from LITCO and the DOE-Idaho Operations Office ensured best information and decisions. The result is a scrubbed down, defensible budget tied to top-level requirements for use in the upcoming DOE-Headquarters' budget workout, the Internal Review Board, the FY98 Activity Data Sheets submittal, and preparation of the FY97 control accounts and out-year plans. In addition to the remarkable accomplishments during the past eight weeks, major issues were identified and documented and follow-on tasks are underway which will lead to further improvements in INEL EM program management.

197 (INEL–96/0148) **Technical requirements document for the waste flow analysis.** Shropshire, D.E. Idaho National Engineering Lab., Idaho Falls, ID (United States). May 1996. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96014177. Source: OSTI; NTIS; INIS; GPO Dep.

Purpose of this Technical Requirements Document is to define the top level customer requirements for the Waste Flow Analysis task. These requirements, once agreed upon with DOE, will be used to flow down subsequent development requirements to the model specifications. This document is intended to be a "living document" which will be modified over the course of the execution of this work element. Initial concurrence with the technical functional requirements from Environmental Management (EM)-50 is needed before the work plan can be developed.

198 (INEL–96/0186) **ICPP environmental monitoring report CY-1995.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Apr 1996. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96013307. Source: OSTI; NTIS; INIS; GPO Dep.

Summarized in this report are the data collected through Environmental Monitoring programs conducted at the Idaho Chemical Processing Plant (ICPP) by the Environmental Protection Department. The ICPP is responsible for complying with all applicable Federal, State, Local and DOE Rules, Regulations and Orders. Radiological effluent and emissions are regulated by the DOE in accordance with the Derived Concentration Guides (DCGs). The State of Idaho regulates nonradiological waste resulting from the ICPP operations including airborne, liquid, and solid waste. The Environmental Department updated the Quality Assurance (QA) Project Plan for Environmental Monitoring activities during the third quarter of 1992. QA activities have resulted in the ICPP's implementation of the Environmental Protection Agency (EPA) rules and guidelines pertaining to the collection, analyses, and reporting of environmentally related samples. Where no EPA methods for analyses existed for radionuclides, Lockheed Idaho Technologies Company (LITCO) methods were used.

199 (KCP–613-5735) **Pollution prevention opportunity assessment approach, training, and technical assistance for DOE contractors. FY 1995 report.** Pemberton, S. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Feb 1996. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE96006087. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy and its contractors are faced with environmental concerns and large waste management costs. Federal legislation and DOE Orders require sites to develop waste minimization/pollution prevention programs. In response to these requirements, the Kansas City Plant developed a pollution prevention tool called a pollution prevention opportunity assessment (PPOA). Pilot assessments resulted in the development of a graded approach to reduce the amount of effort required for activities that utilized nonhazardous and/or low-volume waste streams. The project's objectives in FY95 were to validate DOE's PPOA Graded Approach methodology, provide PPOA training and technical assistance to interested DOE personnel and DOE contractors, enhance the methodology with energy analysis and tools for environmental restoration activities, implement a DOE-wide PPOA database, and provide support to DOE EM-334 in the completion of a report which estimates the future potential for pollution prevention and waste minimization in the DOE complex.

200 (K/ER-47/R1) **Site descriptions of environmental restoration units at the Oak Ridge K-25 Site, Oak Ridge, Tennessee.** Goddard, P.L.; Legeay, A.J.; Pesce, D.S.; Stanley, A.M. Oak Ridge K-25 Site, TN (United States). Nov 1995. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96003111. Source: OSTI; NTIS; INIS; GPO Dep.

This report, Site Descriptions of Environmental Restoration Units at the Oak Ridge K-25 Site, Oak Ridge, Tennessee, is being prepared to assimilate information on sites included in the Environmental Restoration (ER) Program of the K-25 Site, one of three major installations on the Oak Ridge Reservation (ORR) built during World War III as part of the Manhattan Project. The information included in this report will be used to establish program priorities so that resources allotted to the K-25 ER Program can be best used to decrease any risk to humans or the environment, and to determine the sequence in which any remedial activities should be conducted. This document will be updated periodically in both paper and Internet versions. Units within this report are described in individual data sheets arranged alphanumerically. Each data sheet includes entries on project status, unit location, dimensions and capacity, dates operated, present function, lifecycle operation, waste characteristics, site status, media of concern, comments, and references. Each data sheet is accompanied by a photograph of the unit, and each unit is located on one of 13 area maps. These areas, along with the sub-area, unit, and subunit breakdowns within them, are outlined in Appendix A. Appendix B is a summary of information on remote aerial sensing and its applicability to the ER program.

201 (LA-13028-MS) **Baseline radionuclide concentrations in soils and vegetation around the proposed Weapons Engineering Tritium Facility and the Weapons Subsystems Laboratory at TA-16.** Fresquez, P.R.; Ennis, M. Los Alamos National Lab., NM (United States). Sep 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96000053. Source: OSTI; NTIS; INIS; GPO Dep.

A preoperational environmental survey is required by the Department of Energy (DOE) for all federally funded research facilities that have the potential to cause adverse impacts on the environment. Therefore, in accordance with DOE Order 5400.1, an environmental survey was conducted over the proposed sites of the Weapons Engineering Tritium Facility (WETF) and the Weapons Subsystems Laboratory (WSL) at Los Alamos National Laboratory (LANL) at TA-16. Baseline concentrations of tritium (^{3}H), plutonium (^{238}Pu and ^{239}Pu) and total uranium were measured in soils, vegetation (pine needles and oak leaves) and ground litter. Tritium was also measured from air samples, while cesium (^{137}Cs) was measured in soils. The mean concentration of airborne tritiated water during 1987 was 3.9 pCi/m^{3}. Although the mean annual concentration of ^{3}H in soil moisture at the 0–5 cm (2 in) soil depth was measured at 0.6 pCi/mL, a better background level, based on long-term regional data, was considered to be 2.6 pCi/mL. Mean values for ^{137}Cs, ^{218}Pu, ^{239}Pu, and total uranium in soils collected from the 0–5 cm depth were 1.08 pCi/g, 0.0014 pCi/g, 0.0325 pCi/g, and 4.01 { micro} g/g, respectively. Ponderosa pine (Pinus ponderosa) needles contained higher values of ^{238}Pu, ^{239}Pu, and total uranium than did leaves collected from gambel's oak (Quercus gambelii). In contrast, leaves collected from gambel's oak contained higher levels of ^{137}Cs than what pine needles did.

202 (LA-13133-SR) **94-1 Research and Development Project Lead laboratory support. Status report, October 1–December 31, 1995.** Dinehart, M. (comp.). Los Alamos National Lab., NM (United States). May 1996. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96010651. Source: OSTI; NTIS; INIS; GPO Dep.

This is a quarterly progress report of the 94-1 Research and Development Lead Laboratory Support Technical Program Plan for the first quarter of FY 1996. The report provides details concerning descriptions, DOE-complex-wide material stabilization technology needs, scientific background and approach, progress, benefits to the DOE complex, and collaborations for selected subprojects. An executive summary and report on end-of-quarter spending is included.

203 (LA-13148-MS) **Ecotoxicological screen of Potential Release Site 50-006(d) of Operable Unit 1147 of Mortandad Canyon and relationship to the Radioactive Liquid Waste Treatment Facilities project.** Gonzales, G.J.; Newell, P.G. Los Alamos National Lab., NM (United States). Apr 1996. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96010042. Source: OSTI; NTIS; INIS; GPO Dep.

Potential ecological risk associated with soil contaminants in Potential Release Site (PRS) 50-006(d) of Mortandad Canyon at the Los Alamos National Laboratory was assessed by performing an ecotoxicological risk screen. The PRS surrounds Outfall 051, which discharges treated effluent from the Radioactive Liquid Waste Treatment Facility. Discharge at the outfall is permitted under the Clean Water Act National Pollution Discharge Elimination System. Radionuclide discharge is regulated by US Department of Energy (DOE) Order 5400.5. Ecotoxicological Screening Action Levels (ESALSs) were computed for nonradionuclide constituents in the soil, and human risk SALs for radionuclides were used as ESALs. Within the PRS and beginning at Outfall 051, soil was sampled at three points along each of nine linear transects at 100-ft intervals. Soil samples from 3 depths for each sampling point were analyzed for the concentration of a total of 121 constituents. Only the results of the surface sampling are reported in this report.

204 (LA-SUB-96-48) **Product and market study for Los Alamos National Laboratory. Building resources for technology commercialization: The SciBus Analytical, Inc. paradigm.** Los Alamos National Lab., NM (United States); Calidex Corp., Saratoga, CA (United States). 1 Feb

1996. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96012106. Source: OSTI; NTIS; GPO Dep.

The study project was undertaken to investigate how entrepreneurial small businesses with technology licenses can develop product and market strategies sufficiently persuasive to attract resources and exploit commercialization opportunities. The study attempts to answer two primary questions: (1) What key business development strategies are likely to make technology transfers successful, and (2) How should the plan best be presented in order to attract resources (e.g., personnel, funding, channels of distribution)? In the opinion of the investigator, Calidex Corporation, if the business strategies later prove to be successful, then the plan model has relevance for any technology licensee attempting to accumulate resources and bridge from technology resident in government laboratories to the commercial marketplace. The study utilized SciBus Analytical, Inc. (SciBus), a Los Alamos National Laboratory CRADA participant, as the paradigm small business technology licensee. The investigator concluded that the optimum value of the study lay in the preparation of an actual business development plan for SciBus that might then have, hopefully, broader relevance and merit for other private sector technology transfer licensees working with various Government agencies.

205 (LA-SUB–96-97) **Study of polyelectrolytes for Los Alamos National Laboratory. Final report.** Labonne, N. (Florida State Univ., Tallahassee, FL (United States)). Los Alamos National Lab., NM (United States); Florida State Univ., Tallahassee, FL (United States). Nov 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96013704. Source: OSTI; NTIS; INIS; GPO Dep.

To assess the safety of a potential radioactive waste repository, analysis of the fluid solution containing low levels of activity need to be performed. In some cases, the radioactivity would be so weak (3–30 pCi/L) that the solution must be concentrated for measurement. For this purpose, Los Alamos National Laboratory scientists are synthesizing some water soluble polyelectrolytes, which, because they are strong complexing agents for inorganic cations, can concentrate the radioelements in solution. To assist in characterization of these polyelectrolytes, the author has performed experiments to determine physico-chemical constants, such as pKa values and stability constants. The complexation constants between both polyelectrolytes and europium were determined by two methods: solvent extraction and ion exchange. Results are presented.

206 (LA-UR–95-692) **Cost effectiveness studies of environmental technologies: Volume 1.** Silva, E.M.; Booth, S.R. (eds.). Los Alamos National Lab., NM (United States). Feb 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007853. Source: OSTI; NTIS; INIS; GPO Dep.

This paper examines cost effectiveness studies of environmental technologies including the following: (1) In Situ Air Stripping, (2) Surface Towed Ordinance Locator System, (3) Ditch Witch Horizontal Boring Technology, (4) Direct Sampling Ion Trap Mass Spectrometer, (5) In Situ Vitrification, (6) Site Characterization and Analysis Penetrometer System, (7) In Situ Bioremediation, and (8) SEAMIST Membrane System Technology.

207 (LA-UR–95-1703) **Decision support tools for policy and planning.** Jacyk, P.; Schultz, D.; Spangenberg, L. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505278–1: Gensym users group meeting, Cambridge, MA (United States), 24 May 1995). Order Number DE95015327. Source: OSTI; NTIS; INIS; GPO Dep.

A decision support system (DSS) is being developed at the Radioactive Liquid Waste Treatment Facility, Los Alamos National Laboratory (LANL). The DSS will be used to evaluate alternatives for improving LANL's existing central radioactive waste water treatment plant and to evaluate new site-wide liquid waste treatment schemes that are required in order to handle the diverse waste streams produced at LANL. The decision support system consists of interacting modules that perform the following tasks: rigorous process simulation, configuration management, performance analysis, cost analysis, risk analysis, environmental impact assessment, transportation modeling, and local, state, and federal regulation compliance checking. Uncertainty handling techniques are used with these modules and also with a decision synthesis module which combines results from the modules listed above. We believe the DSS being developed can be applied to almost any other industrial water treatment facility with little modification because in most situations the waste streams are less complex, fewer regulations apply, and the political environment is simpler. The techniques being developed are also generally applicable to policy and planning decision support systems in the chemical process industry.

208 (LA-UR–95-1880) **Above and beyond basic public participation.** Mathai, L.P.; Lefkoff, M.S.; Kelly, E.J. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9506237–1: International Congress on Hazardous Waste: impact on human and ecological health, Atlanta, GA (United States), 5-8 Jun 1995). Order Number DE95015197. Source: OSTI; NTIS; INIS; GPO Dep.

This paper evolved out of a discussion about public participation as it is currently being brought to the fore-front of clean-up activities at hazardous waste sites. There exists much official and unofficial documentation pertaining to the need for public involvement. The purposes for public involvement efforts in Environmental Restoration are: to enable substantive input to the clean-up process; methods for establishing formal, and now informal, mechanisms for public input and awareness of on-going facility activities; and the opening of better channels for communication and conflict resolution between the public and the facility. This presentation will briefly outline the regulatory approach for public outreach because many of these terms are used with such frequency, their meanings tend to get forgotten or misconstrued. Then, the authors will critique the most common methods for conducting public involvement as attempted through advisory boards and public meetings. For illustrative purposes, they will be referring to the site they are most familiar with, which is Los Alamos National Laboratory (LANL).

209 (LA-UR–95-2267) **The restructuring of the Environmental Restoration Program at Los Alamos National Laboratory.** Jansen, J. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36.

(CONF-950868–8: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE95016915. Source: OSTI; NTIS; GPO Dep.

The Los Alamos National Laboratory (Laboratory) has supported this country through 50 years of research and development primarily in the area of nuclear weapons and energy. As a result of the Laboratory's activities, contamination of the environment occurred. The cleanup of contaminated areas and the prevention of further contamination has become an important part of the Laboratory's new mission: the reduction of the nuclear danger. The cleanup of the Laboratory is somewhat unique. It is a very large site. It includes 43 square miles of Laboratory land that will continue to be in industrial use or under institutional control for decades or centuries to come. It also includes about 25 square miles of former Laboratory land that has been converted to residential use, the Los Alamos townsite. The unusual topography and hydrogeology of the site was shaped during the last million years through the eruption of a huge volcano and the ensuing erosion of the tuff-basalt plateau into 19 canyons and associated finger-like mesas. During the early phase of the Environmental Restoration (ER) Program, 2,100 sites were identified as potential release sites. Sites range from a few hundred square feet to a few acres in area. Contamination depths range from a few to 100 feet. Typical contaminants are chemicals, heavy metals, radioactive constituents, and high explosives. Of greatest concern are surface contamination, migration of the contaminants along the surface into creeks and arroyos of the canyons and ultimately into the Rio Grande, and migration through the earth into the drinking water aquifers.

210 (LA-UR–96-170) **Dynamic quality assurance/ quality control (QA/QC) program to maximize the use of on-site measurement.** Kelly, L.A.; Roberts, J.B.; Swanson, A.L.; Canavan, H.E. Los Alamos National Lab., NM (United States). [1996]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960175–3: 4. international on-site analysis meeting, Orlando, FL (United States), 21-24 Jan 1996). Order Number DE96007169. Source: OSTI; NTIS; INIS; GPO Dep.

The use of on-site mobile laboratories at Los Alamos National Laboratory (LANL) has increased within the last year to accommodate the diverse analytical requirements of demands for the Environmental Restoration Project (ERP). The purpose of the mobile laboratory is to provide sample results with the appropriate QC components within a near real time (i.e. < 8 hours) to aid in a real time decision process such as determining the extent of contamination and/or where to focus the sampling efforts. To meet the data quality objectives (DQOS) of ERP, a flexible QA/QC program needs to exist. By developing a QA/QC program containing the capability to measure extraction efficiency and instrument sensitivity and by participating in the DQO process, the appropriate QC can easily be tailored to provide quick and inexpensive analytical data while still meeting the project requirements. An QA/QC program, consisting of both static and dynamic elements, can be tailored to meet the ERP objectives.

211 (LA-UR–96-378) **Chemical Exposure Assessment Program at Los Alamos National Laboratory: A risk based approach.** Stephenson, D.J. Los Alamos National Lab., NM (United States). [1996]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960212–67: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96008124. Source: OSTI; NTIS; INIS; GPO Dep.

The University of California Contract And DOE Order 5480.10 require that Los Alamos National Laboratory (LANL) perform health hazard assessments/inventories of all employee workplaces. In response to this LANL has developed the Chemical Exposure Assessment Program. This program provides a systematic risk-based approach to anticipation, recognition, evaluation and control of chemical workplace exposures. Program implementation focuses resources on exposures with the highest risks for causing adverse health effects. Implementation guidance includes procedures for basic characterization, qualitative risk assessment, quantitative validation, and recommendations and reevaluation. Each component of the program is described. It is shown how a systematic method of assessment improves documentation, retrieval, and use of generated exposure information.

212 (LBL–36825) **A joint Russian-American field test at the Chelyabinsk-65 (Mayak) Site: Test description and preliminary results.** Wollenberg, H. (and others); Tsang, C.F.; Frangos, W. Lawrence Berkeley Lab., CA (United States). May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (RAC–12; CONF-950917–11: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95012351. Source: OSTI; NTIS; INIS; GPO Dep.

In September 1994, a Russian-American team conducted hydrogeological, geochemical, geophysical, and radiometric measurements in the territory of the Mayak Production Association. The primary purpose of these operations was to examine the groundwater plume moving from Lake Karachai toward the river. Activities encompassed isolation of hydrologic intervals in two wells and production of water from these intervals, to compare isolated versus open-well sampling methods; surface and soil-water sampling, accompanying radiometric measurements and subsequent chemical analyses; and electrical resistivity profiling in areas of expected contrasting resistivity. Preliminary results indicate that (1) ^{60}Co and ^{137}Cs are present in small concentrations in water of the Mishelyak River, (2) analyses of water samples collected by a downhole sampler and of water produced from packed-off intervals agree within limits of laboratory accuracy, attesting to the efficacy of the sampling methods presently used by the Russian workers; and (3) strong contrasts occur between the electrical resistivities of soil and bedrock. Further collaborative work is strongly recommended, and should include more detailed isolation of intervals in wells by multi-packer installations, to better determine the geochemical and hydrological characteristics of the Karachai-Mishelyak system; deployment of a broader soil-water and soil sampling array; a more detailed examination of the distribution and concentration of radionuclides by high-resolution field gamma spectrometry; and a detailing of the area's electrical resistivity setting, using a mobile electromagnetic measurement system.

213 (LBL–36928) **Strongly coupled single-phase flow problems: Effects of density variation, hydrodynamic dispersion, and first order decay.** Oldenburg, C.M.; Pruess, K. Lawrence Berkeley Lab., CA (United States). Mar 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9503110–1: TOUGH 95: transport of unsaturated

ground water and heat workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95014777. Source: OSTI; NTIS; GPO Dep.

We have developed TOUGH2 modules for strongly coupled flow and transport that include full hydrodynamic dispersion. T2DM models two-dimensional flow and transport in systems with variable salinity, while T2DMR includes radionuclide transport with firstorder decay of a parent-daughter chain of radionuclide components in variable salinity systems. T2DM has been applied to a variety of coupled flow problems including the pure solutal convection problem of Elder and the mixed free and forced convection salt-dome flow problem. In the Elder and salt-dome flow problems, density changes of up to 20% caused by brine concentration variations lead to strong coupling between the velocity and brine concentration fields. T2DM efficiently calculates flow and transport for these problems. We have applied T2DMR to the dispersive transport and decay of radionuclide tracers in flow fields with permeability heterogeneities and recirculating flows. Coupling in th ese problems occurs by velocity-dependent hydrodynamic dispersion. Our results show that the maximum daughter species concentration may occur fully within a recirculating or low-velocity region. In all of the problems, we observe very efficient handling of the strongly coupled flow and transport processes.

214 (LBL–37333) **Geological aspects of the nuclear waste disposal problem.** Laverov, N.P. (Russian Academy of Sciences (Russian Federation)); Omelianenko, B.L.; Velichkin, V.I. Lawrence Berkeley Lab., CA (United States). Jun 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95015138. Source: OSTI; NTIS; INIS; GPO Dep.

For the successful solution of the high-level waste (HLW) problem in Russia one must take into account such factors as the existence of the great volume of accumulated HLW, the large size and variety of geological conditions in the country, and the difficult economic conditions. The most efficient method of HLW disposal consists in the maximum use of protective capacities of the geological environment and in using inexpensive natural minerals for engineered barrier construction. In this paper, the principal trends of geological investigation directed toward the solution of HLW disposal are considered. One urgent practical aim is the selection of sites in deep wells in regions where the HLW is now held in temporary storage. The aim of long-term investigations into HLW disposal is to evaluate geological prerequisites for regional HLW repositories.

215 (LBL–37337) **Weathering products of basic rocks as sorptive materials of natural radionuclides.** Omelianenko, B.I. (AN SSSR, Moscow (Russian Federation). Inst. Geologii Rudnykh Mestorozhdenij, Petrografii, Mineralogii i Geokhimii); Niconov, B.S.; Ryzhov, B.I.; Shikina, N.D. Lawrence Berkeley Lab., CA (United States). Jun 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95015137. Source: OSTI; NTIS; INIS; GPO Dep.

The principal requirements for employing natural minerals as buffer and backfill material in high-level waste (HLW) repositories are high sorptive properties, low water permeability, relatively high thermal conductivity, and thermostability. The major task of the buffer is to prevent the penetration of radionuclides into groundwater. The authors of this report examined weathered basic rocks from three regions of Russia in consideration as a suitable radioactive waste barrier.

216 (LBL–38151) **Direct and inverse modeling of multiphase flow systems.** Finsterle, S. Lawrence Berkeley Lab., CA (United States). Oct 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9510354–1: 1. GAMM seminar on modelling and computation in environmental sciences, Stuttgart (Germany), 12-13 Oct 1995). Order Number DE96008394. Source: OSTI; NTIS; GPO Dep.

A modeling study is presented which demonstrates how the combination of simulation and optimization techniques can be used to improve the design of a multi-component remediation system. A series of computer codes has been developed at the Lawrence Berkeley National Laboratory to solve forward and inverse problems in groundwater hydrology. Simulations of non-isothermal, three-phase flow of volatile organic compounds in three-dimensional heterogeneous media were performed. Inverse modeling capabilities have been developed which can be used for both automatic model calibration and optimization of remediation schemes. In this study, we discuss a sequence of simulations to demonstrate the potential use of numerical models to design and analyze cleanup of a contaminated aquifer.

217 (ORNL/ER–183/A1) **Addendum to the health and safety plan for Waste Area Grouping 6 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Environmental Restoration Program.** Clark, C. Jr.; Burman, S.N.; Wilson, K.A. Oak Ridge National Lab., TN (United States). Aug 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017188. Source: OSTI; NTIS; INIS; GPO Dep.

There are three purposes for this addendum to the health and safety plan for Waste Area Grouping 6. The first purpose is to provide record of a corrective action response concerning an occurrence on WAG 6 in October 1994 (ORO-MMES-ENVRES-1994-0016.) This occurrence involved a precautionary evacuation of subcontractor field crews due to malfunctioning monitor alarms for organic vapors. The corrective action is to revise the WAG 6 Site health and safety plan to improve communications during emergency events. The second purpose is to incorporate any outstanding health and safety issues not addressed in the original health and safety plan for WAG 6 document (ORNL/ER-183). The only variance of note is tritium air monitoring in the Tumulus building. The tritium air monitor is added in this addendum as monitoring equipment for WAG 6 with description of action level and calibration. The third purpose of this addendum is to satisfy a condition of approval for the pending Nuclear Criticality Safety Assessment (NCSA) pertaining to KEMA fuel storage at WAG 6. This approval condition requires the following: "The location of the KEMA burial shall be recorded and maintained in a controlled document that identifies the quantity and the general physical conditions at the time of the entombment with an admonishment to obtain nuclear criticality safety guidance before altering the burial condition." In order to satisfy the approval, this document must be controlled. The predecessor to the pending NCSA is NSR No. 0002WM22001.

218 (ORNL/ER–200/R1) **Meteorological monitoring sampling and analysis plan for the environmental monitoring plan at Waste Area Grouping 6, Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge

National Lab., TN (United States); CDM Federal Programs Corp., Oak Ridge, TN (United States). Sep 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006788. Source: OSTI; NTIS; INIS; GPO Dep.

This Sampling and Analysis Plan addresses meteorological monitoring activities that wall be conducted in support of the Environmental Monitoring Plan for Waste Area Grouping (WAG) 6. WAG 6 is a shallow-burial land disposal facility for low-level radioactive waste at the Oak Ridge National Laboratory, a research facility owned by the US Department of Energy and managed by Lockheed Martin Energy Systems, Inc. Meteorological monitoring of various climatological parameters (e.g., temperature, wind speed, humidity) will be collected by instruments installed at WAG 6. Data will be recorded electronically at frequencies varying from 5-min intervals to 1-h intervals, dependent upon parameter. The data will be downloaded every 2 weeks, evaluated, compressed, and uploaded into a WAG 6 data base for subsequent use. The meteorological data will be used in water balance calculations in support of the WAG 6 hydrogeological model.

219 (ORNL/ER–206/V1) **Final project report on arsenic biogeochemistry in the Clinch River and Watts Bar Reservoir: Volume 1, Main text. Environmental Restoration Program.** Ford, C.J.; Byrd, J.T.; Grebmeier, J.M.; Harris, R.A.; Moore, R.C.; Madix, S.E.; Newman, K.A.; Rash, C.D. Oak Ridge National Lab., TN (United States). Apr 1995. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012537. Source: OSTI; NTIS; GPO Dep.

This document reports on the study of arsenic contamination in the Clinch River/Watts Bar Reservoir (CR/WBR) system, downstream from the US Department of Energy's Oak Ridge Reservation (ORR). Arsenic is of particular interest and concern because it occurs commonly in coal-bearing rock and waste products, such as fly ash associated with the burning of coal; it is classified as a Class A carcinogen by the Environmental Protection Agency; and disposal of fly ash, both on and off the ORR, may have contaminated surface water and sediments in the Clinch River and Watts Bar Reservoir. Four main sites were sampled quarterly over a 3-year period. Sites investigated included lower Watts Bar Reservoir near Watts Bar Dam [Tennessee River kilometer (TRK) 849.6], the Kingston area [Clinch River kilometer (CRK) 1.6], Poplar Creek, and the McCoy Branch Embayment. Additional sites were investigated in the vicinity of these main stations to determine the distribution of contamination and to identify possible alternative or additional sources of arsenic.

220 (ORNL/ER–206/V2) **Final project report on arsenic biogeochemistry in the Clinch River and Watts Bar Reservoir: Volume 2, Quality assurance/quality control summary report for arsenic biogeochemistry in the Clinch River and Watts Bar Reservoir. Environmental Restoration Program.** Newman, K.A.; Ford, C.J.; Byrd, J.T. Oak Ridge National Lab., TN (United States). Apr 1995. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012538. Source: OSTI; NTIS; GPO Dep.

Arsenic contamination was studied in the Clinch River/Watts Bar Reservoir (CR/WBR) system downstream from the US Department of Energy's Oak Ridge Reservation (ORR). Arsenic is of particular interest and concern because (1) it occurs commonly in coal-bearing rock and waste products such as fly ash associated with the burning of coal, (2) it is classified as a Class A carcinogen by the US Environmental Protection Agency, and (3) disposal of fly ash, both on and off the ORR, may have contaminated surface water and sediments in the Clinch River and Watts Bar Reservoir. The present study dffers from previous reports on arsenic concentrations in the CR/WBR system in the use of much more sensitive and precise processing and analytical techniques to measure arsenic species (arsenate, arsenite, and organic arsenic) at levels well below the ecological and human health risk screening criteria. The absolute detection limits using these techniques are approximately 20 to 40 pmol/L or 0.0015 to 0.003 μg/L.

221 (ORNL/ER–307) **Quality Assurance Project Plan for the treatability study of in situ vitrification of Seepage Pit 1 in Waste Area Grouping 7 at Oak Ridge National Laboratory.** Oak Ridge National Lab., TN (United States). Jul 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017047. Source: OSTI; NTIS; INIS; GPO Dep. Environmental Restoration Program.

This Quality Assurance Project Plan (QAPjP) establishes the quality assurance procedures and requirements to be implemented for the control of quality-related activities for Phase 3 of the Treatability Study (TS) of In Situ Vitrification (ISV) of Seepage Pit 1, ORNL Waste Area Grouping 7. This QAPjP supplements the Quality Assurance Plan for Oak Ridge National Laboratory Environmental Restoration Program by providing information specific to the ISV-TS. Phase 3 of the TS involves the actual ISV melt operations and posttest monitoring of Pit 1 and vicinity. Previously, Phase 1 activities were completed, which involved determining the boundaries of Pit 1, using driven rods and pipes and mapping the distribution of radioactivity using logging tools within the pipes. Phase 2 involved sampling the contents, both liquid and solids, in and around seepage Pit 1 to determine their chemical and radionuclide composition and the spatial distribution of these attributes. A separate QAPjP was developed for each phase of the project. A readiness review of the Phase 3 activities presented QAPjP will be conducted prior to initiating field activities, and an Operational Acceptance, Test (OAT) will also be conducted with no contamination involved. After, the OAT is complete, the ISV process will be restarted, and the melt will be allowed to increase with depth and incorporate the radionuclide contamination at the bottom of Pit 1. Upon completion of melt 1, the equipment will be shut down and mobilized to an adjacent location at which melt 2 will commence.

222 (ORNL/ER/Sub–87-99053/2/R1) **Data base management plan for the remedial investigation/feasibility study at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); Bechtel National, Inc., Oak Ridge, TN (United States). Nov 1993. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96002148. Source: OSTI; NTIS; INIS; GPO Dep.

This Data Base Management (DBM) Plan has been prepared for use by Bechtel National, Inc. (Bechtel) and its subcontractors in the performance of the Oak Ridge National Laboratory (ORNL) Remedial Investigation/Feasibility Study (RI/FS) program activities. The RI/FS program is being performed under subcontract to Martin Marietta Energy Systems, Inc. (Energy Systems), the contractor operating ORNL for the Department of Energy. This DBM Plan defines the procedures and protocol to be followed in developing and maintaining the data base used by Bechtel and its subcontractors for RI/FS activities at ORNL; describes the management controls, policies, and guidelines to be followed; and identifies responsible positions and their Energy Systems functions. The Bechtel RI/FS data base will be compatible with the Oak Ridge Environmental Information System and will include data obtained from field measurements and laboratory and engineering analyses. Personnel health and safety information, document control, and project management data will also be maintained as part of the data base. The computerized data management system is being used to organize the data according to application and is capable of treating data from any given site as a variable entity. The procedures required to implement the DBM Plan are cross-referenced to specific sections of the plan.

223 (ORNL/M–4087) **The Center for Environmental Technology Innovative Technology Screening Process.** Bertrand, C.M. Oak Ridge National Lab., TN (United States). Feb 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008966. Source: OSTI; NTIS; INIS; GPO Dep.

The Center for Environmental Technology's (CET) mission is to provide a fully integrated system for accelerated evaluation, development, commercialization, and public acceptance of creative environmental solutions which match the foremost demands in today's environmentally sensitive world. In short, CET will create a means to provide quick, effective solutions for environmental needs. To meet this mission objective, CET has created a unique and innovative approach to eliminating the usual barriers in developing and testing environmental technologies. The approach paves the way for these emerging, cutting-edge technologies by coordinating environmental restoration and waste management activities of industry, universities, and the government to: efficiently and effectively transfer technology to these users, provide market-driven, cost-effective technology programs to the public and DOE, and aid in developing innovative ideas by initiating efforts between DOE facilities and private industry. The central part to this mission is selecting and evaluating specific innovative technologies for demonstration and application at United States Department of Energy (DOE) installations. The methodology and criteria used for this selection, which is called the CET Innovative Technology Screening Process, is the subject of this paper. The selection criteria used for the screening process were modeled after other DOE technology transfer programs and were further developed by CET's Technology Screening and Evaluation Board (TSEB). The process benefits both CET and the proposing vendors by providing objective selection procedures based on predefined criteria. The selection process ensures a rapid response to proposing vendors, all technologies will have the opportunity to enter the selection process, and all technologies are evaluated on the same scale and with identical criteria.

224 (ORNL/M–4913) **Attitudes and practices regarding disposal of liquid nuclear waste at Clinton Laboratories in the very early years: A historical analysis.** Stow, S.H. Oak Ridge National Lab., TN (United States). Feb 1996. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006821. Source: OSTI; NTIS; INIS; GPO Dep.

Many previously unreferenced documents show that the management and disposal of the liquid nuclear waste generated at Clinton Labs (which became ORNL after 1948) during the 1940s was performed with the highest degree of integrity and professionalism, contradicting today's perceptions. Even before construction of the laboratories in early 1943, professionals were making plans for the "safe" disposal of waste through treatment and dilution at medically prescribed levels into White Oak Creek and the Clinch River; concern for human health permeated all the disposal decisions. Chemical and physical treatment processes were used to remove as much of the activity as possible before release. Environmental and biological monitoring of the surface waters was instituted very early in the disposal history. Information learned at Clinton Labs with regard to waste disposal was transferred to Hanford. By the latter part of the 1940s, the scientists were formulating fairly sophisticated research programs for managing liquid waste and began research on the disposal of low-level solid waste. This historical analysis attempts to place the actions of the 1940s in proper perspective, drawing on the attentiveness and integrity of those who participated 50 years ago. Applying standards of the 1990s to actions in the 1940s must be done skilfully, carefully, and with the realization that those individuals were operating under extremely trying conditions, with minimal knowledge of radionuclide behavior.

225 (ORNL/TM–12380) **User's manual for the radioactive decay and accumulation code RADAC.** Salmon, R.; Loghry, S.L.; Ashline, R.C. Oak Ridge National Lab., TN (United States). Nov 1995. 166p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96003110. Source: OSTI; NTIS; INIS; GPO Dep.

The RADAC computer code calculates radioactive decay and accumulation of decayed products using an algorithm based on the direct use of the Bateman equations and referred to here as the yield factor method. This report explains the yield factor method, gives an overview of the various modules in the RADAC code system, and describes the decay and accumulation code in detail. The RADAC code has capacity for two waste types and can accommodate up to 60 years of annual waste inputs. Decay times as high as 1 million years can be calculated. The user supplies the undecayed composition and radioactivity of the waste placed in storage each year. The code calculates the decayed composition, radioactivity, and thermal power of the accumulated waste at the end of each year and gives the results in terms of grams and curies of individual radionuclides. Calculations can be made for up to 19 waste storage sites in a single run. For each site and each waste type, calculations can be made by 1-year steps up to 60 years, by 10-year steps to 160 years, and by 6 discrete steps to 1 million years. Detailed outputs can be printed for each waste site and each time step by individual radionuclides. Summarized outputs are also available. Excluding data-preparation time, RADAC requires about 2 min to run 19 waste sites with two types of transuranic waste at each site, using a 486 DX computer with a clock speed of 33 MHz. Because RADAC uses a preselected set of decay times and does not make in-reactor calculations, it should not be viewed as a substitute for ORIGEN2. RADAC is intended for use in applications in which accumulations at the decay times provided by the code are sufficient for the user's purposes.

226 (PNL–10260-Rev.1) **Financial assistance to states and tribes to support emergency preparedness and response and the safe transportation of hazardous shipments: 1996 Update.** Bradbury, J.A.; Leyson, J.; Lester, M.K. Pacific Northwest Lab., Richland, WA (United

States). Jul 1996. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96014168. Source: OSTI; NTIS; INIS; GPO Dep.

This report revises and updates the 1995 report Financial Assistance to States and Tribes to Support Emergency Preparedness and Response and the Safe Transportation of Hazardous Shipments, PNL-10260 (UC-620). The presentation of data and some of the data reported have been changed; these data supersede those presented in the earlier publication. All data have been updated to fiscal year 1995, with the exception of FEMA data that are updated to fiscal year 1994 only. The report identifies and summarizes existing sources of financial assistance to States and Tribes in preparing and responding to transportation emergencies and ensuring the safe transportation of hazardous shipments through their jurisdictions. It is intended for use as an information resource for the U.S. Department of Energy's Office of Environmental Management (EM), Office of Transportation, Emergency Management, and Analytical Services (EM-76).

227 (PNL–10574) **Hanford Site environmental report for calendar year 1994.** Dirkes, R.L.; Hanf, R.W. (eds.). Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 375p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001346. Source: OSTI; NTIS; INIS; GPO Dep.

This Hanford Site Environmental Report is prepared annually pursuant to DOE Order 5400.1 to summarize environmental data that characterize Hanford Site environmental management performance and demonstrate compliance status. The report also highlights significant environmental programs and efforts. More detailed environmental compliance, monitoring, surveillance, and study reports may be of value; therefore, to the extent practical, these additional reports have been referenced in the text. Individual papers have been indexed separately for the database.

228 (PNL–10575) **Hanford Site environmental data for calendar year 1994: Surface and Columbia River.** Bisping, L.E. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001151. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental monitoring at the Hanford Site, located in southeastern Washington State, is conducted by Battelle Memorial Institute, Pacific Northwest Division, as part of its contract to operate the Pacific Northwest Laboratory (PNL) for the US Department of Energy. The data collected provide a historical record of radionuclide and radiation levels attributable to natural causes, worldwide fallout, and Hanford operations. Data are also collected to monitor several chemicals. Pacific Northwest Laboratory publishes an annual environmental report for the Hanford Site each calendar year. The Hanford Site Environmental Report for Calendar Year 1994 describes the Site mission and activities, general environmental features, radiological and chemical releases from operations, status of compliance with environmental regulations, status of programs to accomplish compliance, and environmental monitoring activities and results. The report includes a summary of offsite and onsite environmental monitoring data collected during 1994 b PNL's Environmental Monitoring Program. Appendix A of that report contains data summaries created from raw surface and river monitoring data. This volume contains the actual raw data used to create the summaries.

229 (PNL–10601) **Toxicology profiles of chemical and radiological contaminants at Hanford.** Harper, B.L.; Strenge, D.L.; Stenner, R.D.; Maughan, A.D.; Jarvis, M.K. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 190p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000877. Source: OSTI; NTIS; INIS; GPO Dep.

This document summarizes toxicology information required under Section 3.3 (Toxicity Assessment) of HSRAM, and can also be used to develop the short toxicology profiles required in site assessments (described in HSRAM, Section 3.3.5). Toxicology information is used in the dose-response step of the risk assessment process. The dose-response assessment describes the quantitative relationship between the amount of exposure to a substance and the extent of toxic injury or disease. Data are derived from animal studies or, less frequently, from studies in exposed human populations. The risks of a substance cannot be ascertained with any degree of confidence unless dose-response relations are quantified. This document summarizes dose-response information available from the US Environmental Protection Agency (EPA). The contaminants selected for inclusion in this document represent most of the contaminants found at Hanford (both radiological and chemical), based on sampling and analysis performed during site investigations, and historical information on waste disposal practices at the Hanford Site.

230 (PNL–10608) **Risk information in support of cost estimates for the Baseline Environmental Management Report (BEMR). Section 1.** Gelston, G.M. (Pacific Northwest Lab., Richland, WA (United States)); Jarvis, M.F.; Warren, B.R.; Von Berg, R. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 302p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015593. Source: OSTI; NTIS; INIS; GPO Dep.

The Pacific Northwest Laboratory (PNL)(1) effort on the overall Baseline Environmental Management Report (BEMR) project consists of four installation-specific work components performed in succession. These components include (1) development of source terms, 92) collection of data and preparation of environmental settings reports, (3) calculation of unit risk factors, and (4) utilization of the unit risk factors in Automated Remedial Action Methodology (ARAM) for computation of target concentrations and cost estimates. This report documents work completed for the Nevada Test Site, Nevada, for components 2 and 3. The product of this phase of the BEMR project is the development of unit factors (i.e., unit transport factors, unit exposure factors, and unit risk factors). Thousands of these unit factors are gene rated and fill approximately one megabyte of computer information per installation. The final unit risk factors (URF) are transmitted electronically to BEMR-Cost task personnel as input to a computer program (ARAM). Abstracted files and exhibits of the URF information are included in this report. These visual formats are intended to provide a sample of the final task deliverable (the URF files) which can be easily read without a computer.

231 (PNL–10714) **Nonradiological chemical pathway analysis and identification of chemicals of concern for environmental monitoring at the Hanford Site.** Blanton, M.L.; Cooper, A.T.; Castleton, K.J. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 80p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC06-76RL01830. Order Number DE96003370. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest's Surface Environmental Surveillance Project (SESP) is an ongoing effort tot design, review, and conducted monitoring on and off the Hanford site. Chemicals of concern that were selected are listed. Using modeled exposure pathways, the offsite cancer incidence and hazard quotient were calculated and a retrospective pathway analysis performed to estimate what onsite concentrations would be required in the soil for each chemical of concern and other detected chemicals that would be required to obtain an estimated offsite human-health risk of 1.0E-06 cancer incidence or 1.0 hazard quotient. This analysis indicates that current nonradiological chemical contamination occurring on the site does not pose a significant offsite human-health risk; the highest cancer incidence to the offsite maximally exposed individual was from arsenic (1.76E-10); the highest hazard quotient was chromium(VI) (1.48E-04). The most sensitive pathways of exposure were surfacewater and aquatic food consumption. Combined total offsite excess cancer incidence was 2.09E-10 and estimated hazard quotient was 2.40E-04. Of the 17 identified chemicals of concern, the SESP does not currently (routinely) monitor arsenic, benzo(a)pyrene, bis(2- ethylhexyl)phthalate (BEHP), and chrysene. Only 3 of the chemicals of concern (arsenic, BEHP, chloroform) could actually occur in onsite soil at concern high enough to cause a 1.0E-06 excess cancer incidence or a 1.0 hazard index for a given offsite exposure pathway. During the retrospective analysis, 20 other chemicals were also evaluated; only vinyl chloride and thallium could reach targeted offsite risk values.

232 (PNL-SA-23600) **TEMPEST: A computer code for three-dimensional analysis of transient fluid dynamics.** Fort, J.A. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015802. Source: OSTI; NTIS; INIS; GPO Dep.

TEMPEST (Transient Energy Momentum and Pressure Equations Solutions in Three dimensions) is a powerful tool for solving engineering problems in nuclear energy, waste processing, chemical processing, and environmental restoration because it analyzes and illustrates 3-D time-dependent computational fluid dynamics and heat transfer analysis. It is a family of codes with two primary versions, a N- Version (available to public) and a T-Version (not currently available to public). This handout discusses its capabilities, applications, numerical algorithms, development status, and availability and assistance.

233 (PNL-SA-25593) **Incorporating pollution into US Department of Energy design projects: Case study results and participant feedback.** Dorsey, J.A. (Pacific Northwest Lab., Richland, WA (United States)); Greitzer, F.L.; Raney, E.A. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950646-30: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95014183. Source: OSTI; NTIS; GPO Dep.

Pollution prevention seeks to eliminate the release of all pollutants (hazardous and non-hazardous) to all media (land, air, and water). Beyond eliminating pollution at the source, pollution prevention includes energy conservation, water conservation, and protection of natural resources. Therefore, pollution prevention addresses not only wastes exiting a process, but materials entering and being consumed by the process as well. Historically, pollution prevention activities within the US Department of Energy (DOE) have focused on existing process waste streams – the Pollution Prevention Opportunity Assessment (P2OA) being the central tool for identifying and implementing pollution prevention opportunities. However, it is estimated that 70% of a product's total lifecycle cost is fixed by design (i.e., before the product, process, or facility ever gets built). By moving pollution prevention upstream into design, new opportunities emerge for minimizing waste not only during operations, but during construction and dismantlement of a facility as well. This is significant because it is estimated that the environmental consequences from construction of a building are comparable to a decade of operating the building, and demolition creates even more waste than construction.

234 (PNL-SA-25713) **Development of an educational partnership for enhancement of a computer risk assessment model.** Topper, K. (Mesa State Coll., Grand Junction, CO (United States). Dept. of Physics and Environmental Sciences); Castleton, K.; Buck, J.; Droppo, J. Jr. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216-155: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95014191. Source: OSTI; NTIS; INIS; GPO Dep.

The Multimedia Environmental Pollutant Assessment System (MEPAS) is a computer program which evaluates exposure pathways for chemical and radioactive releases according to their potential human health impacts. MEPAS simulates the exposure pathways through standard source-to-receptor transport principles using, a multimedia approach (air, groundwater, overland flow, soil, surface water) in conjunction with specific chemical exposure considerations. This model was originally developed by Pacific Northwest Laboratory (PNL) to prioritize environmental concerns at potentially contaminated US Department of Energy (DOE) sites. Currently MEPAS is being used to evaluate a range of environmental problems which are not restricted to DOE sites. A partnership was developed between PNL and Mesa State College during 1991. This partnership involves the use of undergraduate students, faculty, and PNL personnel to complete enhancements to MEPAS. This has led to major refinements to the original MEPAS shell for DOE in a very cost-effective manner. PNL was awarded a 1993 Federal Laboratory Consortium Award and Mesa State College was awarded an Environmental Restoration and Waste Management Distinguished Faculty Award from DOE in 1993 as a result of this collaboration. The college has benefited through the use of MEPAS within laboratories and through the applied experience gained by the students. Development of this partnership will be presented with the goal of allowing other DOE facilities to replicate this program. It is specifically recommended that DOE establish funded programs which support this type of a relationship on an ongoing basis. Additionally, specific enhancements to MEPAS will be presented through computer display of the program.

235 (PNL-SA-26080) **Development and implementation of an analytical quality assurance plan at the Hanford site.** Kuhl-Klinger, K.J. (Pacific Northwest Lab., Richland, WA (United States)); Taylor, C.D.; Kawabata, K.K. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 11p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC06-76RL01830. (CONF-950877–22: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE96002716. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Analytical Services Quality Assurance Plan (HASQAP) provides a uniform standard for onsite and offsite laboratories performing analytical work in support of Hanford Site environmental cleanup initiatives. The Hanford Site is a nuclear site that originated during World War 11 and has a legacy of environmental clean up issues. In early 1993, the need for and feasibility of developing a quality assurance plan to direct all analytical activities performed to support environmental cleanup initiatives set forth in the Hanford Federal Facility Agreement and Consent Order were discussed. Several group discussions were held and from them came the HASQAP. This document will become the quality assurance guidance document in a Federal Facility Agreement and Consent Order. This paper presents the mechanics involved in developing a quality assurance plan for this scope of activity, including the approach taken to resolve the variability of quality control requirements driven by numerous regulations. It further describes the consensus building process and how the goal of uniting onsite and offsite laboratories as well as inorganic, organic, and radioanalytic disciplines under a common understanding of basic quality control concepts was achieved.

236 (PNL-SA–26402) **Overview of contamination from US and Russian nuclear complexes.** Bradley, D.J. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9506245–1: NATO meeting on nuclear submarine decommissioning and related problems, Moscow (Russian Federation), 19-22 Jun 1995). Order Number DE95016818. Source: OSTI; NTIS; INIS; GPO Dep.

This paper briefly compares the United States and Russian weapons complexes and provides a perspective on the releases of radioactivity to the environment in both countries. Fortunately, the technologies, data, models, and scientific experience that have been gained over the last 50 years are being shared between the US Department of Energy (DOE) and Ministry of Atomic Energy of the Russian Federation (MINATOM) which constitutes a new environmental partnership between the two countries.

237 (PNL-SA–26460) **Risk-based prioritization at Hanford Nuclear Site.** Hesser, W.A.; Mosely, M.T. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-951135–26: 1995 International mechanical engineering congress and exhibition, San Francisco, CA (United States), 12-17 Nov 1995). Order Number DE96004382. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the method used to incorporate risk-based decision making into the Hanford resource allocation process. This method, the Revised Priority Planning Grid, is used as a tool to calculate benefits and benefit-to-cost ratios for comparison of environmental cleanup activities. The tool is based on Hanford Site objectives. Benefits are determined by estimating the impact on those objectives resulting from funding specific environmental management activities. Impacts are also a function of the weights associated with the objectives. These weights in the Revised Priority Planning Grid reflect US Development of Energy management values, which were obtained through a formal value-elicitation process. With modification to the objectives and weights, the Revised Priority Planning Grid could be used in different situations. By factoring in environmental, safety, and health risk and assigning higher scores to those activities that provide the most benefit, the Revised Priority Planning Grid is a reproducible, scientific way of scoring competing activities or interests.

238 (PNNL–10969) **TWRS privatization bibliography.** Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008336. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this bibliography is to present a select set of documents that may be of interest to the Offeror, covering a variety of subject areas related to the TWRS Privatization Project. The organization of this bibliography is by subject area. Some of the documents overlap subject areas, and may be presented in more than one. Additionally, assignment of a document to one subject area does not necessarily preclude that document from containing information relevant to other subject areas not identified. The subject areas include, in order of presentation:. Waste Characterization; Pre-treatment; High-level Waste Immobilization; Low-level Waste Immobilization; Low-level Waste Melter Test Program; Performance Assessment; and General Safety.

239 (PNNL–10969-Rev.1) **TWRS privatization bibliography.** Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008174. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this bibliography is to present a select set of documents that may be of interest to the Offeror, covering a variety of subject areas related to the TWRS Privatization Project. This bibliography is not, nor is intended to be, exhaustive or complete. It was prepared with the intent of providing a sampling of representative documents potentially helpful to Offerors. The documents referenced herein have been identified as representative of those potentially helpful to Offerors. This list of documents does not represent the full extent of available and potentially helpful information, nor should it be taken as a representation of documents determined to be of greater importance than other documents not referenced herein. There are numerous documents available to the public that are NOT cited in this bibliography; the Offeror is encouraged to perform searches for alternate sources of information.

240 (PNNL–10969-Rev.2) **TWRS privatization bibliography. Revision 2.** Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96011470. Source: OSTI; NTIS; GPO Dep.

The purpose of this bibliography is to present a select set of documents that may be of interest to the Offeror, covering a variety of subject areas related to the TWRS Privatization Project. This bibliography is not, nor is it intended to be, exhaustive or complete. It was prepared with the intent of providing a sampling of representative documents potentially helpful to Offerors. This bibliography is organized by subject area. The subjects covered are: waste characterization; pre-treatment; high-level waste immobilization; low-level waste immobilization; low-level waste melter test program; performance assessment; general; and safety.

241 (PNNL–11030) **TWEAT '95: User's documentation update.** Robertus, B.; Lambert, R. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008180. Source: OSTI; NTIS; INIS; GPO Dep.

This report is designed to be a supplement to TWEAT'94 (PVTD-C94-05.01K Rev.1). It is intended to describe the primary features of the Ternary Waste Envelope Assessment Tool software package that have been added in FY'95 and how to use them. It contains only minimal duplication of information found in TWEAT'94 even though all features of TWEAT'94 will still be available. Emphasis on this Update is the binary plotting capability and the OWL Import modifications. Like it's predecessors, this manual does not provide instructions for modifying the program code itself. The user of TWEAT'95 is expected to be familiar with the basic concepts and operation of the TWEAT software as discussed in TWEAT'94. Software and hardware requirements have not changed since TWEAT'94. TWEAT has now been tested using Macintosh System software versions 6.05 through 7.5.

242 (PNNL–11080) **Supplemental mathematical formulations, Atmospheric pathway: The Multimedia Environmental Pollutant Assessment System (MEPAS).** Droppo, J.G.; Buck, J.W. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008330. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); INIS; GPO Dep.

The Multimedia Environmental Pollutant Assessment System (MEPAS) is an integrated software implementation of physics-based fate and transport models for health and environmental risk assessments of both radioactive and hazardous pollutants. This atmospheric component report is one of a series of formulation reports that document the MEPAS mathematical models. MEPAS is a "multimedia" model; pollutant transport is modeled within, through, and between multiple media (air, soil, groundwater, and surface water). The estimated concentrations in the various media are used to compute exposures and impacts to the environment, to maximum individuals, and to populations.

243 (PNNL–11080-Rev.) **The Multimedia Environmental Pollutant Assessment System (MEPAS)®: Atmospheric pathway formulations. Revision.** Droppo, J.G.; Buck, J.W. Pacific Northwest National Lab., Richland, WA (United States). Mar 1996. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96010944. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); INIS; GPO Dep.

Report is unlimited; software package is copyrighted.

The Multimedia Environmental Pollutant Assessment System (MEPAS) is an integrated software implementation of physics-based fate and transport models for health and environmental risk assessments of both radioactive and hazardous pollutants. This atmospheric component report is one of a series of formulation reports that document the MEPAS mathematical models. MEPAS is a multimedia model; pollutant transport is modeled within, through, and between multiple media (air, soil, groundwater, and surface water). The estimated concentrations in the various media are used to compute exposures and impacts to the environment, to maximum individuals, and to populations. The MEPAS atmospheric component for the air media documented in this report includes models for emission from a source to the air, initial plume rise and dispersion, airborne pollutant transport and dispersion, and deposition to soils and crops. The material in this report is documentation for MEPAS Versions 3.0 and 3.1 and the MEPAS version used in the Remedial Action Assessment System (RAAS) Version 1.0.

244 (PNNL–11106) **CY 1995 radiation dose reconciliation report and resulting CY 1996 dose estimate for the 324 nuclear facility.** Landsman, S.D.; Thornhill, R.E.; Peterson, C.A. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 91p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96010136. Source: OSTI; NTIS; INIS; GPO Dep.

In this report, the dose estimate for CY 1995 is reconciled by month wih actual doses received. Results of the reconciliation were used to revise estimates of worker dose for CY 1996. Resulting dose estimate for the facility is also included. Support for two major programs (B-Cell Cleanout and Surveillance and Maintenance) accounts for most of the exposure received by workers in the faility. Most of the expousre received by workers comes from work in the Radiochemical Engineering Complex airlock. In spite of schedule and work scope changes during CY 1995, dose estimates were close to actual exposures received. A number of ALARA measures were taken throughout the year; exposure reduction due to those was 20.6 Man-Rem, a 28% reduction from the CY 1995 estimate. Baseline estimates for various tasks in the facility were used to compile the CY 1996 dose estimate of 45.4 Man-Rem; facility goal for CY 1996 is to reduce worker dose by 20%, to 36.3 Man-Rem.

245 (SAND–93-0350) **Dynamic pulse buckling of cylindrical shells under axial impact: A comparison of 2D and 3D finite element calculations with experimental data.** Hoffman, E.L.; Ammerman, D.J. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014529. Source: OSTI; NTIS; INIS; GPO Dep.

A series of tests investigating dynamic pulse buckling of a cylindrical shell under axial impact is compared to several 2D and 3D finite element simulations of the event. The purpose of the work is to investigate the performance of various analysis codes and element types on a problem which is applicable to radioactive material transport packages, and ultimately to develop a benchmark problem to qualify finite element analysis codes for the transport package design industry. Four axial impact tests were performed on 4 in-diameter, 8 in-long, 304 L stainless steel cylinders with a 3/16 in wall thickness. The cylinders were struck by a 597 lb mass with an impact velocity ranging from 42.2 to 45.1 ft/sec. During the impact event, a buckle formed at each end of the cylinder, and one of the two buckles became unstable and collapsed. The instability occurred at the top of the cylinder in three tests and at the bottom in one test. Numerical simulations of the test were performed using the following codes and element types: PRONTO2D with axisymmetric four-node quadrilaterals; PRONTO3D with both four-node shells and eight-node hexahedrons; and ABAQUS/Explicit with axisymmetric two-node shells and four-node quadrilaterals, and 3D four-node shells and eight-node hexahedrons. All of the calculations are compared to the tests with respect to deformed shape and impact load history. As in the tests, the location of the instability is not consistent in all of the calculations. However, the calculations show good agreement with impact load measurements with the exception of an initial load spike which is proven to be the dynamic response of the load cell to the impact. Finally, the PRONIT02D calculation is compared to the tests with respect to strain and acceleration histories. Accelerometer data exhibited good qualitative agreement with the calculations. The strain comparisons show that measurements are very sensitive to gage placement.

246 (SAND–94-0932) **The effect of stratigraphic dip on brine inflow and gas migration at the Waste Isolation Pilot Plant.** Webb, S.W. (Sandia National Labs., Albuquerque, NM (United States)); Larson, K.W. Sandia National Labs., Albuquerque, NM (United States). Feb 1996. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96006448. Source: OSTI; NTIS; INIS; GPO Dep.

The natural dip of the Salado Formation at the Waste Isolation Pilot Plant (WIPP), although regionally only about 111, has the potential to affect brine inflow and gas-migration distances due to buoyancy forces. Current models, including those in WIPP Performance Assessment calculations, assume a perfectly horizontal repository and stratigraphy. With the addition of buoyancy forces due to the dip, brine and gas flow patterns can be affected. Brine inflow may increase due to countercurrent flow, and gas may preferentially migrate up dip. This scoping study has used analytical and numerical modeling to evaluate the impact of the dip on brine inflow and gas-migration distances at the WIPP in one, two, and three dimensions. Sensitivities to interbed permeabilities, two-phase curves, gas-generation rates, and interbed fracturing were studied.

247 (SAND–94-1311) **Air intake shaft performance tests (Shaft 5): In situ data report (May 1988–July 1995). Waste Isolation Pilot Plant (WIPP) Thermal/Structural Interactions Program.** Munson, D.E. (Sandia National Labs., Albuquerque, NM (United States). Repository Isolation Systems Dept.); Hoag, D.L.; Ball, J.R.; Baird, G.T.; Jones, R.L. Sandia National Labs., Albuquerque, NM (United States). Jul 1995. 181p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96006196. Source: OSTI; NTIS; INIS; GPO Dep.

Data are presented from the Air Intake Shaft Test, an in situ test fielded at the Waste Isolation Pilot Plant (WIPP). The construction of this shaft, well after the initial three access shafts, presented an unusual opportunity to obtain valuable detailed data on the mechanical response of a shaft for application to seal design. These data include selected fielding information, test configuration, instrumentation activities, and comprehensive results from a large number of gages. Construction of the test began in December 1987; gage data in this report cover the period from May 1988 through July 1995, with the bulk of the data obtained after obtaining access in November, 1989 and from the heavily instrumented period after remote gage installation between May, 1990, and October, 1991.

248 (SAND–94-1945) **ITEP: A survey of innovative environmental restoration technologies in the Netherlands and France.** Roberds, W.J. (Golder Associates, Inc., Redmond, WA (United States)); Voss, C.F.; Hitchcock, S.A. Sandia National Labs., Albuquerque, NM (United States); Golder Associates, Inc., Redmond, WA (United States). May 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015057. Source: OSTI; NTIS; INIS; GPO Dep.

The International Technology Exchange Program (ITEP) of the Department of Energy's (DOE's) Office of Environmental Management (EM) is responsible for promoting the import of innovative technologies to better address EM's needs and the export of US services into foreign markets to enhance US competitiveness. Under this program, potentially innovative environmental restoration technologies, either commercially available or under development in the Netherlands and France, were identified, described, and evaluated. It was found that 12 innovative environmental restoration technologies, which are either commercially available or under development in the Netherlands and France, may have some benefit for the DOE EM program and should be considered for transfer to the United States.

249 (SAND–94-1946) **A survey of environmental needs and innovative technologies in Germany.** Voss, C.F. (Golder Associates, Inc., Redmond, WA (United States)); Roberds, W.J. Sandia National Labs., Albuquerque, NM (United States); Golder Associates, Inc., Redmond, WA (United States). May 1995. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015058. Source: OSTI; NTIS; INIS; GPO Dep.

The International Technology Program (IT?), formerly the international Technology Exchange Program (ITEP), of the Department of Energy's (DOE's) Office of Environmental Restoration and Waste Management (EM) is responsible for promoting: (1) the import of innovative technologies to better address EM's needs; and (2) the export of US services into foreign markets to enhance US competitiveness. Under this program: (1) the environmental restoration market in Germany was evaluated, including the description of the general types of environmental problems, the environmental regulations, and specific selected contaminated sites; and (2) potentially innovative environmental restoration technologies, either commercially available or under development in Germany, were identified, described and evaluated. It was found that: (1) the environmental restoration market in Germany is very large, on the order of several billion US dollars per year, with a significant portion possibly available to US businesses; and (2) a large number (54) of innovative environmental restoration technologies, which are either commercially available or under development in Germany, may have some benefit to the DOE EM program and should be considered for transfer to the US.

250 (SAND–94-1949) **Estimating the hydrogen ion concentration in concentrated NaCl and Na_2SO_4 electrolytes.** Rai, D. (Pacific Northwest Lab., Richland, WA (United States)); Felmy, A.R.; Juracich, S.P.; Rao, F. Sandia National Labs., Albuquerque, NM (United States); Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95016459. Source: OSTI; NTIS; GPO Dep.

Combination glass electrodes were tested for determining H^+ concentrations in concentrated pure and mixed NaCl and Na_2SO_4 solutions, as well as natural brine systems. NaCl, Na_2SO_4, and mixtures of NaCl and Na_2SO_4 solutions were analyzed. Correction factors for estimating $pC_H{}^+$ (negative logarithm of H^+ concentration) were determined from measured/observed pH values. Required Gran-type titrations were done with HCl and/or NaOH. The titration method is described and a step-by-step procedure provided; it has been used previously for determining pC_H^+ values of synthetic chloride-dominated brines. Precautions are required to determine correction factors for electrolytes that react with H^+ or OH^- [sulfate brines for titration with acid; magnesium brines for titration with base because of precipitation of Mg(OH)2]. Correction factors A ($pC_H^+ = pH_{ob} + A$) from HCl titrations were similar to those from NaOH titrations where the concentration of free H^+ was calculated using a thermodynamic model. These values should be applicable to solns with a very large range in measured pH values (2 to 12). Because a large number of solns were titrated with HCl and the A values are similar for HCl and NaOH titrations, the A values for NaCl and Na2SO4 solns were fit as a function of molality to allow extrapolation. For NaCl solns 0 to 6.0 M, A can be obtained by multiplying the molality by 0.159. For Na2SO4 solns 0 to 2.0 M, the values of A can be obtained from ($0.221 - 0.549X + 0.201X^2$), where X is the molality of Na_2SO_4. Orion-Ross electrode evaluations indicated that the A values did not differ significantly for different electrodes. Results suggest that the data in this report can be used to estimate A values for different NaCl and Na_2SO_4 solns even for noncalibrated electrodes.

251 (SAND–95-0081C) **Estimates of fire environments in ship holds containing radioactive material packages.** Koski, J.A. (Sandia National Labs., Albuquerque, NM (United States)); Cole, J.K.; Hohnstreiter, G.F.; Wix, S.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–18: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003643. Source: OSTI; NTIS; INIS; GPO Dep.

Fire environments that occur on cargo ships differ significantly from the fire environments found in land transport. Cargo ships typically carry a large amount of flammable fuel for propulsion and shipboard power, and may transport large quantities of flammable cargo. As a result, sea mode transport accident records contain instances of long lasting and intense fires. Since Irradiated Nuclear Fuel (INF) casks are not carried on tankers with large flammable cargoes, most of these dramatic, long burning fires are not relevant threats, and transport studies must concentrate on those fires that are most likely to occur. By regulation, INF casks must be separated from flammable cargoes by a fire-resistant, liquid-tight partition. This makes a fire in an adjacent ship hold the most likely fire threat. The large size of a cargo ship relative to any spent nuclear fuel casks on board, however, may permit a severe, long lasting fire to occur with little or no thermal impact on the casks. Although some flammable materials such as shipping boxes or container floors may exist in the same hold with the cask, the amount of fuel available may not provide a significant threat to the massive transport casks used for radioactive materials. This shipboard fire situation differs significantly from the regulatory conditions specified in 10 CFR 71 for a fully engulfing pool fire. To learn more about the differences, a series of simple thermal analyses has been completed to estimate cask behavior in likely marine and land thermal accident situations. While the calculations are based on several conservative assumptions, and are only preliminary, they illustrate that casks are likely to heat much more slowly in shipboard hold fires than in an open pool fire. The calculations also reinforce the basic regulatory concept that for radioactive materials, the shipping cask, not the ship, is the primary protection barrier to consider.

252 (SAND–95-0184C) **Impact limiter design for a lightweight tritium hydride vessel transport container.** Harding, D.C.; Longcope, D.B.; Neilsen, M.K. Sandia National Labs., Albuquerque, NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–10: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003645. Source: OSTI; NTIS; INIS; GPO Dep.

Sandia National Laboratories (SNL) has designed an impact-limiting system for a small, lightweight radioactive material shipping container. The Westinghouse Savannah River Company (WSRC) is developing this Type B package for the shipment of tritium, replacing the outdated LP-50 shipping container. Regulatory accident resistance requirements for Type B packages, including this new tritium package, are specified in 10 CFR 71 (NRC 1983). The regulatory requirements include a 9-meter free drop onto an unyielding target, a 1-meter drop onto a mild steel punch, and a 30-minute 800° C fire test. Impact limiters are used to protect the package in the free-drop accident condition in any impact orientation without hindering the package's resistance to the thermal accident condition. The overall design of the new package is based on a modular concept using separate thermal shielding and impact mitigating components in an attempt to simplify the design, analysis, test, and certification process. Performance requirements for the tritium package's limiting system are based on preliminary estimates provided by WSRC. The current tritium hydride vessel (THV) to be transported has relatively delicate valving assemblies and should not experience acceleration levels greater than approximately 200 g's. A thermal overpack and outer stainless steel shell, to be designed by WSRC, will form the inner boundary of the impact-limiting system (see Figure 1). The mass of the package, including cargo, inner container, thermal overpack, and outer stainless steel shell (not including impact limiters) should be approximately 68 kg. Consistent with the modular design philosophy, the combined thermal overpack and containment system should be considered essentially rigid, with the impact limiters incurring all deformation.

253 (SAND–95-0185C) **Chemical compatibility screening results of plastic packaging to mixed waste simulants.** Nigrey, P.J.; Dickens, T.G. Sandia National Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–3: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003070. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed a chemical compatibility program for evaluating transportation packaging components for transporting mixed waste forms. We have performed the first phase of this experimental program to determine the effects of simulant mixed wastes on packaging materials. This effort involved the screening of 10 plastic materials in four liquid mixed waste simulants. The testing protocol involved exposing the respective materials to ~3 kGy of gamma radiation followed by 14 day exposures to the waste simulants of 60 C. The seal materials or rubbers were tested using VTR (vapor transport rate) measurements while the liner materials were tested using specific gravity as a metric. For these tests, a screening criteria of ~1 g/m^2/hr for VTR and a specific gravity change of 10% was used. It was concluded that while all seal materials passed exposure to the aqueous simulant mixed waste, EPDM and SBR had the lowest VTRs. In the chlorinated hydrocarbon simulant mixed waste, only VITON passed the screening tests. In both the simulant scintillation fluid mixed waste and the ketone mixture simulant mixed waste, none of the seal materials met the screening criteria. It is anticipated that those materials with the lowest VTRs will be evaluated in the comprehensive phase of the program. For specific gravity testing of liner materials the data showed that while all materials with the exception of polypropylene passed the screening criteria, Kel-F, HDPE, and XLPE were found to offer the greatest resistance to the combination of radiation and chemicals.

254 (SAND–95-0193C) **The development of a visualization tool for displaying analysis and test results.** Uncapher, W.L. (Sandia National Labs., Albuquerque, NM (United States). Transportation System Development Dept.); Ammerman, D.J.; Ludwigsen, J.S.; Knight, R.D.; Wix, S.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–61: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007665. Source: OSTI; NTIS; INIS; GPO Dep.

The evaluation and certification of packages for transportation of radioactive materials is performed by analysis, testing, or a combination of both. Within the last few years, many transport packages that were certified have used a combination of analysis and testing. The ability to combine and display both kinds of data with interactive graphical tools allows a faster and more complete understanding of the response of the package to these environments. Sandia National Laboratories has developed an initial version of a visualization tool that allows the comparison and display of test and of analytical data as part of a Department of Energy-sponsored program to support advanced analytical techniques and test methodologies. The capability of the tool extends to both mechanical (structural) and thermal data.

255 (SAND–95-0194C) **Integration of finite element analysis and numerical optimization techniques for RAM transport package design.** Harding, D.C.; Eldred, M.S.; Witkowski, W.R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–11: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003655. Source: OSTI; NTIS; INIS; GPO Dep.

Type B radioactive material transport packages must meet strict Nuclear Regulatory Commission (NRC) regulations specified in 10 CFR 71. Type B containers include impact limiters, radiation or thermal shielding layers, and one or more containment vessels. In the past, each component was typically designed separately based on its driving constraint and the expertise of the designer. The components were subsequently assembled and the design modified iteratively until all of the design criteria were met. This approach neglects the fact that components may serve secondary purposes as well as primary ones. For example, an impact limiter's primary purpose is to act as an energy absorber and protect the contents of the package, but can also act as a heat dissipater or insulator. Designing the component to maximize its performance with respect to both objectives can be accomplished using numerical optimization techniques.

256 (SAND–95-0201C) **Testing of the structural evaluation test unit.** Ammerman, D.J.; Bobbe, J.G. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–56: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007686. Source: OSTI; NTIS; INIS; GPO Dep.

In the evaluation of the safety of radioactive material transportation it is important to consider the response of Type B packages to environments more severe than that prescribed by the hypothetical accident sequence in Title 10 Part 71 of the Code of Federal Regulations (NRC 1995). The impact event in this sequence is a 9-meter drop onto an essentially unyielding target, resulting in an impact velocity of 13.4 m/s. The behavior of 9 packages when subjected to impacts more severe than this is not well known. It is the purpose of this program to evaluate the structural response of a test package to these environments. Several types of structural response are considered. Of primary importance is the behavior of the package containment boundary, including the bolted closure and 0-rings. Other areas of concern are loss of shielding capability due to lead slump and the deceleration loading of package contents, that may cause damage to them. This type of information is essential for conducting accurate risk assessments on the transportation of radioactive materials. Currently very conservative estimates of the loss of package protection are used in these assessments. This paper will summarize the results of a regulatory impact test and three extra-regulatory impact tests on a sample package.

257 (SAND–95-0203C) **Crush performance of redwood for developing design procedures for impact limiters.** Cramer, S.M. (Univ. of Wisconsin, Madison, WI (United States)); Hermanson, J.C.; McMurtry, W.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–17: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003642. Source: OSTI; NTIS; INIS; GPO Dep.

Containers for the transportation of hazardous and radioactive materials incorporate redwood in impact limiters. Redwood is an excellent energy absorber, but only the most simplistic information exists on its crush properties. Tbe stress-strain interrelationship for any wood species subject to three-dimensional stresses is largely unknown for any all stress condition and wood behavior at both high strains and high strain-rates is known only in general terms. Both stress-strain and crush failure theories have been developed based only on uniaxial load tests. The anisotropy of wood adds an additional complexity to measuring wood response and developing suitable theories to describe it. A long history of wood utilization in the building industry has led to design procedures and property information related to simple uniaxial loadings that do not inflict damage to the wood. This lack of knowledge may be surprising for a material that has a long history of engineered use, but the result is difficulty in utilizing wood in more sophisticated designs such as impact limiters. This study provides a step toward filling the information gap on wood material response for high performance applications such as impact limiters.

258 (SAND–95-0204C) **Analytical determination of package response to severe impact.** Ludwigsen, J.S.; Ammerman, D.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–50: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007683. Source: OSTI; NTIS; INIS; GPO Dep.

One important part of radioactive material transport risk assessments is amount of release from packages in accidents more severe than design basis accident (US NRC 10CFR71 1995). In order to remove some of the conservatism from current risk assessments, an effort is ongoing to qualify the finite element method for predicting cask performance by comparing analytical results to test measurements of the Structural Evaluation Test Unit (SETU) cask. Comparisons of deformed shapes, strains, and accelerations were made for impact velocities of 13.4, 20.1, and 26.8 m/s (30, 45, and 60 mph). The 13.4 m/s impact corresponds to the regulatory 9 m (30 ft) free fall, and the others correspond to impacts with 2.25 and 4 times the kinetic energy of the regulatory impact. One other analysis at an impact velocity of 38.0 m/s (85 mph) or 8 times regulatory impact kinetic energy was also done.

259 (SAND–95-0211C) **SeaRAM: an evaluation of the safety of RAM transport by sea.** McConnell, P. (Sandia National Labs., Livermore, CA (United States)); Sorenson, K.B.; Carter, M.H.; Keane, M.P.; Keith, V.F.; Heid, R.J. Sandia National Labs., Livermore, CA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–47: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007422. Source: OSTI; NTIS; INIS; GPO Dep.

SeaRAM is a multi-year Department of Energy (DOE) project designed to validate the safety of shipping radioactive materials (RAM) by sea. The project has an ultimate goal of developing and demonstrating analytic tools for performing comprehensive analyses to evaluate the risks to humans and the environment due to sea transport of plutonium, vitrified high-level waste (VHLW), and spent fuel associated with reprocessing and research reactors. To achieve this end, evaluations of maritime databases and structural an thermal analyses of particular severe collision and fire accidents have been and will continue to be conducted. Program management for SeaRAM is based at the DOE's Office of Environmental Restoration. Technical activities for the project are being conducted at Sandia National Laboratories (SNL). Several private organizations are also involved in providing technical support, notably Engineering Computer Optecnomics, Inc. (ECO). The technical work performed for SeaRAM also supports DOE participation in an International Atomic Energy Agency (IAEA) Cooperative Research Program (CRP) entitled Accident Severity at Sea During Transport of Radioactive Material. This paper discusses activities performed during the first year of the project.

260 (SAND–95-0227C) **Development on inelastic analysis acceptance criteria for radioactive material transportation packages.** Ammerman, D.J.; Ludwigsen, J.S. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–55: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007685. Source: OSTI; NTIS; INIS; GPO Dep.

The response of radioactive material transportation packages to mechanical accident loadings can be more accurately characterized by non-linear dynamic analysis than by the "Equivalent dynamic" static elastic analysis typically used in the design of these packages. This more accurate characterization of the response can lead to improved package safety and design efficiency. For non-linear dynamic analysis to become the preferred method of package design analysis, an acceptance criterion must be established that achieves an equivalent level of safety as the currently used criterion defined in NRC Regulatory Guide 7.6 (NRC 1978). Sandia National Laboratories has been conducting a study of possible acceptance criteria to meet this requirement. In this paper non-linear dynamic analysis acceptance criteria based on stress, strain, and strain-energy-density will be discussed. An example package design will be compared for each of the design criteria, including the approach of NRC Regulatory Guide 7.6.

261 (SAND–95-0375C) **Impact limiter tests of four commonly used materials and establishment of an impact limiter data base.** McMurtry, W.M.; Hohnstreiter, G.F. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–19: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003644. Source: OSTI; NTIS; INIS; GPO Dep.

In designing a package for transporting hazardous or radioactive materials, there are a number of components whose design can lead to the success or failure to meet regulatory requirements for Type B packages. One of these components is the impact limiter. The primary purpose of the impact limiter is to protect the package and its contents from sudden deceleration. It can also act as a thermal barrier. The package is protected by the impact limiter's ability to act as an energy absorber. The crush strength of most impact limiting materials is determined by a standard quasistatic (QS) method. However it has been observed that there are a number of factors that affect crush strength. The material being used as an impact limiter may appear incompressible because of one or more of these factors. Factors that determine compressive strength of impact limiter materials are; the material density; the thickness of the impact limiter material. There must be adequate material to absorb the impact and not go into lockup, lockup up occurs when the free volume of the material is eliminated and the crush strength sharply increases; the angle of impact; and the loading rate and operating temperature. All of these are interactive and therefore difficult to model. It is the intent of tests discussed in this paper to determine the dependency of crush strength to loading rate and angle of impact to the basic grain direction of two different densities of four impact limiting materials.

262 (SAND–95-1758) **International technology catalogue: Foreign technologies to support the environmental restoration and waste management needs of the DOE complex.** Matalucci, R.V. (ed.) (Sandia National Labs., Albuquerque, NM (United States). International Programs Dept.); Jimenez, R.D.; Esparza-Baca, C. (ed.). Sandia National Labs., Albuquerque, NM (United States). Jul 1995. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95017835. Source: OSTI; NTIS; INIS; GPO Dep.

This document represents a summary of 27 foreign-based environmental restoration and waste management technologies that have been screened and technically evaluated for application to the cleanup problems of the Department of Energy (DOE) nuclear weapons complex. The evaluation of these technologies was initiated in 1992 and completed in 1995 under the DOE's International Technology Coordination Program of the Office of Technology Development. A methodology was developed for conducting a country-by-country survey of several regions of the world where specific environmental technology capabilities and market potential were investigated. The countries that were selected from a rank-ordering process for the survey included: then West Germany, the Netherlands, France, Japan, Taiwan, the Czech and Slovak Republics, and the Former Soviet Union. The notably innovative foreign technologies included in this document were screened initially from a list of several hundred, and then evaluated based on criteria that examined for level of maturity, suitability to the DOE needs, and for potential cost effective application at a DOE site. Each of the selected foreign technologies that were evaluated in this effort for DOE application were subsequently matched with site-specific environmental problem units across the DOE complex using the Technology Needs Assessment CROSSWALK Report. For ease of tracking these technologies to site problem units, and to facilitate their input into the DOE EnviroTRADE Information System, they were categorized into the following three areas: (1) characterization, monitoring and sensors, (2) waste treatment and separations, and (3) waste containment. Technical data profiles regarding these technologies include title and description, performance information, development status, key regulatory considerations, intellectual property rights, institute and contact personnel, and references.

263 (SAND–95-2639C) **A successful effort to involve stakeholders in the selection of a site for a corrective action management unit.** Conway, R. (Sandia National Labs., Albuquerque, NM (United States)); Merkhofer, M.W.; Oms, E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960804–1: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96002780. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the effort to clean up hazardous waste sites, Sandia National Laboratories in New Mexico (SNL/NM) adopted a novel approach to involving stakeholders in a key decision associated with its Environmental Restoration (ER) Project. The decision was where to locate a Corrective Action Management Unit (CAMU), an area designed to consolidate, store, and treat wastes generated from cleanup activities. The decision-making approach was a variation of a technique known as multiattribute utility analysis (MUA). Although MUA has rarely been undertaken during normal Project activities, it proved to be a surprisingly effective means for involving stakeholders in the decision process, generating consensus over a selected site, and enhancing public trust and understanding of Project activities. Requirements and criteria for selecting CAMU sites are provided by the Environmental Protection Agency's (EPA's) CAMU Final Rule (EPA 1993). Recognizing the lack of experience with the Rule and the importance of community understanding and support, the ER Project sought an approach that would allow stakeholders to participate in the site-selection process.

264 (SAND–95-2696C) **Study of evacuation times based on general accident history.** Mills, G.S. (Sandia National Labs., Albuquerque, NM (United States)); Neuhauser, K.S.; Smith, J.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–5: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003099. Source: OSTI; NTIS; INIS; GPO Dep.

The RADTRAN 4 computer code, which calculates estimates of accident dose-risk corresponding to specified transportation scenarios, ascribes doses to potentially exposed members of the public. These persons are modeled as not being evacuated from the affected area for 24 hours following a release of radioactive material. Anecdotal evidence has suggested that this value may be unnecessarily conservative; consequently risk estimates are unnecessarily high. An initial survey of recent trucking accidents, reported in newspapers and other periodicals (1988 through 1994), that involved evacuation of the general population in the affected areas was undertaken to establish the actual time required for such evacuations. Accidents involving hazardous materials other than those which are radioactive (e.g., gasoline, insecticides, other chemicals) but also requiring evacuations of nearby residents were included in the survey. However, the resultant set of sufficiently documented trucking incidents yielded rather sparse data [1]. When the probability density distribution of the truck accident data was compared with that resulting from addition of four other (rail and fixed site) incidents, there was no statistically significant difference between them. Therefore, in order to improve the statistical significance of the data set, i.e., maximize the number of pertinent samples, a search for evacuations resulting from all types of accidents was performed. This resulted in many more references; a set of 48 incidents which could be adequately verified was compiled and merged with the original two data sets for a total of 66 evacuation accounts.

265 (SAND–95-2736C) **Verification of RADTRAN.** Kanipe, F.L.; Neuhauser, K.S. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951204–28: Fall meeting of the American Geophysical Union, San Francisco, CA (United States), 11-15 Dec 1995). Order Number DE96003663. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents details of the verification process of the RADTRAN computer code which was established for the calculation of risk estimates for radioactive materials transportation by highway, rail, air, and waterborne modes.

266 (SAND–95-2842C) **MPATHav: A software prototype for multiobjective routing in transportation risk assessment.** Ganter, J.H.; Smith, J.D. Sandia National

Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–25: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003660. Source: OSTI; NTIS; INIS; GPO Dep.

Most routing problems depend on several important variables: transport distance, population exposure, accident rate, mandated roads (e.g., HM-164 regulations), and proximity to emergency response resources are typical. These variables may need to be minimized or maximized, and often are weighted. 'Objectives' to be satisfied by the analysis are thus created. The resulting problems can be approached by combining spatial analysis techniques from geographic information systems (GIS) with multiobjective analysis techniques from the field of operations research (OR); we call this hybrid multiobjective spatial analysis' (MOSA). MOSA can be used to discover, display, and compare a range of solutions that satisfy a set of objectives to varying degrees. For instance, a suite of solutions may include: one solution that provides short transport distances, but at a cost of high exposure; another solution that provides low exposure, but long distances; and a range of solutions between these two extremes.

267 (SAND–95-3018C) **Application of spreadsheets to standardize transportation radiological risk assessments.** McClure, J.D. (Sandia National Labs., Albuquerque, NM (United States)); Neuhauser, K.S.; Smith, J.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–22: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003639. Source: OSTI; NTIS; INIS; GPO Dep.

Because of the complexity, volume of data and calculations required, one preferred analytical tool to perform transportation risk assessments is the RADTRAN computer code. RADTRAN combines user-determined material, packaging, transportation, demographic and meteorological factors, with health physics data to calculate expected radiological consequences and accident risk from transporting radioactive materials by all commercial modes including truck, rail, ship, air and barge. The computer code consists of two major modules for each transport mode: the incident-free module, in which doses from normal transport are calculated; and the accident module, in which dose consequences and probabilities are evaluated to generate risk estimates. The purpose of this presentation is to describe the development of a standardized procedure to perform transportation radiological risk assessments employing conventional spreadsheet programs to automate generation of RADTRAN input files and post-processing analysis of the resulting output.

268 (SAND–95-3019C) **Determination of buildup factors in titanium and depleted uranium.** Jones, T.H. (Univ. of New Mexico, Albuquerque, NM (United States)); Busch, R.D.; Miller, J.A.; Seager, K.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–15: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003640. Source: OSTI; NTIS; INIS; GPO Dep.

Approximately 13% by volume of the US Department of Energy (DOE) current backlog of radioactive waste is characterized as high-level waste. Transportation of these wastes requires that the waste package have adequate shielding against gamma radiation. This project investigates the radiation shielding performance of titanium and depleted uranium, which have been proposed for use as gamma shielding materials in DOE transportation packages, by experimentally determining their buildup factors. Buildup factors are important in shield heating and radiation damage calculations. A point-isotropic-source type of buildup factor is the most useful for application in the point-kernal approach utilized in many simple shielding codes. The point-kernal method provides reasonable results for cases in which the shield is made of one solid material and the source can be approximated as one homogeneous material. The point-kernal method has been incorporated into a large number of shielding codes treating three-dimensional geometry using buildup factor data in some form. Buildup factors vary with a number of parameters such as the distance of penetration through the attenuating medium; the geometric configuration of the attenuating medium, source and detector position; the composition of the medium; the detector response function; and the energy and direction of emission of the source photons, ideally taken to be monoenergetic and isotropic.

269 (SAND–95-3020C) **Thermal effects of an advanced wire mesh packaging material.** Wix, S.D. (Gram, Inc., Albuquerque, NM (United States)); Pierce, J.D. 270 (SAND–96-0203C) **A successful effort to involve stakeholders in a facility siting decision using LIPS with stakeholder involvement.** Merkhofer, L. (Applied Decision Analysis, Inc., Menlo Park, CA (United States)); Conway, R.; Anderson, B. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9511179–1: State and tribal forum on risk based decision making, St. Louis, MO (United States), 12-15 Nov 1995). Order Number DE96007682. Source: OSTI; NTIS; INIS; GPO Dep.

Local public opposition to federal bureaucratic decisions has resulted in public agencies rethinking the role of stakeholders in decision making. Efforts to include stakeholders directly in the decision-making process are on the increase. Unfortunately, many attempts to involve members of the public in decisions involving complex technical issues have failed. A key problem has been defining a meaningful role for the public in the process of arriving at a technical decision. This paper describes a successful effort by Sandia National Laboratories (SNL) in New Mexico to involve stakeholders in an important technical decision associated with its Environmental Restoration (ER) Project. The decision was where to locate a Corrective Action Management Unit

(CAMU), a facility intended to consolidate and store wastes generated from the cleanup of hazardous waste sites. A formal priority setting process known as the Laboratory Integration Prioritization System (LIPS) was adapted to provide an approach for involving the public. Although rarely applied to stakeholder participation, the LIPS process proved surprisingly effective. It produced a consensus over a selected site and enhanced public trust and understanding of Project activities.

271 (SAND–96-0209C) **A status report on the development and certification of the Beneficial Uses Shipping System (BUSS) cask.** Yoshimura, H.R.; Bronowski, D.R. Sandia National Labs., Albuquerque, NM (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–46: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007663. Source: OSTI; NTIS; INIS; GPO Dep.

In the early 1980s, the US Department of Energy (DOE) implemented a program to encourage beneficial uses of nuclear byproduct materials, such as cesium-137 and strontium-90, created during the production of defense materials. Potential uses of the cesium-137 (^{137}CS) isotope included sterilizing medical products, maintaining the quality of certain food products, and disinfecting municipal sewage sludge. Strontium-90 (^{90}Sr) is a good heat source and has been used in thermoelectric generators and other products that require a constant supply of heat. During that same period, a proposed facility in Albuquerque, New Mexico, was designed to use cesium-137 to sterilize sewage sludge. To support the sewage sludge treatment facility, Sandia National Laboratories was funded by the DOE to develop a Nuclear Regulatory Commission (NRC)-certified Type B shipping container to transport cesium chloride (CsCl) or strontium fluoride (SrF_2) capsules produced by the Hanford Waste Encapsulation and Storage Facility (WESF) in the State of Washington. The primary purpose of the Beneficial Uses Shipping System (BUSS) cask is to provide shielding and confinement, as well as impact, puncture, and thermal protection for certified, special form contents during transport under normal and hypothetical accident conditions. The BUSS cask was designed to meet dimensional and weight constraints of the WESF and user facilities. Attaining as-low-as-reasonably-achievable (ALARA) radiation exposures in the design and operation of the transport system was a major design goal. Another goal was to obtain regulatory approval of the design by preparing a safety analysis report for packaging (SARP) (Yoshimura et al. 1993).

272 (SAND–96-0258C) **An assessment of simplified methods to determine damage from ship-to-ship collisions.** Parks, M.B.; Ammerman, D.J. Sandia National Labs., Albuquerque, NM (United States). [1996]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–62: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007667. Source: OSTI; NTIS; INIS; GPO Dep.

Sandia National Laboratories (SNL) is studying the safety of shipping, radioactive materials (RAM) by sea, the SeaRAM project (McConnell, et al. 1995), which is sponsored by the US Department of Energy (DOE). The project is concerned with the potential effects of ship collisions and fires on onboard RAM packages. Existing methodologies are being assessed to determine their adequacy to predict the effect of ship collisions and fires on RAM packages and to estimate whether or not a given accident might lead to a release of radioactivity. The eventual goal is to develop a set of validated methods, which have been checked by comparison with test data and/or detailed finite element analyses, for predicting the consequences of ship collisions and fires. These methods could then be used to provide input for overall risk assessments of RAM sea transport. The emphasis of this paper is on methods for predicting- effects of ship collisions.

273 (SAND–96-0282C) **Analysis of a ship-to-ship collision.** Porter, V.L.; Ammerman, D.J. Sandia National Labs., Albuquerque, NM (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–63: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007668. Source: OSTI; NTIS; INIS; GPO Dep.

Sandia National Laboratories is involved in a safety assessment for the shipment of radioactive material by sea. One part of this study is investigation of the consequences of ship-to-ship collisions. This paper describes two sets of finite element analyses performed to assess the structural response of a small freighter and the loading imparted to radioactive material (RAM) packages during several postulated collision scenarios with another ship. The first series of analyses was performed to evaluate the amount of penetration of the freighter hull by a striking ship of various masses and initial velocities. Although these analyses included a representation of a single RAM package, the package was not impacted during the collision so forces on the package could not be computed. Therefore, a second series of analyses incorporating a representation of a row of seven packages was performed to ensure direct package impact by the striking ship. Average forces on a package were evaluated for several initial velocities and masses of the striking ship. In addition to. providing insight to ship and package response during a few postulated ship collisions scenarios, these analyses will be used to benchmark simpler ship collision models used in probabilistic risk assessment analyses.

274 (SAND–96-0323C) **Transportation risks associated with moving special nuclear material from RFETS to Lowry AFB, Denver.** Weiner, R.F. Sandia National Labs., Albuquerque, NM (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960804–2: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96005900. Source: OSTI; NTIS; INIS; GPO Dep.

Among the alternatives considered for the short-term disposition of special nuclear material now stored at the Rocky Flats Environmental Technology Site (RFETS)was transportation of the material offsite and disposition in an unused missile silo. Such silos may be available at the Lowry Air Force Base on the east side of Denver. Therefore, the risks of transporting the material under consideration were analyzed. The risks were analyzed using RADTRAN 4.0.18 (Neuhauser and Kanipe, 1992). The 40-km route from RFETS to Lowry maximized the use of limited-access divided highways (26 of the 40 km): the routes from RFETS to Denver and through Denver were on limited-access freeway, while the route from Denver to Lowry AFB was on secondary roads and is modeled using the RADTRAN "suburban" designation. Population densities were given in the HIGHWAY routing code available on TRANSNET, and used 1990 census figures. The source term was that given in an available file developed for RADTRAN by Sandia National Laboratories, and the shipment modeled contained 203 Curies of Pu-239 oxide and 47.9 Curies Pu-240 oxide. Radiation exposure at 1 meter from the container surface was 1.5 mrem/hr (transport index = 1.5). RADTRAN 4.0 and HIGHWAY are validated and verified codes; TRANSNET is the user interface.

275 (SAND–96-0341C) **Classification of poison inhalation hazard materials into severity groups.** Griego, N.R.; Weiner, R.F. Sandia National Labs., Albuquerque, NM (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–48: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007423. Source: OSTI; NTIS; INIS; GPO Dep.

Approximately 1.5 billion tons of hazardous materials (hazmat) are transported in the US annually, and most reach their destinations safely. However, there are infrequent transportation accidents in which hazmat is released from its packaging. These accidental releases can potentially affect the health of the exposed population and damage the surrounding environment. Although these events are rare, they cause genuine public concern. Therefore, the US Department of Transportation Research & Special Programs Administration (DOT- RSPA) has sponsored a project to evaluate the protection provided by the current bulk (defined as larger than 118 gallons) packagings used to transport materials that have been classified as Poison Inhalation Hazards (PIH) and recommend performance standards for these PIH packagings. This project was limited to evaluating bulk packagings larger than 2000 gallons. This project involved classifying the PIH into severity categories so that only one set of packaging performance criteria would be needed for each severity category rather than a separate set of performance criteria for each individual PIH. By grouping the PIH into Hazard Zones, Packaging Groups and performance standards for these Hazard Zones can be defined. Each Hazard Zone can correspond to a Packaging Group or, as in 49CFR173 for non-bulk packagings, one Packaging Group may cover more than one Hazard Zone. If the packaging groups are chosen to correspond to the classification categories presented in this report, then the maximum allowable leak rates used to define these categories could be used as the maximum allowable leak rates for the performance oriented packaging standards. The results discussed in this report are intended to provide quantitative guidance for the appropriate authorities to use in making these decisions.

276 (SAND–96-0370C) **Geospatial analyses and system architectures for the next generation of radioactive materials risk assessment and routing.** Ganter, J.H. Sandia National Labs., Albuquerque, NM (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–57: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96007427. Source: OSTI; NTIS; INIS; GPO Dep.

This paper suggests that inexorable changes in the society are presenting both challenges and a rich selection of technologies for responding to these challenges. The citizen is more demanding of environmental and personal protection, and of information. Simultaneously, the commercial and government information technologies markets are providing new technologies like commercial off-the-shelf (COTS) software, common datasets, "open" GIS, recordable CD-ROM, and the World Wide Web. Thus one has the raw ingredients for creating new techniques and tools for spatial analysis, and these tools can support participative study and decision-making. By carrying out a strategy of thorough and demonstrably correct science, design, and development, can move forward into a new generation of participative risk assessment and routing for radioactive and hazardous materials.

277 (SAND–96-0714C) **Investigation of RADTRAN Stop Model input parameters for truck stops.** Griego, N.R.; Smith, J.D.; Neuhauser, K.S. Sandia National Labs., Albuquerque, NM (United States). [1996]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212–44: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006980. Source: OSTI; NTIS; INIS; GPO Dep.

RADTRAN is a computer code for estimating the risks and consequences as transport of radioactive materials (RAM). RADTRAN was developed and is maintained by Sandia National Laboratories for the US Department of Energy (DOE). For incident-free transportation, the dose to persons exposed while the shipment is stopped is frequently a major percentage of the overall dose. This dose is referred to as Stop Dose and is calculated by the Stop Model. Because stop dose is a significant portion of the overall dose associated with RAM transport, the values used as input for the Stop Model are important. Therefore, an investigation of typical values for RADTRAN Stop Parameters for truck stops was performed. The resulting data from these investigations were analyzed to provide mean values, standard deviations, and histograms. Hence, the mean values can be used when an analyst does not have a basis for selecting other input values for the Stop Model. In addition, the histograms and their characteristics can be used to guide statistical sampling techniques to measure sensitivity of the RADTRAN calculated Stop Dose to the uncertainties in the stop model input parameters. This paper discusses the details and presents the results of the investigation of stop model input parameters at truck stops.

278 (SAND–96-0715C) **Expected residence time model.** Smith, J.D.; Neuhauser, K.S.; Kanipe, F.L. Sandia National Labs., Albuquerque, NM (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212–43: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006979. Source: OSTI; NTIS; INIS; GPO Dep.

The Transportation Technology Department of Sandia National Laboratories develops analytical and computational tools for the US Department of Energy to assess the radiological consequences and risks from the transportation of radioactive materials by all modes. When large quantities of materials are to be transported movements may occur over an extended period of time in what is collectively referred as a "shipping campaign". Since the routes over which the shipments occur often remain the same, cumulative exposure to individuals inhabiting the population zones adjacent to the transport links must be estimated. However, individuals do not remain in the same residences throughout their lifetimes and, in fact, move quite often. To appropriately allocate exposures among populations over extended periods of time, perhaps years, requires a model that accounts for three population categories; (1) the original populations residing in the areas adjacent to the transport links, (2) individuals moving out and (3) individuals moving into residences in the designated areas. The model described here accounts for these conditions and will be incorporated as a user option in the RADTRAN computer code for transportation consequence and risk analysis (Reference 1). RADTRAN is a computer code for estimating the consequences and risks associated with the transport of radioactive materials.

279 (SAND–96-0850C) **Multiattribute utility analysis as a framework for public participation siting a hazardous waste facility.** Merkhofer, M.W. (Applied Decision Analysis, Inc., Menlo Park, CA (United States)); Conway, R.; Anderson, R.G. Sandia National Labs., Albuquerque, NM (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9605147–1: 1996 prioritization methodology workshop, Oakland, CA (United States), 14-15 May 1996). Order Number DE96008867. Source: OSTI; NTIS; INIS; GPO Dep.

How can the public play a role in decisions involving complicated scientific arguments? This paper describes a public participation exercise in which stakeholders used multiattribute utility analysis to select a site for a hazardous waste facility. Key to success was the ability to separate and address the two types of judgements inherent in environmental decisions: technical judgements on the likely consequences of alternative choices and value judgements on the importance or seriousness of those consequences. This enabled technical specialists to communicate the essential technical considerations and allowed stakeholders to establish the value judgements for the decision. Although rarely used in public participation, the multiattribute utility approach appears to provide a useful framework for the collaborative resolution of many complex environmental decision problems.

280 (SAND–96-1922C) **Use of inelastic analysis to determine the response of packages to puncture accidents.** Ammerman, D.J.; Ludwigsen, J.S. Sandia National Labs., Albuquerque, NM (United States). [1996]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960706–29: American Society of Mechanical Engineers (ASME) pressure vessels and piping conference, Montreal (Canada), 21-26 Jul 1996). Order Number DE96013238. Source: OSTI; NTIS; INIS; GPO Dep.

The accurate analytical determination of the response of radioactive material transportation packages to the hypothetical puncture accident requires inelastic analysis techniques. Use of this improved analysis method recudes the reliance on empirical and approximate methods to determine the safety for puncture accidents. This paper will discuss how inelastic analysis techniques can be used to determine the stresses, strains and deformations resulting from puncture accidents for thin skin materials with different backing materials. A method will be discussed to assure safety for all of these types of packages.

281 (WHC-EP–0850-1) **Hanford Facility resource conservation and recovery act permit general inspection plan.** Beagles, D.B. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006831. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Facility Resource Conservation and Recovery Act Permit, General Inspection Requirements, includes a requirement that general facility inspections be conducted of the 100, 200 East, 200 West, 300, 400, and 1100 Areas and the banks of the Columbia River. This inspection plan describes the activities that shall be conducted for a general inspection of the Hanford Facility.

282 (WHC-EP–0853-Vol.2) **DNFSB Recommendation 94-1 Hanford Site Integrated Stabilization Management Plan. Volume 2.** McCormack, R.L. Westinghouse Hanford Co., Richland, WA (United States). Aug 1995. 43p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95017152. Source: OSTI; NTIS; GPO Dep.

The Hanford Site Integrated Stabilization Management Plan (SISMP) is being developed in support of the US Department of Energy's (DOE) Defense Nuclear Facilities Safety Board (DNFSB) Recommendation 94-1 Integrated Program Plan (IPP). Volume 1 of the SISMP identifies the technical scope and costs associated with Hanford Site plans to resolve concerns identified in DNFSB Recommendation 94-1. Volume 2 of the SISMP provides the Resource Loaded Integrated Schedules for Spent Nuclear Fuel Project and Plutonium Finishing Plant activities identified in Volume 1 of the SISMP. Appendix A provides the schedules and progress curves related to spent nuclear fuel management. Appendix B provides the schedules and progress curves related to plutoniumbearing material management. Appendix C provides programmatic logic diagrams that were referenced in Volume 1 of the SISMP.

283 (WHC-EP–0857) **Statement of work for analytical services provided to Westinghouse Hanford Company by the Pacific Northwest Laboratory Analytical Chemistry Laboratory.** Perry, J.K. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012822. Source: OSTI; NTIS; INIS; GPO Dep.

This statement of work establishes the laboratory analytical criteria and requirements for the fiscal year 1995 radioactive airborne emissions measurement program for the Hanford Site.

284 (WHC-EP–0889) **Hanford Isotope Project strategic business analysis Cesium-137 (Cs-137).** Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 141p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006823. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this business analysis is to address the beneficial reuse of Cesium 137 (Cs-137) in order to utilize a valuable national asset and possibly save millions of tax dollars. Food irradiation is the front runner application along with other uses. This business analysis supports the objectives of the Department of Energy National Isotope Strategy distributed in August 1994 which describes the DOE plans for the production and distribution of isotope products and services. As part of the Department's mission as stated in that document. "The Department of Energy will also continue to produce and distribute other radioisotopes and enriched stable isotopes for medical diagnostics and therapeutics, industrial, agricultural, and other useful applications on a businesslike basis. This is consistent with the goals and objectives of the National Performance Review. The Department will endeavor to look at opportunities for private sector to co-fund or invest in new ventures. Also, the Department will seek to divest from ventures that can more profitably or reliably be operated by the private sector."

285 (WHC-EP-0890) **Hanford isotope project strategic business analysis yttrium-90 (Y-90).** Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006824. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this analysis is to address the short-term direction for the Hanford yttrium-90 (Y-90) project. Hanford is the sole DOE producer of Y-90, and is the largest repository for its source in this country. The production of Y-90 is part of the DOE Isotope Production and Distribution (IP and D) mission. The Y-90 is "milked" from strontium-90 (Sr-90), a byproduct of the previous Hanford missions. The use of Sr-90 to produce Y-90 could help reduce the amount of waste material processed and the related costs incurred by the clean-up mission, while providing medical and economic benefits. The cost of producing Y-90 is being subsidized by DOE-IP and D due to its use for research, and resultant low production level. It is possible that the sales of Y-90 could produce full cost recovery within two to three years, at two curies per week. Preliminary projections place the demand at between 20,000 and 50,000 curies per year within the next ten years, assuming FDA approval of one or more of the current therapies now in clinical trials. This level of production would incentivize private firms to commercialize the operation, and allow the government to recover some of its sunk costs. There are a number of potential barriers to the success of the Y-90 project, outside the control of the Hanford Site. The key issues include: efficacy, Food and Drug Administration (FDA) approval and medical community acceptance. There are at least three other sources for Y-90 available to the US users, but they appear to have limited resources to produce the isotope. Several companies have communicated interest in entering into agreements with Hanford for the processing and distribution of Y-90, including some of the major pharmaceutical firms in this country.

286 (WHC-SA-2788) **NRF TRIGA packaging.** Clements, M.D. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951203-37: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96005196. Source: OSTI; NTIS; INIS; GPO Dep.

Training Reactor Isotopes, General Atomics (TRIGA®) Reactors are in use at four US Department of Energy (DOE) complex facilities and at least 23 university, commercial, or government facilities. The development of the Neutron Radiography Facility (NRF) TRIGA packaging system began in October 1993. The Hanford Site NRF is being shut down and requires an operationally user-friendly transportation and storage packaging system for removal of the TRIGA fuel elements. The NRF TRIGA packaging system is designed to remotely remove the fuel from the reactor and transport the fuel to interim storage (up to 50 years) on the Hanford Site. The packaging system consists of a cask and an overpack. The overpack is used only for transport and is not necessary for storage. Based upon the cask's small size and light weight, small TRIGA reactors will find it versatile for numerous refueling and fuel storage needs. The NRF TRIGA packaging design also provides the basis for developing a certifiable and economical packaging system for other TRIGA reactor facilities. The small size of the NRF TRIGA cask also accommodates placing the cask into a larger certified packaging for offsite transport. The Westinghouse Hanford Company NRF TRIGA packaging, as described herein can serve other DOE sites for their onsite use, and the design can be adapted to serve university reactor facilities, handling a variety of fuel payloads.

287 (WHC-SA-2796) **Type A radioactive liquid sample packaging family.** Edwards, W.S. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951203-36: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96005195. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Hanford Company (WHC) has developed two packagings that can be used to ship Type A quantities of radioactive liquids. WHC designed these packagings to take advantage of commercially available items where feasible to reduce the overall packaging cost. The Hedgehog packaging can ship up to one liter of Type A radioactive liquid with no shielding and 15 cm of distance between the liquid and the package exterior, or 30 ml of liquid with 3.8 cm of stainless steel shielding and 19 cm of distance between the liquid and the package exterior. The One Liter Shipper can ship up to one liter of Type A radioactive liquid that does not require shielding.

288 (WHC-SA-2831) **Project planning at the Hanford Site for International Atomic Energy Agency (IAEA) safeguards of excess fissile material.** Smith, B.W. (Pacific Northwest Lab., Richland, WA (United States)); McRae, L.P.; Walker, A.C. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950787-59: 36. annual meeting of the Institute for Nuclear Materials Management, Palm Desert, CA (United States), 9-12 Jul 1995). Order Number DE95015737. Source: OSTI; NTIS; INIS; GPO Dep.

In his September 1993 address to the United Nations General Assembly, President Clinton proposed several initiatives to promote nuclear nonproliferation. One element is of these initiatives was that the United States offered to place excess fissile material under International Atomic Energy Agency @A) safeguards. Three Department of Energy (DOE) facilities were identified as part of a phased approach for initial implementation. This paper describes the planning process used to provide information to assist the DOE in making decisions for the initial offer, outlines tasks to be performed, and develops a budget request. The process consisted of: (1) Characterizing the Hanford Site from the perspective of IAEA safeguards; (2) identify key issues to be resolved; (3) developing budget estimates and schedules; (4) interfacing with other DOE components and the IAEA to clarify expected activities; and (5) initiating additional data collection and preparatory activities to reduce planning uncertainties.

289 (WHC-SA–2835) **Facility preparations for the initial International Atomic Energy Agency Inpsection of Hanford Site excess material.** Johnson, W.C. (USDOE Richland Operations Office, WA (United States)); Scott, D.D.; Bartlett, W.D.; Delegard, C.H.; McRae, L.P.; Six, D.E.; Amacker, O.P. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950923–19: 5. international conference on facility-safeguards interface, Jackson Hole, WY (United States), 24-30 Sep 1995). Order Number DE96002796. Source: OSTI; NTIS; GPO Dep.

In September 1993 President Clinton offered to place excess US nuclear materials under IAEA safeguards. In January 1994, the Hanford Site was identified as the second site in the US to be prepared for placement on the eligibility list for LAEA safeguards selection. Planning and preparation started at Hanford in February 1994. The PFP mission is to provide safe storage of Category 1 and 2 special nuclear material (SNM) and laboratory support to the Hanford Site. The mission includes the stabilizing and packaging of SNM for temporary storage sufficient to support the deactivation and cleanup function of the facility. The storage of Category 1 and 2 SNM at this facility indirectly supports national security interests, and safe storage is accomplished in a manner that ensures the health and safety of the public and employees are not compromised. The PFP is located in the approximate center of the Hanford Site inside the 200 West Area. The PFP is within a designated protected area (PA) and is located approximately 10.5 km from the Columbia River and 34 km northwest of the Richland city limits. The, Hanford Site is located in Southeastern Washington and has been associated with plutonium production since the mid 1940s. Excess plutonium oxide has been placed under IAEA safeguards in a phased approach at the PFP's Plutonium Storage Vault. This paper is an overview and summary of the many tasks required to meet IAEA safeguards requirements.

290 (WHC-SA–2855) **Studies of the chemistry of transuranium elements and technetium at the Institute of Physical Chemistry, Russian Academy of Sciences, supported by the US Department of Energy.** Peretrukhin, V.F. (Russian Academy of Sciences, Moscow (Russian Federation). Inst. of Physical Chemistry); Delegard, C.H. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950917–10: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95011570. Source: OSTI; NTIS; INIS; GPO Dep.

Studies at Hanford in the 1980s revealed the potential for actinides to form stable soluble complexes in alkaline media, simulating radioactive tank waste. Pu(IV) hydrous oxide and Pu(VI) solubility increased with hydroxide concentration, ionic strength, and aluminate/carbonate concentrations. Subsequent contacts between US and Russian researchers in 1993 led to a technical literature review of the chemistry of TRU and Tc in alkaline media; this review addresses oxidation states, solubility, speciation, redox reactions, electrochemistry, radiation chemistry, and separations in alkaline media. As an outgrowth, a program of fundamental and applied chemistry studies of TRU and Tc is being conducted at IPC/RAS with US DOE support: solubility, redox reagents, coprecipitation, and radiation chemistry. This overview provides information on the Hanford Site tank waste system, US DOE technological needs, and IPC/RAS developments.

291 (WHC-SA–2885) **Assessment for potential radionuclide emissions from stacks and diffuse and fugitive sources on the Hanford Site.** Davis, W.E. (Westinghouse Hanford Co., Richland, WA (United States)); Schmidt, J.W.; Gleckler, B.P.; Rhoads, K. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9507119–1: Summer national meeting of the American Institute of Chemical Engineers, Boston, MA (United States), 30 Jul - 2 Aug 1995). Order Number DE95016338. Source: OSTI; NTIS; INIS; GPO Dep.

By using the six EPA-approved methods, instead of only the original back calculation method for assessing the 84 WHC registered stacks, the number of stacks requiring continuous monitoring was reduced from 32 to 19 stacks. The intercomparison between results showed that no correlation existed between back calculations and release fractions. Also the NDA, upstream air samples, and powder release fraction method results were at least three orders of magnitude lower then the back calculations results. The most surprising results of the assessment came from NDA. NDA was found to be an easy method for assessing potential emissions. For the nine stacks assessed by NDA, all nine of the stacks would have required continuous monitoring when assessed by back calculations. However, when NDA was applied all stacks had potential emissions that would cause an EDE below the $>$ 0.1 mrem/y standard. Apparent DFs for the HEPA filter systems were calculated for eight nondesignated stacks with emissions above the detection limit. These apparent DFs ranged from 0.5 to 250. The EDE dose to the MEI was calculated to be 0.028 mrem/y for diffuse and fugitive emissions from the Hanford Sited. This is well below the $>$ 0.1 mrem/y standard.

292 (WHC-SA–2890) **Comparison of the N Reactor and Ignalina Unit No. 2 Level 1 Probabilistic Safety Assessments.** Coles, G.A.; McKay, S.L. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950914–2: American Nuclear Society international topical conference on the safety of operating reactors, Seattle, WA (United States), 17-23 Sep 1995). Order Number DE95015811. Source: OSTI; NTIS; INIS; GPO Dep.

A multilateral team recently completed a full-scope Level 1 Probabilistic Safety Assessment (PSA) on the Ignalina Unit No. 2 reactor plant in Lithuania. This allows comparison of results to those of the PSA for the U.S. Department of Energy's (DOE) N Reactor. The N Reactor, although unique as a Western design, has similarities to Eastern European and Soviet graphite block reactors.

293 (WHC-SA–2931-FP) **Information/records management-defensible budgets for the 21st century.** DiLiberto, A.J.; Whittet, L.A. Westinghouse Hanford Co., Richland, WA (United States). Aug 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950876–2: 19. annual symposium of the Nuclear Information Records Management Association, Washington, DC (United States), 27-30 Aug 1995). Order Number DE96001103. Source: OSTI; NTIS; GPO Dep.

This paper provides to the Nuclear Information and Records Management Association (NIRMA) members the skills, knowledge, and information needed to develop performance-based cost estimating. It includes a detailed basis of estimates to represent a work breakdown structure that is technically complete, fully documented, defensible to various external reviews, and validatable.

294 (WHC-SA-2935) **Hanford site Computer Automated Mapping Information System (CAMIS).** Rush, S.F. (ICF Kaiser Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9509349-1: Geographic technology in government, Reston, VA (United States), 6 Sep 1995). Order Number DE96009103. Source: OSTI; NTIS; INIS; GPO Dep.

The Computer Automated Mapping Information System (CAMIS) provides sitewide, networked access to CAD based geographically referenced data. CAMIS allows multiple organizations to maintain and share their data. Information collected and managed according to site-wide standards, enables each organization to focus their limited resources on data issues tied to their own discipline without having to collect or manage reference data outside their respective domains. Sharing information also minimizes redundant data and helps improve the overall quality of the sites' data resources.

295 (WHC-SA-2959) **Interpretation of large-strain geophysical crosshole tests.** Drnevich, V.P. (School of Civil Engineering, West Lafayette, IN (United States)); Salgado, R.; Ashmawy, A.; Grant, W.P.; Vallenas, P. Westinghouse Hanford Co., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). Oct 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9511128-14: 5. Department of Energy (DOE) natural phenomena hazards mitigation symposium, Denver, CO (United States), 13-17 Nov 1995). Order Number DE96005192. Source: OSTI; NTIS; INIS; GPO Dep.

At sites in earthquake-prone areas, the nonlinear dynamic stress-strain behavior of soil with depth is essential for earthquake response analyses. A seismic crosshole test has been developed where large dynamic forces are applied in a borehole. These forces generate shear strains in the surrounding soil that are well into the nonlinear range. The shear strain amplitudes decrease with distance from the source. Velocity sensors located in three additional holes at various distances from the source hole measure the particle velocity and the travel time of the shear wave from the source. This paper provides an improved, systematic interpretation scheme for the data from these large-strain geophysical crosshole tests. Use is made of both the measured velocities at each sensor and the travel times. The measured velocity at each sensor location is shown to be a good measure of the soil particle velocity at that location. Travel times to specific features on the velocity time history, such as first crossover, are used to generate travel time curves for the waves which are nonlinear. At some distance the amplitudes reduce to where the stress-strain behavior is essentially linear and independent of strain amplitude. This fact is used together with the measurements at the three sensor locations in a rational approach for fitting curves of shear wave velocity versus distance from the source hole that allow the determination of the shear wave velocity and the shear strain amplitude at each of the sensor locations as well as the shear wave velocity associated with small-strain (linear) behavior. The method is automated using off-the-shelf PC-based software. The method is applied to large-strain crosshole tests performed as part of the studies for the design and construction of the proposed Multi-Function Waste Tank Facility planned for Hanford Site.

296 (WHC-SA-2964) **Comparison of RESRAD with hand calculations.** Rittmann, P.D. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951209-4: 17. low-level radioactive waste management conference, Phoenix, AZ (United States), 12-14 Dec 1995). Order Number DE96002797. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a continuation of an earlier comparison done with two other computer programs, GENII and PATHRAE. The dose calculations by the two programs were compared with each other and with hand calculations. These band calculations have now been compared with RESRAD Version 5.41 to examine the use of standard models and parameters in this computer program. The hand calculations disclosed a significant computational error in RESRAD. The Pu-241 ingestion doses are five orders of magnitude too small. In addition, the external doses from some nuclides differ greatly from expected values. Both of these deficiencies have been corrected in later versions of RESRAD.

297 (WHC-SA-2975) **An overview of the Radioisotope Thermoelectric Generator Transporation System Program.** McCoy, J.C. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960109-10: STAIF 96: space technology and applications international forum, Albuquerque, NM (United States), 7-11 Jan 1996). Order Number DE96003113. Source: OSTI; NTIS; INIS; GPO Dep.

Radioisotope Thermoelectric Generators (RTG) convert the heat generated by radioactive decay to electricity using thermocouples. RTGs have a long operating life, are reasonably lightweight, and require little or no maintenance once assembled and tested. These factors make RTGs particularly attractive for use in spacecraft However, because RTGs contain significant quantities of radioactive materials, normally plutonium-238 and its decay products, they must be transported in packages built in accordance with Title 10, Code of Federal Regulations, Part 71. The US Department of Energy assigned the Radioisotope Thermoelectric Generator Transportation System (RTGTS) Program to Westinghouse Hanford Company in 1988 to develop a system meeting the regulatory requirements. The program objective was to develop a transportation system that would fully comply with 10 CFR 71 while protecting RTGs from adverse environmental conditions during normal conditions of transport (e.g., shock and heat). The RTGTS is scheduled for completion in December 1996 and will be available to support the National Aeronautics and Space Administrations Cassini mission to Saturn in October 1997. This paper provides an overview of the RTGTS and discusses the hardware being produced. Additionally, various program management innovations mandated by recent ma or changes in the US Department of Energy structure and resources will be outlined.

298 (WHC-SA-2979) **Radioisotope Thermoelectric Generator Transporation System licensed hardware second certification test series and package shock mount**

system test. Ferrell, P.C.; Moody, D.A. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960109–11: STAIF 96: space technology and applications international forum, Albuquerque, NM (United States), 7-11 Jan 1996). Order Number DE96003112. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a summary of two separate drop test a e performed in support of the Radioisotope Thermoelectric Generator (RTG) Transportation System (RTGTS). The first portion of this paper presents the second series of drop testing required to demonstrate that the RTG package design meets the requirements of Title 10, Code of Federal Regulations, "Part 71" (10 CFR 71). Results of the first test series, performed in July 1994, demonstrated that some design changes were necessary. The package design was modified to improve test performance and the design changes were incorporated into the Safety Analysis Report for Packaging (SARP). The second full-size certification test article (CTA-2) incorporated the modified design and was tested at the US Department of Energy's (DOE) Hanford Site near Richland, Washington. With the successful completion of the test series, and pending DOE Office of Facility Safety Analysis approval of the SARP, a certificate of compliance will be issued for the RTG package allowing its use. The second portion of this paper presents the design and testing of the RTG Package Mount System. The RTG package mount was designed to protect the RTG from excessive vibration during transport, provide shock protection during on/off loading, and provide a mechanism for moving the RTG package with a forklift. Military Standard (MIL-STD) 810E, Transit Drop Procedure (DOE 1989), was used to verify that the shock limiting system limited accelerations in excess of 15 G's at frequencies below 150 Hz. Results of the package mount drop tests indicate that an impact force of 15 G's was not exceeded in any test from a free drop height of 457 mm (18 in.).

299 (WHC-SA–2980) **A compendium of the radioisotope thermoelectric generator transportation system and recent programmatic changes.** Becker, D.L.; McCoy, J.C. Westinghouse Hanford Co., Richland, WA (United States). Mar 1996. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960706–12: American Society of Mechanical Engineers (ASME) pressure vessels and piping conference, Montreal (Canada), 21-26 Jul 1996). Order Number DE96009891. Source: OSTI; NTIS; INIS; GPO Dep.

Because RTGs contain significant quantities of radioactive materials, usually plutonium-238 and its decay products, they must be transported in packages built in accordance with 10 CFR 71 (1994). To meet these regulatory requirements, US DOE commissioned Westinghouse Hanford Co. in 1988 to develop a Radioisotope Thermoelectric Generator Transportation System (RTGTS) that would fully comply while protecting RTGs from adverse environmental conditions during normal transport conditions (eg, mainly shock and heat). RTGTS is scheduled for completion Dec. 1996 and will be available to support NASA's Cassini mission to Saturn in Oct. 1997. This paper provides an overview of the RTGTS project, discusses the hardware being produced, and summarizes various programmatic and management innovations required by recent changes at DOE.

300 (WHC-SA–2995-FP) **Air pollution control at a DOE facility.** Curn, B.L. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951173–2: 18. world energy engineering congress, Atlanta, GA (United States), 8-10 Nov 1995). Order Number DE96003498. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) plutonium production program Produced some of the greatest scientific and engineering accomplishments of all time. It is remarkable to consider the accomplishments of the Manhattan Project. The Reactor on the Hanford Site, the first production reactor in the world, began operation only 13 months after the start of construction. The DOE nuclear production program was also instrumental in pioneering other fields such as health physics an radiation monitoring. The safety record of these installations is remarkable considering that virtually every significant accomplishment was on the technological threshold of the time. One other area that the DOE Facilities pioneered was the control of radioactive particles and gases emitted to the atmosphere. The high efficiency particulate air filter (HEPA) was a development that provided high collection efficiencies of particulates to protect workers and the public. The halogen and noble gases also were of particular concern. Radioactive iodine is captured by adsorption on activated carbon or synthetic zeolites. Besides controlling radioncuclide air pollution, DOE facilities are concerned with other criteria pollutants and hazardous air pollutant emissions. The Hanford Site encompasses all those air pollution challenges.

301 (WHC-SA–3006-FP) **Technical liaison with the Institute of Physical Chemistry (Russian Academy of Science).** Delegard, C.H. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960158–1: Efficient separations and processing crosscutting program 1996 technical meeting, Gaithersburg, MD (United States), 16-19 Jan 1996). Order Number DE96004831. Source: OSTI; NTIS; INIS; GPO Dep.

The Institute of Physical Chemistry of the Russian Academy of Science (IPC/RAS) is engaged by the DOE to conduct studies of the fundamental and applied chemistry of the transuranium elements (TRU; primarily neptunium, plutonium, and americium; Np, Pu, Am) and technetium $T_c$in alkaline media. This work is being supported by the DOE because the radioactive wastes stored in underground tanks at DOE sites (Hanford, Savannah River, and Oak Ridge) contain TRU and T_c, are alkaline, and the chemistries of TRU and $T_c$are not well developed in this system. Previous studies at the IPC/RAS centered on the fundamental chemistry and on coprecipitation. Work continuing in FY 1996 will focus more on the applied chemistry of the TRU and $T_c$in alkaline media and continue effort on the coprecipitation task.

302 (WHC-SA–3013) **Type B Drum packages.** Edwards, W.S. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951203–38: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96005190. Source: OSTI; NTIS; INIS; GPO Dep.

The Type B Drum package is a container in which a single drum containing Type B quantities of radioactive material will be packaged for shipment. The Type B Drum containers are being developed to fill a void in the packaging and transportation capabilities of the US Department of Energy (DOE), as no double containment packaging for single drums of Type B radioactive material is currently available. Several multiple-drum containers and shielded casks presently exist. However, the size and weight of these containers present multiple operational challenges for single-drum shipments. The Type B Drum containers will offer one unshielded version and, if needed, two shielded versions, and will provide for the option of either single or double containment. The primary users of the Type B Drum container will be any organization with a need to ship single drums of Type B radioactive material. Those users include laboratories, waste retrieval facilities, emergency response teams, and small facilities.

303 (WHC-SA-3053) **ISOSHLD 4.0.** Greenborg, J.; Schmittroth, F.A.; Rittman, P.D.; Roetman, V.E. Westinghouse Hanford Co., Richland, WA (United States). Mar 1996. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960415–38: American Nuclear Society (ANS) Radiation Protection and Shielding Division topical meeting on advancements and applications in radiation protection and shielding, Falmouth, MA (United States), 21-25 Apr 1996). Order Number DE96009910. Source: OSTI; NTIS; INIS; GPO Dep.

ISOSHLD was developed to carry out routine shielding calculations that would otherwise be very laborious. More sophisticated methods exist, but there is still need for easy-to-use reliable computer codes. The code has been revised several times including PC and mainframe-based versions. These versions generally represent different objectives and differ in code, data, and supported features. The current version includes all features. It has a 30 group energy range from 10 keV and 10 MeV. Bremsstrahlung is included, MODE 1 capability is retained (fission product inventories from decay and transmutation), and the libraries now fully support the actinides. There were several design objectives in this latest revision; modernization, state-of-the-art nuclear data, and full capability including source generation and time dependent calculations.

304 (WHC-SD-CP-DRD–002) **Conceptual baseline document for the nuclear materials safeguards system.** Nelson, R.A. Westinghouse Hanford Co., Richland, WA (United States). Aug 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050000. Source: OSTI; NTIS; INIS; GPO Dep.

This document defines the baseline scope, schedule, and cost requirements of the Nuclear Materials Safeguards System (NMSS) replacement for the Plutonium Finishing Plant. The Nuclear Material Safeguards System (NMSS), operating in PFP, comprises data from several site safeguards systems that have been merged since 1987. NMSS was designed and implemented to the state of computer technology for the mid 1970's. Since implementation, the hardware vendor has stopped producing computer systems and the availability of personnel trained and willing to work with the technology has diminished. Maintenance has become expensive and 'reliability is a serious concern. -This effort provides a replacement in kind of the NMSS, using modern, scalable, upgradable hardware and software to the same standards used for the Hanford Local Area Network (HLAN) system. The NMSS Replacement is a Client/Server architecture designed on a Personal Computer based local area network (LAN) platform. The LAN is provided through an ethernet interface running the Transmission Control Protocol/Internet Protocol (TCP/IP). This architecture conforms to the HLAN standard, including the End System Operating Environment (ESOE). The Server runs the Microsoft Windows NT' Server operating system, Microsoft SQL Server2 database management system, and application tools. Clients run Microsoft Windows' and application software provided as part of the system. The interface between the clients and the database is through Microsoft ODBC4.

305 (WHC-SD-CP-LB–036) **Method performance for radioanalytical chemistry.** Catlow, S.A. Westinghouse Hanford Co., Richland, WA (United States). 1 Sep 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050002. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides method qualification data for radioanalytical procedures as required by WHC-SD-CP-QAPP-016. A short description of the Methodology, the original source(s) of the methodology, a MDC example, and precision and accuracy from historic data.

306 (WHC-SD-CP-QAPP–016-Rev.1) **222-S Laboratory Quality Assurance Plan. Revision 1.** Meznarich, H.K. Westinghouse Hanford Co., Richland, WA (United States). 31 Jul 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001067. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Plan provides,quality assurance (QA) guidance, regulatory QA requirements (e.g., 10 CFR 830.120), and quality control (QC) specifications for analytical service. This document follows the U.S Department of Energy (DOE) issued Hanford Analytical Services Quality Assurance Plan (HASQAP). In addition, this document meets the objectives of the Quality Assurance Program provided in the WHC-CM-4-2, Section 2.1. Quality assurance elements required in the Guidelines and Specifications for Preparing Quality Assurance Program Plans (QAMS-004) and Interim Guidelines and Specifications for Preparing Quality Assurance Project Plans (QAMS-005) from the US Environmental Protection Agency (EPA) are covered throughout this document. A quality assurance index is provided in the Appendix A. This document also provides and/or identifies the procedural information that governs laboratory operations. The personnel of the 222-S Laboratory and the Standards Laboratory including managers, analysts, QA/QC staff, auditors, and support staff shall use this document as guidance and instructions for their operational and quality assurance activities. Other organizations that conduct activities described in this document for the 222-S Laboratory shall follow this QA/QC document.

307 (WHC-SD-CP-QAPP–017) **Quality Assurance Program Plan for the Waste Sampling and Characterization Facility.** Grabbe, R.R. Westinghouse Hanford Co., Richland, WA (United States). 2 Mar 1995. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008870. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this Quality Assurance Plan is to provide quality assurance (QA) guidance, implementation of regulatory QA requirements, and quality control (QC) specifications for analytical service. This document follows the

Department of Energy (DOE)-issued Hanford Analytical Services Quality Assurance Plan (HASQAP) and additional federal [10 US Code of Federal Regulations (CFR) 830.120] QA requirements that HASQAP does not cover. This document describes how the laboratory implements QA requirements to meet the federal or state requirements, provides what are the default QC specifications, and/or identifies the procedural information that governs how the laboratory operates. In addition, this document meets the objectives of the Quality Assurance Program provided in the WHC-CM-4-2, Section 2.1. This document also covers QA elements that are required in the Guidelines and Specifications for Preparing Quality Assurance Program Plans (QAPPs), (QAMS-004), and Interim Guidelines and Specifications for Preparing Quality Assurance Product Plans (QAMS-005) from the Environmental Protection Agency (EPA). A QA Index is provided in the Appendix A.

308 (WHC-SD-CP-TI–171) **Flowsheet for shear/leach processing of N Reactor fuel at PUREX.** Enghusen, M.B. Westinghouse Hanford Co., Richland, WA (United States). 13 Apr 1995. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011573. Source: OSTI; NTIS; INIS; GPO Dep.

This document was originally prepared to support the restart of the PUREX plant using a new Shear/Leach head end process. However, the PUREX facility was shutdown and processing of the remaining N Reactor fuel is no longer considered an alternative for fuel disposition. This document is being issued for reference only to document the activities which were investigated to incorporate the shear/leach process in the PUREX plant.

309 (WHC-SD-CP-TI–197) **GENII dose calculations for offsite maximum individual and populations from Plutonium Finishing Plant.** Nguyen, L.V. Westinghouse Hanford Co., Richland, WA (United States). 29 Sep 1995. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050003. Source: OSTI; NTIS; INIS; GPO Dep.

Document describes the potential dose consequences to the offsite maximum individual and population for ground and stack level releases at the offsite receptors from the Plutonium Finishing Plant.

310 (WHC-SD-EN-CSUD–002) **ABCASH plotting program users guide.** Troyer, G.L. Westinghouse Hanford Co., Richland, WA (United States). 25 Apr 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011652. Source: OSTI; NTIS; INIS; GPO Dep.

The Automated Bar Coding of Air Samples at Hanford (ABCASH) system provides an integrated data collection, sample tracking, and data reporting system for radioactive particulate air filter samples. The ABCASH plotting program provides a graphical trend report for ABCASH of the performance of air sample results. This document provides an operational guide for using the program. Based on sample location identifier and date range, a trend chart of the available data is generated. The trend chart shows radiological activity versus time. General indications of directional trend of the concentrations in air over time may be discerned. Comparison limit set point values are also shown as derived from the ABCASH data base.

311 (WHC-SD-FF-CSWD–055-Rev.1) **R-1 (C-620-A) and R-2 (C-620-B) air compressor control logic, computer software description. Revision 1.** Walter, K.E. Westinghouse Hanford Co., Richland, WA (United States). 8 Jun 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014314. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides an updated computer software description for the software used on the FFTF R-1 (C-620-A) and R-2 (C-620-B) air compressor programmable controllers. Logic software design changes were required to allow automatic starting of a compressor that had not been previously started.

312 (WHC-SD-FF-CSWD–056-Rev.1) **R-189 (C-620) air compressor control logic software documentation. Revision 1.** Walter, K.E. Westinghouse Hanford Co., Richland, WA (United States). 8 Jun 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014313. Source: OSTI; NTIS; INIS; GPO Dep.

This relates to FFTF plant air compressors. Purpose of this document is to provide an updated Computer Software Description for the software to be used on R-189 (C-620-C) air compressor programmable controllers. Logic software design changes were required to allow automatic starting of a compressor that had not been previously started.

313 (WHC-SD-LL-ATP–023) **GENRTC Project No. 2F3E0A, OCB A-382, acceptance test procedure.** Akerson, A.W. Westinghouse Hanford Co., Richland, WA (United States). 10 Apr 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010739. Source: OSTI; NTIS; GPO Dep.

This test procedure provides the steps necessary to verify correct functional operation of controls, annunciators, alarms, protective relays and related systems impacted by CENRTC #2F3E0A, Microwave Transfer Trip Project, modification work performed under work package 6B-93-00040/M (CENRTC 2F3E0A MWTT OCB A-382 PACKAGE).

314 (WHC-SD-MP-SWD–30001-Rev.7) **Certification of MCNP Version 4A for WHC computer platforms. Revision 7.** Carter, L.L. Westinghouse Hanford Co., Richland, WA (United States). 3 May 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011546. Source: OSTI; NTIS; INIS; GPO Dep.

MCNP is a general-purpose Monte Carlo code that can be used for neutron, photon, or coupled neutron/photon transport, including the capability to calculate eigenvalues for critical systems. The code treats an arbitrary three-dimensional configuration of materials in geometric cells bounded by first- and second-degree surfaces, and some special fourth-degree surfaces (elliptical tori).

315 (WHC-SD-NR-TSR–001) **Fuel supply shutdown facility interim operational safety requirements.** Besser, R.L.; Brehm, J.R.; Benecke, M.W.; Remaize, J.A. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013341. Source: OSTI; NTIS; INIS; GPO Dep.

These Interim Operational Safety Requirements (IOSR) for the Fuel Supply Shutdown (FSS) facility define acceptable conditions, safe boundaries, bases thereof, and management or administrative controls to ensure safe operation. The IOSRs apply to the fuel material storage buildings in various modes (operation, storage, surveillance).

316 (WHC-SD-PRP-HA-012-Rev.1) **283-E and 283-W Hazards Assessment.** Sutton, L.N. Westinghouse Hanford Co., Richland, WA (United States). 8 Sep 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050020. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes the technical basis in support of Emergency Planning Activites for the 283-E and 283-W Facilities on the Hanford Site. Through this document, the technical basis for the development of facility specific Emergency Action Levels and the Emergency Planning Zone is demonstrated.

317 (WHC-SD-SNF-ATP-010) **Acceptance test procedure for High Pressure Water Jet System.** Crystal, J.B. Westinghouse Hanford Co., Richland, WA (United States). 30 May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015652. Source: OSTI; NTIS; INIS; GPO Dep.

The overall objective of the acceptance test is to demonstrate a combined system. This includes associated tools and equipment necessary to perform cleaning in the 105 K East Basin (KE) for achieving optimum reduction in the level of contamination/dose rate on canisters prior to removal from the KE Basin and subsequent packaging for disposal. Acceptance tests shall include necessary hardware to achieve acceptance of the cleaning phase of canisters. This acceptance test procedure will define the acceptance testing criteria of the high pressure water jet cleaning fixture. The focus of this procedure will be to provide guidelines and instructions to control, evaluate and document the acceptance testing for cleaning effectiveness and method(s) of removing the contaminated surface layer from the canister presently identified in KE Basin. Additionally, the desired result of the acceptance test will be to deliver to K Basins a thoroughly tested and proven system for underwater decontamination and dose reduction. This report discusses the acceptance test procedure for the High Pressure Water Jet.

318 (WHC-SD-SNF-PLN-008) **Small Water System Management Program: 100 K Area.** Hunacek, G.S. Jr. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Wastren, Inc., Idaho Falls, ID (United States). 29 Jun 1995. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016345. Source: OSTI; NTIS; INIS; GPO Dep.

Purposes of this document are: to provide an overview of the service and potable water system presently in service at the Hanford Site's 100 K Area; to provide future system forecasts based on anticipated DOE activities and programs; to delineate performance, design, and operations criteria; and to describe planned improvements. The objective of the small water system management program is to assure the water system is properly and reliably managed and operated, and continues to exist as a functional and viable entity in accordance with WAC 246-290-410.

319 (WHC-SD-SQA-CSA-20398) **CSER 95-008: Criticality storage category for grouted K Basin cartridge filters at CWC.** Miller, E.M. Westinghouse Hanford Co., Richland, WA (United States). 19 May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013344. Source: OSTI; NTIS; INIS; GPO Dep.

The 13 containers from K Basins hold one cartridge filter each. The filters removed solids from the K Basins water before the water went to air-cooled chillers. The filters are about 75.7 cm (30 inches) in diameter and 86 cm (34 inches) tall (based on an outline on drawing H-1-34709 (Reference 1)). This is a volume of 388 liters. Drawing H-1-34709 (Reference 1) shows the configuration of the concreted 122 cm (48 inch) diameter culvert cut to 124 cm (49 inches) long and shows the imbedded steel. The culvert is 0.35 cm (0.138 inches) thick and has a volume of 1450 liters. There are four 127 cm (50 inch) long 2 inch by 3/4 inch steel bars and reinforcing steel in the container. The culvert and four bars weigh 169.6 kg. The cylindrical culvert is oriented vertically with an 11 gauge bottom plate welded on and then filled to 15 cm (6 inches) with grout. The cartridge filter, bagged in 20 mill plastic (Reference 2), is then placed in the center of the culvert and the culvert is filled with concrete. Four of the 13 culverts were then put vertically into 152 cm (5 foot) diameter culverts about 61 cm (2 feet) high, centered radially, and concreted into the larger base. The two configurations weigh about 3600 and 5400 kgs, respectively.

320 (WHC-SD-TP-CSWD-002-Vol.2) **Radcalc for Windows. Volume 2: Technical manual.** Green, J.R. Westinghouse Hanford Co., Richland, WA (United States). 27 Sep 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050093. Source: OSTI; NTIS; INIS; GPO Dep.

Radcalc for Windows is a user-friendly menu-driven Windows-compatible software program with applications in the transportation of radioactive materials. It calculates the radiolytic generation of hydrogen gas in the matrix of low-level and high-level radioactive waste using NRC-accepted methodology. It computes the quantity of a radionuclide and its associated products for a given period of time. In addition, the code categorizes shipment quantities as radioactive, Type A or Type B, limited quantity, low specific activity, highway route controlled, and fissile excepted using DOT definitions and methodologies, as outlined in 49 CFR Subchapter C. The code has undergone extensive testing and validation. Volume I is a User's Guide, and Volume II is the Technical Manual for Radcalc for Windows

321 (WHC-SD-TP-RPT-015-Rev.1) **Transportation impact analysis for the shipment of low specific activity nitric acid. Revisison 1.** Green, J.R. Westinghouse Hanford Co., Richland, WA (United States). 16 May 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013330. Source: OSTI; NTIS; INIS; GPO Dep.

This is in support of the Plutonium-Uranium Extraction (PUREX) Facility Low Specific Activity (LSA) Nitric Acid Shipment Environmental Assessment. It analyzes potential toxicological and radiological risks associated with transportation of PUREX Facility LSA Nitric Acid from the Hanford Site to Portsmouth VA, Baltimore MD, and Port Elizabeth NJ.

322 (WHC-SD-TP-SEP-034) **Safety evaluation for packaging CPC metal boxes.** Romano, T. Westinghouse Hanford Co., Richland, WA (United States). 15 May 1995. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012577. Source: OSTI; NTIS; INIS; GPO Dep.

This Safety Evaluation for Packaging (SEP) provides authorization for the use of Container Products Corporation (CPC) metal boxes, as described in this document, for the interarea shipment of radioactive contaminated equipment and debris for storage in the Central Waste Complex (CWC) or T Plant located in the 200 West Area. Authorization is granted until November 30, 1995. The CPC boxes included in this SEP were originally procured as US Department of Transportation (DOT) Specification 7A Type A boxes. A review of the documentation provided by the manufacturer revealed the documentation did not adequately demonstrate compliance to the 4 ft drop test requirement of 49 CFR 173.465(c). Preparation of a SEP is necessary to document the equivalent safety of the onsite shipment in lieu of meeting DOT packaging requirements until adequate documentation is received. The equivalent safety of the shipment is based on the fact that the radioactive contents consist of contaminated equipment and debris which are not dispersible. Each piece is wrapped in two layers of no less than 4 mil plastic prior to being placed in the box which has an additional 10 mil liner. Pointed objects and sharp edges are padded to prevent puncture of the plastic liner and wrapping.

323 (WHC-SD-WM-MAR–007) **Waste Encapsulation and Storage Facility mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013879. Source: OSTI; NTIS; INIS; GPO Dep.

This report defines the mission for the Waste Encapsulation and Storage Facility (WESF). It contains summary information regarding the mission analysis which was performed by holding workshops attended by relevant persons involved in the WESF operations. The scope of the WESF mission is to provide storage of Cesium (Cs) and Strontium (Sr) capsules, previously produced at WESF, until every capsule has been removed from the facility either to another storage location, for disposal or for beneficial use by public or private enterprises. Since the disposition of the capsules has not yet been determined, they may be stored at WESF for many years, even decades. The current condition of the WESF facility must be upgraded and maintained to provide for storage which is safe, cost effective, and fully compliant with DOE direction as well as federal, state, and local laws and regulations. The Cs capsules produced at WESF were originally released to private enterprises for uses such as the sterilization of medical equipment; but because of the leakage of one capsule, all are being returned. The systems, subsystems, and equipment not required for the storage mission will be available for use by other projects or private enterprises. Beyond the storage of the Cs and Sr capsules, no future mission for the WESF has been identified.

324 (WHC-SD-WM-UM–030) **ISO-PC Version 1.98: User's guide.** Rittmann, P.D. Westinghouse Hanford Co., Richland, WA (United States). 2 May 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012788. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes how to use Version 1.98 of the shielding program named ISO-PC. Version 1.98 corrects all known errors in ISOSHLD-II. In addition, a few numeric problems have been eliminated. There are three new namelist variables, 25 additional shielding materials, and 5 more energy groups. The two major differences with the original ISOSHLD-II are the removal of RIBD(radioisotope buildup and decay) source generator, and the removal of the non-uniform source distribution parameter, SSV1. This version of ISO-PC works with photon energies from 10 KeV to 10 MeV using 30 energy groups.

325 (WHC-SP–0098-6) **Routine environmental monitoring schedule, calendar year 1995.** Schmidt, J.W.; Markes, B.M.; McKinney, S.M. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 115p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015812. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides Bechtel Hanford, Inc. (BHI) and Westinghouse Hanford Company (WHC) a schedule of monitoring and sampling routines for the Operational Environmental Monitoring (OEM) program during calendar year (CY) 1995. Every attempt will be made to consistently follow this schedule; any deviation from this schedule will be documented by an internal memorandum (DSI) explaining the reason for the deviation. The DSI will be issued by the scheduled performing organization and directed to Near-Field Monitoring. The survey frequencies for particular sites are determined by the technical judgment of Near-Field Monitoring and may depend on the site history, radiological status, use and general conditions. Additional surveys may be requested at irregular frequencies if conditions warrant. All radioactive wastes sites are scheduled to be surveyed at least annually. Any newly discovered wastes sites not documented by this schedule will be included in the revised schedule for CY 1995.

326 (WHC-SP–0564-37) **Westinghouse Hanford Company Health and Safety Performance Report. First quarter calendar year 1995.** Lansing, K.A. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013514. Source: OSTI; NTIS; GPO Dep.

During the first quarter of CY 1995, four of the WHC sitewide ALARA performance goals were completed on or ahead of schedule. One of the completed goals related to reduction of radiological areas at WHC-managed facilities. Due to anticipated resource reductions and increased scope of work, several facilities escalated their reduction schedule. This allowed the ALARA goal to be completed and exceeded ahead of schedule. Industrial Safety and Health initiatives are being pursued in areas such as workplace ergonomics, safety training, and standards development. Positive efforts are ongoing in the areas of management commitment and employee involvement through the WHC Voluntary Protection Program. Successful implementation continues through the President's Accident Prevention Council (PAPC) and division employee Accident Prevention Councils. The Company now has established CY 1995 PAPC goals. Major programmatic accomplishments completed during this reporting period include the Department of Energy-Headquarters (DOE-HQ) formally endorsing the Radiological Control organization's approach toward development of the Radiation Protection Program (RPP) document. The DOE-HQ has recognized the significant contributions and leadership that Radiological Control has provided in planning and implementation of this "model example of an RPP" across the DOE complex and is encouraging other sites to contact WHC for assistance in developing their RPPs.

327 (WHC-SP–0564-39) **Westinghouse Hanford Company health and safety performance report. Third**

quarter calendar year 1995. Lansing, K.A. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96005129. Source: OSTI; NTIS; INIS; GPO Dep.

The lost/restricted workday severity rate posted in CY 1994 of 45.50 was a significant improvement over the prior years and, remarkably, this rate has been reduced to 16.40 thus far in CY 1995 (Table 2–2). The indications from this sustained reduction are that employee, management, HEHF, and accident investigator efforts to manage injuries are becoming stronger (page 2–8). Congratulations to the Human Resources Department for working over 835,000 hours without a lost workday away injury/illness! The last lost workday away case occurred on 12/17/92. The Workers Compensation Report shows significant reduction in the amount of money expended for medical treatments and time loss due to industrial injuries. The cost of insurance continues to decrease. Continued savings can be attributed to aggressive claims and safety case management, an enhanced attitude by management creating a positive and proactive safety awareness culture, and a more aggressive return-to-work philosophy.

328 (WHC-SP–0665-17) **Quarterly environmental radiological survey summary: Second Quarter 1995 100, 200, 300, and 600 Areas.** McKinney, S.M. Westinghouse Hanford Co., Richland, WA (United States). 27 Jul 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001070. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a summary of the radiological surveys performed in support of the operational environmental monitoring program at the Hanford Site. The Second Quarter 1995 survey results and the status of actions required from current and past reports are summarized.

329 (WHC-SP–0856-Rev.2) **Maintenance implementation plan for T Plant. Revision 2.** Ayers, W.S. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013579. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a Maintenance Implementation Plan (MIP) for the T Plant Facility complex located in the 200 West Area of the Hanford Reservation in Washington state. This plan has been developed to provide a disciplined approach to maintenance functions and to describe how the T Plant facility will implement and comply with the regulations according to US DOE order 4330.4B, entitled Maintenance Management Program, Chapter 2.0 "Nuclear Facilities". Physical structures, systems, processes, as well as all associated equipment specifically assigned to these groups are included in the MIP.

330 (WHC-SP–0969-48) **Site management system executive summary report – March 1995.** Schultz, E.A. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013581. Source: OSTI; NTIS; INIS; GPO Dep.

Performance data for March 1995 reflects a continued unfavorable schedule variance and favorable cost variance. The March fiscal-year-to-date (FYTD) schedule variance is an unfavorable $105.5M. EM-30 (Office of Waste Management) is the biggest contributor ($81.9 million) to the behind-schedule condition. The majority of the EM-30 schedule variance is associated with the Tank Waste Remediation System (TWRS) program. A breakdown of individual program performance is listed on page 6. The TWRS schedule variance totals a negative $63.0 million and is attributed to the delay in receiving key decision 0 (KD-0) for Project W-314, "Tank Farm Restoration and Safe Operations"; the delay in receiving KD-3 for Project W-320, "106-C Sluicing"; late deployment of the rotary and push mode sampling trucks due to equipment and operational issues; late placement of melter contracts; and the Multi-Function Waste Tank Facility (MWTF) workscope still being a part of the baseline. Class I change requests are in process to rebaseline the activities associated with KDs. An aggressive sampling schedule has been developed for the rotary and push mode sampling activity. Thirty-seven enforceable agreement milestones were schedule FYTD. Thirty-six (97 percent) of the thirty-seven were completed on or ahead of schedule and one (3 percent) is delinquent. The Department of Energy, Richland Operations Office entered into dispute resolution on April 7, 1995, for the delinquent milestone. Six (13 percent) of the 39 remaining enforceable agreement milestones scheduled for FY 1995 are forecast to be late. Additional information on these milestones can be found on pages 13 through 15. Performance data reflects a significant favorable $25.7 million (4 percent) cost variance. The majority of the cost variance is attributed to progress towards achievement of productivity commitment goals and is expected to continue for the remainder of this fiscal year.

331 (WHC-SP–0969-52) **Hanford Site performance summary – EM funded programs, July 1995.** Schultz, E.A. Westinghouse Hanford Co., Richland, WA (United States). Jul 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001818. Source: OSTI; NTIS; INIS; GPO Dep.

Performance data for July 1995 reflects a 4% unfavorable schedule variance and is an improvement over June 1995. The majority of the behind schedule condition is attributed to EM-30, (Office of Waste Management). The majority of the EM-30 schedule variance is associated with the Tank Waste Remediation System (TWRS) Program. The TWRS schedule variance is attributed to the delay in obtaining key decision 0 (KD-0) for Project W-314, "Tank Farm Restoration and Safe Operations" and the Multi-Function Waste Tank Facility (MWTF) workscope still being a part of the baseline. Baseline Change Requests (BCRs) are in process rebaselining Project W-314 and deleting the MWTF from the TWRS baseline. Once the BCR's are approved and implemented, the overall schedule variance will be reduced to $15.0 million. Seventy-seven enforceable agreement milestones were scheduled FYTD. Seventy-one (92%) of the seventy-seven were completed on or ahead of schedule, two were completed late and four are delinquent. Performance data reflects a continued significant favorable cost variance of $124.3 million (10%). The cost variance is attributed to process improvements/efficiencies, elimination of low-value work, workforce reductions and is expected to continue for the remainder of this fiscal year. A portion of the cost variance is attributed to a delay in billings which should self-correct by fiscal year-end.

332 (WHC-SP–0969-53) **Hanford site performance summary: EM funded programs August 1995.** Schultz, E.A. Westinghouse Hanford Co., Richland, WA (United States). Aug 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003260. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents information about the milestones achieved by the Environmental Management program at the Hanford Site. This information is presented is context of cost of each milestone.

333 (WHC-SP–0969-54) **Hanford Site performance summary: EM funded programs.** Edwards, C. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96004643. Source: OSTI; NTIS; INIS; GPO Dep.

Hanford performance at fiscal year end reflects a three percent unfavorable schedule variance ($46.3 million*) which was an improvement over August 1995 ($46.3 million for September versus $65.9 million for August) and is below established reporting thresholds (greater than 3 percent). The majority of the behind schedule condition (53 percent) is attributed to EM-40 (Office of Environmental Restoration [ER]) and is a result of late receipt of funds, procurement delays, and US Army Corps of Engineers (USACE) work planned but not accomplished. Other primary contributors to the behind schedule condition are associated with tank farm upgrades, high-level waste disposal and work for others (support to the US Department of Energy-Headquarters [DOE-HQ]). The remaining behind schedule condition is distributed throughout the remaining Hanford programs and do not share common causes. A breakdown of individuals listed on page 8.

334 (WHC-SP–1103-Rev.1) **Information management fiscal year 1996 site support program plan, WBS 6.4. Revision 1.** Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003351. Source: OSTI; NTIS; GPO Dep.

In the recent past, information resource management (IRM) was a neatly separable component of the overall DOE mission, concerned primarily with procuring and implementing automatic data processing (ADP) systems. As the DOE missions have shifted from producing product to managing processes, those clear lines have blurred. Today, IRM is firmly embedded in all aspects of the DOE mission. BCS Richland, Inc., (BCSR) provides IRM for the Hanford Site. The main focus in executing this mission is to meet customer goals by providing high-quality, timely, and cost-effective electronic communication, computing, and information services. Information resources provide the US Department of Energy, Richland Operations Office (RL) and the Hanford Site contractors the ability to generate, store, access, and communicate information quickly, reliably, and cost effectively. BCSR plans, implements, and operates electronic communication, computing and information management systems that enable effective operation of the Hanford Site. Five strategic initiatives to encompass the vision provide guidance and focus to the information technology (IT) direction for developing the BCSR program plan. These strategic initiatives are the program vision and are as follows: primary focus; fast response; accessible information; world class information management infrastructure; powerful desktop. The business directions that guide the development of the BCSR Program Plan are: (1) emphasize providing cost-effective and value-added communication, computing, and information systems products and services to the Site missions; (2) strengthen the alignment of products and services with Site projects and programs and eliminate duplications Sitewide; (3) focus on the effective resolution of critical Site information management (IM) issues.

335 (WHC-SP–1132) **External communication FY 1995 Site Support Program Plan WBS 6.10.6.** Whiting, W.P. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96005137. Source: OSTI; NTIS; INIS; GPO Dep.

External Communications activities provide value to the company, its projects, and DOE by achieving compliance to more than 30 DOE orders, DOE directives, policies, state and federal laws. Through the systematic development of informed consent involving Hanford management, stakeholders, the general public and regulators, Hanford cleanup is better able to proceed in concert with involved parties. External Communications provides further efficiencies as the single point of contact for media interactions which otherwise would be scattered throughout WHC programs. Enhanced efficiency is expected from the realignment of multi-purpose communication teams which are dedicated to five key programmatic areas: TWRS Communications, Transition Facilities Communications, Spent Fuels Communications, Waste, Analytical and Environmental Services Communications, and Program Communications Services.

336 (WHC-SP–1138-Rev.1) **Engineering testing and technology projects FY 1996 Site Support Program Plan, WBS 6.3.3 and 6.3.8. Revision 1.** Brown, L.C. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001631. Source: OSTI; NTIS; INIS; GPO Dep.

The engineering laboratory services for development, assembly, testing, and evaluation to support the resolution of WHC, Hanford, and DOE complex wide engineering issues for 1996 are presented. Primary customers are: TWRS, spent nuclear fuels, transition projects, liquid effluent program, and other Hanford contractors and programs. Products and services provided include: fabrication and assembly facilities for prototype and test equipment, development testing, proof of principle testing, instrumentation testing, nondestructive examination application development and testing, prototype equipment design and assembly, chemical engineering unit operations testing, engineering test system disposal, and safety issue resolution.

337 (WHC-SP–1166) **Liaison activities with the Institute of Physical Chemistry/Russian Academy of Science Fiscal Year 1995.** Delegard, C.H. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96002793. Source: OSTI; NTIS; INIS; GPO Dep.

Investigations into the chemistry of alkaline Hanford Site tank waste (TTP RL4-3-20-04) were conducted in Fiscal Year 1995 at Westinghouse Hanford Company under the support of the Efficient Separations and Processing Crosscutting Program (EM-53). The investigation had two main subtasks: liaison with the Institute of Physical Chemistry of the Russian Academy of Science and further laboratory testing of the chemistry of thermal reconstitution of Hanford Site tank waste. Progress, which was achieved in the liaison subtask during Fiscal Year 1995, is summarized as follows: (1) A technical dialogue has been established with Institute scientists. (2) Editing was done on a technical literature review on the chemistry of transuranic elements and technetium in alkaline media written by researchers at the Institute. The report was issued in May 1995 as a Westinghouse Hanford Company document. (3) Four tasks from the Institute were selected for support by the U.S. Department of Energy. Work on three tasks commenced on 1 March 1995; the fourth task commenced on 1 April 1995. (4) Technical information describing the composition of Hanford Site tank waste was supplied to the Institute. (5) A program review of the four tasks was conducted at the Institute during a visit 25 August to 1 September, 1995. A lecture on the origin, composition, and proposed treatment of Hanford Site tank wastes was presented during this visit. Eight additional tasks were proposed by Institute scientists for support in Fiscal Year 1996. (6) A paper was presented at the Fifth International Conference on Radioactive Waste Management and Environmental Remediation (ICEM'95) in Berlin, Germany on 3 to 9 September, 1995 on the solubility of actinides in alkaline media.

338 (WHC-SP–1168) **Packaging design criteria for the Type B Drum.** Edwards, W.S.; Smith, R.J.; Wells, A.H. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001632. Source: OSTI; NTIS; INIS; GPO Dep.

The Type B Drum package is a transportation cask capable of shipping a single 55-gal (208 L) drum of transuranic (TRU) waste. The Type B Drum is smaller than existing certified packages, such as the TRUPACT-II cask, but will allow payloads with higher thermal and gas generation rates, thus providing greater operational flexibility. The Type B Drum package has double containment so that plutonium contents and other radioactive material may be transported in Type B quantities. Conceptual designs of unshielded and shielded versions of the Type B Drum were completed in Report on the Conceptual Design of the Unshielded Type B Drum Packaging and Report on the Conceptual Design of the Shielded type B Drum Packaging (WEC 1994a, WEC 1994b), which demonstrated the Type B Drum to be a viable packaging system. A Type B package containment system must withstand the normal conditions of transport and the hypothetical accident conditions, which include a 9-m (30-ft) drop onto an unyielding surface and a 1-m (3-ft) drop onto a 15-cm (6-in.) diameter pin, and a fire and immersion scenarios.

339 (WHC-SP–1169) **Site Support Program Plan Infrastructure Program.** Westinghouse Hanford Co., Richland, WA (United States). 26 Sep 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96005135. Source: OSTI; NTIS; INIS; GPO Dep.

The Fiscal Year 1996 Infrastructure Program Site Support Program Plan addresses the mission objectives, workscope, work breakdown structures (WBS), management approach, and resource requirements for the Infrastructure Program. Attached to the plan are appendices that provide more detailed information associated with scope definition. The Hanford Site's infrastructure has served the Site for nearly 50 years during defense materials production. Now with the challenges of the new environmental cleanup mission, Hanford's infrastructure must meet current and future mission needs in a constrained budget environment, while complying with more stringent environmental, safety, and health regulations. The infrastructure requires upgrading, streamlining, and enhancement in order to successfully support the site mission of cleaning up the Site, research and development, and economic transition.

340 (WINCO–1197) **Using ytterbium-169 for safe and economical industrial radiography.** Dowalo, J.A. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Jan 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE96003482. Source: OSTI; NTIS; INIS; GPO Dep.

Safety has become an issue of paramount importance for industrial radiography. Many NDE facilities and suppliers are finding the cost of performing radiography Prohibitive due to heightened safety concerns for radiation area protection. The most common sources used in radiography, Iridium-192 and Cobalt-60, result in high radiation fields over a large area. Even when collimators are used large radiation fields can result from multicurie source radiography. Radiographic operations are being forced to find alternative test methods and techniques to the use of the old stand-by sources. These alternate methods are not always as comprehensive a test as full volumetric examination with radiography. Since Iridium and Cobalt are in such wide spread use, they are sometimes called upon to perform test of materials which are not in their optimum sensitivity range.

341 (WSRC-MS–94-0255) **The Savannah River Environmental Technology Field Test Platform: Phase 2.** Rossabi, J.; Riha, B.D.; Eddy-Dilek, C.A.; Pemberton, B.E.; May, C.P.; Jarosch, T.R.; Looney, B.B.; Raymond, R. Westinghouse Savannah River Co., Aiken, SC (United States). 14 Mar 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060138. Source: OSTI; NTIS; INIS; GPO Dep.

The principal goal in the development of new technologies for environmental monitoring and characterization is transferring them to organizations and individuals for use in site assessment and compliance monitoring. The DOE complex has devised several strategies to facilitate this transfer including joint research projects between private industries and government laboratories or universities (CRADAs) and streamlined licensing procedures. One strategy that has been under-utilized is a planned sequence gradually moving from laboratory development and field demonstration to long term evaluation and onsite use. Industrial partnership and commercial production can be initiated at any step based on the performance, market, user needs, and costs associated with the technology. This approach allows use of the technology by onsite groups for compliance monitoring tasks (e.g. Environmental Restoration and Waste Management), while following parallel research and development organizations the opportunity to evaluate the long term performance and to make modifications or improvements to the technology. This probationary period also provides regulatory organizations, potential industrial partners, and potential users with the opportunity to evaluate the technology's performance and its utility for implementation in environmental characterization and monitoring programs.

342 (WSRC-MS–95-0478) **HyTech - The Hydrogen Technology Laboratory at Savannah River.** Motyka, T.; Knight, J.R.; Heung, L.K.; Lee, M.W. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960601–2: 11. world hydrogen energy conference: designing the energy

link, Stuttgart (Germany), 23-27 Jun 1996). Order Number DE96009651. Source: OSTI; NTIS; INIS; GPO Dep.

SRS recently announced the formation of the Hydrogen Technology Laboratory (HyTech) to work with industry and government in developing technologies based on the site's four decades of experience with tritium and other forms of H. HyTech will continue to sustain the site's ongoing role in H technology applications for defense programs. In addition, the laboratory will work with the chemical, transportation, power, medical, and other industries to develop and test related technologies. HyTech, which is located in the Savannah River Technology Center, will make use of its facilities and staff, as well as the infrastructure within the site's Tritium Facilities. More than 80 SRS scientists, engineers, and technical professionals with backgrounds in chemistry, engineering, materials science, metallurgy, physics, and computer science will work with the laboratory. This paper describes some of HyTech's current initiatives in the area of H storage, transportation, and energy applications.

343 (WSRC-TR-94-100-12) **SRTC Monthly Report December 1994.** Ferrell, J.M. Westinghouse Savannah River Co., Aiken, SC (United States). 19 Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060145. Source: OSTI; NTIS; GPO Dep.

This is the Savannah River Technology Center monthly report for December 1994.

344 (ANL–95/7) **Surveillance of Site A and Plot M report for 1994.** Golchert, N.W. Argonne National Lab., IL (United States). May 1995. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013276. Distribution: UC-2020. Source: OSTI; NTIS; INIS; GPO Dep.

The results of the environmental surveillance program conducted at Site A/Plot M in the Palos Forest Preserve area for 1994 are presented. The surveillance program is the ongoing remedial action that resulted from the 1976-1978 radiological characterization of the site. That study determined that very low levels of hydrogen-3 (as tritiated water) had migrated from the burial ground and were present in two nearby hand-pumped picnic wells. The current program consists of sample collection and analysis of air, surface and subsurface water, and bottom sediment. The results of the analyses are used to (1) monitor the migration pathway of water from the burial ground (Plot M) to the hand-pumped picnic wells, (2) establish if buried radionuclides other than hydrogen-3 have migrated, and (3) generally characterize the radiological environment of the area. Hydrogen-3 in the Red Gate Woods picnic wells was still detected this year, but the average and maximum concentrations were significantly less than found earlier. Tritiated water continues to be detected in a number of wells, boreholes, dolomite holes, and a surface stream. For many years it was the only radionuclide found to have migrated in measurable quantities. Analyses since 1984 have indicated the presence of low levels of strontium-90 in water from a number of boreholes next to Plot M. The available data does not allow a firm conclusion as to whether the presence of this nuclide represents recent migration or movement that may have occurred before Plot M was capped. The results of the surveillance program continue to indicate that the radioactivity remaining at Site A/Plot M does not endanger the health or safety of the public visiting the site, using the picnic area, or living in the vicinity.

345 (ANL/CMT/CP–88385) **Transport through low porosity media – microstructure and uncertainty analysis.** Tam, S.W.; Steindler, M.J. Argonne National Lab., IL (United States). [1996]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960421–31: 7. annual international high-level radioactive waste management conference, Las Vegas, NV (United States), 29 Apr - 3 May 1996). Order Number DE96008398. 346 (ANL/EA/CP–84187) **Options for improving hazardous waste cleanups using risk-based criteria.** Elcock, D. Argonne National Lab., Washington, DC (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950646–27: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95013712. Source: OSTI; NTIS; INIS; GPO Dep.

This paper explores how risk- and technology-based criteria are currently used in the RCRA and CERCLA cleanup programs. It identifies ways in which risk could be further incorporated into RCRA and CERCLA cleanup requirements and the implications of risk-based approaches. The more universal use of risk assessment as embodied in the risk communication and risk improvement bills before Congress is not addressed. Incorporating risk into the laws and regulations governing hazardous waste cleanup, will allow the use of the best scientific information available to further the goal of environmental protection in the United States while containing costs. and may help set an example for other countries that may be developing cleanup programs, thereby contributing to enhanced global environmental management.

347 (ANL/EA/CP–85472) **A Bayesian/geostatistical approach to the design of adaptive sampling programs.** Johnson, R.L. (Argonne National Lab., IL (United States). Environmental Assessment Div.). Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950159–2: Geostatistics for environmental and geotechnical applications, Phoenix, AZ (United States), 26-27 Jan 1995). Order Number DE95013500. Source: OSTI; NTIS; GPO Dep.

Traditional approaches to the delineation of subsurface contamination extent are costly and time consuming. Recent advances in field screening technologies present the possibility for adaptive sampling programs–programs that adapt or change to reflect sample results generated in the field. A coupled Bayesian/geostatistical methodology can be used to guide adaptive sampling programs. A Bayesian approach quantitatively combines "soft" information regarding contaminant location with "hard" sampling results. Soft information can include historical information, non-intrusive geophysical survey data, preliminary transport modeling results, past experience with similar sites, etc. Soft information is used to build an initial conceptual image of where contamination is likely to be. As samples are collected and analyzed, indicator kriging is used to update the initial conceptual image. New sampling locations are selected to minimize the uncertainty associated with contaminant extent. An example is provided that illustrates the methodology.

348 (ANL/EA/CP–86379) **Streamlined RI/FS planning for the groundwater operable unit at the Weldon Spring Site.** Picel, M.H.; Durham, L.A.; Blunt, D.L.; Hartmann, H.M. Argonne National Lab., IL (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950868–43: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96007243. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) is conducting cleanup activities at the chemical plant area of the Weldon Spring Site located in St. Charles County, Missouri, about 48 km (30 mi) west of St. Louis and 22 km (14 mi) southwest of the City of St. Charles. The 88-ha (217-acre) chemical plant area is chemically and radioactively contaminated as a result of uranium processing activities conducted by the U.S. Atomic Energy Commission during the 1950s and 1960s. The Army also used the chemical plant area for the production of explosives in the 1940s. The Weldon Spring Site chemical plant area was listed on the National Priorities List (NPL) in 1989. Adjacent to the chemical plant area is another NPL site known as the Weldon Spring Ordnance Works. The ordnance works area is a former explosive production facility that manufactured trinitrotoluene (TNT) and dinitrotoluene (DNT) during World War II. The ordnance works area covers 7,000 ha (17,232 acres); cleanup of this site is managed by the U.S. Army Corps of Engineers (CE).

349 (ANL/EA/CP–87306) **Optimized remedial groundwater extraction using linear programming.** Quinn, J.J. Argonne National Lab., IL (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950868–38: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96005536. Source: OSTI; NTIS; INIS; GPO Dep.

Groundwater extraction systems are typically installed to remediate contaminant plumes or prevent further spread of contamination. These systems are expensive to install and maintain. A traditional approach to designing such a wellfield uses a series of trial-and-error simulations to test the effects of various well locations and pump rates. However, the optimal locations and pump rates of extraction wells are difficult to determine when objectives related to the site hydrogeology and potential pumping scheme are considered. This paper describes a case study of an application of linear programming theory to determine optimal well placement and pump rates. The objectives of the pumping scheme were to contain contaminant migration and reduce contaminant concentrations while minimizing the total amount of water pumped and treated. Past site activities at the area under study included disposal of contaminants in pits. Several groundwater plumes have been identified, and others may be present. The area of concern is bordered on three sides by a wetland, which receives a portion of its input budget as groundwater discharge from the pits. Optimization of the containment pumping scheme was intended to meet three goals: (1) prevent discharge of contaminated groundwater to the wetland, (2) minimize the total water pumped and treated (cost benefit), and (3) avoid dewatering of the wetland (cost and ecological benefits). Possible well locations were placed at known source areas. To constrain the problem, the optimization program was instructed to prevent any flow toward the wetland along a user-specified border. In this manner, the optimization routine selects well locations and pump rates so that a groundwater divide is produced along this boundary.

350 (ANL/EA/CP–87307) **Application of a computationally efficient geostatistical approach to characterizing variably spaced water-table data.** Quinn, J.J. Argonne National Lab., IL (United States). [1996]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950868–44: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96007241. Source: OSTI; NTIS; INIS; GPO Dep.

Geostatistical analysis of hydraulic head data is useful in producing unbiased contour plots of head estimates and relative errors. However, at most sites being characterized, monitoring wells are generally present at different densities, with clusters of wells in some areas and few wells elsewhere. The problem that arises when kriging data at different densities is in achieving adequate resolution of the grid while maintaining computational efficiency and working within software limitations. For the site considered, 113 data points were available over a 14-mi^2 study area, including 57 monitoring wells within an area of concern of 1.5 mi^2. Variogram analyses of the data indicate a linear model with a negligible nugget effect. The geostatistical package used in the study allows a maximum grid of 100 by 100 cells. Two-dimensional kriging was performed for the entire study area with a 500-ft grid spacing, while the smaller zone was modeled separately with a 100-ft spacing. In this manner, grid cells for the dense area and the sparse area remained small relative to the well separation distances, and the maximum dimensions of the program were not exceeded. The spatial head results for the detailed zone were then nested into the regional output by use of a graphical, object-oriented database that performed the contouring of the geostatistical output. This study benefitted from the two-scale approach and from very fine geostatistical grid spacings relative to typical data separation distances. The combining of the sparse, regional results with those from the finer-resolution area of concern yielded contours that honored the actual data at every measurement location. The method applied in this study can also be used to generate reproducible, unbiased representations of other types of spatial data.

351 (ANL/EAD/TM–42) **Derivation of guidelines for uranium residual radioactive material in soil at the former Baker Brothers, Inc., Site, Toledo, Ohio.** Nimmagadda, M.; Kamboj, S.; Yu, C. Argonne National Lab., IL (United States). Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012410. Source: OSTI; NTIS; INIS; GPO Dep.

Residual radioactive material guidelines for uranium in soil were derived for the former Baker Brothers, Inc., site in Toledo, Ohio. This site has been identified for remedial action under the U.S. Department of Energy's (DOE's) Formerly Utilized Sites Remedial Action Program (FUSRAP). Single-nuclide and total-uranium guidelines were derived on the basis of the requirement that following remedial action, the 50-year committed effective dose equivalent to a hypothetical individual living or working in the immediate vicinity of the site should not exceed a dose constraint of 30 mrem/yr for the current use and likely future use scenarios or a dose limit of 100 mrem/yr for less likely future use scenarios. The DOE residual radioactive material guideline computer code, RESRAD, was used in this evaluation; RESRAD implements the methodology described in the DOE manual for establishing residual radioactive material guidelines. Three scenarios were considered; each assumed that for a period of 1,000 years following remedial action, the site would be used without radiological restrictions. The three scenarios varied with regard to the type of site use, time spent at the site by the exposed individual, and sources of food and water consumed. The evaluation indicates that the dose constraint of 30 mrem/yr would not be exceeded for uranium (including uranium-234, uranium-235, and uranium-238) within 1,000 years, provided that the soil concentration of total combined uranium (uranium-234, uranium-235, and uranium-238) at the former Baker Brothers site did not exceed 710 pCi/g for Scenario A (industrial worker, current use) or 210 pCi/g for Scenario B (resident - municipal water supply, a likely future use). The dose limit of 100 mrem/yr would not be exceeded at the site if the total uranium concentration of the soil did not exceed 500 pCi/g for Scenario C (subsistence farmer - on-site well water, a plausible but unlikely future use).

352 (ANL/EAD/TM–49) **Floodplain/wetlands assessment for the remediation of Vicinity Property 9 at the Weldon Spring Site, Weldon Spring, Missouri.** Lonkhuyzen, R.A. Van (Argonne National Lab., IL (United States). Environmental Assessment Div.). Argonne National Lab., IL (United States). Nov 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96005924. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) proposes to excavate contaminated soil at Vicinity Property 9 (VP9), a 0.64-ha (1.6-acre) parcel near the Weldon Spring Site in Missouri. A palustrine wetland approximately 0.10 ha (0.25 acre) in size within VP9 would be excavated. Site restoration should allow palustrine wetland to become reestablished. No long-term impacts to floodplains are expected.

353 (ANL/ER/CP–86429) **Integration of geophysics within the Argonne expedited site characterization Program at a site in the southern High Plains.** Hastings, B.; Hildebrandt, G.; Meyer, T.; Saunders, W.; Burton, J.C. Argonne National Lab., IL (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950450–8: 8. annual symposium on the application of geophysics to environmental and engineering problems, Orlando, FL (United States), 23-27 Apr 1995). Order Number DE95011792. Source: OSTI; NTIS; GPO Dep.

An Argonne National Laboratory Expedited Site Characterization (ESC) program was carried out at a site in the central United States. The Argonne ESC process emphasizes an interdisciplinary approach in which all available information is integrated to produce as complete a picture as possible of the geologic and hydrologic controls on contaminant distribution and transport. As part of this process, all pertinent data that have been collected from previous investigations are thoroughly analyzed before a decision is made to collect additional information. A seismic reflection program recently concluded at the site had produced inconclusive results. Before we decided whether another acquisition program was warranted, we examined the existing data set to evaluate the quality of the raw data, the appropriateness of the processing sequence, and the integrity of the interpretation. We decided that the field data were of sufficient quality to warrant reprocessing and reinterpretation. The main thrust of the reprocessing effort was to enhance the continuity of a shallow, low-frequency reflection identified as a perching horizon within the Ogallala formation. The reinterpreted seismic data were used to locate the boundaries of the perched aquifer, which helped to guide the Argonne ESC drilling and sampling program. In addition, digitized geophysical well log data from previous drilling programs were reinterpreted and integrated into the geologic and hydrogeologic model.

354 (ANL/ES/CP–85247) **Ultrasonic process for remediation of organics-contaminated groundwater/wastewater.** Wu, J.M.; Peters, R.W. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505217–3: Air & Waste Management Association Policy meeting, Washington, DC (United States), 10-12 May 1995). Order Number DE95013690. Source: OSTI; NTIS; INIS; GPO Dep.

A technology is being developed that employs ultrasonic-wave energy for remediation of groundwater/wastewater contaminated with volatile organic compounds such as carbon tetrachloride (CCl_4) and trichloroethylene (TCE). This paper presents the updated results of a laboratory investigation of ultrasonic groundwater remediation using synthetic groundwaters prepared with laboratory deionized water. Key process parameters investigated included steady-state temperature, contaminant concentration, solution pH, sonication time, and intensity of the applied ultrasonics-wave energy. High destruction efficiencies of the target contaminants were achieved, and the sonication time required for a given degree of destruction decreased with increasing intensity of the applied ultrasonic energy. The sonication time can be further reduced by adding a chemical oxidant such as hydrogen peroxide.

355 (ANL/ES/CP–86536) **Plutonium mobility studies in soil sediment decontaminated by means of a soil-washing technology.** Negri, M.C. (Argonne National Lab., IL (United States)); Orlandini, K.A.; Swift, N.; Carfagno, D. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505101–7: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE95013719. Source: OSTI; NTIS; INIS; GPO Dep.

The ACT*DE*CON^{SM} process extracts plutonium from contaminated soils/sediments by means of a series of washings with a blend of chemicals, that includes a chelating agent, an oxidant, and carbonates. At the end of the process, the Pu level in the soil is lowered to 25-30 pCi/g from an initial contamination level averaging 500 pCi/g. The radionuclide still present in the soil at the end of the treatment must be strongly immobilized in or onto the soil particles to minimize the risk of its percolation to the aquifer and/or uptake by vegetation. This paper reports the investigation of residual Pu mobility as K_d (distribution coefficient) in the treated soil/sediment. Six batches of contaminated soil were treated simultaneously by means of the ACT*DE*CON^{SM} process. Some batches of the treated soil were amended with a standard fertilizer treatment of compost and nutrient and brought to pH 8.5. The treated soil, treated and fertilized soil, and the untreated controls were then incubated at 18°C for 90 days. At four different times, a small aliquot of soil was retrieved from each of the batches and contacted with rainwater for six days to determine the Pu solid/liquid distribution and K_d. Results indicated that a higher total amount of Pu was leached from the untreated soil, probably as a consequence of the higher content of available/exchangeable Pu in this soil compared with the treated ones. Treated/fertilized soils showed Pu leaching at intermediate levels between those for treated and untreated soils, at least for the first 30 days of incubation. K_d values at the beginning of the incubation period were significantly lower in the untreated and treated/fertilized soils compared with those for the treated-only, but at 90 days, these values were substantially equal among the three different soils. Traces of the chelant were detectable only in treated, unfertilized soil.

356 (BHI–00046-Rev.1) **Safety assessment for the proposed pilot-scale treatability tests for the 200-UP-1 and 200-ZP-1 groundwater operable units. Revision 1.** Lehrschall, R.R. (IT Hanford, Inc., Richland, WA (United States)); Oestreich, D.K. Bechtel Hanford, Inc., Richland, WA (United States). Dec 1994. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005866. Source: OSTI; NTIS; INIS; GPO Dep.

This safety assessment provides an analysis of the proposed pilot-scale treatability test activities to be and conducted within the 200 Area groundwater operable units on the Hanford Site. The 200-UP-1 and 200-ZP-1 operable units are located in the 200 West Area of the Hanford Site. These tests will evaluate an ion exchange (IX) water purification treatment system and granular activated carbon (GAC). A detailed engineering analysis of (GAC) adsorption for remediation of groundwater contamination. A detailed engineering analysis of the IX treatment system. The principal source of information for this assessment, states that the performance objective of the treatment systems is to remove 90% of the uranium and technetium-99 (^{99}Tc) from the extracted groundwater at the 200-UP-1 site. The performance objective for 200-ZP-1 is to remove 90% of the carbon tetrachloride (CCl_4), chloroform, and trichloroethylene (TCE) from the extracted groundwater.

357 (BHI–00055-Rev.1) **Qualitative risk assessment for the 100-NR-2 Operable Unit. Revision 1.** IT Corporation (IT Corp., Las Vegas, NV (United States)). Bechtel Hanford, Inc., Richland, WA (United States); IT Corp., Las Vegas, NV (United States). Mar 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005867. Source: OSTI; NTIS; INIS; GPO Dep.

This qualitative risk assessment provides information about the 100- NR-2 Groundwater Operable Unit of the Hanford reservation. Topics discussed in this report are: data evaluation; human health risk assessment overview; ecological evaluations; summary of uncertainty; results of both the ecological and human health evaluations; toxicity assessment; risk characterization; and a summary of contaminants of potential concern.

358 (BHI–00079-Rev.) **Groundwater protection plan for the Environmental Restoration Disposal Facility.** Weekes, D.C.; Jaeger, G.K.; McMahon, W.J.; Ford, B.H. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1996. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005929. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the groundwater protection plan for the Environmental Restoration Disposal Facility (ERDF) Project. This plan is prepared based on the assumption that the ERDF will receive waste containing hazardous/dangerous constituents, radioactive constituents, and combinations of both. The purpose of this plan is to establish a groundwater monitoring program that (1) meets the intent of the applicable or relevant and appropriate requirements, (2) documents baseline groundwater conditions, (3) monitors those conditions for change, and (4) allows for modifications to groundwater sampling if required by the leachate management program. Groundwater samples indicate the occurrence of preexisting groundwater contamination in the uppermost unconfined aquifer below the ERDF Project site, as a result of past waste-water discharges in the 200 West Area. Therefore, it is necessary for the ERDF to establish baseline groundwater quality conditions and to monitor changes in the baseline over time. The groundwater monitoring program presented in this plan will provide the means to assess onsite and offsite impacts to the groundwater. In addition, a separate leachate management program will provide an indication of whether the liners are performing within design standards.

359 (BHI–00124) **Integrated test plan for the field demonstration of the supported liquid membrane unit.** Dunks, K.L.; Hodgson, K.M. Bechtel Hanford, Inc., Richland, WA (United States). Jun 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005708. Source: OSTI; NTIS; INIS; GPO Dep.

This Integrated Test Plan describes the operation and testing of a hybrid reverse osmosis (RO)/coupled transport (CT) groundwater remediation test unit, also referred to as the Environmental Restoration Technology Demonstrations at the Hanford Site. The SLM will be used to remove uranium, technetium-99, and nitrate from a selected groundwater source at the Hanford Site. The overall purpose of this test is to determine the efficiency of the RO/CT membranes operating in a hybrid unit, the ease of operating and maintaining the SLM, and the amount of secondary waste generated as a result of processing. The goal of the SLM is to develop a RO/CT process that will be applicable for removing contaminants from almost any contaminated water. This includes the effluents generated as part of the day-to-day operation of most any US Department of Energy (DOE) site. The removal of contaminants from the groundwaters before they reach the Columbia River or offsite extraction wells will reduce the risk that the population will be exposed to these compounds and will reduce the cost of subsequent groundwater cleanup.

360 (BHI–00135-Rev.1) **N-Springs barrier wall drilling program data package. Revision 1.** Johnson, V.M.; Lindsey, K.A.; Serne, J.R.; Edrington, R.S.; Mitchell, T.H. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005051. Source: OSTI; NTIS; INIS; GPO Dep.

This revision provides results of geotechnical site characterization field work performed from September 1994 to February 1995 by the Environmental Restoration Contractor (ERC) to support the proposed installation of 3,000-ft-long sheet-pile wall at N-Springs. N-Springs, which is located along the banks of the Columbia River at 100-N Area, was contaminated during the operation of the 1301-N and 1325-N liquid waste disposal facilities (LWDF). The work scope included the following: blow count sampling to determine relative penetration resistance of formation; geologic logging of the Hanford formation, the Ringold Formation, and the Ringold upper mud; geohydrologic characterization of the Ringold upper mud and unit E; soil chemistry; and elevation of the Ringold upper mud. The purpose of this report is to present a compilation of data gathered during field activities.

361 (BHI–00147-Rev.02) **N Springs pump-and-treat well design. Revision 2.** Borghese, J.V.; Edrington, R.S.; Walker, L.D. Bechtel Hanford, Inc., Richland, WA (United States). Jun 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005056. Source: OSTI; NTIS; INIS; GPO Dep.

Past practices in the 100-N Area have resulted in contamination of soils and underlying groundwater. The release of large volumes of water to the 1301-N and 1325-N liquid waste disposal facilities (LWDF) has resulted in transport of contaminants, particularly ^{90}Sr, to the Columbia River. Since the shutdown of N Reactor in 1987, the releases to the LWDF have been discontinued. Results from groundwater monitoring programs indicate that the principal contaminants in the groundwater downgradient of the 1301-N and 1325-N cribs are tritium and ^{90}Sr. Other radionuclides are also present, but these are below regulatory limits. The scope of this document is to provide guidelines and design criteria for two extraction wells, one injection well, and rehabilitation of well 199-N-14. The new extraction and injection wells will be drilled to the bottom of the unconfined aquifer and completed with a fully penetrating screen. The extraction wells will be screened across the entire aquifer so that water samples can be collected at discrete intervals. The results of sample analyses and analysis of geophysical logs should indicate zones of higher contamination. Once this determination has been made, the zone of higher contamination can be packed off within the well so that water is pumped from this zone.

362 (BHI–00149) **200-UP-1 vertical profiling activity summary report.** Ford, B.H. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005059. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes and interprets hydrochemical results collected in support of the 200-UP-1 Groundwater Operable Unit Contaminant Vertical Profiling Activity. Two primary contaminants of concern (uranium and technetium-99 [^{99}Tc]) and two secondary contaminants (nitrate and carbon tetrachloride) are present in the groundwater along the southeastern edge of the 200 West Area. These contaminants are the subject of 200-UP-1 operable unit investigation activities. Contaminant distribution maps are presented. Potential source units for uranium, ^{99}Tc, and nitrate within the mapped area are the 216-U-1 and 216-U-2 cribs, the 216-U-8 crib, and the 216-U-12 crib. The 216-U-16 crib is important in that effluent disposal to it provided hydraulic driving force for the movement of contaminants to groundwater beneath the 216-U-1 and 216-U-2 cribs. The data and interpretations presented in this report will be used to support characterization and remedial decisions for the 200-UP-1 operable unit.

363 (BHI–00158) **Review of selected 100-N waste sites related to N-Springs remediation projects.** DeFord, D.H.; Carpenter, R.W. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1996. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005053. Source: OSTI; NTIS; INIS; GPO Dep.

This document has been prepared in support of the environmental restoration program at the US Department of Energy's Hanford Site near Richland, Washington, by the Bechtel Hanford, Inc. Facility and Waste Site Research Office. It provides historical information that documents and characterizes selected waste sites that are related to the N-Springs remediation projects. The N-Springs are a series of small, inconspicuous groundwater seepage springs located along the Columbia River shoreline near the 100-N Reactor. The spring site is hydrologically down-gradient from several 100-N Area liquid waste sites that are believed to have been the source(s) of the effluents being discharged by the springs. This report documents and characterizes these waste sites, including the 116-N-1 Crib and Trench, 116-N-3 Crib and Trench, unplanned releases, septic tariks, and a backwash pond.

364 (BHI–00159) **Design criteria for, the 200-ZP-1 interim remedial measure.** Mudge, J.F.; Olson, J.W. Bechtel Hanford, Inc., Richland, WA (United States). Aug 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005054. Source: OSTI; NTIS; INIS; GPO Dep.

The Interim Remedial Measure Proposed Plan for the 200-ZP-1 Operable Unit recommended a pump and treat action to contain contaminated groundwater and limit further degradation of groundwater due to elevated concentrations of carbon tetrachloride, chloroform, and trichloroethylene in the 200-ZP-1 Operable Unit. This design criteria document defines the Project. The Project encompasses: site preparation; development of groundwater wells for monitoring, extraction, and injection; extraction and injection equipment; construction of a treatment system with support buildings/utilities; management; engineering design, analysis, and reporting; and operation and maintenance. A groundwater pump and treat system, hereafter the System, will be composed of extraction wells, a piping network, treatment equipment, water storage, and injection wells. Based upon engineering judgment, the selected technology in the proposed plan (DOE-RL 1994a) is air stripping of the organic contaminants followed by vapor-phase adsorption onto granulated activated carbon (GAC); liquid-phase GAC may be required as a polishing step. The Treatment Equipment refers to air stripping towers, adsorption vessels, water pumps, air blowers, instrumentation, and control devices which will be procured as a turn-key system.

365 (BHI–00161) **Risk-based decision analysis for groundwater operable units.** Chiaramonte, G.R. Bechtel Hanford, Inc., Richland, WA (United States). Jan 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005055. Source: OSTI; NTIS; INIS; GPO Dep.

This document proposes a streamlined approach and methodology for performing risk assessment in support of interim remedial measure (IRM) decisions involving the remediation of contaminated groundwater on the Hanford Site.

This methodology, referred to as "risk-based decision analysis," also supports the specification of target cleanup volumes and provides a basis for design and operation of the groundwater remedies. The risk-based decision analysis can be completed within a short time frame and concisely documented. The risk-based decision analysis is more versatile than the qualitative risk assessment (QRA), because it not only supports the need for IRMs, but also provides criteria for defining the success of the IRMs and provides the risk-basis for decisions on final remedies. For these reasons, it is proposed that, for groundwater operable units, the risk-based decision analysis should replace the more elaborate, costly, and time-consuming QRA.

366 (BHI–00164-Rev.1) **N Springs expedited response action performance monitoring plan. Revision 1.** Bechtel Hanford, Inc., Richland, WA (United States). Aug 1995. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005057. Source: OSTI; NTIS; INIS; GPO Dep.

Groundwater contained in the 100-NR-2 Operable Unit is contaminated with various radionuclides derived from waste water disposal practices and spills associated with 100-N Reactor operations. Of primary concern is the presence of high levels of ^{90}Sr in the groundwater and the discharge of ^{90}Sr-contaminated groundwater to the nearby Columbia River through historic river bank seeps known as "N Springs." A pump-and-treat system is being installed to remove ^{90}Sr contamination from the groundwater as part of the N Springs expedited response action (ERA). The groundwater extraction system will consist of four extraction and two injection wells with a proposed initial treatment capacity of 50 gal/min. The proposed location of the groundwater extraction system relative to the ^{90}Sr groundwater plume is presented.

367 (BHI–00180-Rev.) **Geophysical investigation of the 120-KE-3 and 118-K-2 sites, 100-KR-2 operable unit.** Bergstrom, K.A.; Mitchell, T.H.; Bolin, B.J. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96006964. Source: OSTI; NTIS; INIS; GPO Dep.

Geophysical investigations using ground-penetrating radar (GPR) and electromagnetic induction (EMI) were conducted at two waste sites, 120-KE-3 and 118-K-2, in the 100-K Area (Figure 1). Both of the sites are located within Operable Unit 100-KR-2. The 120-KE-3 waste site (Figure 2), also known as the 183-Filter Water Facility Trench and 100-KE-3, received sulfuric acid sludge from sulfuric acid storage tanks that were contaminated with 700 kg of mercury. The trench is documented as 3 ft wide by 3 ft deep by 40 ft long. However, part or all of the trench was excavated when an outside contractor attempted to recover the mercury (Carpenter and Cote 1994). Therefore, the actual size of the "disturbed area" from the trench and subsequent excavation is unknown. The objective of the geophysical investigation was to locate the original or reworked trench. The 118- K-2 site (Figure 3) was reportedly used to dispose radioactive sludge from the 116-KE-4 and 116-KW-3 retention basins. The size of the "trench" is unknown and documentation shows it in two different locations. No other information si available on the site. The objective of the investigation was to locate the trench.

368 (BHI–00185-Rev.) **Reevaluation of the N-Springs barrier wall.** Knepp, A.J.; Serne, J.R.; Ford, B.H.; Connelly, M.P.; Jacksha, G.L. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1995. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005937. Source: OSTI; NTIS; INIS; GPO Dep.

The quantity of the radioactive isotope ^{90}Sr entering the Columbia River at N-Springs is estimated to be 1.6 Ci over 10 years (0.16 Ci/yr). This new estimate is based on data collected during the installation of eight boreholes along the alignment of a proposed sheet pile barrier. New information was used to refine the hydrogeologic conceptualization of groundwater flow and contaminant transport at N-Springs. this revised estimate is significantly lower than the original estimate of 1.2 Ci/yr. Barrier walls of 2,000 ft and 3,000 ft in length were estimated to allow 0.03 Ci/yr. Barrier walls of 2,000 ft and 3,000 ft in length were estimated to allow 0.03. Ci/yr and 0.004 ci/yr of ^{90}Sr, respectively, to enter the Columbia River. Strontium-90 is found preferentially on soil between the historical water table and the current water table and in the area between the 1301-N crib and the N-Springs wells NS-1 through NS-6. Past operations of the 1301-N and 1325-N Liquid Waste Disposal Facilities elevated the pre-existing groundwater table by approximately 20 ft in some locations, bringing contaminated liquids into contact with soils that are now found above the existing water table. An approximately 1500-ft-long erosional feature was identified along the proposed barrier wall alignment encompassing these N-Springs wells. Strontium-90 found on soils in portions of this area are in direct contact with Columbia River water. Low concentrations found in N-Springs wells support the conclusion that the exchange of ^{90}Sr with the Columbia River is minimal.

369 (BHI–00187) **Engineering evaluation/ conceptual plan for the 200-UP-1 groundwater operable unit interim remedial measure.** Myers, D.A.; Swanson, L.C.; Weeks, R.S.; Giacinto, J.; Gustafson, F.W.; Ford, B.H.; Wittreich, C.; Parnell, S.; Green, J. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005050. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents an engineering evaluation and conceptual plan for an interim remedial measure (ERM) to address a uranium and technetium-99 groundwater plume and an associated nitrate contamination plume in the 200-UP-1 Groundwater Operable Unit located in the 200 West Area of the Hanford Site. This report provides information regarding the need and potentially achievable objectives and goals for an IRM and evaluates alternatives to contain elevated concentrations of uranium, technetium-99, nitrate, and carbon tetrachloride and to obtain information necessary to develop final remedial actions for the operable unit.

370 (BHI–00187-Rev.1) **Engineering evaluation/ conceptual plan for the 200-UP-1 groundwater operable unit interim remedial measure.** Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012117. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents an engineering evaluation and conceptual plan for an interim remedial measure (IRM) to address an uranium and technetium 99 groundwater plume in the 200-UP-1 Groundwater Operable Unite located in the 200 West Area of the Hanford Site. This report provides information regarding the need for an IRM and its potential achievable objectives and goals. The report also evaluates alternatives to contain elevated concentrations of uranium and technetium 99 and to obtain information necessary to develop final remedial actions for the operable unit.

371 (BHI–00187-Rev.2) **Engineering evaluation/ conceptual plan for the 200-UP-1 Groundwater Operable Unit interim remedial measure. Revision 2.** Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009914. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents an engineering evaluation and conceptual plan for an interim remedial measure (IRM) to address a uranium and technetium-99 groundwater plume in the 200-UP-1 Groundwater Operable Unit located in the 200 West Area of the Hanford Site. This report provides information regarding the need for an IRM and its potentially achievable objectives and goals. The report also evaluates alternatives to contain elevated concentrations of uranium and technetium-99 and to obtain information necessary to develop final remedial actions for the operable unit.

372 (BHI–00194) **200-ZP-1 Phase interim remedial measure conceptual design report.** Olson, J.W.; Windmueller, C.R.; Parnell, S.E.; Mudge, J.G. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1995. 306p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005873. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the conceptual design for a pump-and-treat system [interim remedial measure (IRM) system] to reduce the volatile organic compound (VOC) content of the 200-ZP-1 Operable Unit groundwater. This conceptual design is for the 200-ZP-1, phase 2 IRM. The IRM was defined and presented in the Engineering Evaluation/ Conceptual Plan for the 200-ZP-1 Operable Unit Interim Remedial Measure (BHI 1994) and the Interim Remedial Measure Proposed Plan for the 200-ZP-1 Operable Unit (DOE-RL 1994). The IRM consists of removing groundwater via extraction wells, treating via air stripping and vapor-phase granular activated carbon (GAC), and injection of treated water back into the aquifer. Air stripping and vapor-phase GAC were chosen because of their effectiveness at removing VOC from groundwater and adsorbing VOC in the vapor phase (EPA 1991a, 1991b). Following development of the conceptual plan, the design criteria were defined in the Design Criteria for the 200-ZP-1 Interim Remedial Measure (BHI 1995). These criteria present the basic objectives and criteria for the IRM. These criteria form the basis for the IRM design. The 200-ZP-1 IRM is composed of three phases. Phase I is a treatability test, currently underway south of the 234-5Z Plant in the 200 West Area, consisting of groundwater extraction, liquid-phase GAC treatment, and injection of treated water. Phase 2 expands the measure from a treatability test to a full-scale remedial measure. The phase 2 IRM will use air stripping and vapor-phase GAC treatment and will operate at 200 gpm. Phase 3 is an optional phase. If the performance of phase 2 justifies increasing the treatment rate, it will be increased up to a maximum of 500 gpm. This option is accounted for in the conceptual plan as an increase to 300 gpm in fiscal year 1996 and another increase to 500 gpm in fiscal year 1997.

373 (BHI–00345-Rev.1) **Pore water chromium concentration at 100-H Reactor Area adjacent to fall chinook salmon spawning habitat of the Hanford Reach, Columbia River. Revision 1.** Hope, S.J.; Peterson, R.A. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005832. Source: OSTI; NTIS; INIS; GPO Dep.

Groundwater underlying the 100-H Reactor Area discharges into the Columbia River in the vicinity of fall chinook salmon (Onchorynchus tshawytscha) spawning habitat within the Hanford Reach. Hexavalent chromium is a contaminant of concern that is found in the groundwater. The contaminant is considered toxic to aquatic ecological receptors, as its concentrations exceed the US Environmental Protection Agency's chronic ambient water quality criteria (AWQC) of 11 μg/L. A methodology was designed and implemented to successfully obtain pore water samples from salmon spawning habitat located near the 100-H Reactor Area. Background data were obtained from three transacts, each containing two sample sites, upstream at Vemita Bar. Pore water was obtained from the substrate by divers from a depth of 46 cm (18 in.), which is deeper than the 10 to 40 cm (4 to 16 in.) substrate depth typically excavated by fall chinook salmon during spawning. Chromium was detected at levels above AWQC at three of 31 sample sites. One explanation for not detecting chromium at the remaining sites is that the interface between river water flowing within the substrate and groundwater upwelling into the substrate is below the 45 cm (18 in.) depth that was sampled. The potential impacts of contaminated groundwater discharge on the success of salmon spawning are uncertain.

374 (BHI–00402) **Data validation summary report for the 100-HR-3 Round 8, Phases 1 and 2 groundwater sampling task.** Bechtel Hanford, Inc., Richland, WA (United States); Golder Associates, Inc., Golden, CO (United States). Jan 1996. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008013. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a summary of data validation results on groundwater samples collected for the 100-HR-3 Round 8 Groundwater Sampling task. The analyses performed for this project consisted of: metals, general chemistry, and radiochemistry. The laboratories conducting the analyses were Quanterra Environmental Services (QES) and Lockheed Analytical Services. As required by the contract and the WHC statement of work (WHC 1994), data validation was conducted using the Westinghouse data validation procedures for chemical and radiochemical analyses (WHC 1993a and 1993b). Sample results were validated to levels A and D as described in the data validation procedures. At the completion of validation and verification of each data package, a data validation summary was prepared and transmitted with the original documentation to Environmental Restoration Contract (ERC) for inclusion in the project QA record.

375 (BHI–00409) **Data validation summary report for the 100-BC-5 Operable Unit Round 8 Groundwater Sampling.** Kearney, A.T. (Kearney (A.T.), Inc., Chicago, IL (United States)). Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 143p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008048. Source: OSTI; NTIS; INIS; GPO Dep.

The information provided in this validation summary report includes data from the chemical analyses of samples from the 100-BC-5 Operable Unit Round 8 Groundwater Sampling Investigation. All of the data from this sampling event and their related quality assurance samples were reviewed and validated to verify that the reported sample results were of sufficient quality to support decisions regarding remedial actions performed at this site. Sample analyses included metals, general chemistry and radiochemistry.

376 (BHI–00410) **200-ZP-1 Semi-Annual Groundwater Sampling validation summary: March 1995.** Bechtel Hanford, Inc., Richland, WA (United States); Los Alamos Technical Associates, Inc., NM (United States). Feb 1996. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008194. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a summary of data validation results for groundwater samples collected from the 200-ZP-1 Semi-Annual Groundwater Sampling-March 1995 Project. The analyses performed for this project include the following: General Chemistry: anions (nitrate), and Volatiles: target compound list [TCL] + carbon tetrachloride [$CC1_4$], chloroform, trichloroethane [TCE]. The objectives of this project were to validate a minimum of 10% of the samples to level C as outlined in the data validation procedures (WHC 1993). In addition, this report provides a summary of the data as defined by laboratory performance criteria and project-specific data quality objectives to ensure the data are acceptable for use on the 200-ZP-1 Semi-Annual Groundwater Sampling-March 1995 Project.

377 (BHI–00416-Rev.2) **Risk-based decision analysis for the 200-BP-5 groundwater operable unit. Revision 2.** Chiaramonte, G.R. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005932. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents data from a risk analysis that was performed on three groundwater contaminant plumes within the 200-BP-5 Operable Unit. Hypothetical exposure scenarios were assessed based on current and future plume conditions. For current conditions, a hypothetical industrial groundwater scenarios were assumed. The industrial ingestion scenario, which is derived from HSRAM, was not used for drinking water and should not be implied by this risk analysis that the DOE is advocating use of this groundwater for direct human ingestion. Risk was calculated at each monitoring well using the observed radionuclide concentrations in groundwater from that well. The calculated values represent total radiological incremental lifetime cancer risk. Computer models were used to show the analytical flow and transport of contaminants of concern.

378 (BHI–00432) **Construction quality assurance report for the prototype surface barrier.** Buckmaster, M.A. Bechtel Hanford, Inc., Richland, WA (United States). Nov 1995. 595p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96004508. Source: OSTI; NTIS; INIS; GPO Dep.

This construction quality assurance (CQA) report follows the requirements of the prototype surface barrier CQA plan, describes the construction work sequence, and reports significant inspection activities for project W-263 and construction of the barrier over the 21 6-B-57 Crib. This report compiles the material testing into tabulation and block evaluations and reports the compliance requirements for each separate construction work activity (e.g., subgrade, composite asphalt barrier, and drainage layer). Each work activity is tied to the respective specification section and related design drawings. The report provides a basis for defining the work attested to by the CQA Officer.

379 (BHI–00446) **Well drilling summary report for well 199-N-106A.** Walker, L.D. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008046. Source: OSTI; NTIS; INIS; GPO Dep.

Past liquid waste disposal practices within the 100-N Area have resulted in the contamination of the underlying sediments and groundwater. The release of large volumes of liquid effluent to the 1301-N and 1325-N Liquid Waste Disposal Facilities caused the transport of ^{90}Sr and other contaminants to the groundwater. Further discussion of 100-N Area hydrogeology is provided in Hartman and Lindsey (1993). A pump-and-treat system combined with a vertical barrier is the preferred alternative for the N Springs Expedited Response Action. This document is a compilation of the data collected during the drilling of well 199-N-106A, an extraction well for the 100-N Pump-and-Treat Project.

380 (BHI–00456) **Preliminary engineering assessment of treatment alternatives for groundwater from the Hanford 200 Area 200-BP-5 plumes.** Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012120. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the Preliminary Engineering Assessment of Treatment Alternatives (PEATA), an engineering evaluation of potential treatment alternatives for groundwater extracted from the 200-BP-5 Area's 216-BY Cribs and 216-B-5 Reverse Well plumes. The primary objective of the PEATA was to identify treatment technologies that are worth further consideration (i.e., treatability testing or a more refined engineering evaluation). It will also provide a basis for evaluating the results of the treatability testing that is currently being conducted on the presumptive remedy of ion exchange with disposal of spent resin and will serve as a guide for selection of other technologies for additional testing. Because there are little data or past experience with groundwater similar to the BY-Crib and B-5 Reverse Well Plumes, treatment efficiencies cannot be predicted with certainty and rigorous treatment system designs and costs cannot be developed. This applies to all alternatives, including the presumptive remedy of ion exchange. The approach for this study was to develop conceptual designs and approximate costs for the treatment technologies that were most likely to be effective on the BY-Crib and B-5 Reverse Well groundwater.

381 (BHI–00458) **200-UP-1 groundwater pump-and-treat Phase 1 quarterly report, September 1995–November 1995.** Myers, D.A.; Gustafson, F.W.; Wittreich, C.D. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009915. Source: OSTI; NTIS; GPO Dep.

A groundwater pump-and-treat activity is being performed in the 200-UP-1 Groundwater Operable Unit. The purpose of the pump and treat is to contain and treat elevated concentrations of uranium and technetium-99 in the 200-UP-1 Operable Unit and collect data on aquifer response to the pump and treat. The pump and treat began operations in

March 1994 as a pilot-scale treatability test to assess the effectiveness of an ion-exchange treatment system to remove uranium and technetium-99 from extracted groundwater. Pump-and-treat operations continued through August 1995, at which time the system was upgraded to increase the flow rate from 57 to 190 L/min, consistent with the interim remedial measure (IRM) proposed plan for 200-UP-1. Wells were installed to provide additional groundwater extraction and reinjection capacity, to enhance containment of high concentrations of uranium and technetium-99, and to improve aquifer response/remediation monitoring. The upgraded pump-and-treat system, referred to as the Phase 1 system, is expected to continue operating until an IRM record of decision is issued and implemented. This report summarizes and evaluates treatment, hydrologic, and geochemistry data collected for the initial quarter of 200-UP-1 Phase 1 pump-and-treat operations.

382 (BHI–00463) **Hazard classification for the 200-ZP-1 Operable Unit Phase 2 and 3 interim remedial measure.** Oestreich, D.K. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008964. Source: OSTI; NTIS; INIS; GPO Dep.

This safety assessment documents the Final Hazard Classification (FHC) for Phase 2 and 3 interim remedial measure (IRM) activities to be conducted in the 200 West Area of the Hanford Site. The 200-ZP-1 Phase 2 and 3 IRM activities will involve the air stripping of carbon tetrachloride (CCl_4) from extracted groundwater using a packed-bed stripper column followed by gas-phase adsorption of the CCl_4 from the stripper off-gas onto a granular activated carbon (GAC) bed. The stripper is designed to be operated at a feedwater flow rate of up to 1,893 L/min (500 gal/min) and to remove 13.6 kg/day (30.0 lb/day) of CCl_4. For Phase 2, which includes the initial year of operation, it is planned to operate the stripper at 568 L/min (150 gal/min). The process flow diagram for the Phase 2 and 3 system is shown.

383 (BHI–00464) **Hanford sitewide grounwater remediation - supporting technical information.** Chiaramonte, G.R. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 91p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012121. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Sitewide Groundwater Remediation Strategy was issued in 1995 to establish overall goals for groundwater remediation on the Hanford Site. This strategy is being refined to provide more detailed justification for remediation of specific plumes and to provide a decision process for long-range planning of remediation activities. Supporting this work is a comprehensive modeling study to predict movement of the major site plumes over the next 200 years to help plan the remediation efforts. The information resulting from these studies will be documented in a revision to the Strategy and the Hanford Site Groundwater Protection Management Plan. To support the modeling work and other studies being performed to refine the strategy, this supporting technical information report has been produced to compile all of the relevant technical information collected to date on the Hanford Site groundwater contaminant plumes. The primary information in the report relates to conceptualization of the source terms and available history of groundwater transport, and description of the contaminant plumes. The primary information in the report relates to conceptualization of the source terms and available history of groundwater transport, description of the contaminant plumes, rate of movement based on the conceptual model and monitoring data, risk assessment, treatability study information, and current approach for plume remediation.

384 (BHI–00465) **Aquifer test results, 200-UP-1 operable unit IRM plume: Wells 299-W19-39 and 299-W19-36.** Swanson, L.C. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008963. Source: OSTI; NTIS; INIS; GPO Dep.

An aquifer test was conducted at 200-UP-1 extraction well 299-W19-39 from September 6 to 8, 1995. The testing process consisted of pumping groundwater from the extraction well, using the surface treatment system to purify the water, and reinjecting the water through well 299-W19-36. Multiple observation wells were used to measure the response of the aquifer during the pumping and recovery phases of the test. Tables 1 and 2 list each well monitored and give well location and configuration information. Pretest monitoring initiated on August 31, 1995 was used to establish water-level trends and barometric pressure responses in the extraction, injection, and observation wells. Water-level monitoring continued for about 2 weeks after pumping ceased. The objectives of the aquifer test were to determine large-scale aquifer properties to confirm hydraulic conductivity input values used in previous numerical modeling work, to evaluate the long-term performance of the extraction and monitoring wells, and to estimate the radial extent of the drawdown cone (i.e., the expected capture area and depth). All of the test objectives were met. A discussion of the test results follows.

385 (BHI–00552) **Validtion summary report for the 200-UP-1 groundwater round 2.** Bechtel Hanford, Inc., Richland, WA (United States). Jan 1996. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005869. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents a summary of data validation results on groundwater samples collected for the 200-UP-1 Groundwater Round 2 Project. The analyses performed for this project were as follows: metals; general chemistry including anions, total organic carbon, total dissolved solids, total suspended solids, and alkalinity; radiochemistry including gross alpha, technetium-99, strontium-90, iodine-129, plutonium-238/239/240, and total uranium; volatiles including volatile organics; and semivolatiles including semivolatile organics. This summary report validates sample delivery groups and provides a summary of the data as defined by laboratory performance criteria and project-specific data quality objectives to ensure that the data is acceptable for use on the 200-UP-1 Groundwater Round 2 Project.

386 (BHI–00553) **Validation summary report for the 100-KR-4 Groundwater Round 8.** Bechtel Hanford, Inc., Richland, WA (United States); Los Alamos Technical Associates, Inc., NM (United States). Jan 1996. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008049. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a summary of data validation results on groundwater samples collected for the 100-KR-4 Groundwater Round 8 Project. The analyses performed for this project were as follows: Metals: inductively coupled plasma (ICP) metals (filtered and unfiltered); General chemistry: anions (fluoride, chloride, nitrate, nitrite, phosphate, and sulfate) and turbidity; and Radiochemistry: carbon-14, gamma scan, gross alpha, gross beta, strontium-90, tritium, and uranium-234/235/238. The objectives of this project were to validate all sample delivery groups (SDG) at level D as defined in the data validation procedures.

387 (BHI–00554) **Validation summary report for the 100-HR-3 Groundwater Round 9 Phase 1 and 2.** Bechtel Hanford, Inc., Richland, WA (United States); Los Alamos Technical Associates, Inc., NM (United States). Feb 1996. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008045. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a summary of data validation results on groundwater samples collected for the 100-HR-3 Groundwater Round 9-Phase I and II Project. The analyses performed for this project were as follows: Metals–inductively coupled plasma (ICP) metals (filtered and unfiltered); General Chemistry–anions (fluoride, chloride, nitrate, nitrite, phosphate, and sulfate), turbidity, ammonia, nitrate+nitrite, and sulfide; and Radiochemistry–gross alpha, gross beta, technetium-99, tritium, and uranium-234/235/238. The objectives of this project were to validate sample detection limit as defined in the data validation procedures (WHC 1993). In addition, this report provides a summary of the data as defined by laboratory performance criteria and project-specific data quality objectives.

388 (BHI–00555-Rev.) **Data validation summary report for the 100-NR-2 operable unit groundwater sampling round 8.** Kearney, A.T. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 137p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005934. Source: OSTI; NTIS; INIS; GPO Dep.

The information provided in this validation summary report includes data from the chemical analyses of samples from the 100-NR-2 Operable Unit Round 8 Groundwater Sampling Investigation. Data from this sampling event and their related quality assurance (QA) samples were reviewed and validated in accordance with Westinghouse Hanford Company (WHC) guidelines at the requested level. Sample analyses included metals, general chemistry, and radiochemistry. Forty-eight (48) metals samples were analyzed by Quanterra Environmental Services (QES) and Lockheed Analytical Services (LAS). The metals samples were validated using WHC protocols specified in WHC (1992a). All metals data were qualified based on this guidance. The container for sample number BOGJW7 in Sample Delivery Group (SDG) No. W0721-QES was broken in transit and therefore no results were available for validation. Table 1 lists the metals SDGs that were validated for this sampling event.

389 (BHI–00556) **Data validation summary report for the 100-BC-5 Operable Unit Round 9 Groundwater Sampling. Revision 0.** Kearney, A.T. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 94p. Sponsored by USDOE, Washington; DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008208. Source: OSTI; NTIS; INIS; GPO Dep.

The information provided in this validation summary report includes chemical analyses of samples from 100-BC-5 Operable Unit Round 9 Groundwater sampling data. Data from this sampling event and their related quality assurance (QA) samples were reviewed and validated in accordance with Westinghouse Hanford Company (WHC) guidelines at the requested level. Sample analyses included metals, general chemistry, and radiochemistry. Sixty metals samples were analyzed by Quanterra Environmental Services (QES) and Lockheed Analytical Services (LAS). The metals samples were validated using WHC protocols specified in Data Validation Procedures for Chemical Analyses. All qualifiers assigned to the metals data were based on this guidance. The Table 1.1 lists the metals sample delivery group (SDG) that were validated for this sampling event.

390 (BHI–00557) **Data validation summary report for the 100-FR-3 Operable Unit Round 8 Groundwater.** Kearney, A.T. (Kearney (A.T.), Inc., Chicago, IL (United States)). Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 301p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008028. Source: OSTI; NTIS; INIS; GPO Dep.

The information provided in this validation summary report includes data from the chemical and radiochemical analyses of samples from the 100-FR-3 Operable Unit Groundwater Round 8. Data from this sampling event and their related quality assurance (QA) samples were reviewed and validated in accordance with Westinghouse Hanford Company (WHC) guidelines at the requested level.

391 (BHI–00607) **Aquifer test plan in support of N Springs ERA Performance Monitoring.** McMahon, W.J. Bechtel Hanford, Inc., Richland, WA (United States). Oct 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012139. Source: OSTI; NTIS; INIS; GPO Dep.

A series of aquifer tests is planned in October and November, 1995 at N Springs pump-and-treat extraction wells. Data collected during the tests will aid in the evaluation of system effectiveness and efficiency in reducing the flux of Strontium 90 into the Columbia River. This test plan describes the aquifer testing and the operations monitoring planned for the other extraction wells comprising the pump-and-treat system. This test plan will be revised as necessary when aquifer testing is planned at other wells and when other wells become available for testing. The goal of the aquifer testing and operations monitoring is to evaluate the impact of the pump-and-treat system on the aquifer and Strontium 90 contamination, and to enhance current knowledge of the aquifer flow system. This test plan provides technical guidance for conducting the aquifer tests, information on test design and operations monitoring, and data collection requirement for the tests.

392 (BHI–00608) **Hanford statewide groundwater flow and transport model calibration report.** Law, A.; Panday, S.; Denslow, C.; Fecht, K.; Knepp, A. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012122. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the development and calibration of a three-dimensional, finite element model (VAM3DCG) for the unconfined groundwater flow system at the Hanford Site. This flow system is the largest radioactively contaminated groundwater system in the United States. Eleven groundwater plumes have been identified containing organics, inorganics, and radionuclides. Because groundwater from the unconfined groundwater system flows into the Columbia River, the development of a groundwater flow model is essential to the long-term management of these plumes. Cost effective decision making requires the capability to predict the effectiveness of various remediation approaches. Some of the alternatives available to remediate groundwater include: pumping contaminated water from the ground for treatment with reinjection or to other disposal facilities; containment of plumes by means of impermeable walls, physical barriers, and hydraulic control measures; and, in some cases, management of groundwater via planned recharge and withdrawals. Implementation of these methods requires a knowledge of the groundwater flow system and how it responds to remedial actions.

393 (BHI–00701) **Groundwater cleanup discussion paper.** Vedder, B.L. Bechtel Hanford, Inc., Richland, WA (United States). Dec 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005878. Source: OSTI; NTIS; INIS; GPO Dep.

Contaminated groundwater is present beneath a variety of locations at the Hanford Site. In many instances, extensive groundwater cleanup is unrealistic based upon existing remediation technologies and costs involved. Nevertheless, under the US Environmental Protection Agency's (EPA) interpretation of the Comprehensive Environmental Response Compensation and Liability Act of 1980 (CERCLA), contaminated groundwater generally must be cleaned up to meet maximum contamination levels (MCL) or maximum contamination level goals (MCLG) established under the Safe Drinking Water Act if the groundwater, prior to contamination, could have been used at some future date as a source of drinking water. In a similar manner, Resource Conservation and Recovery Act of 1976 (RCRA) standards require cleanup of groundwater at hazardous waste treatment, storage, and disposal units to meet MCLs unless alternate concentration limits (ACL) have been established. As "relevant and appropriate requirements" under CERCLA, these RCRA provisions typically must be met for contaminated groundwater at CERCLA sites. Because of these requirements, "Hanford groundwater must be remediated to meet drinking water standards unless a regulatory allowed alternative is authorized" (see Appendix A for further details pertaining to regulatory requirements for groundwater cleanup). Three primary regulatory alternatives exist that could be used to support less stringent groundwater restoration efforts. These are (1) reclassifying groundwater to administratively establish a non-drinking water source, (2) establishing ACLs for contaminant plumes, or (3) using one or more of the CERCLA waivers. This discussion paper provides implementation guidance relating to the ACL option.

394 (BHI–00719) **N-Springs aquifer test report for Well 199-N-103A.** McMahon, W.J. Bechtel Hanford, Inc., Richland, WA (United States). Dec 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005872. Source: OSTI; NTIS; INIS; GPO Dep.

An aquifer test was conducted at Well 199-N-103A during the week October 23-27, 1995, using equipment installed as part of the N Springs expedited response action (ERA) pump-and-treat. The test included both aquifer hydraulic and contaminant response to pumping. The test procedure is described in the aquifer test plan. All pumping, purge water, and monitoring equipment was previously installed for the pump-and-treat system. Execution of the test was coordinated with pump-and-treat operations to avoid disrupting the remediation system. Results are presented to support the evaluation criteria of the pump-and-treat system effectiveness at reducing the flux of ^{90}Sr to the Columbia River.

395 (BHI–00753) **100-N in situ treatment zone design and acquisition strategy plan.** Sykes, K.L. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008027. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes a plan for the design and acquisition of the 100-N in situ treatment zone (ISTZ) treatability test and contains design and acquisition strategy information gathered from references. This treatability test is being conducted in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) to support the selection of long-term remedial alternatives for contaminated groundwater underlying the 100-N Area of the Hanford Site. The requirements for conducting the treatability test are presented in the In Situ Treatability Test Plan (DOE-RL, 1995). The purpose of this treatability test is to verify laboratory scale testing of the ISTZ technology under actual field conditions. This test will also provide preliminary construction information which will be included in the 100-NR-1 and 100-NR-2 Corrective Measures Study (CMS). Additional information such as effectiveness of the ISTZ as a long-term remedial action to address Strontium-90 (^{90}Sr) release to the Columbia River at N-Springs will be made available in the close-out report for this project.

396 (BHI–00764) **100-HR-3 and 100-KR-4 interim remedial measure pump-and-treat acquisition and design strategy plan.** Lau, E.; Winters, J.N. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012125. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes a plant for the acquisition/design for the 100-HR-3 and 100-KR-4 groundwater pump-and-treat systems. These pump- and-treat systems are the proposed plan for the interim remedial measure at the 100-HR-3 and 100-KR-4 Operable Units.

397 (BHI–00770) **100-HR-3 and 100-KR-4 pump-and-treat drilling description of work.** Auten, J.E.; Myers, D.A. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012123. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the installation of wells necessary to implement the 100-HR-3 and 100-KR-4 Interim Remedial Action. the placement of wells is based on numerical modeling and requirements contained in the Record of Decision dated 4-1-1996. All of the wells drilled for this project will be designed as potential production wells. Five wells will be drilled in the 100-H Area to supplement seven existing wells. Initially, three of the wells will be injection wells; the remaining two wells will be used for compliance monitoring wells. These wells will be used in conjunction with two existing wells. In the 100-K Area, thirteen wells will be drilled to supplement two existing wells; five of the wells be used as extraction wells, four of the wells will be used as injection wells, and the remaining four wells will be used as compliance monitoring wells.

398 (BNL–52469) **Overview of research and development in subsurface fate and transport modeling.**

Sullivan, T.M. (Brookhaven National Lab., Upton, NY (United States)); Chehata, M. Brookhaven National Lab., Upton, NY (United States). May 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95012459. Distribution: UC-2010. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy is responsible for the remediation of over 450 different subsurface-contaminated sites. Contaminant plumes at these sites range in volume from several to millions of cubic yards. The concentration of contaminants also ranges over several orders of magnitude. Contaminants include hazardous wastes such as heavy metals and organic chemicals, radioactive waste including tritium, uranium, and thorium, and mixed waste, which is a combination of hazardous and radioactive wastes. The physical form of the contaminants includes solutes, nonaqueous phase liquids (NAPLs), and vapor phase contaminants such as volatilized organic chemicals and radon. The subject of contaminant fate and transport modeling is multi-disciplinary, involving hydrology, geology, microbiology, chemistry, applied mathematics, computer science, and other areas of expertise. It is an issue of great significance in the United States and around the world. As such, many organizations have substantial programs in this area. In gathering data to prepare this report, a survey was performed of research and development work that is funded by US government agencies to improve the understanding and mechanistic modeling of processes that control contaminant movement through subsurface systems. Government agencies which fund programs that contain fate and transport modeling components include the Environmental Protection Agency, Nuclear Regulatory Commission, Department of Agriculture, Department of Energy, National Science Foundation, Department of Defense, United States Geological Survey, and National Institutes of Health.

399 (BNL--61458) **Effect of groundwater on soil-structure interaction.** Xu, J. (Brookhaven National Lab., Upton, NY (United States)); Bandyopadhyay, K.K.; Kassir, M.K. Brookhaven National Lab., Upton, NY (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740--69: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014518. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents results of a parametric study performed to investigate the effect of pore water in saturated soils on the response of nuclear containment structures to seismic motions. The technique employed uses frequency domain algorithm which incorporates impedances for both dry and saturated soils into an SSI model. A frequency domain time history analysis is carried out using the computer code CARES for a typical PWR containment structure. Structural responses presented in terms of floor response spectra indicate that considering the presence of the pore water in soils could benefit the design of massive nuclear containment structures.

400 (CONF-940815--117) **White Oak Creek embayment sediment retention structure design and construction.** Van Hoesen, S.D. (Oak Ridge National Lab., TN (United States)); Kimmell, B.L.; Page, D.G.; Wilkerson, R.B.; Hudson, G.R.; Kauschinger, J.L.; Zocolla, M. Oak Ridge National Lab., TN (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From SPECTRUM '94: international nuclear and hazardous waste management conference; Atlanta, GA (United States); 14-18 Aug 1994. Order Number DE96009620. Source: OSTI; NTIS; INIS; GPO Dep.

White Oak Creek is the major surface water drainage throughout the Department of Energy (DOE) Oak Ridge National Laboratory (ORNL). Samples taken from the lower portion of the creek revealed high levels of Cesium 137 and lower level of Cobalt 60 in near surface sediment. Other contaminants present in the sediment included: lead, mercury, chromium, and PCBs. In October 1990, DOE, US Environmental Protection Agency (EPA), and Tennessee Department of Environment and Conservation (TDEC) agreed to initiate a time critical removal action in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) to prevent the transport of the contaminated sediments into the Clinch River system. This paper discusses the environmental, regulatory, design, and construction issues that were encountered in conducting the remediation work.

401 (CONF-950483--11) **Subsurface microbial communities and degradative capacities during trichloroethylene bioremediation.** Pfiffner, S.M.; Ringelberg, D.B.; Hedrick, D.B.; Phelps, T.J.; Palumbo, A.V. Oak Ridge National Lab., TN (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 3. international in situ and on-site bioreclamation symposium; San Diego, CA (United States); 24-27 Apr 1995. Order Number DE96010666. Source: OSTI; NTIS; INIS; GPO Dep.

Subsurface amendments of air, methane, and nutrients were investigated for the in situ stimulation of trichloroethylene- degrading microorganisms at the US DOE Savannah River Integrated Demonstration. Amendments were injected into a lower horizontal well coupled with vacuum extraction from the vadose zone horizontal well. The amendments were sequenced to give increasingly more aggressive treatments. Microbial populations and degradative capacities were monitored in groundwaters samples bi-monthly.

402 (CONF-9504123--2) **Biological tracer for waste site characterization.** Strong-Gunderson, J. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Innovative concepts technology and business opportunities; Denver, CO (United States); 20-21 Apr 1995. Order Number DE95014598. Source: OSTI; NTIS; INIS; GPO Dep.

Remediating hazardous waste sites requires detailed site characterization. In groundwater remediation, characterizing the flow paths and velocity is a major objective. Various tracers have been used for measuring groundwater velocity and transport of contaminants, colloidal particles, and bacteria and nutrients. The conventional techniques use dissolved solutes, dyes. and gases to estimate subsurface transport pathways. These tracers can provide information on transport and diffusion into the matrix, but their estimates for groundwater flow through fractured regions are very conservative. Also, they do not have the same transport characteristics as bacteria and suspended colloid tracers, both of which must be characterized for effective in-place remediation. Bioremediation requires understanding bacterial transport and nutrient distribution throughout the acquifer, knowledge of contaminants s mobile colloidal particles is just essential.

403 (CONF-950646–21) **Chemical oxidation of volatile and semi-volatile organic compounds in soil.** Gates, D.D.; Siegrist, R.L.; Cline, S.R. Oak Ridge National Lab., TN (United States). [1995]. 16p. Sponsored by US-DOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Air and Waste Management Association meeting; San Antonio, TX (United States); 18-23 Jun 1995. Order Number DE95013048. Source: OSTI; NTIS; INIS; GPO Dep.

Subsurface contamination with fuel hydrocarbons or chlorinated hydrocarbons is prevalent throughout the Department of Energy (DOE) complex and in many sites managed by the Environmental Protection Agency (EPA) Superfund program. The most commonly reported chlorinated hydrocarbons (occurring $>$ 50% of DOE contaminated sites) were trichloroethylene (TCE), 1, 1, 1,-trichloroethane (TCA), and tetrachloroethylene (PCE) with concentrations in the range of 0.2 μg/kg to 12,000 mg/kg. The fuel hydrocarbons most frequently reported as being present at DOE sites include aromatic compounds and polyaromatic compounds such as phenanthrene, pyrene, and naphthalene. The primary sources of these semi-volatile organic compounds (SVOCs) are coal waste from coal fired electric power plants used at many of these facilities in the past and gasoline spills and leaks. Dense non-aqueous phase liquids (DNAPLs) can migrate within the subsurface for long periods of time along a variety of pathways including fractures, macropores, and micropores. Diffusion of contaminants in the non-aqueous, aqueous, and vapor phase can occur from the fractures and macropores into the matrix of fine-textured media. As a result of these contamination processes, removal of contaminants from the subsurface and the delivery of treatment agents into and throughout contaminated regions are often hindered, making rapid and extensive remediation difficult.

404 (CONF-950868–33) **Waste and cost reduction using dual wall reverse circulation drilling with multilevel groundwater sampling for contaminant plume delineation.** Smuin, D.R. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From ER '95: environmental remediation conference: committed to results; Denver, CO (United States); 13-18 Aug 1995. Order Number DE96003047. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the drilling and sampling methods used to delineate a groundwater contaminant plume at the Paducah Gaseous Diffusion Plant (PGDP) during the Groundwater Monitoring IV characterization. The project was unique in that it relied upon dual wall reverse circulation drilling instead of the traditional hollow stem auger method. The Groundwater Monitoring program sought to characterize the boundaries, both vertically and horizontally, of the northeast plume which contains both ^{99}Tc and trichloroethene. This paper discusses the strengths and weaknesses of the drilling method used by investigators.

405 (CONF-951006–10) **Estimation of contaminant transport in groundwater beneath radioactive waste disposal facilities.** Wang, J.C.; Tauxe, J.D.; Lee, D.W. Oak Ridge National Lab., TN (United States). 25 May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society (ANS); San Francisco, CA (United States); 29 Oct - 1 Nov 1995. Order Number DE95014577. Source: OSTI; NTIS; INIS; GPO Dep.

Performance assessments are required for low-level radioactive waste disposal facilities to demonstrate compliance with the performance objectives, consider human exposures from water, air, and inadvertent intruder pathways. Among these, the groundwater pathway analysis usually involves complex numerical simulations with results which are often difficult to verify and interpret. This paper presents a technique to identify and simplify the essential parts of the groundwater analysis. The transport process of radionuclides including infiltration of precipitation, leachate generation, and advection and dispersion in the groundwater is divided into several steps. For each step, a simple analytical model is constructed and refined to capture the dominant phenomena represented in the complex analysis included in a site-specific performance assessment. This step-wise approach provides a means for gaining insights into the transport process and obtaining reasonable estimates of relevant quantities for facility design and site evaluation.

406 (CONF-960539–2) **Relating groundwater and sediment chemistry to microbial characterization at a BTEX-contaminated site.** Pfiffner, S.M. (Oak Ridge National Lab., TN (United States)); Palumbo, A.V.; McCarthy, J.F.; Gibson, T. Oak Ridge National Lab., TN (United States). 1996. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From 18. symposium on biotechnology for fuels and chemicals; Gatlinburg, TN (United States); 5-9 May 1996. Order Number DE96012081. Source: OSTI; NTIS; INIS; GPO Dep.

The National Center for Manufacturing Science is investigating bioremediation of petroleum hydrocarbon at a site in Belleville, Michigan. As part of this study we examined the microbial communities to help elucidate biodegradative processes currently active at the site. We observed high densities of aerobic hydrocarbon degraders and denitrifiers in the less-contaminated sediments. Low densities of iron and sulfate reducers were measured in the same sediments. In contrast, the highly-contaminated sediments showed low densities of aerobic hydrocarbon degraders and denitrifiers and high densities of iron and sulfate reducers. Methanogens were also found in these highly-contaminated sediments. These contaminated sediments also showed a higher biomass, by phospholipid fatty acids, and greater ratios of phospholipid fatty acids which indicate stress within the microbial community. Aquifer chemistry analyses indicated that the more-contaminated area was more reduced and had lower sulfate than the less-contaminated area. These conditions suggest that the subsurface environment at the highly-contaminated area had progressed into sulfate reduction and methanogensis. The less-contaminated area, although less reduced, also appeared to be progressing into primarily iron- and sulfate-reducing microbial communities. The proposed treatment to stimulate bioremediation includes addition of oxygen and nitrate. Groundwater chemistry and microbial analyses revealed significant differences resulted from the injection of dissolved oxygen and nitrate in the subsurface. These differences included increases in pH and Eh and large decreases in BTEX, dissolved iron, and sulfate concentrations at the injection well.

407 (CONF-960804–8) **Discovery, interception, and treatment of a groundwater plume: Oak Ridge National Laboratory.** Lee, R. (Oak Ridge National Lab., TN (United States). Energy Div.); Ketelle, D. Oak Ridge National Lab.,

TN (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From SPECTRUM '96: international conference on nuclear and hazardous waste management; Seattle, WA (United States); 18-23 Aug 1996. Order Number DE96009633. Source: OSTI; NTIS; INIS; GPO Dep.

A radiological groundwater plume was discovered to be discharging into a surface stream and portions of the storm drain network at Oak Ridge National Laboratory (ORNL). A CERCLA removal action was initiated to address the discharges. The plume was found to be migrating 65 degrees oblique to the overall hydraulic gradient and was identified only after historic data were analyzed and field tests were performed under the working hypothesis of stratabound flow and transport. A detailed geologic and hydrologic analysis was performed that accurately predicted the 3-dimensional plume configuration from a single point datum where significantly elevated contaminant levels were found in a bedrock core hole. Subsequent sampling found that direct discharges of contamination existed in the stream only in the location of the predicted stratum. The affected storm drain outfall discharges were suspected to be the major contributors to ^{90}Sr surface water risk from ORNL. Thus, the selected removal action focused on eliminating the known seepage to the storm drain network. Intercept system operations reduced the total surface water ^{90}Sr flux by about 90%. Ongoing investigations seek to identify the source of the plume with the hope that the intercept system may eventually be deactivated. However, the efficiency of the system exceeded expectations and demonstrated that a good understanding of the hydrodynamics is a prerequisite to success. The relatively trouble free operation of the system also indicates that simple technologies can serve as effective measures to address immediate problems.

408 (DOE/AL–050520.0000) **Remedial action plan and site design for stabilization of the inactive uranium mill tailings site at Falls City, Texas. Remedial action selection report, attachment 2, geology report; attachment 3, groundwater hydrology report; and attachment 4, water resources protection strategy. Final report.** Texas State Government, Falls City, TX (United States). Sep 1992. 736p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-87AL20532. Order Number DE96013586. Source: OSTI; NTIS; INIS; GPO Dep.

The uranium processing site near Falls City, Texas, was one of 24 inactive uranium mill sites designated to be remediated by the U.S. Department of Energy (DOE) under Title I of the Uranium Mill Tailings Radiation Control Act of 1978 (UMTRCA). The UMTRCA requires that the U.S. Nuclear Regulatory Commission (NRC) concur with the DOE's remedial action plan (RAP) and certify that the remedial action conducted at the site complies with the standards promulgated by the U.S. Environmental Protection Agency (EPA). The RAP, which includes this summary remedial action selection report (RAS), serves a two-fold purpose. First, it describes the activities proposed by the DOE to accomplish long-term stabilization and control of the residual radioactive materials at the inactive uranium processing site near Falls City, Texas. Second, this document and the remainder of the RAP, upon concurrence and execution by the DOE, the State of Texas, and the NRC, becomes Appendix B of the Cooperative Agreement between the DOE and the State of Texas.

409 (DOE/AL/62350–21F-Rev.1-Attach.3-App.A) **Remedial Action Plan and Site Design for stabilization of the inactive Uranium Mill Tailings sites at Slick Rock, Colorado: Appendix A to Attachment 3, Tables. Final.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States); Morrison-Knudsen Corp., San Francisco, CA (United States). Sep 1995. 605p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000225. Source: OSTI; NTIS; INIS; GPO Dep.

This volume contains tables of data on ground water quality for the study on ground water hydrology, which is attachment 3 of this series of reports.

410 (DOE/AL/62350–43-Rev.2) **Baseline risk assessment of ground water contamination at the Monument Valley uranium mill tailings site Cane Valley, Arizona.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96011537. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project consists of the Surface Project (Phase I) and the Ground Water Project (Phase II). Under the UMTRA Surface Project, tailings, radioactive contaminated soil, equipment, and materials associated with the former uranium ore processing at UMTRA Project sites are placed into disposal cells. The cells are designed to reduce radon and other radiation emissions and to minimize further contamination of ground water. Surface cleanup at the Monument Valley UMTRA Project site near Cane Valley, Arizona, was completed in 1994. The Ground Water Project evaluates the nature and extent of ground water contamination that resulted from the uranium ore processing activities. The Ground Water Project is in its beginning stages. Human health may be at risk from exposure to ground water contaminated by uranium ore processing. Exposure could occur by drinking water pumped out of a hypothetical well drilled in the contaminated areas. Adverse ecological and agricultural effects may also result from exposure to contaminated ground water. For example, livestock should not be watered with contaminated ground water. A risk assessment describes a source of contamination, how that contamination reaches people and the environment, the amount of contamination to which people or the ecological environment may be exposed, and the health or ecological effects that could result from that exposure. This risk assessment is a site-specific document that will be used to evaluate current and potential future impacts to the public and the environment from exposure to contaminated ground water. The results of this evaluation and further site investigations will be used to determine a compliance strategy to comply with the UMTRA ground water standards.

411 (DOE/AL/62350–57-Rev.2) **Baseline risk assessment of groundwater contamination at the uranium mill tailings site, near Gunnison, Colorado. Revision 2.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1996. 156p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96013531. Source: OSTI; NTIS; INIS; GPO Dep.

This report is the second site-specific risk assessment document prepared for the Ground Water Project at the Gunnison site. A preliminary risk assessment was conducted in 1990 to determine whether long-term use of ground water from private wells near the Gunnison site had the potential for adverse health effects. Due to the results of that preliminary risk assessment, the residents were provided bottled water on an interim basis. In July 1994, the residents and the nearby Valco cement/concrete plant were given the option to connect to anew alternate water supply system, eliminating the bottled water option. This document evaluates current and potential future impacts to the public and the environment from exposure to contaminated ground water. The results of this evaluation and further site characterization will be used to determine whether more action is needed to protect human health and the environment and to comply with the EPA standards.

412 (DOE/AL/62350–65-Rev.1) **Baseline risk assessment of ground water contamination at the uranium mill tailings site near Riverton, Wyoming. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000235. Source: OSTI; NTIS; INIS; GPO Dep.

The Uranium Mill Tailings Remedial Action (UMTRA) Project consists of two phases: the Surface Project and the Ground Water Project. At the UMTRA Project site near Riverton, Wyoming, Surface Project cleanup occurred from 1988 to 1990. Tailings and radioactively contaminated soils and materials were taken from the Riverton site to a disposal cell in the Gas Hills area, about 60 road miles (100 kilometers) to the east. The surface cleanup reduces radon and other radiation emissions and minimizes further ground water contamination. The UMTRA Project's second phase, the Ground Water Project, will evaluate the nature and extent of ground water contamination at the Riverton site that has resulted from the uranium ore processing activities. Such evaluations are used at each site to determine a strategy for complying with UMTRA ground water standards established by the US Environmental Protection Agency (EPA) and if human health risks could result from exposure to ground water contaminated by uranium ore processing. Exposure could hypothetically occur if drinking water were pumped from a well drilled in an area where ground water contamination might have occurred. Human health and environmental risks may also result if people, plants, or animals are exposed to surface water that has mixed with contaminated ground water.

413 (DOE/AL/62350–70-Rev.1) **Guidance document for preparing water sampling and analysis plans for UMTRA Project sites. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000234. Source: OSTI; NTIS; INIS; GPO Dep.

A water sampling and analysis plan (WSAP) is prepared for each Uranium Mill Tailings Remedial Action (UMTRA) Project site to provide the rationale for routine ground water sampling at disposal sites and former processing sites. The WSAP identifies and justifies the sampling locations, analytical parameters, detection limits, and sampling frequency for the routine ground water monitoring stations at each site. This guidance document has been prepared by the Technical Assistance Contractor (TAC) for the US Department of Energy (DOE). Its purpose is to provide a consistent technical approach for sampling and monitoring activities performed under the WSAP and to provide a consistent format for the WSAP documents. It is designed for use by the TAC in preparing WSAPs and by the DOE, US Nuclear Regulatory Commission, state and tribal agencies, other regulatory agencies, and the public in evaluating the content of WSAPS.

414 (DOE/AL/62350–72-Rev.2) **UMTRA project technical assistance contractor quality assurance implementation plan for surface and ground water, Revision 2.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Nov 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96003086. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the Technical Assistance Contractor (TAC) Quality Assurance Implementation Plan (QAIP) for the Uranium Mill Tailings Remedial Action (UMTRA) Project. The QAIP outlines the primary requirements for integrating quality functions for TAC technical activities applied to the surface and ground water phases of the UMTRA Project. The QA program is designed to use monitoring, audit, and surveillance activities as management tools to ensure that UMTRA Project activities are carried out in amanner to protect public health and safety, promote the success of the UMTRA Project, and meet or exceed contract requirements.

415 (DOE/AL/62350–87-Rev.1) **UMTRA Project water sampling and analysis plan, Durango, Colorado. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000239. Source: OSTI; NTIS; INIS; GPO Dep.

Planned, routine ground water sampling activities at the US Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project site in Durango, Colorado, are described in this water sampling and analysis plan. The plan identifies and justifies the sampling locations, analytical parameters, detection limits, and sampling frequency for the routine monitoring stations at the site. The ground water data are used to characterize the site ground water compliance strategies and to monitor contaminants of potential concern identified in the baseline risk assessment (DOE, 1995a). Regulatory basis for routine ground water monitoring at UMTRA Project sites is derived from the US EPA regulations in 40 CFR Part 192 (1994) and EPA standards of 1995 (60 FR 2854). Sampling procedures are guided by the UMTRA Project standard operating procedures (SOP) (JEG, n.d.), the Technical Approach Document (TAD) (DOE, 1989), and the most effective technical approach for the site.

416 (DOE/AL/62350–90S) **Supplement to the UMTRA Project water sampling and analysis plan, Ambrosia Lake, New Mexico.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Aug 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000240. Source: OSTI; NTIS; INIS; GPO Dep.

The Ambrosia Lake Uranium Mill Tailings Remedial Action (UMTRA) Project site is in McKinley County, New Mexico. As part of UMTRA surface remediation, residual radioactive materials were consolidated on the site in a disposal cell that was completed July 1995. The need for ground water monitoring was evaluated and found not to be necessary beyond the completion of the remedial action because the ground water in the uppermost aquifer is classified as limited use.

417 (DOE/AL/62350–95-Rev.1) **UMTRA Project water sampling and analysis plan, Canonsburg, Pennsylvania. Revision 1.** Jacobs Engineering Group, Inc.,

Albuquerque, NM (United States). Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000656. Source: OSTI; NTIS; INIS; GPO Dep.

Surface remedial action was completed at the US Department of Energy (DOE) Canonsburg and Burrell Uranium Mill Tailings Remedial Action (UMTRA) Project sites in southwestern Pennsylvania in 1985 and 1987, respectively. The Burrell disposal site, included in the UMTRA Project as a vicinity property, was remediated in conjunction with the remedial action at Canonsburg. On 27 May 1994, the Nuclear Regulatory Commission (NRC) accepted the DOE final Long-Term Surveillance Plan (LTSP) (DOE, 1993) for Burrell thus establishing the site under the general license in 10 CFR §40.27 (1994). In accordance with the DOE guidance document for long-term surveillance (DOE, 1995), all NRC/DOE interaction on the Burrell site's long-term care now is conducted with the DOE Grand Junction Projects Office in Grand Junction, Colorado, and is no longer the responsibility of the DOE UMTRA Project Team in Albuquerque, New Mexico. Therefore, the planned sampling activities described in this water sampling and analysis plan (WSAP) are limited to the Canonsburg site. This WSAP identifies and justifies the sampling locations, analytical parameters, detection limits, and sampling frequencies for routine monitoring at the Canonsburg site for calendar years 1995 and 1996. Currently, the analytical data further the site characterization and demonstrate that the disposal cell's initial performance is in accordance with design requirements.

418 (DOE/AL/62350–97-Rev.1) **UMTRA project water sampling and analysis plan, Falls City, Texas. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000447. Source: OSTI; NTIS; INIS; GPO Dep.

Planned, routine ground water sampling activities at the US Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project site near Falls City, Texas, are described in this water sampling and analysis plan (WSAP). The following plan identifies and justifies the sampling locations, analytical parameters, and sampling frequency for the routine monitoring stations at the site. The ground water data are used for site characterization and risk assessment. The regulatory basis for routine ground water monitoring at UMTRA Project sites is derived from the US Environmental Protection Agency (EPA) regulations in 40 CFR Part 192. Sampling procedures are guided by the UMTRA Project standard operating procedures (SOP) (JEG, n.d.), the Technical Approach Document (TAD) (DOE, 1989), and the most effective technical approach for the site. The Falls City site is in Karnes County, Texas, approximately 8 miles [13 kilometers southwest of the town of Falls City and 46 mi (74 km) southeast of San Antonio, Texas. Before surface remedial action, the tailings site consisted of two parcels. Parcel A consisted of the mill site, one mill building, five tailings piles, and one tailings pond south of Farm-to-Market (FM) Road 1344 and west of FM 791. A sixth tailings pile designated Parcel B was north of FM 791 and east of FM 1344.

419 (DOE/AL/62350–99-Rev.1) **UMTRA Project water sampling and analysis plan, Salt Lake City, Utah. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95015576. Source: OSTI; NTIS; INIS; GPO Dep.

This water sampling and analysis plan describes planned, routine ground water sampling activities at the US Department of Energy Uranium Mill Tailings Remedial Action Project site in Salt Lake City, Utah. This plan identifies and justifies sampling locations, analytical parameters, detection limits, and sampling frequencies for routine monitoring of ground water, sediments, and surface waters at monitoring stations on the site.

420 (DOE/AL/62350–116-Rev.1) **Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Site near Green River, Utah. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96002053. Source: OSTI; NTIS; INIS; GPO Dep.

The Uranium Mill Tailings Remedial Action (UMTRA) Project consists of the Surface Project (phase 1) and the Ground Water Project (phase 2). For the UMTRA Project site located near Green River, Utah, the Surface Project cleanup occurred from 1988 to 1989. The tailings and radioactively contaminated soils and materials were removed from their original locations and placed into a disposal cell on the site. The disposal cell is designed to minimize radiation emissions and minimize further contamination of ground water beneath the site. The UMTRA Project's second phase, the Ground Water Project, evaluates the nature and extent of ground water contamination resulting from uranium processing and determines a strategy for ground water compliance with the Environmental Protection Agency (EPA) ground water standards established for the UMTRA Project. For the Green River site, the risk assessment helps determine whether human health risks result from exposure to ground water contaminated by uranium processing. This risk assessment report is the first site-specific document prepared for the UMTRA Ground Water Project at the Green River site. What follows is an evaluation of current and possible future impacts to the public and the environment from exposure to contaminated ground water. The results of this evaluation and further site characterization will be used to determine what is necessary, if anything, to protect human health and the environment while complying with EPA standards.

421 (DOE/AL/62350–117S) **Supplement to the UMTRA Project water sampling and analysis plan, Riverton, Wyoming.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000658. Source: OSTI; NTIS; INIS; GPO Dep.

This water sampling and analysis plan (WSAP) supplement supports the regulatory and technical basis for water sampling at the Riverton, Wyoming, Uranium Mill Tailings Remedial Action (UMTRA) Project site, as defined in the 1994 WSAP document for Riverton (DOE, 1994). Further, the supplement serves to confirm the Project's present understanding of the site relative to the hydrogeology and contaminant distribution as well as the intent to continue to use the sampling strategy as presented in the 1994 WSAP document for Riverton. Ground water and surface water monitoring activities are derived from the US Environmental Protection Agency regulations in 40 CFR Part 192 and 60

FR 2854. Sampling procedures are guided by the UMTRA Project standard operating procedures (JEG, n.d.), the Technical Approach Document (DOE, 1989), and the most effective technical approach for the site. Additional site-specific documents relevant to the Riverton site are the Riverton Baseline Risk Assessment (BLRA) (DOE, 1995a) and the Riverton Site Observational Work Plan (SOWP) (DOE, 1995b).

422 (DOE/AL/62350–118S) **Supplement to the UMTRA Project water sampling and analysis plan, Mexican Hat, Utah.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000655. Source: OSTI; NTIS; INIS; GPO Dep.

This water sampling and analysis plan (WSAP) supplement supports the regulatory and technical basis for water sampling at the Mexican Hat, Utah, Uranium Mill Tailings Remedial Action (UMTRA) Project site, as defined in the 1994 WSAP document for Mexican Hat (DOE, 1994). Further, the supplement serves to confirm our present understanding of the site relative to the hydrogeology and contaminant distribution as well as our intention to continue to use the sampling strategy as presented in the 1994 WSAP document for Mexican Hat. Ground water and surface water monitoring activities are derived from the US Environmental Protection Agency regulations in 40 CFR Part 192 (1991) and 60 FR 2854 (1995). Sampling procedures are guided by the UMTRA Project standard operating procedures (JEG, n.d.), the Technical Approach Document (DOE, 1989), and the most effective technical approach for the site. Additional site-specific documents relevant to the Mexican Hat site are the Mexican Hat Long-Term Surveillance Plan (currently in progress), and the Mexican Hat Site Observational Work Plan (currently in progress).

423 (DOE/AL/62350–121-Rev.1) **UMTRA project water sampling and analysis plan, Naturita, Colorado. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000448. Source: OSTI; NTIS; INIS; GPO Dep.

Planned, routine ground water sampling activities for calendar year 1995 to 1997 at the US Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project site near Naturita, Colorado, are described in this water sampling and analysis plan. The following plan identifies and justifies the sampling locations, analytical parameters, detection limits, sampling frequency, and specific rationale for each routine monitoring station at the site. The regulatory basis for routine ground water monitoring at UMTRA Project sites is derived from the US Environmental Protection Agency (EPA) regulations in 40 CFR Part 192. Sampling procedures are guided by the UMTRA Project standard operating procedures (SOP) (JEG, n.d.), the Technical Approach Document (TAD) (DOE, 1989), and the most effective technical approach for the site.

424 (DOE/AL/62350–122S) **Supplement to the UMTRA Project water sampling and analysis plan, Monument Valley, Arizona.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000654. Source: OSTI; NTIS; INIS; GPO Dep.

This water sampling and analysis plan (WSAP) supplement supports the regulatory and technical basis for water sampling at the Riverton, Wyoming, Uranium Mill Tailings Remedial Action (UMTRA) Project site, as defined in the 1994 WSAP document for Riverton (DOE, 1994). Further, the supplement serves to confirm the Project's present understanding of the site relative to the hydrogeology and contaminant distribution as well as the intent to continue to use the sampling strategy as presented in the 1994 WSAP document for Riverton. Ground water and surface water monitoring activities are derived from the US Environmental Protection Agency regulations in 40 CFR Part 192 and 60 FR 2854. Sampling procedures are guided by the UMTRA Project standard operating procedures (JEG, n.d.), the Technical Approach Document (DOE, 1989), and the most effective technical approach for the site. Additional site-specific documents relevant to the Riverton site are the Riverton Baseline Risk Assessment (BLRA) (DOE, 1995a) and the Riverton Site Observational Work Plan (SOWP) (DOE, 1995b).

425 (DOE/AL/62350–125S) **Supplement to the UMTRA Project water sampling and analysis plan, Maybell, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000659. Source: OSTI; NTIS; INIS; GPO Dep.

This water sampling and analysis plan (WSAP) supplement supports the regulatory and technical basis for water sampling at the Maybell, Colorado, Uranium Mill Tailings Remedial Action (UMTRA) Project site, as defined in the 1994 WSAP document for Maybell (DOE, 1994a). Further, this supplement serves to confirm our present understanding of the site relative to the hydrogeology and contaminant distribution as well as our intention to continue to use the sampling strategy as presented in the 1994 WSAP document for Maybell. Ground water and surface water monitoring activities are derived from the US Environmental Protection Agency regulations in 40 CFR Part 192 (1994) and 60 CFR 2854 (1 995). Sampling procedures are guided by the UMTRA Project standard operating procedures (JEG, n.d.), the Technical Approach Document (DOE, 1989), and the most effective technical approach for the site. Additional site-specific documents relevant to the Maybell site are the Maybell Baseline Risk Assessment (currently in progress), the Maybell Remedial Action Plan (RAP) (DOE, 1994b), and the Maybell Environmental Assessment (DOE, 1995).

426 (DOE/AL/62350–132-Rev.2) **UMTRA Project water sampling and analysis plan, Gunnison, Colorado. Revision 2.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000653. Source: OSTI; NTIS; INIS; GPO Dep.

Surface remedial action at the Gunnison Uranium Mill Tailings Remedial Action Project site began in 1992; completion is expected in 1995. Ground water and surface water will be sampled semiannually at the Gunnison processing site (GUN-01) and disposal site (GUN-08). Results of previous water sampling at the Gunnison processing site indicate that ground water in the alluvium is contaminated by the former uranium processing activities. Background ground water conditions have been established in the uppermost aquifer (Tertiary gravels) at the Gunnison disposal site. Semiannual water sampling is scheduled for the spring and fall. Water quality sampling is conducted at the processing site (1) to ensure protection of human health and the environment, (2) for ground water compliance monitoring during remedial action construction, and (3) to define the extent of contamination. At the processing site, the frequency and duration of sampling will be dependent upon the nature and extent of residual contamination and the compliance strategy chosen. The monitor well locations provide a representative distribution of sampling points to characterize ground water quality and ground water flow conditions in the vicinity of the sites. The list of analytes has been modified with time to reflect constituents that are related to uranium processing activities and the parameters needed for geochemical evaluation.

427 (DOE/AL/62350–133-Rev.1-Ver.6) **UMTRA Project water sampling and analysis plan, Grand Junction, Colorado. Revision 1, Version 6.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000691. Source: OSTI; NTIS; INIS; GPO Dep.

This water sampling and analysis plan describes the planned, routine ground water sampling activities at the Grand Junction US DOE Uranium Mill Tailings Remedial Action (UMTRA) Project site (GRJ-01) in Grand Junction, Colorado, and at the Cheney Disposal Site (GRJ-03) near Grand Junction. The plan identifies and justifies the sampling locations, analytical parameters, detection limits, and sampling frequencies for the routine monitoring stations at the sites. Regulatory basis is in the US EPA regulations in 40 CFR Part 192 (1994) and EPA ground water quality standards of 1995 (60 FR 2854). This plan summarizes results of past water sampling activities, details water sampling activities planned for the next 2 years, and projects sampling activities for the next 5 years.

428 (DOE/AL/62350–134-Rev.1) **Baseline risk assessment of ground water contamination at the uranium mill tailings site near Salt Lake City, Utah. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000238. Source: OSTI; NTIS; INIS; GPO Dep.

The Uranium Mill Tailings Remedial Action (UMTRA) Project consists of two phases: the first is the Surface Project, and the second is the Ground Water Project. For the UMTRA Project site known as the Vitro site, near Salt Lake City, Utah, Surface Project cleanup occurred from 1985 to 1987. The UMTRA Project's second phase, the Ground Water Project, evaluates the nature and extent of ground water contamination resulting from uranium processing and determines a strategy for ground water compliance with the Environmental Protection Agency (EPA) ground water standards established for the UMTRA Project. A risk assessment is the process of describing a source of contamination and showing how that contamination may reach people and the environment. The amount of contamination people or the environment may be exposed to is calculated and used to characterize the possible health or environmental effects that may result from this exposure. This risk assessment report is the first site-specific document prepared for the UMTRA Ground Water Project at the Vitro site. The results of this report and further site characterization of the Vitro site will be used to determine what is necessary, if anything, to protect human health and the environment while complying with EPA standards.

429 (DOE/AL/62350–145-Rev.1) **Baseline risk assessment of ground water contamination at the uranium mill tailings site near Lakeview, Oregon. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Dec 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96004146. Source: OSTI; NTIS; INIS; GPO Dep.

Surface cleanup at the Uranium Mill Tailings Remedial Action (UMTRA) Project site near Lakeview, Oregon was completed in 1989. The Ground Water Project evaluates the nature and extent of ground water contamination that resulted from the uranium ore processing activities. The Ground Water Project is in its beginning stages. Human health may be at risk from exposure to ground water contaminated by uranium ore processing. Exposure could occur by drinking water pumped out of a hypothetical well drilled in the contaminated areas. Ecological risks to plants or animals may result from exposure to surface water and sediment that have received contaminated ground water. A risk assessment describes a source of contamination, how that contamination reaches people and the environment, the amount of contamination to which people or the ecological environment may be exposed, and the health or ecological effects that could result from that exposure. This risk assessment is a site-specific document that will be used to evaluate current and potential future impacts to the public and the environment from exposure to contaminated ground water. The results of this evaluation and further site characterization will determine whether any action is needed to protect human health or the ecological environment.

430 (DOE/AL/62350–145-Rev.2) **Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Site near Lakeview, Oregon. Revision 2.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 191p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96008307. Source: OSTI; NTIS; GPO Dep.

The U.S. Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project consists of the Surface Project (Phase I) and the Ground Water Project (Phase II). Under the UMTRA Surface Project, tailings, contaminated soil, equipment, and materials associated with the former uranium ore processing at UMTRA Project sites are placed into disposal cells. The cells are designed to reduce radon and other radiation emissions and to minimize further contamination of ground water. Surface cleanup at the UMTRA Project site near Lakeview, Oregon, was completed in 1989. The mill operated from February 1958 to November 1960. The Ground Water Project evaluates the nature and extent of ground water contamination that resulted from the uranium ore processing activities. The Ground Water Project is in its beginning stages. Human health may be at risk from exposure to ground water contaminated by uranium ore processing. Exposure could occur by drinking water pumped out of a hypothetical well drilled in the contaminated areas. Ecological risks to plants or animals may result from exposure to surface water and sediment that have received contaminated ground water. A risk assessment describes a source of contamination, how that contamination reaches people and the environment, the amount of contamination to which people or the ecological environment may be exposed, and the health or ecological effects that could result from that exposure. This risk assessment is a site-specific document that will be used to evaluate current and potential future impacts to the public and the environment from exposure to contaminated ground water. The results of this evaluation and further site characterization will determine whether any action is needed to protect human health or the ecological environment.

431 (DOE/AL/62350–146S) **Supplement to the UMTRA project water sampling and analysis plan, Slick Rock, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000660. Source: OSTI; NTIS; INIS; GPO Dep.

The water sampling and analysis plan (WSAP) provides the regulatory and technical basis for ground water and surface water sampling at the Uranium Mill Tailings Remedial Action (UMTRA) Project Union Carbide (UC) and North Continent (NC) processing sites and the Burro Canyon disposal site near Slick Rock, Colorado. The initial WSAP was finalized in August 1994 and will be completely revised in accordance with the WSAP guidance document (DOE, 1995) in late 1996. This version supplements the initial WSAP, reflects only minor changes in sampling that occurred in 1995, covers sampling scheduled for early 1996, and provides a preliminary projection of the next 5 years of sampling and monitoring activities. Once surface remedial action is completed at the former processing sites, additional and more detailed hydrogeologic characterization may be needed to develop the Ground Water Program conceptual ground water model and proposed compliance strategy. In addition, background ground water quality needs to be clearly defined to ensure that the baseline risk assessment accurately estimated risks from the contaminants of potential concern in contaminated ground water at the UC and NC sites.

432 (DOE/AL/62350–147-Rev.1) **Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Sites near Slick Rock, Colorado. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000662. Source: OSTI; NTIS; INIS; GPO Dep.

Two UMTRA (Uranium Mill Tailings Remedial Action) Project sites are near Slick Rock, Colorado: the North Continent site and the Union Carbide site. Currently, no one uses the contaminated ground water at either site for domestic or agricultural purposes. However, there may be future land development. This risk assessment evaluates possible future health problems associated with exposure to contaminated ground water. Since some health problems could occur, it is recommended that the contaminated ground water not be used as drinking water.

433 (DOE/AL/62350–157-Rev.) **Site observational work plan for the UMTRA Project site at Falls City, Texas.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95015575. Source: OSTI; NTIS; INIS; GPO Dep.

Produced by the US Department of Energy (DOE), this site observational work plan (SOWP) will be used to determine site-specific activities to comply with the US Environmental Protection Agency (EPA) ground water standards at this Uranium Mill Tailings Remedial Action (UMTRA) Project site. The purpose of the SOWP is to recommend a site-specific ground water compliance strategy at the Falls City UMTRA Project site. The Falls City SOWP presents a comprehensive summary of site hydrogeological data, delineates a conceptual model of the aquifer system, and discusses the origins of milling-related ground water contamination. It also defines the magnitude of ground water contamination, potential environmental and health risks associated with ground water contamination and data gaps, and targets a proposed compliance strategy.

434 (DOE/AL/62350–158-Rev.) **Site Observational Work Plan for the UMTRA Project Site at Shiprock, New Mexico. Revision.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jul 1995. 88p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95016288. Source: OSTI; NTIS; INIS; GPO Dep.

The site observational work plan (SOWP) for the Shiprock, New Mexico, Uranium Mill Tailings Remedial Action (UMTRA) Project Site is one of the first documents for developing an approach for achieving ground water compliance at the site. This SOWP applies Shiprock site information to a regulatory compliance framework, which identifies strategies for meeting ground water compliance at the site. The compliance framework was developed in the UMTRA ground water programmatic environmental impact statement.

435 (DOE/AL/62350–159S) **Supplement to the site observational work plan for the UMTRA project site at Ambrosia Lake, New Mexico.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Nov 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96004148. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to provide additional and more detailed information to supplement review of the site observational work plan (SOWP) (DOE, 1995) for the Ambrosia Lake, New Mexico, Uranium Mill Tailings Remedial Action (UMTRA) Project site. This document includes a discussion of the average linear velocity of the ground water in the alluvium and a discussion of the ground water quality of the alluvium, weathered Mancos Shale, and the Tres Hermanos-C Member of the Mancos Shale. The data from a 1989 aquifer test were analyzed using the curve-matching software AQTESOLV and then compared with the original results. A hydrograph of the ground water elevations in monitoring wells screened in the alluvium is presented to show how the ground water elevations change with time. Stiff and Piper diagrams were created to describe the changes in ground water geochemistry in the alluvium/weathered Mancos Sahel unit, the Tres Hermanos-C Sandstone unit, the Tres Hermanos-B Sandstone unit, and the Dakota Sandstone. Background information on other related topics such as site history, cell construction, soil characteristics, and well construction are presented in the SOWP. A geologic cross section depicts the conceptual model of the hydrostratigraphy and ground water chemistry of the Ambrosia Lake site. Hydrogeologic information of each hydrostratigraphic unit is presented.

436 (DOE/AL/62350–159S(2/96)) **Supplement to the site observational work plan for the UMTRA Project Site at Ambrosia Lake, New Mexico.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1996. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96007544. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to provide additional and more detailed information to supplement review of the site observational work plan (SOWP) for the Ambrosia Lake, New Mexico, Uranium Mill Tailings Remedial Action (UMTRA) Project site. This document includes a discussion of (1) the average linear velocity of the ground water in the alluvium; (2) the ground water quality of the alluvium, weathered Mancos Shale, and the Tres Hermanos-C Member of the Mancos Shale; and (3) the fate and transport of contaminants from the uppermost aquifer to the Westwater Canyon Member of the Morrison Formation. The data from a 1989 aquifer test were analyzed using the curve-matching software AQTESOLV and then compared with the original results. A hydrograph of the ground water elevations in monitoring wells screened in the alluvium is presented to show how the ground water elevations change with time. Stiff and Piper diagrams were created to describe the changes in ground water geochemistry in the alluvium/ weathered Mancos Shale unit, the Tres Hermanos-C Sandstone unit, the Tres Hermanos-B Sandstone unit, and the Dakota Sandstone. Background information on other related topics such as site history, cell construction, soil characteristics, and well construction are presented in the SOWP. Figure 1 is a geologic cross section depicting the conceptual model of the hydrostratigraphy and ground water chemistry of the Ambrosia Lake site. Table 1 presents hydrogeologic information of each hydrostratigraphic unit.

437 (DOE/AL/62350–175-Rev.1) **Baseline risk assessment of ground water contamination at the uranium mill tailings site near Durango, Colorado. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000237. Source: OSTI; NTIS; INIS; GPO Dep.

For the UMTRA .Project site located near Durango, Colorado (the Durango site), the Surface Project cleanup occurred from 1986 to 1991. An evaluation was made to determine whether exposure to ground water contaminated by uranium processing could affect people's health. Exposure could occur from drinking water pumped from a hypothetical well drilled in the contaminated ground water area. In addition, environmental risks may result if plants or animals are exposed to contaminated ground water, or surface water that has mixed with contaminated ground water. This risk assessment report is the first site-specific document prepared for the UMTRA Ground Water Project at the Durango site. The results of this report and further site characterization of the Durango site will be used to determine what is necessary to protect public health and the environment, and to comply with the EPA standards.

438 (DOE/AL/62350–177) **Ground water work breakdown structure dictionary.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Apr 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95011234. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the activities that are necessary to assess in ground water remediation as specified in the UMTRA Project. These activities include the following: site characterization; remedial action compliance and design documentation; environment, health, and safety program; technology assessment; property access and acquisition activities; site remedial actions; long term surveillance and licensing; and technical and management support.

439 (DOE/AL/62350–179) **Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Sites near Rifle, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). May 1995. 252p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95013503. Source: OSTI; NTIS; INIS; GPO Dep.

The ground water project evaluates the nature and extent of ground water contamination resulting from the uranium ore processing activities. This report is a site specific document that will be used to evaluate current and future impacts to the public and the environment from exposure to contaminated ground water. Currently, no one is using the ground water and therefore, no one is at risk. However, the land will probably be developed in the future and so the possibility of people using the ground water does exist. This report examines the future possibility of health hazards resulting from the ingestion of contaminated drinking water, skin contact, fish ingestion, or contact with surface waters and sediments.

440 (DOE/AL/62350–179-Rev.1) **Baseline risk assessment of ground water contamination at the uranium mill tailings sites near Rifle, Colorado. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Aug 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000236. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project consists of the Surface Project (Phase 1) and the Ground Water Project (Phase 2). Under the UMTRA Surface Project, tailings, radioactive contaminated soil, equipment, and materials associated with the former uranium ore processing sites are placed into disposal cells. The cells are designed to reduce radon and other radiation emissions and to prevent further ground water contamination. The Ground Water Project evaluates the nature and extent of ground water contamination resulting from the uranium ore processing activities. Two UMTRA Project sites are near Rifle, Colorado: the Old Rifle site and the New Rifle site. Surface cleanup at the two sites is under way and is scheduled for completion in 1996. The Ground Water Project is in its beginning stages. A risk assessment identifies a source of contamination, how that contamination reaches people and the environment, the amount of contamination to which people or the environment may be exposed, and the health or environmental effects that could result from that exposure. This report is a site-specific document that will be used to evaluate current and future impacts to the public and the environment from exposure to contaminated ground water. This evaluation and further site characterization will be used to determine if action is needed to protect human health or the environment.

441 (DOE/AL/62350–179-Rev.2) **Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Sites near Rifle, Colorado. Revision 2.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1996. 252p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96008003. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project consists of the Surface Project (Phase I) and the Ground Water Project (Phase II). Under the UMTRA Surface Project, tailings, radioactive contaminated soil, equipment, and materials associated with the former uranium ore processing sites are placed into disposal cells. The cells are designed to reduce radon and other radiation emissions and to prevent further ground water contamination. The Ground Water Project evaluates the nature and extent of ground water contamination resulting from the uranium ore processing activities. Two UMTRA Project sites are near Rifle, Colorado: the Old Rifle site and the New Rifle site. Surface cleanup at the two sites is under way and is scheduled for completion in 1996. The Ground Water Project is in its beginning stages. A risk assessment identifies a source of contamination, how that contamination reaches people and the environment, the amount of contamination to which people or the environment may be exposed, and the health or environmental effects that could result from that exposure. This report is a site-specific document that will be used to evaluate current and future impacts to the public and the environment from exposure to contaminated ground water. This evaluation and further site characterization will be used to determine if action is needed to protect human health or the environment. Human health risk may result from exposure to ground water contaminated from uranium ore processing. Exposure could occur from drinking water obtained from a well placed in the areas of contamination. Furthermore, environmental risk may result from plant or animal exposure to surface water and sediment that have received contaminated ground water.

442 (DOE/AL/62350–190) **Private well/spring position paper, Rifle, Colorado, sites.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). May 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95011233. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the hydrogeochemical relationship between the New and Old Rifle processing sites and 15 domestic wells in their vicinity. The relationship of the domestic wells to the Old and New Rifle tailings sites requires clarification due to recent advances in understanding of Rifle site conceptual models. In order to form a bridge from the Rifle remedial action plan (RAP) and the recent baseline risk assessment to this position paper, several issues require discussion. First, through analysis of long-term ground water level data, the hydraulic gradient between the former tailings and private wells and springs was assessed. Second, in the Rifle RAP there was not a strong emphasis placed on describing regional influences on water quality in the vicinity of the processing sites. This document uses available information coupled with theory of regional ground water flow to describe regional flow systems north of Rifle. Third, the definition of background water quality from the RAP has been refined in several ways. Also, for the recent baseline risk assessment, all alluvial wells used to define background for the sites were located east of Old Rifle. In the RAP, alluvial background wells were also placed between the sites (downgradient of Old Rifle). Two additional wells were installed for the recent baseline risk assessment upgradient of Old Rifle which verified that several of the older wells (RFO-01-0597 and -0598) were in locations representative of background.

443 (DOE/AL/62350–191) **Report of ground water monitoring for expansion of the golf course, Salt Lake City, Utah, vitro processing site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95013501. Source: OSTI; NTIS; INIS; GPO Dep.

To determine the potential impacts of the proposed golf course expansion on the south side of the Vitro site, ground water data from the UMTRA Vitro processing site were evaluated in response to the U.S. Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project Office request. Golf in the Round, Inc., has proposed an expansion of the present driving range to include a 9-hole golf course on the UMTRA Vitro processing site, which is owned by the Central Valley Water Reclamation Facility (CVWRF). An expanded golf course would increase irrigation and increase the amount of water that could infiltrate the soil, recharging the unconfined aquifer. Increased water levels in the aquifer could alter the ground water flow regime; contaminants in the shallow ground water could then migrate off the site or discharge to surface water in the area. Dewatering of the unconfined aquifer on CVWRF property could also impact site contaminant migration; a significant amount of ground water extraction at CVWRF could reduce the amount of contaminant migration off the site. Since 1978, data have been collected at the site to determine the distribution of tailings materials (removed from the site from 1985 to 1987) and to characterize the presence and migration of contaminants in sediments, soils, surface water, and ground water at the former Vitro processing site. Available data suggest that irrigating an expanded golf course may cause contamination to spread more rapidly within the unconfined aquifer. The public is not at risk from current Vitro processing site activities, nor is risk expected due to golf course expansion. However, ecological risk could increase with increased surface water contamination and the development of ground water seeps.

444 (DOE/AL/62350–192) **Ground water elevation monitoring at the Uranium Mill Tailings Remedial Action Salt Lake City, Utah, Vitro processing site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95011232. Source: OSTI; NTIS; INIS; GPO Dep.

In February 1994, a ground water level monitoring program was begun at the Vitro processing site. The purpose of the program was to evaluate how irrigating the new golf driving range affected ground water elevations in the unconfined aquifer. The program also evaluated potential impacts of a 9-hole golf course planned as an expansion of the driving range. The planned golf course expansion would increase the area to be irrigated and, thus, the water that could infiltrate the processing site soil to recharge the unconfined aquifer. Increased water levels in the aquifer could alter the ground water flow regime; contaminants in ground water could migrate off the site or could discharge to bodies of surface water in the area. The potential effects of expanding the golf course have been evaluated, and a report is being prepared. Water level data obtained during this monitoring program indicate that minor seasonal mounding may be occurring in response to irrigation of the driving range. However, the effects of irrigation appear small in comparison to the effects of precipitation. There are no monitor wells in the area that irrigation would affect most; that data limitation makes interpretations of water levels and the possibility of ground water mounding uncertain. Limitations of available data are discussed in the conclusion.

445 (DOE/AL/62350–193) **UMTRA ground water sampling techniques: Comparison of the traditional and**

low flow methods. Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jul 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95016205. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the potential changes in water quality data that may occur with the conversion from MBV (multiple bore volume) to LF (low flow) sampling and provides two examples of how such a change might impact Project decisions. The existing scientific literature on LF sampling is reviewed and the new LF data from three UMTRA Uranium Mill Tailings Remedial Action Project sites are evaluated seeking answers to the questions posed above. Several possible approaches, that the UMTRA Project may take to address issues unanswered by the literature are presented and compared, and a recommendation is offered for the future direction of the LF conversion effort.

446 (DOE/AL/62350–194) **Comment and response document for the ground water protection strategy for the Uranium Mill Tailings Site at Green River, Utah.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000657. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) responses to comments from both the US Nuclear Regulatory Commission (NRC) and the state of Utah are provided in this document. The Proposed Ground Water Protection Strategy for the Uranium Mill Tailings Site at Green River, Utah, presents the proposed (modified) ground water protection strategy for the disposal cell at the Green River disposal site for compliance with Subpart A of 40 CFR Part 192. Before the disposal cell was constructed, site characterization was conducted at the Green River Uranium Mill Tailings Remedial Action (UMTRA) Project site to determine an acceptable compliance strategy. Results of the investigation are reported in detail in the final remedial action plan (RAP) (DOE, 1991a). The NRC and the state of Utah have accepted the final RAP. The changes in this document relate only to a modification of the compliance strategy for ground water protection.

447 (DOE/AL/62350–195) **Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Site near Naturita, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Aug 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000440. Source: OSTI; NTIS; INIS; GPO Dep.

The Uranium Mill Tailings Remedial Action (UMTRA) Project consists of the Surface Project (phase I), and the Ground Water Project (phase II). For the UMTRA Project site located near Naturita, Colorado (the Naturita site), phase I involves the removal of radioactively contaminated soils and materials and their transportation to a disposal site at Union Carbide Corporation's Upper Burbank Repository at Uravan, Colorado, about 13 road miles (mi) (21 kilometers [km]) to the northwest. No uranium mill tailings are involved because the tailings were removed from the Naturita site and placed at Coke Oven, Colorado, during 1977 to 1979. Phase II of the project will evaluate the nature and extent of ground water contamination resulting from uranium processing and its effect on human health or the environment; and will determine site-specific ground water compliance strategies in accordance with the US Environmental Protection Agency (EPA) ground water standards established for the UMTRA Project. Human health risks could occur from drinking water pumped from a hypothetical well drilled in the contaminated ground water area. Environmental risks may result if plants or animals are exposed to contaminated ground water, or surface water that has received contaminated ground water. Therefore, a risk assessment is conducted for the Naturita site. This risk assessment report is the first site-specific document prepared for the Ground Water Project at the Naturita site. What follows is an evaluation of current and possible future impacts to the public and the environment from exposure to contaminated ground water. The results of this evaluation and further site characterization will be used to determine whether any action is needed to protect human health or the environment.

448 (DOE/AL/62350–195-Rev.1) **Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Site near Naturita, Colorado. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Nov 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96003077. Source: OSTI; NTIS; INIS; GPO Dep.

The Uranium Mill Tailings Remedial Action (UMTRA) Project consists of the Surface Project, and the Ground Water Project. For the UMTRA Project site located near Naturita, Colorado, phase I involves the removal of radioactively contaminated soils and materials and their transportation to a disposal site at Union Carbide Corporation's Upper Burbank Repository at Uravan, Colorado. The surface cleanup will reduce radon and other radiation emissions from the former uranium processing site and prevent further site-related contamination of ground water. Phase II of the project will evaluate the nature and extent of ground water contamination resulting from uranium processing and its effect on human health and the environment, and will determine site-specific ground water compliance strategies in accordance with the US Environmental Protection Agency (EPA) ground water standards established for the UMTRA Project. Human health risks could occur from drinking water pumped from a hypothetical well drilled in the contaminated ground water area. Environmental risks may result if plants or animals are exposed to contaminated ground water or surface water that has mixed with contaminated ground water. Therefore, a risk assessment was conducted for the Naturita site. This risk assessment report is the first site-specific document prepared for the Ground Water Project at the Naturita site. What follows is an evaluation of current and possible future impacts to the public and the environment from exposure to contaminated ground water. The results of this evaluation and further site characterization will be used to determine whether any action is needed to protect human health or the environment.

449 (DOE/AL/62350–196) **Work plan for monitor well installation water and sediment sample collection aquifer testing and topographic surveying at the Riverton, Wyoming, UMTRA Project Site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000450. Source: OSTI; NTIS; INIS; GPO Dep.

Investigations conducted during preparation of the site observational work plan (SOWP) at the Uranium Mill Tailings Remedial Action (UMTRA) Project site support a proposed natural flushing ground water compliance strategy, with institutional controls. However, additional site-specific data are needed to reduce uncertainties in order to confirm the applicability and feasibility of this proposed compliance strategy option. This proposed strategy will be analyzed in the site-specific environmental assessment. The purpose of this work plan is to summarize the data collection objectives to fill those data needs, describe the data collection activities that will be undertaken to meet those objectives, and elaborate on the data quality objectives which define the procedures that will be followed to ensure that the quality of these data meet UMTRA Project needs.

450 (DOE/AL/62350–201) **Site observational work plan for the UMTRA Project site at Monument Valley, Arizona.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96002052. Source: OSTI; NTIS; INIS; GPO Dep.

The site observational work plan (SOWP) for the Monument Valley, Arizona, US Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project site is one of the first site-specific documents developed to achieve ground water compliance at the site. This SOWP applies information about the Monument Valley site to a regulatory compliance framework that identifies strategies that could be used to meet ground water compliance. The compliance framework was developed in the UMTRA Ground Water programmatic environmental impact statement (DOE, 1995). The DOE's goal is to implement a cost-effective site strategy that complies with the US Environmental Protection Agency (EPA) ground water standards and protects human health and the environment. The compliance strategy that emerges in the final version of the SOWP will assess potential environmental impacts and provide stakeholder a forum for review and comment. When the compliance strategy is acceptable, it will be detailed in a remedial action plan that will be subject to review by the state and/or tribe and concurrence by the US Nuclear Regulatory Commission (NRC). Information available for the preparation of this SOWP indicates active remediation is the most likely compliance strategy for the Monument Valley site. Additional data are needed to determine the most effective remediation technology.

451 (DOE/AL/62350–201(3/96)) **Site observational work plan for the UMTRA Project site at Monument Valley, Arizona.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 597p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96009934. Source: OSTI; NTIS; INIS; GPO Dep.

The site observational work plan (SOWP) for the Monument Valley, Arizona, US Department of Energy (DOE) Uranium Mill Tailings Remedial Action(UMTRA) Project site is one of the first site-specific documents developed to achieve ground water compliance at the site. This SOWP applies information about the Monument Valley site to a regulatory compliance framework that identifies strategies that could be used to meet ground water compliance. The compliance framework was developed in the UMTRA Ground Water programmatic environmental impact statement (DOE, 1996). The DOE's goal is to implement a cost-effective site strategy that complies with the US Environmental Protection Agency (EPA) ground water standards and protects human health and the environment. The compliance strategy that emerges in the final version of the SOWP will be evaluated in the site-specific environmental assessment to determine potential environmental impacts and provide stakeholders a forum for review and comment. When the compliance strategy is acceptable, it will be detailed in a remedial action plan that will be subject to review by the state and/or tribe and concurrence by the US Nuclear Regulatory Commission (NRC). Information for the preparation of this SOWP indicates active remediation is the most likely compliance strategy for the Monument Valley site. Additional data are needed to determine the most effective remediation technology.

452 (DOE/AL/62350–209) **Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Site near Maybell, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000449. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project consists of the Surface Project (Phase I) and the Ground Water Project (Phase II). Under the UMTRA Surface Project, tailings, radioactive contaminated soil, building foundations, and materials associated with the former processing of uranium ore at UMTRA sites are placed into disposal cells. The cells are designed to reduce radon and other radiation emissions and to prevent further contamination of ground water. One UMTRA Project site is near Maybell, Colorado. Surface cleanup at this site is under way and is scheduled for completion in 1996. The tailings are being stabilized in-place at this site. The disposal area has been withdrawn from public use by the DOE and is referred to as the permanent withdrawal area. The Ground Water Project evaluates the nature and extent of ground water contamination resulting from past uranium ore processing activities. The Ground Water Project at this site is in its beginning stages. This report is a site-specific document that will be used to evaluate current and future potential impacts to the public and the environment from exposure to contaminated ground water. The results of this evaluation and further site characterization will determine whether any action is needed to protect human health or the environment. Currently, no points of exposure (e.g. a drinking water well); and no receptors of contaminated ground water have been identified at the Maybell site. Therefore, there are no current human health and ecological risks associated with exposure to contaminated ground water. Furthermore, if current site conditions and land- and water-use patterns do not change, it is unlikely that contaminated ground water would reach people or the ecological communities in the future.

453 (DOE/AL/62350–209-Rev.1) **Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Site near Maybell, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96006185. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project consists of the Surface Project (Phase I) and the Ground Water Project (Phase II). Under the UMTRA Surface Project, tailings, contaminated soil, building foundations, and materials associated with the former processing of uranium ore at UMTRA Project sites are placed into disposal cells. The cells are designed to reduce radon and other radiation emissions and to prevent further contamination of ground water. One UMTRA

Project site is near Maybell, Colorado. Surface cleanup at this site began in 1995 and is scheduled for completion in 1996. The tailings are being stabilized in place at this site. The disposal area has been withdrawn from public use by the DOE and is referred to as the permanent withdrawal area. The Ground Water Project evaluates the nature and extent of ground water contamination resulting from past uranium ore processing activities. The Ground Water Project at this site is in its beginning stages. This report is a site-specific document that will be used to evaluate current and future potential impacts to the public and the environment from exposure to contaminated ground water. The results presented in this document and other evaluations will determine whether any action is needed to protect human health or the environment.

454 (DOE/AL/62350–213-Rev.2) **Work plan for preliminary investigation of organic constituents in ground water at the New Rifle site, Rifle, Colorado. Revision 2.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jan 1996. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96004143. Source: OSTI; NTIS; INIS; GPO Dep.

A special study screening for Appendix 9 (40 CFR Part 264) analytes identified the New Rifle site as a target for additional screening for organic constituents. Because of this recommendation and the findings in a recent independent technical review, the US Department of Energy (DOE) has requested that the Technical Assistance Contractor (TAC) perform a preliminary investigation of the potential presence of organic compounds in the ground water at the New Rifle Uranium Mill Tailings Remedial Action (UMTRA) Project site, Rifle, Colorado. From 1958 to 1972, organic chemicals were used in large quantities during ore processing at the New Rifle site, and it is possible that some fraction was released to the environment. Therefore, the primary objective of this investigation is to determine whether organic chemicals used at the milling facility are present in the ground water. The purpose of this document is to describe the work that will be performed and the procedures that will be followed during installation of ground water well points at the New Rifle site. The selection of analytes and the procedures for collecting ground water samples for analysis of organic constituents are also described.

455 (DOE/AL/62350–214) **UMTRA project water sampling and analysis plan, Tuba City, Arizona.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1996. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96007515. Source: OSTI; NTIS; INIS; GPO Dep.

Planned, routine ground water sampling activities at the U.S. Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project site in Tuba City, Arizona, are described in the following sections of this water sampling and analysis plan (WSAP). This plan identifies and justifies the sampling locations, analytical parameters, detection limits, and sampling frequency for the stations routinely monitored at the site. The ground water data are used for site characterization and risk assessment. The regulatory basis for routine ground water monitoring at UMTRA Project sites is derived from the U.S. Environmental Protection Agency (EPA) regulations in 40 CFR Part 192 (1994) and the final EPA standards of 1995 (60 FR 2854). Sampling procedures are guided by the UMTRA Project standard operating procedures (SOP) (JEG, n.d.), and the most effective technical approach for the site.

456 (DOE/AL/62350–215) **Site observational work plan for the UMTRA project site at Grand Junction, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jan 1996. 190p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96004142. Source: OSTI; NTIS; INIS; GPO Dep.

This site observational work plan (SOWP) is one of the first Uranium Mill Tailings Remedial Action (UMTRA) Ground Water Project documents developed to select a compliance strategy that meets the UMTRA ground water standards for the Grand Junction site. This SOWP applies information about the Grand Junction site to the compliance strategy selection framework developed in the UMTRA Ground Water Project draft programmatic environmental impact statement. This risk-based, decision-making framework identifies the decision logic for selecting compliance strategies that could be used to meet the ground water standards. The US Department of Energy (DOE) goal is to implement a cost-effective site strategy that complies with the ground water standards and protects human health and the environment. Based on an evaluation of the site characterization and risk assessment data available for the preparation of this SOWP, DOE proposes that the most likely compliance strategy for the Grand Junction site is no remediation with the application of supplemental standards. This proposed strategy is based on a conceptual site model that indicates site-related contamination is confined to a limited-use aquifer as defined in the ground water standards. The conceptual model demonstrates that the uranium processing-related contamination at the site has affected the unconfined alluvial aquifer, but not the deeper confined aquifer.

457 (DOE/AL/62350–215(3/96)) **Site observational work plan for the UMTRA Project Site at Grand Junction, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 186p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96006187. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) has prepared this initial site observational work plan (SOWP) for the Uranium Mill Tailings Remedial Action (UMTRA) Project site in Grand Junction, Colorado. This SOWP is one of the first UMTRA Ground Water Project documents developed to select a compliance strategy that meets the UMTRA ground water standards (40 CFR Part 192, as amended by 60 FR 2854) for the Grand Junction site. This SOWP applies information about the Grand Junction site to the compliance strategy selection framework developed in the UMTRA Ground Water Project draft programmatic environmental impact statement (PEIS). This risk-based, decision-making framework identifies the decision logic for selecting compliance strategies that could be used to meet the ground water standards. The DOE goal is to use the observational method to implement a cost-effective site strategy that complies with the ground water standards and protects human health and the environment. Based on an evaluation of the site characterization and risk assessment data available for the preparation of this SOWP, DOE proposes that the most likely compliance strategy for the Grand Junction site is no remediation based on the application of supplemental standards. This proposed strategy is based on a conceptual site model that indicates site-related contamination is confined to a limited-use aquifer as defined in the ground water standards.

458 (DOE/AL/62350–219) **Buffer zone monitoring plan for the Dos Rios subdivision, Gunnison, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1996. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96007516. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a plan for water quality monitoring at the Dos Rios subdivision (Units 2, 3, and the Island Unit) that is intended to satisfy the informational needs of residents who live southwest (downgradient) of the former Gunnison processing site. Water quality monitoring activities described in this report are designed to protect the public from residual contamination that entered the ground water as a result of previous uranium milling operations. Requirements presented in this monitoring plan are also included in the water sampling and analysis plan (WSAP) for the Gunnison Uranium Mill Tailings Remedial Action (UMTRA) Project site. The Gunnison WSAP is a site-specific document prepared by the U.S. Department of Energy (DOE) that provides background, guidance, and justification for future ground water sampling and analysis activities for the UMTRA Project Gunnison processing and disposal sites. The WSAP will be updated annually, as additional water quality data are collected and interpreted, to provide ongoing protection for public health and the environment.

459 (DOE/AL/62350–220) **UMTRA Ground Water Project management action process document.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96006184. Source: OSTI; NTIS; INIS; GPO Dep.

A critical U.S. Department of Energy (DOE) mission is to plan, implement, and complete DOE Environmental Restoration (ER) programs at facilities that were operated by or in support of the former Atomic Energy Commission (AEC). These facilities include the 24 inactive processing sites the Uranium Mill Tailings Radiation Control Act (UMTRCA) (42 USC Section 7901 et seq.) identified as Title I sites, which had operated from the late 1940s through the 1970s. In UMTRCA, Congress acknowledged the potentially harmful health effects associated with uranium mill tailings and directed the DOE to stabilize, dispose of, and control the tailings in a safe and environmentally sound manner. The UMTRA Surface Project deals with buildings, tailings, and contaminated soils at the processing sites and any associated vicinity properties (VP). Surface remediation at the processing sites will be completed in 1997 when the Naturita, Colorado, site is scheduled to be finished. The UMTRA Ground Water Project was authorized in an amendment to the UMTRCA (42 USC Section 7922(a)), when Congress directed DOE to comply with U.S. Environmental Protection Agency (EPA) ground water standards. The UMTRA Ground Water Project addresses any contamination derived from the milling operation that is determined to be present at levels above the EPA standards.

460 (DOE/AL/62350–227) **Position paper on the applicability of supplemental standards to the uppermost aquifer at the Uranium Mill Tailings Vitro Processing Site, Salt Lake City, Utah.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96006186. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the results of the evaluation of the potential applicability of supplemental standards to the uppermost aquifer underlying the Uranium Mill Tailings Remedial Action (UMTRA) Project, Vitro Processing Site, Salt Lake City, Utah. There are two goals for this evaluation: provide the landowner with information to make an early qualitative decision on the possible use of the Vitro property, and evaluate the proposed application of supplemental standards as the ground water compliance strategy at the site. Justification of supplemental standards is based on the contention that the uppermost aquifer is of limited use due to wide-spread ambient contamination not related to the previous site processing activities. In support of the above, this report discusses the site conceptual model for the uppermost aquifer and related hydrogeological systems and establishes regional and local background water quality. This information is used to determine the extent of site-related and ambient contamination. A risk-based evaluation of the contaminants' effects on current and projected land uses is also provided. Reports of regional and local studies and U.S. Department of Energy (DOE) site investigations provided the basis for the conceptual model and established background ground water quality. In addition, a limited field effort (4 through 28 March 1996) was conducted to supplement existing data, particularly addressing the extent of contamination in the northwestern portion of the Vitro site and site background ground water quality. Results of the field investigation were particularly useful in refining the conceptual site model. This was important in light of the varied ground water quality within the uppermost aquifer. Finally, this report provides a critical evaluation, along with the related uncertainties, of the applicability of supplemental standards to the uppermost aquifer at the Salt Lake City Vitro processing site.

461 (DOE/AL/62350–229) **Report of ground water monitoring for expansion of the golf course, Salt Lake City, Utah, Vitro Processing Site. Revision 0.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96008001. Source: OSTI; NTIS; INIS; GPO Dep.

Ground water elevations of the shallow unconfined aquifer have been monitored at the Uranium Mill Tailings Remedial Action (UMTRA) Project, Vitro Processing site, Salt Lake City, Utah, for the purposes of characterizing ground water flow conditions and evaluating the effects of irrigation of the golf driving range. Data collected, to date, show that the water table reached its highest level for the year during March and April 1995. From May through July 1995, the water table elevations decreased in most monitor wells due to less precipitation and higher evapotranspiration. Review and evaluation of collected data suggest that irrigation of the golf driving range will have negligible effects on water levels and ground water flow patterns if rates of irrigation do not significantly exceed future rates of evapotranspiration.

462 (DOE/AL/62350–050510-GRNO-Rev.2-Ver.5) **Ground water protection strategy for the Uranium Mill Tailings Site at Green River, Utah. Final, Revision 2, Version 5: Appendix E to the remedial action plan and site design for stabilization of the inactive uranium mill tailings site at Green River, Utah.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Sep 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96000661. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this appendix is to provide a ground water protection strategy for the Uranium Mill Tailings Remedial

Action (UMTRA) Project disposal site at Green River, Utah. Compliance with the US Environmental Protection Agency (EPA) ground water protection standards will be achieved by applying supplemental standards (40 CFR § 192.22(a); 60 FR 2854) based on the limited use ground water present in the uppermost aquifer that is associated with widespread natural ambient contamination (40 CFR § 192.11(e); 60 FR 2854). The strategy is based on new information, including ground water quality data collected after remedial action was completed, and on a revised assessment of disposal cell design features, surface conditions, and site hydrogeology. The strategy will result in compliance with Subparts A and C of the EPA final ground water protection standards (60 FR 2854). The document contains sufficient information to support the proposed ground water protection strategy, with monitor well information and ground water quality data included as a supplement. Additional information is available in the final remedial action plan (RAP) (DOE, 1991a), the final completion report (DOE, 1991b), and the long-term surveillance plan (LTSP) (DOE, 1994a).

463 (DOE/EA–1155) **Environmental assessment of ground water compliance activities at the Uranium Mill Tailings Site, Spook, Wyoming. Revision 0.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1996. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96008308. Source: OSTI; NTIS; GPO Dep.

This document is an environmental assessment of the Spook, Wyoming, Uranium Mill Tailings Remedial Action (UMTRA) Project site. It analyzes the impacts of the U.S. Department of Energy (DOE) proposed action for ground water compliance. The proposed action is to comply with the U.S. Environmental Protection Agency (EPA) standards for the UMTRA Project sites (40 CFR Part 192) by meeting supplemental standards based on the limited use ground water at the Spook site. This proposed action would not require site activities, including ground water monitoring, characterization, or institutional controls. Ground water in the uppermost aquifer was contaminated by uranium processing activities at the Spook site, which is in Converse County, approximately 48 miles (mi) (77 kilometers [km]) northeast of Casper, Wyoming. Constituents from the site infiltrated and migrated into the uppermost aquifer, forming a plume that extends approximately 2500 feet (ft) (800 meters [m]) downgradient from the site. The principal site-related hazardous constituents in this plume are uranium, selenium, and nitrate. Background ground water in the uppermost aquifer at the site is considered limited use. It is neither a current nor a potential source of drinking water because of widespread, ambient contamination that cannot be cleaned up using treatment methods reasonably employed in public water supply systems (40 CFR § 192.11 (e)). Background ground water quality also is poor due to first, naturally occurring conditions (natural uranium mineralization associated with an alteration front), and second, the effects of widespread human activity not related to uranium milling operations (uranium exploration and mining activities). There are no known exposure pathways to humans, animals, or plants from the contaminated ground water in the uppermost aquifer because it does not discharge to lower aquifers, to the surface, or to surface water.

464 (DOE/EIS–0198) **Draft programmatic environmental impact statement for the Uranium Mill Tailings Remedial Action Ground Water Project.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Apr 1995. 251p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95011264. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is responsible for performing remedial action to bring surface and ground water contaminant levels at 24 inactive uranium processing sites into compliance with the US Environmental Protection Agency (EPA) standards. DOE is accomplishing this through the Uranium Mill Tailings Remedial Action (UMTRA) Surface and Ground Water Projects. Remedial action will be conducted with the concurrence of the US Nuclear Regulatory Commission (NRC) and the full participation of affected states and Indian tribes. Uranium processing activities at most of 24 the inactive mill sites resulted in the contamination of ground water beneath and, in some cases, downgradient of the sites. This contaminated ground water often has elevated levels of constituents such as uranium and nitrate. The purpose of the UMTRA Ground Water Project is to eliminate, or reduce to acceptable levels, the potential health and the environmental consequences of milling activities by meeting the EPA standards in areas where ground water has been contaminated. The first step in the UMTRA Ground Water Project is the preparation of this programmatic environmental impact statement (PEIS). This document analyzes potential impacts of four programmatic alternatives, including the proposed action. The alternatives do not address site-specific ground water compliance strategies. Rather, the PEIS is a planning document that provides a framework for conducting the Ground Water Project; assesses the potential programmatic impacts of conducting the Ground Water Project; provides a method for determining the site-specific ground water compliance strategies; and provides data and information that can be used to prepare site-specific environmental impacts analyses more efficiently.

465 (DOE/EIS–0198-Vol.1) **Preliminary final programmatic environmental impact statement for the Uranium Mill Tailings Remedial Action Ground Water Project. Volume 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jan 1996. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96005293. Source: OSTI; NTIS; INIS; GPO Dep.

The first step in the UMTRA Ground Water Project is the preparation of this programmatic environmental impact statement (PEIS). This document analyzes the potential impacts of four alternative systems for conducting the ground water program. One of these systems is the proposed action. These alternatives do not address site-specific ground water compliance strategies, because the PEIS is a planning document only. It assesses the potential programmatic impacts of conducting the Ground Water Project, provides a method for determining the site-specific ground water compliance strategies, and provides data and information that can be used to prepare site-specific environmental impacts analyses more efficiently. This PEIS presents multiple ground water compliance strategies, each with its own set of potential impacts, that could be used to implement all the alternatives presented in the PEIS except the no action alternative. The no action alternative must be considered by law. It consists of taking no action to meet EPA standards. Implementing all PEIS alternatives (except no action) means applying a ground water compliance strategy or a combination of strategies that would result in site-specific impacts.

466 (DOE/EIS–0198-Vol.1(4/96)) **Final programmatic environmental impact statement for the Uranium Mill Tailings Remedial Action Ground Water Project. Volume 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Apr 1996. 285p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96013507. Source: OSTI; NTIS; INIS; GPO Dep.

The first step in the UMTRA Ground Water Project is the preparation of this programmatic environmental impact statement (PEIS). This document analyzes the potential impacts of four alternatives for conducting the Ground Water Project. One of these alternatives is the proposed action. These alternatives do not address site-specific ground water compliance strategies because the PEIS is a planning document only. It assesses the potential programmatic impacts of conducting the Ground Water Project, provides a method for determining the site-specific ground water compliance strategies, and provides data and information that can be used to prepare site-specific environmental impacts analyses more efficiently. This PEIS differs substantially from a site-specific environmental impact statement because multiple ground water compliance strategies, each with its own set of potential impacts, could be used to implement all the alternatives except the no action alternative. In a traditional environmental impact statement, an impacts analysis leads directly to the defined alternatives. The impacts analysis for implementing alternatives in this PEIS first involves evaluating a ground water compliance strategy or strategies, the use of which will result in site-specific impacts. This PEIS impacts analysis assesses only the potential impacts of the various ground water compliance strategies, then relates them to the alternatives to provide a comparison of impacts.

467 (DOE/EIS–0198-Vol.2) **Preliminary final programmatic environmental impact statement for the Uranium Mill Tailings Remedial Action Ground Water Project. Volume 2.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jan 1996. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96005294. Source: OSTI; NTIS; INIS; GPO Dep.

Volume 2 of the programmatic environmental impact statement (PIES) is a comment and response document; it is the collection of the 577 comments received on the draft PEIS. The US Department of Energy's (DOE) response to each comment is provided after each comment. If the comment resulted in a change to the PEIS, the affected section number of the PEIS is provided in the response. Comments 1 through 259 were received at public hearings. Comments were recorded on flip charts and by notetakers. DOE representatives were present to hear the comments and respond to them. The DOE's written response is provided after each comment. Comments 260 through 577 were received in writing at the hearings, and from various federal, tribal, and state agencies and from individuals during the public comment period. Copies of the written comments follow the comments and responses.

468 (DOE/EIS–0198-Vol.2(4/96)) **Final programmatic environmental impact statement for the Uranium Mill Tailings Remedial Action Ground Water Project. Volume 2.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Apr 1996. 293p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE96013508. Source: OSTI; NTIS; INIS; GPO Dep.

The first step in the UMTRA Ground Water Project is the preparation of a programmatic environmental impact statement. It assesses the potential programmatic impacts of conducting the Ground Water Project, provides a method for determining the site-specific ground water compliance strategies, and provides data and information that can be used to prepare site-specific environmental impacts analyses more efficiently. This volume of the programmatic environmental impact statement (PEIS) is a comment and response document. It is the collection of the comments received on the draft PEIS.

469 (DOE/EM–0248) **Contaminant plumes containment and remediation focus area. Technology summary.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. Jun 1995. 244p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016125. Source: OSTI; NTIS; INIS; GPO Dep.

EM has established a new approach to managing environmental technology research and development in critical areas of interest to DOE. The Contaminant Plumes Containment and Remediation (Plumes) Focus Area is one of five areas targeted to implement the new approach, actively involving representatives from basic research, technology implementation, and regulatory communities in setting objectives and evaluating results. This document presents an overview of current EM activities within the Plumes Focus Area to describe to the appropriate organizations the current thrust of the program and developing input for its future direction. The Plumes Focus Area is developing remediation technologies that address environmental problems associated with certain priority contaminants found at DOE sites, including radionuclides, heavy metals, and dense non-aqueous phase liquids (DNAPLs). Technologies for cleaning up contaminants of concern to both DOE and other federal agencies, such as volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), and other organics and inorganic compounds, will be developed by leveraging resources in cooperation with industry and interagency programs.

470 (DOE/EM–0268-96003563) **ResonantSonic drilling. Innovative technology summary report.** Oak Ridge National Lab., TN (United States); Colorado Center for Environmental Management, Denver, CO (United States). Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG34-91RF00117. Order Number DE96003563. Source: OSTI; NTIS; INIS; GPO Dep.

The technology of ResonantSonic drilling is described. This technique has been demonstrated and deployed as an innovative tool to access the subsurface for installation of monitoring and/or remediation wells and for collection of subsurface materials for environmental restoration applications. The technology uses no drilling fluids, is safe and can be used to drill slant holes.

471 (DOE/EM–0269) **In situ air stripping using horizontal wells. Innovative technology summary report.** Stone and Webster Environmental Technology and Services, Boston, MA (United States); Lawrence Livermore National Lab., CA (United States). Apr 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG34-91RF00117. Order Number DE96003564. Source: OSTI; NTIS; INIS; GPO Dep.

In-situ air stripping employs horizontal wells to inject or sparge air into the ground water and vacuum extract VOC'S from vadose zone soils. The horizontal wells provide better access to the subsurface contamination, and the air sparging eliminates the need for surface ground water treatment systems and treats the subsurface in-situ. A full-scale demonstration was conducted at the Savannah River Plant in an area polluted with trichloroethylene and tetrachloroethylene. Results are described.

472 (DOE/EM–0270) **In situ bioremediation using horizontal wells. Innovative technology summary report.** Oak Ridge National Lab., TN (United States). Apr 1995. 30p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96003565. Source: OSTI; NTIS; INIS; GPO Dep.

In Situ Bioremediation (ISB) is the term used in this report for Gaseous Nutrient Injection for In Situ Bioremediation. This process (ISB) involves injection of air and nutrients (sparging and biostimulation) into the ground water and vacuum extraction to remove Volatile Organic Compounds (VOCs) from the vadose zone concomitant with biodegradation of the VOCs. This process is effective for remediation of soils and ground water contaminated with VOCs both above and below the water table. A full-scale demonstration of ISB was conducted as part of the Savannah River Integrated Demonstration: VOCs in Soils and Ground Water at Nonarid Sites. This demonstration was performed at the Savannah River Site from February 1992 to April 1993.

473 (DOE/EM–0271) **Dynamic underground stripping. Innovative technology summary report.** Stone and Webster Environmental Technology and Services, Boston, MA (United States); Lawrence Livermore National Lab., CA (United States). Apr 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG34-91RF00117. Order Number DE96003566. Source: OSTI; NTIS; INIS; GPO Dep.

Dynamic Underground Stripping (DUS) is a combination of technologies targeted to remediate soil and ground water contaminated with organic compounds. DUS is effective both above and below the water table and is especially well suited for sites with interbedded sand and clay layers. The main technologies comprising DUS are steam injection at the periphery of a contaminated area to heat permeable subsurface areas, vaporize volatile compounds bound to the soil, and drive contaminants to centrally located vacuum extraction wells; electrical heating of less permeable sediments to vaporize contaminants and drive them into the steam zone; and underground imaging such as Electrical Resistance Tomography to delineate heated areas to ensure total cleanup and process control. A full-scale demonstration was conducted on a gasoline spill site at Lawrence Livermore National Laboratory in Livermore, California from November 1992 through December 1993.

474 (DOE/EM–0272) **Six phase soil heating. Innovative technology summary report.** Stone and Webster Environmental Technology and Services, Boston, MA (United States); Lawrence Livermore National Lab., CA (United States). Apr 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG34-91RF00117. Order Number DE96003567. Source: OSTI; NTIS; INIS; GPO Dep.

Six Phase Soil Heating (SPSH) was developed to remediate soils contaminated with volatile and semi-volatile organic compounds. SPSH is designed to enhance the removal of contaminates from the subsurface during soil vapor extraction. The innovation combines an emerging technology, six-phase electric heating, with a baseline technology, soil vapor extraction, to produce a more efficient in situ remediation systems for difficult soil and/or contaminate applications. This document describes the technology and reports on field demonstrations conducted at Savannah River and the Hanford Reservation.

475 (DOE/EM–0273) **Frozen soil barrier technology. Innovative technology summary report.** Oak Ridge National Lab., TN (United States). Apr 1995. 20p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96003568. Source: OSTI; NTIS; INIS; GPO Dep.

The technology of using refrigeration to freeze soils has been employed in large-scale engineering projects for a number of years. This technology bonds soils to give load-bearing strength during construction; to seal tunnels, mine shafts, and other subsurface structures against flooding from groundwater; and to stabilize soils during excavation. Examples of modern applications include several large subway, highway, and water supply tunnels. Ground freezing to form subsurface frozen soil barriers is an innovative technology designed to contain hazardous and radioactive contaminants in soils and groundwater. Frozen soil barriers that provide complete containment ("V"configuration) are formed by drilling and installing refrigerant piping (on 8-ft centers) horizontally at approximately 45° angles for sides and vertically for ends and then recirculating an environmentally safe refrigerant solution through the piping to freeze the soil porewater. Freeze plants are used to keep the containment structure at subfreezing temperatures. A full-scale containment structure was demonstrated from May 12 to October 10, 1994, at a nonhazardous site on SEG property on Gallaher Road, Oak Ridge, Tennessee.

476 (DOE/EM–0278) **The Western Environmental Technology Office (WETO), Butte, Montana. Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of the Deputy Assistant Secretary for Technology Development. Mar 1996. 61p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96007145. Source: OSTI; NTIS; INIS; GPO Dep.

The Western Environmental Technology Office (WETO) is a multi-purpose engineering test facility located in Butte, Montana, and is managed by MSE, Inc. WETO seeks to contribute to environmental research by emphasizing projects to develop heavy metals removal and recovery processes, thermal vitrification systems, and waste minimization/pollution prevention technologies. WETO's environmental technology research and testing activities focus on the recovery of usable resources from waste. In one of WETO's areas of focus, groundwater contamination, water from the Berkeley Pit, located near the WETO site, is being used in demonstrations directed toward the recovery of potable water and metal from the heavy metal-bearing water. The Berkeley Pit is part of an inactive copper mine near Butte that was once part of the nation's largest open-pit mining operation. The Pit contains approximately 25 billion gallons of Berkeley Pit groundwater and surface water containing many dissolved minerals. As part of DOE/OST's Resource Recovery Project (RRP), technologies are being demonstrated to not only clean the contaminated water but to recover metal values such as copper, zinc, and iron with an estimated gross value of more than $100 million. When recovered, the Berkeley Pit waters could benefit the entire Butte valley with new water resources for fisheries, irrigation, municipal, and industrial use. At WETO, the emphasis is on environmental technology development and commercialization activities, which will focus on mine cleanup, waste treatment, resource recovery, and water resource management.

477 (DOE/EM–0296) **Subsurface contaminants focus area.** USDOE Office of Science and Technology, Washington, DC (United States). Office of Program Analysis. Aug 1996. 296p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013524. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Enregy (DOE) Subsurface Contaminants Focus Area is developing technologies to address environmental problems associated with hazardous and radioactive contaminants in soil and groundwater that exist throughout the DOE complex, including radionuclides, heavy metals; and dense non-aqueous phase liquids (DNAPLs). More than 5,700 known DOE groundwater plumes have contaminated over 600 billion gallons of water and 200 million cubic meters of soil. Migration of these plumes threatens local and regional water sources, and in some cases has already adversely impacted off-site rsources. In addition, the Subsurface Contaminants Focus Area is responsible for supplying technologies for the remediation of numerous landfills at DOE facilities. These landfills are estimated to contain over 3 million cubic meters of radioactive and hazardous buried Technology developed within this specialty area will provide efective methods to contain contaminant plumes and new or alternative technologies for development of in situ technologies to minimize waste disposal costs and potential worker exposure by treating plumes in place. While addressing contaminant plumes emanating from DOE landfills, the Subsurface Contaminants Focus Area is also working to develop new or alternative technologies for the in situ stabilization, and nonintrusive characterization of these disposal sites.

478 (DOE/EW/53023–T12) **Hazardous materials in aquatic environments of the Mississippi River Basin. Quarterly progress report, July 1, 1995–September 30, 1995.** Tulane Univ., New Orleans, LA (United States). [1995]. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-93EW53023. Order Number DE96002884. Source: OSTI; NTIS; GPO Dep.

This report is the quarterly progress report for July through September 1995 for work done by Tulane and Xavier Universities under DOE contract number DE-FG01-93-EW53023. Accomplishments for various tasks including administrative activities, collaborative cluster projects, education projects, initiation projects, coordinated instrumentation facility, and an investigators' retreat are detailed in the report.

479 (DOE/ID/13042–49) **Estimation of hydraulic properties and development of a layered conceptual model for the Snake River plain aquifer at the Idaho National Engineering Laboratory, Idaho.** Frederick, D.B.; Johnson, G.S. Idaho Univ., Moscow, ID (United States). Water Resources Research Inst. Feb 1996. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-91ID13042. Order Number DE96011926. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho INEL Oversight Program, in association with the University of Idaho, Idaho Geological Survey, Boise State University, and Idaho State University, developed a research program to determine the hydraulic properties of the Snake River Plain aquifer and characterize the vertical distribution of contaminants. A straddle-packer was deployed in four observation wells near the Idaho Chemical Processing Plant at the Idaho National Engineering Laboratory. Pressure transducers mounted in the straddle-packer assembly were used to monitor the response of the Snake River Plain aquifer to pumping at the ICPP production wells, located 2600 to 4200 feet from the observation wells. The time-drawdown data from these tests were used to evaluate various conceptual models of the aquifer. Aquifer properties were estimated by matching time-drawdown data to type curves for partially penetrating wells in an unconfined aquifer. This approach assumes a homogeneous and isotropic aquifer. The hydraulic properties of the aquifer obtained from the type curve analyses were: (1) Storativity = 3 x 10^{-5}, (2) Specific Yield = 0.01, (3) Transmissivity = 740 ft^2/min, (4) Anisotropy (Kv:Kh)= 1:360.

480 (DOE/ID/13042–50) **Characterizing aquifer hydrogeology and anthropogenic chemical influences on groundwater near the Idaho Chemical Processing Plant, Idaho National Engineering Laboratory, Idaho.** Fromm, J.M. Idaho State Univ., Pocatello, ID (United States). 1995. 322p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-91ID13042. Order Number DE96011925. Source: OSTI; NTIS; INIS; GPO Dep.

A conceptual model of the Eastern Snake River Plain aquifer in the vicinity of monitoring well USGS-44, downgradient of the Idaho Chemical Processing Plant (ICPP) on the Idaho National Engineering Laboratory (INEL), was developed by synthesis and comparison of previous work (40 years) and new investigations into local natural hydrogeological conditions and anthropogenic influences. Quantitative tests of the model, and other recommendations are suggested. The ICPP recovered fissionable uranium from spent nuclear fuel rods and disposed of waste fluids by release to the regional aquifer and lithosphere. Environmental impacts were assessed by a monitoring well network. The conceptual model identifies multiple, highly variable, interacting, and transient components, including INEL facilities multiple operations and liquid waste handling, systems; the anisotropic, in homogeneous aquifer; the network of monitoring and production wells, and the intermittent flow of the Big Lost River. Pre anthropogenic natural conditions and early records of anthropogenic activities were sparsely or unreliably documented making reconstruction of natural conditions or early hydrologic impacts impossible or very broad characterizations.

481 (DOE/ID–22128) **Thickness of surficial sediment at and near the Idaho National Engineering Laboratory, Idaho.** Anderson, S.R.; Liszewski, M.J.; Ackerman, D.J. Geological Survey, Idaho Falls, ID (United States). Jun 1996. 22p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). Order Number DE96014158. Source: OSTI; NTIS; INIS; US Geological Survey, Earth Science Information Center, Open-File Reports Section, Box 25286, MS 517, Denver Federal Center, Denver, CO 80225 (United States); GPO Dep.

Thickness of surficial sediment was determined from natural-gamma logs in 333 wells at and near the Idaho National Engineering Laboratory in eastern Idaho to provide reconnaissance data for future site-characterization studies. Surficial sediment, which is defined as the unconsolidated clay, silt, sand, and gravel that overlie the uppermost basalt flow at each well, ranges in thickness from 0 feet in seven wells drilled through basalt outcrops east of the Idaho

Chemical Processing Plant to 313 feet in well Site 14 southeast of the Big Lost River sinks. Surficial sediment includes alluvial, lacustrine, eolian, and colluvial deposits that generally accumulated during the past 200 thousand years. Additional thickness data, not included in this report, are available from numerous auger holes and foundation borings at and near most facilities.

482 (DOE/MC/29111-96/CO570) **Surfactant-enhanced aquifer remediation at the Portsmouth Gaseous Diffusion Plant.** Jackson, R.E.; Londergan, J.T.; Pickens, J. INTERA, Inc., Austin, TX (United States). 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29111. (CONF-9510108–38: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003695. Source: OSTI; NTIS; INIS; GPO Dep.

Many DOE facilities are situated in areas of sand and gravel which have become polluted with dense, nonaqueous phase liquids or DNAPLs, such as chlorinated solvents, from the various industrial operations at these facilities. The presence of such DNAPLs in sand and gravel aquifers is now recognized as the principal factor in the failure of standard ground-water remediation methods, i.e., "pump-and-treat" operations, to decontaminate such systems. The principal objective of this study is to demonstrate that multi-component DNAPLs can be readily solubilized in sand and gravel aquifers by dilute surfactant solutions.

483 (DOE/MC/29114–5174) **SoilSaw™ demonstration. Final report, September 1992–January 1995.** Saugier, K.; Isaac, R.E. Halliburton NUS, Houston, TX (United States). Feb 1996. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29114. Order Number DE96004443. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) has identified leaking underground storage tanks and buried mixed waste at numerous sites within the DOE complex. Preventing these wastes from entering the environment is a challenging task. One method of preventing waste migration is to isolate the contaminants using subsurface containment barriers. Isolation and containment can be accomplished by both in situ and ex situ methods. This report describes a novel in situ construction method of forming vertical containment barriers (slurry walls) using the SoilSaw™ Barrier System. The SoilSaw™ Barrier System is shown to be a feasible process for constructing subsurface vertical containment barriers to depths of fifty feet. The process is most efficient in sandy soil (including free flowing sand) with barrier construction rates of over 130 square feet per minute. Productivity diminishes to approximately 30 square feet per minute as soils become harder and more cohesive. The present hardware is designed to form a barrier of approximately 12 inch in width. Additional barrier widths can be constructed with this technology by application of wider jet heads. The requirement for a varied arrangement of barrier widths is an increase in hydraulic horse power and additional jet heads.

484 (DOE/MC/29117–5061) **Stabilization and reuse of heavy metal contaminated soils by means of quicklime sulfate salt treatment. Final report, September 1992–February 1995.** Dermatas, D. Stevens Inst. of Tech., Hoboken, NJ (United States). Center for Environmental Engineering. Aug 1995. 218p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29117. Order Number DE96000601. Source: OSTI; NTIS; INIS; GPO Dep.

Capillary and hydraulic flows of water in porous media contaminated by heavy metal species often result in severe aquifer contamination. In the present study a chemical admixture stabilization approach is proposed, where heavy metal stabilization/immobilization is achieved by means of quicklime-based treatment. Both in-situ treatment by injection and on-site stabilization by excavation, mixing, and compaction will be investigated. In addition, the potential to reuse the resulting stabilized material as readily available construction material will also be investigated. The heavy metals under study include: arsenic, chromium, lead, and mercury. The proposed technical approach consists of three separate phases. During phase A, both artificial and naturally occurring contaminated soil mixes were treated, and then tested for stress-strain properties, leachability, micromorphology, mineralogical composition, permeability, setting time, and durability. In such a way, the effectiveness of the proposed remediation technology was verified, the treatment approach was optimized, and the underlying mechanisms responsible for stabilization were established. During phase B, the proposed technology will be tested for two DOE-site subscale systems, involving naturally occurring contaminated soil, using the same testing methodology as the one outlined for phase A. Provided that the proposed technology is proven effective for the subscale systems, a field application will be demonstrated. Again process quality monitoring will be performed by testing undisturbed samples collected from the treated sites, in the same fashion as for the previous phases. Following completion of the proposed study, a set of comprehensive guidelines for field applications will be developed. 42 refs., 196 figs., 26 tabs.

485 (DOE/MC/29121–5126) **Remote mining for in-situ waste containment. Final report.** Martinelli, D. (and others); Banta, L.; Peng, S. West Virginia Univ. Research Corp., Morgantown, WV (United States). Oct 1995. 195p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29121. Order Number DE96000646. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the findings of a study conducted at West Virginia University to determine the feasibility of using a combination of longwall mining and standard landfill lining technologies to mitigate contamination of groundwater supplies by leachates from hazardous waste sites.

486 (DOE/MC/30360–96/CO614) **Laboratory "proof of principle" investigation for the acoustically enhanced remediation technology.** Iovenitti, J.L. (and others); Spencer, J.W.; Hill, D.G. Weiss Associates, Emeryville, CA (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-94MC30360. (CONF-9510108–4: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003453. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes a three phase program of Weiss Associates which investigates the systematics of using acoustic excitation fields (AEFs) to enhance the in-situ remediation of contaminated soil and ground water under both saturated and unsaturated conditions. The focus in this particular paper is a laboratory proof of principle investigation. The field deployment and engineering viability of acoustically enhanced remediation technology is also examined.

487 (DOE/MC/31177–96/C0623) **Field portable detection of VOCs using a SAW/GC system.** Staples, E.J. Aero Power Systems, Inc., Berkeley, CA (United States). 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-94MC31177. (CONF-9510108–47: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96004624. Source: OSTI; NTIS; GPO Dep.

This paper describes research on a fast gas chromatography (GC) vapor analysis system which uses a new type of surface acoustic wave (SAW) detector technology to characterize organic compounds in soils and groundwater. Field testing of GC/SAW was performed at the Savannah River plant.

488 (DOE/MC/31178–96/CO612) **Steerable/distance enhanced penetrometer delivery system.** Amini, A.; Shenhar, J.; Lum, K.D. UTD, Inc., Newington, VA (United States). 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-94MC31178. (CONF-9510108–34: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003684. Source: OSTI; NTIS; INIS; GPO Dep.

The first steps toward contaminant plume contaminant and remediation are detection and mapping of the plume. Penetrometers can be used to map the plume efficiently and also provide the means for in-situ sampling and remediation. In traditional penetrometer applications, the instrumentation package located at the tip measures soil resistance. However, for environmental monitoring purposes, an array of environmental sensors is packed inside the penetrometer rods for in-situ sampling and analysis, or for collection of laboratory samples. At present, penetrometer applications are limited primarily to vertical pushes and because of their heavy weight, the use of penetrometer trucks over shallow buried storage tanks is restricted. To close the technology gap in the use of penetrometers for environmental purposes, UTD took the initiative by developing a new position location device referred to as POLO (short for POsition LOcator), which provides real-time position location without blocking downhole access for environmental sensors. The next step taken was the initiation of work to make penetrometers steerable and capable of greater penetration capabilities. The product of this work will be a relatively lightweight vibratory steerable penetrometer that can provide greater penetration capability than traditional penetrometers of the same weight, permitting applications over shallow buried storage tanks.

489 (DOE/MC/31185–96/CO619) **Development of the integrated in situ Lasagna process.** Ho, S. (and others); Athmer, C.; Sheridan, P. Monsanto Co., St. Louis, MO (United States). 1995. 18p. Sponsored by US-DOE, Washington, DC (United States). DOE Contract AR21-94MC31185. (CONF-9510108–37: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003638. Source: OSTI; NTIS; INIS; GPO Dep.

Contamination in deep, low permeability soils poses a significant technical challenge to in-situ remediation efforts. Poor accessibility to the contaminants and difficulty in uniform delivery of treatment reagents have rendered existing in-situ methods such as bioremediation, vapor extraction, and pump and treat rather ineffective when applied to low permeability soils present at many contaminated sites.

490 (DOE/MC/32108–96/CO616) **Surfactant-modified zeolites as permeable barriers to organic and inorganic groundwater contaminants.** Bowman, R.S.; Sullivan, E.J. New Mexico Inst. of Mining and Technology, Socorro, NM (United States). 1995. 6p. Sponsored by US-DOE, Washington, DC (United States). DOE Contract AR21-95MC32108. (CONF-9510108–16: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003466. Source: OSTI; NTIS; INIS; GPO Dep.

We have shown in laboratory experiments that natural zeolites treated with hexadecyltrimethylammonium (HDTMA) are effective sorbents for nonpolar organics, inorganic cations, and inorganic anions. Due to their low cost (~$0.75/kg) and granular nature, HDTMA-zeolites appear ideal candidates for reactive, permeable subsurface barriers. The HDTMA-zeolites are stable over a wide range of pH (3-13), ionic strength (1 M Cs^+ or Ca^{2+}), and in organic solvents. Surfactant-modified zeolites sorb nonpolar organics (benzene, toluene, xylene, chlorinated aliphatics) via a partitioning mechanism, inorganic cations (Pb^{2+}) via ion exchange and surface complexation, and inorganic anions (CrO_4^{2-}, SeO_4^{2-},SO_4^{2-}) via surface precipitation.

491 (DOE/MC/32114–96/CO625) **Development of HUMASORB™, a lignite derived humic acid for removal of metals and organic contaminants from groundwater.** Sanjay, H.G.; Srivastava, K.C.; Walia, D.S. ARCTECH, Inc., Chantilly, VA (United States). 1995. 14p. Sponsored by US-DOE, Washington, DC (United States). DOE Contract AR21-95MC32114. (CONF-9510108–40: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003741. Source: OSTI; NTIS; INIS; GPO Dep.

Heavy metal and organic contamination of surface and groundwater systems is a major environmental concern. The contamination is primarily due to improperly disposed industrial wastes. The presence of toxic heavy metal ions, volatile organic compounds (VOCs) and pesticides in water is of great concern and could affect the safety of drinking water. Decontamination of surface and groundwater can be achieved using a broad spectrum of treatment options such as precipitation, ion-exchange, microbial digestion, membrane separation, activated carbon adsorption, etc. The state of the art technologies for treatment of contaminated water however, can in one pass remediate only one class of contaminants, i.e., either VOCs (activated carbon) or heavy metals (ion exchange). This would require the use of at a minimum, two different stepwise processes to remediate a site. The groundwater contamination at different Department of Energy (DOE) sites (e.g., Hanford) is due to the presence of both VOCs and heavy metals. The two-step approach increases the cost of remediation. To overcome the sequential treatment of contaminated streams to remove both organics and metals, a novel material having properties to remove both classes of contaminants in one step is being developed as part of this project.

492 (DOE/NV/11040–T1) **Summary of hydrogeologic controls on ground-water flow at the Nevada Test Site, Nye County, Nevada.** Laczniak, R.J.; Cole, J.C.; Sawyer, D.A.; Trudeau, D.A. Geological Survey, Carson City, NV (United States). 1996. 128p. Sponsored by US-DOE, Washington, DC (United States). DOE Contract AI08-91NV11040. Order Number DE96012361. Source: OSTI; NTIS; INIS; GPO Dep.

Includes maps.

The underground testing of nuclear devices has generated substantial volumes of radioactive and other chemical contaminants below ground at the Nevada Test Site (NTS). Many of the more radioactive contaminants are highly toxic and are known to persist in the environment for thousands of years. In response to concerns about potential health hazards, the US Department of Energy, under its Environmental Restoration Program, has made NTS the subject of a long-term investigation. Efforts will assess whether byproducts of underground testing pose a potential hazard to the health and safety of the public and, if necessary, will evaluate and implement steps to remediate any of the identified dangers. Ground-water flow is the primary mechanism by which contaminants can be transported significant distances away from the initial point of injection. Flow paths between contaminant sources and potential receptors are separated by remote areas that span tens of miles. The diversity and structural complexity of the rocks along these flow paths complicates the hydrology of the region. Although the hydrology has been studied in some detail, much still remains uncertain about flow rates and directions through the fractured-rock aquifers that transmit water great distances across this arid region. Unique to the hydrology of NTS are the effects of underground testing, which severely alter local rock characteristics and affect hydrologic conditions throughout the region. This report summarizes what is known and inferred about ground-water flow throughout the NTS region. The report identifies and updates what is known about some of the major controls on ground-water flow, highlights some of the uncertainties in the current understanding, and prioritizes some of the technical needs as related to the Environmental Restoration Program. 113 refs.

493 (DOE/OR--01-1393/V3&D2) **Remedial investigation/feasibility study of the Clinch River/Poplar Creek Operable Unit. Volume 3. Risk assessment information. Appendixes E, F.** Oak Ridge National Lab., TN (United States). Mar 1996. 755p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. (ORNL/ER--315/V3&D2). Order Number DE96013719. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the findings of an investigation into contamination of the Clinch River and Poplar Creek near the U.S. Department of Energy's (DOE's) Oak Ridge Reservation (ORR) in eastern Tennessee. For more than 50 years, various hazardous and radioactive substances have been released to the environment as a result of operations and waste management activities at the ORR. In 1989, the ORR was placed on the National Priorities List (NPL), established and maintained under the federal Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA). Under CERCLA, NPL sites must be investigated to determine the nature and extent of contamination at the site, assess the risk to human health and the environment posed by the site, and, if necessary, identify feasible remedial alternatives that could be used to clean the site and reduce risk. To facilitate the overall environmental restoration effort at the ORR, CERCLA activities are being implemented individually as distinct operable units (OUs). This document is Volume 3 of the combined Remedial Investigation and Feasibility Study Report for the Clinch River/Poplar Creek OU.

494 (DOE/OR--2006) **Aqueous-stream uranium-removal technology cost/benefit and market analysis.** Kapline Enterprises, Inc., Knoxville, TN (United States). Mar 1994. 247p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016400. Source: OSTI; NTIS; INIS; GPO Dep.

The primary purpose of this report is to present information that was gathered by Kapline Enterprises, Inc. (KEI) in order to help the Department of Energy (DOE) determine the merit of continued biosorption research funding. However, in the event that funding is continued, it is also intended to help the researchers in their efforts to develop a better uranium-removal process. This report (1) provides a comparison of DOE sites that may utilize aqueous-stream, uranium-removal biosorption technology, (2) presents a comparison of the biosorption and ion exchange processes, and (3) establishes performance criteria by which the project can be measured. It also attempts to provide focus for biosorbent ground-water-remediation research and to ask questions that need to be answered. This report is primarily a study of the US market for technologies that remove uranium from aqueous streams, but it also addresses the international market-particularly for Germany. Because KEI's access to international market information is extremely limited, the material presented in this report represents a best effort to obtain this data. Although uranium-contaminated aqueous streams are a problem in other countries as well, the scope of this report is primarily limited to the US and Germany for two reasons: (1) Germany is the country of the biosorbent-CRADA partner and (2) time constraints.

495 (DOE/OR--2035) **Demonstration test and evaluation of ultraviolet/ultraviolet catalyzed peroxide oxidation for groundwater remediation at Oak Ridge K-25 Site.** Oak Ridge National Lab., TN (United States); Schafer (W.J.) Associates, Inc., Chelmsford, MA (United States); Vulcan Peroxidation Systems, Inc., Tucson, AZ (United States). [1994]. 249p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-93OR22000. Order Number DE95016634. Source: OSTI; NTIS; GPO Dep.

In the Ultraviolet/Ultraviolet Catalyzed Groundwater Remediation program, W.J. Schafer Associates, Inc. (WJSA) demonstrated, tested and evaluated a new ultraviolet (UV) lamp integrated with an existing commercial technology employing UV catalyzed peroxide oxidation to destroy organics in groundwater at an Oak Ridge K-25 site. The existing commercial technology is the perox-pure™ process of Peroxidation Systems Incorporated (PSI) that employs standard UV lamp technology to catalyze H_2O_2 into OH radicals, which attack many organic molecules. In comparison to classical technologies for remediation of groundwater contaminated with organics, the perox-pure™ process not only is cost effective but also reduces contaminants to harmless by-products instead of transferring the contaminants from one medium to another (such as in activated carbon or air stripping). Although the perox-pure™ process is cost effective against many organics, it is not effective for some organic contaminants of interest to DOE such as TCA, which has the highest concentration of the organics at the K-25 test site. Contaminants such as TCA are treated more readily by direct photolysis using short wavelength UV light. WJSA has been developing a unique UV lamp which is very efficient in the short UV wavelength region. Consequently, combining this UV lamp with the perox-pure™ process results in a means for treating essentially all organic contaminants. In the program reported here, the new UV lamp lifetime was improved and the lamp integrated into a PSI demonstration trailer. Even though this UV lamp operated at less than optimum power and UV efficiency, the destruction rate for the TCA was more than double that of the commercial unit. An optimized UV lamp may double again the destruction rate; i.e., a factor of four greater than the commercial system.

496 (DOE/OR/21548–567) **Work plan for the remedial investigation/feasibility study for the groundwater operable units at the Chemical Plant Area and the Ordnance Works Area, Weldon Spring, Missouri.** Argonne National Lab., IL (United States); USDOE Weldon Spring Site Remedial Action Project, MO (United States). Aug 1995. 149p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-86OR21548 ; W-31109-ENG-38. Order Number DE95017588. Source: OSTI; NTIS; INIS; GPO Dep.

US Department of Energy (DOE) and the US Army Corps of Engineers (CE) are conducting cleanup activities at two properties, the chemical plant area and the ordnance works area, located adjacent to one another in St. Charles County, Missouri. In accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, DOE and CE are evaluating conditions and potential responses at the chemical plant area and at the ordnance works area, respectively, to address groundwater and surface water contamination. This work plan provides a comprehensive evaluation of areas that are relevant to the (GWOUs) of both the chemical plant and the ordnance works area. Following areas or media are addressed in this work plan: groundwater beneath the chemical plant area (including designated vicinity properties described in Section 5 of the RI for the chemical plant area [DOE 1992d]) and beneath the ordnance works area; surface water and sediment at selected springs, including Burgermeister Spring. The organization of this work plan is as follows: Chapter 1 discusses the objectives for conducting the evaluation, including a summary of relevant site information and overall environmental compliance activities to be undertaken; Chapter 2 presents a history and a description of the site and areas addressed within the GWOUs, along with currently available data; Chapter 3 presents a preliminary evaluation of areas included in the GWOUs, which is based on information given in Section 2, and discusses data requirements; Chapter 4 presents rationale for data collection or characterization activities to be carried out in the remedial investigation (RI) phase, along with brief summaries of supporting documents ancillary to this work plan; Chapter 5 discusses the activities planned for GWOUs under each of the 14 tasks for an remedial (RI/FS); Chapter 6 presents proposed schedules for RI/FS for the GWOUS; and Chapter 7 explains the project management structure.

497 (DOE/RL–94-36-4) **Quarterly report of RCRA groundwater monitoring data for period October 1 through December 31, 1994.** Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 429p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012821. Source: OSTI; NTIS; INIS; GPO Dep.

Hanford Site interim-status groundwater monitoring projects are conducted as either background, indicator parameter evaluation, or groundwater quality assessment monitoring programs as defined in the Resource Conservation and Recovery Act of 1976 (RCRA); and "Interim Status Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities" (Title 40 Code of Federal Regulations [CFR] Part 265), as amended. Compliance with the 40 CFR 265 regulations is required by the Washington Administrative Code (WAC) 173-303. This report contains data from Hanford Site groundwater monitoring projects. The location of each facility is shown. Westinghouse Hanford Company (WHC) manages the RCRA groundwater monitoring projects for federal facilities on the Hanford Site. Performing project management, preparing groundwater monitoring plans, well network design and installation, specifying groundwater data needs, performing quality control (QC) oversight, data management, and preparing project sampling schedules are all parts of this responsibility. Pacific Northwest Laboratory (PNL) administers the contract for analytical services and provides groundwater sampling services to WHC for the RCRA groundwater monitoring program. This quarterly report contains data received between October and December 1994, which are the cutoff dates for this reporting period. This report may contain not only data from the October through December quarter, but also data from earlier sampling events that were not previously reported.

498 (DOE/RL–94-102) **Proposed plan for interim remedial measure at the 100-HR-3 Operable Unit.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Aug 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017545. Source: OSTI; NTIS; INIS; GPO Dep.

This Proposed Plan identifies the preferred alternative for an interim remedial measure at the 100-HR-3 Operable Unit, located at the Hanford Site. It also summarizes other alternatives evaluated for interim remedial measures in this operable unit. The intent of an interim remedial measure is to speed up actions to address contaminated areas that pose threats to human health or the environment. This Proposed Plan is intended to be a fact sheet for public review that briefly describes the remedial alternatives that have been analyzed, identifies the preferred alternative, and summarizes the information relied upon to recommend the preferred alternative. The preferred alternative presented in this Proposed Plan is to remove contaminated groundwater from the 100-HR-3 Operable Unit, treat it by ion exchange, and dispose of treated groundwater by using upgradient injection wells to return it to the aquifer.

499 (DOE/RL–94-102-Rev.1) **Proposed plan for interim remedial measure at the 100-HR-3 Operable Unit. Revision 1.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Sep 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017501. Source: OSTI; NTIS; INIS; GPO Dep.

Operable Unit, located at the Hanford Site. It also summarizes other alternative evaluated for interim remedial measures in this operable unit. The intent of an interim remedi measure is to speed up actions to address contaminate areas that pose threats to human health or environment. This Proposed Plan is intended to be a fact sheet for public review that briefly describes the remedial alternatives that have been analyzed, identifies the preferred alternative, and summarizes the information relied upon to recommend the preferred alternative. The preferred alternative presented in this Proposed Plan is to remove contaminated groundwater from the 100-HR-3 Operable Unit, treat it by ion exchange, and dispose of treated groundwater by using upgradient injection wells to return it to the aquifer.

500 (DOE/RL–95-02) **Treatability test report for the 200-UP-1 Operable Unit, Hanford Site.** Bechtel National,

Inc., Richland, WA (United States). Jul 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017532. Source: OSTI; NTIS; INIS; GPO Dep.

A pilot-scale groundwater treatability test was performed in the 200-UP-1 Operable Unit located in the 200 West Area of the Hanford Site. The primary focus of the pilot-scale test was to assess the performance, operating parameters, and costs associated with the operation of an aboveground ion-exchange treatment system designed to remove uranium and technetium-99 from extracted 200-UP-1 groundwater. Laboratory-scale tests were also performed obtain additional contaminant loading data at different flow rates for the ion-exchange resin used in the treatment system and to assess the performance of other ion-exchange resins. The tests were also used to asses resins in removing nitrate contamination from the groundwater. The pilot-scale test treated approximately 1 million gallons of extracted groundwater. Monitoring of the treatment system indicated that the ion-exchange process achieved a greater that 99% efficiency at removing uranium and technetium from the extracted groundwater. The ion-exchange process provided to be ineffective at removing nitrates (using the resin selected for this test) with little or no change in the average nitrate concentrations. The laboratory-scale flow-through column test results indicated that contact times did not have a major effect on technetium or uranium loading rates and capacities within the range tested. This indicates that the resin kinetics support the 5.7-minute contact time used in the operation of the pilot-scale treatment system. The batch equilibrium tests identified several resins effective at treating for uranium and technetium including the resin used in the pilot-scale system. None of these resins exhibited a significant capacity for nitrates.

501 (DOE/RL--95-26) **Interim remedial measure proposed plan for the 200-UP-1 operable unit, Hanford, Washington, Revision 0.** USDOE Richland Operations Office, WA (United States). Aug 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017529. Source: OSTI; NTIS; INIS; GPO Dep.

This interim remedial measure (IRM) proposed plan describes an interim action that is proposed for the 200-UP-1 Groundwater Operable Unit (200-UP-1) located in the 200 West Area of the U.S. Department of Energy's (DOE) Hanford Site. The Hanford Site is a 560-square mile federal facility located near the city of Richland in Benton County, Washington. The 200-UP-1 addresses certain groundwater contaminants in southern portions of the 200 West Area. The objectives of this IRM are to contain elevated concentrations of uranium and technetium-99 in 200-UP-1 and collect data on aquifer and contaminant response to the remediation measure. Monitoring data indicate that the highest concentrations of these contaminants are within the boundary of the 200 West Area. However, lower concentrations of these contaminants have migrated beyond the 200 West Area boundary.

502 (DOE/RL--95-30) **200-ZP-1 Operable Unit Treatability Test Report.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Jul 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017544. Source: OSTI; NTIS; INIS; GPO Dep.

A pilot-scale treatability test was performed in the 200-ZP-1 groundwater operable unit, located in the 200 West Area of the Hanford Site. The performance of the test was based on the Treatability Test Plan for the 200-ZP-1 Operable Unit (DOE-RL 1994b) and an agreement between the US Department of Energy (DOE), the US Environmental Protection Agency (EPA), and the Washington State Department of Ecology (Ecology) documented in the Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement) (Change Control Form M-13-93-03). The pilot-scale treatability test was conducted on the volatile organic compound (VOC) contaminant plume associated with the 200-ZP-1 Operable Unit and focused on assessing the performance of an aboveground treatment system with respect to its ability to remove carbon tetrachloride, chloroform, and trichloroethylene from extracted groundwater.

503 (DOE/RL--95-32) **In Situ Remediation Integrated Program: FY 1994 program summary.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. Apr 1995. 168p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95011333..Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) established the Office of Technology Development (EM-50) as an element of the Office of Environmental Management (EM) in November 1989. In an effort to focus resources and address priority needs, EM-50 introduced the concept of integrated programs (IPs) and integrated demonstrations (IDs). The In Situ Remediation Integrated Program (ISR IP) focuses research and development on the in-place treatment of contaminated environmental media, such as soil and groundwater, and the containment of contaminants to prevent the contaminants from spreading through the environment. Using in situ remediation technologies to clean up DOE sites minimizes adverse health effects on workers and the public by reducing contact exposure. The technologies also reduce cleanup costs by orders of magnitude. This report summarizes project work conducted in FY 1994 under the ISR IP in three major areas: treatment (bioremediation), treatment (physical/chemical), and containment technologies. Buried waste, contaminated soils and groundwater, and containerized waste are all candidates for in situ remediation. Contaminants include radioactive waste, volatile and nonvolatile organics, heavy metals, nitrates, and explosive materials.

504 (DOE/RL--95-69-2) **RCRA groundwater monitoring data. Quarterly report, April 1, 1995–June 30, 1995.** Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96005130. Source: OSTI; NTIS; INIS; GPO Dep.

Nineteen Resource Conservation and Recovery Act of 1976 (RCRA) groundwater monitoring projects are conducted at the Hanford Site. These projects include treatment, storage, and disposal facilities for both solid and liquid waste. The groundwater monitoring programs described in this report comply with the interim-status federal (Title 40 Code of Federal Regulation [CFR] Part 265) and state (Washington Administrative Code [WAC] 173-303-400) regulations. The RCRA projects are monitored under one of three programs: background monitoring, indicator parameter evaluation, or groundwater quality assessment. Westinghouse Hanford Company (WHC) manages the RCRA groundwater monitoring projects on the Hanford Site. Performing project management, preparing groundwater monitoring plans, well network design and installation, specifying groundwater data needs, performing quality control (QC) oversight, data management, and preparing project sampling schedules are all parts of this responsibility. Pacific Northwest Laboratory (PNL) administers the contract for analytical services to WHC for the RCRA groundwater monitoring program. This quarterly report contains data received between April and June 1995, which are the cutoff dates for this reporting period. This report may contain not only data from the April through June quarter, but also data from earlier sampling events that were not previously reported.

505 (DOE/RL–95-69-3) **Quarterly report of RCRA groundwater monitoring data for period July 1–September 30, 1995.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 351p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96006860. Source: OSTI; NTIS; INIS; GPO Dep.

Nineteen RCRA groundwater monitoring projects are conducted at the Hanford site. They include treatment, storage, and disposal facilities for both solid and liquid waste. Groundwater monitoring programs described in this report comply with the interim- and final- status federal and state regulations. The RCRA projects are monitored under one of the following programs: background monitoring, indicator parameter evaluation, or groundwater quality assessment or detection. This quarterly report contains data received between July 1 and Sept. 30, 1995, which are the cutoff dates for this reporting period. This report may contain not only data from the July-Sept. quarter, but also data from earlier sampling events not previously reported.

506 (DOE/RL–95-89) **Iodine-129 contamination: Nature, extent, and treatment technologies.** Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008183. Source: OSTI; NTIS; INIS; GPO Dep.

This document was prepared to satisfy the requirements of the Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement) Milestone M-15-81B. The document provides information on the known nature and extent of iodine-129 (^{129}I) contamination in the soil and groundwater of the 200 Area Plateau, lists potential applicable or relevant and appropriate requirements, and describes the available treatment methods to remediate ^{129}I contamination in both groundwater and soils. The radioactive isotope ^{129}I was generated at the Hanford Site during plutonium production and processing. A portion of this ^{129}I was released to the soils in process effluent waste streams at the separations plants in the 200 East and 200 West Areas. As a result of this effluent discharge, ^{129}I has impacted the groundwater in the unconfined aquifer. The ^{129}I contamination plumes are large and diffuse, with areas of higher activity located near the original disposal sites. The highest activity encountered in Hanford Site groundwater is 86.1 pCi/L near the S Plant in the 200 West Area. The highest activity noted for the 200 East Area plume is 12.4 pCi/L in a well located near the Plutonium/Uranium Extraction (PUREX) Plant. Iodine-129-contaminated groundwater from the low-activity, leading edge of the contaminant plume has reached the Columbia River. The 15.7 million year half-life, high mobility, and bioaccumulation tendency of this radioisotope contribute to the concern about potential risks to human health and the environment. The very low number of ^{129}I detections to date is likely due to the fact that site investigations have not been conducted at the source operable unit cribs where ^{129}I-bearing process wastes were disposed. As a result, it cannot currently be determined whether any cribs present a continuing or future source of ^{129}I contamination to the groundwater.

507 (DOE/RL–95-99) **100-FR-3 groundwater/soil gas supplemental limited field investigation report.** USDOE Richland Operations Office, WA (United States). Apr 1996. 40p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013564. Source: OSTI; NTIS; INIS; GPO Dep.

In 1993, a Limited Field Investigation (LFI) was conducted for the 100-FR-3 Operable Unit which identified trichloroethylene (TCE) as a contaminant of potential concern (COPC) (DOE-RL 1994). In groundwater samples collected for the LFI, TCE was detected in well 199-177-1 at a concentration exceeding the U.S. Environmental Protection Agency (EPA) maximum contaminant level (5 μg/L) and Washington State groundwater criteria (3 μg/L). With the concurrence of the EPA and the Washington State Department of Ecology (Ecology), a supplemental LFI was conducted to determine the extent and potential source of TCE groundwater contamination associated with the 100-FR-3 Operable Unit. This report summarizes the activities and results of the groundwater/soil gas supplemental LFI for the 100-FR-3 Operable Unit. The primary objective of this investigation was to assess the lateral distribution of TCE in shallow (3 to 5 ft below the water table) groundwater associated with the 100-FR-3 Operable Unit. The second objective was to assess soil gas (3 to 5 concentrations in the study area in an attempt to identify potential sources of TCE and develop a correlation between soil gas and groundwater concentrations). Finally, the third objective of the investigation was to refine the site conceptual model.

508 (DOE/RL–95-101) **An analysis of potential impacts to the groundwater monitoring networks in the Central Plateau. Revision 0.** Department of Energy, Richland, WA (United States). Richland Operations Office. [1996]. 96p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005876. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of an evaluation of potential impacts to the four groundwater monitoring projects operating in the Central Plateau of the Hanford Site. It specifically fulfills Milestone M-15-81A of the Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement). Milestone M-15-81A specifies the evaluation of the potential impacts to the groundwater monitoring well systems in the Central Plateau caused by the following activities: reduction of liquids discharged to soil, proposed and operational liquid treatment facilities, and proposed pump-and-treat systems. For this report, an "impact" is defined as a restriction of the ability to draw samples from a well and/or a reduction of the ability of a monitoring well to meet its intended purpose (such as the detection of contaminant seepage from a facility). Approximately 20% (74 wells) of the groundwater monitoring wells potentially will experience sampling problems by the year 2005 due to the declining water table in the Central Plateau. Reduction of discharges to the B Pond complex and operation of the Treated Effluent Disposal System will directly cause four additional wells to potentially experience sampling problems. Approximately 90 monitoring wells (35 of which are Resource Conservation and Recovery Act of 1976 [RCRA] wells) will be potentially affected by the operation of pump-and-treat systems in the 200 West Area. Most of the impacts will be caused by local changes to groundwater flow directions that will potentially reduce the ability of the RCRA well network to monitor a limited number of RCRA facilities.

509 (DOE/RL–96-01) **Annual report for RCRA groundwater monitoring projects at Hanford Site facilities for 1995.** Hartman, M.J. Westinghouse Hanford Co., Richland, WA (United States). Feb 1996. 580p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96009932. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the annual hydrogeologic evaluation of 19 Resource Conservation and Recovery Act of 1976 facilities and 1 nonhazardous waste facility at the US Department of Energy's Hanford Site. Although most of the facilities no longer receive dangerous waste, a few facilities continue to receive dangerous waste constituents for treatment, storage, or disposal. The 19 Resource Conservation and Recovery Act facilities comprise 29 waste management units. Nine of the units are monitored under groundwater quality assessment status because of elevated levels of contamination indicator parameters. The impact of those units on groundwater quality, if any, is being investigated. If dangerous waste or waste constituents have entered groundwater, their concentration profiles, rate, and extent of migration are evaluated. Groundwater is monitored at the other 20 units to detect leakage, should it occur. This report provides an interpretation of groundwater data collected at the waste management units between October 1994 and September 1995. Groundwater quality is described for the entire Hanford Site. Widespread contaminants include nitrate, chromium, carbon tetrachloride, tritium, and other radionuclides.

510 (DOE/RL–96-59) **200-BP-5 operable unit treatability test report.** USDOE Richland Operations Office, WA (United States). Apr 1996. 411p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013575. Source: OSTI; NTIS; INIS; GPO Dep.

The 200-BP-5 Operable Unit was established in response to recommendations presented in the 200 East Groundwater Aggregate Area Management Study Report (AAMSR) (DOE-RL 1993a). Recognizing different approaches to remediation, the groundwater AAMSR recommended separating groundwater from source and vadose zone operable units and subdividing 200 East Area groundwater into two operable units. The division between the 200-BP-5 and 200-PO-1 Operable Units was based principally on source operable unit boundaries and distribution of groundwater plumes derived from either B Plant or Plutonium/Uranium Extraction (PUREX) Plant liquid waste disposal sites.

511 (EML–567) **Inventory of site-derived ^{36}Cl in the Snake River plain aquifer, Idaho National Engineering Laboratory, Idaho.** Beasley, T.M. Department of Energy, New York, NY (United States). Environmental Measurements Lab. Feb 1995. 51p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014966. Source: OSTI; NTIS; INIS; GPO Dep.

Radioactive waste management practices at the U.S. Department of Energy's Idaho National Engineering Laboratory (INEL) in Idaho have introduced ^{36}Cl ($T_{1/2}$ = 301,000 yr) into the Snake River Plain aquifer underlying the site. The ^{36}Cl is believed to originate from neutron activation of stable ^{35}Cl in nuclear fuels (principally) and in reactor cooling/process water. Wastewater releases of ^{3}H at the INEL have been documented by the site operators for the period 1952 to 1988. During this time, approximately 1.2 PBq of ^{3}H (30,000 Ci) were introduced to the subsurface through disposal wells and seepage ponds. By sampling a number of monitoring and production wells downgradient from points of introduction, ^{3}H movement and dispersion in the groundwater have been documented by the U.S. Geological Survey. The present report uses these historical ^{3}H release and monitoring data to choose hydrologic parameters (matrix porosity and plume penetration depth) that produce concordance between the ^{3}H release estimates and the inventory calculated from measurements of ^{3}H in the subsurface. These parameters are then applied to ^{36}Cl isopleths to generate an estimated ^{36}Cl inventory in the subsurface. Using assumptions about irradiation times, neutron fluxes, and total fuel processed, as little as 23 g of stable chloride impurity in fuel elements would be adequate to produce the amount of ^{36}Cl estimated to be in the groundwaters underlying the site. The highest atom concentration of ^{36}Cl measured onsite (222×10^{10} atoms 1^{-1}) corresponds to an activity level of ~4 pCi 1^{-1} and represents 0.2 percent of the U.S. Environmental Protection Agency's (EPA) drinking water standard for this radionuclide (2000 pCi 1^{-1}).

512 (FEMP/SUB–095) **Horizontal grout barrier project results of the latest testing.** Riedel, K.W. (PARSONS Environmental Remedial Action Project, Fairfield, OH (United States)); Ridenour, D.E.; Walker, J. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950868–15: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96000317. Source: OSTI; NTIS; INIS; GPO Dep.

Throughout United States Department of Energy (DOE) sites are situations where storage tanks and pits are leaking or have the potential to leak contamination into the soil. Subsequent leaching from rain and groundwater flow disperses the contamination far from the original site and, in some cases, into aquifers which serve as a drinking water source. Fernald Environmental Restoration Management Corporation (FERMCO) at Fernald working with the DOE Office of Technology Development (OTD) and two subcontractors, is pursuing the goal of placing a barrier beneath the contamination to prevent this dispersion. The technology being developed is an in situ approach based on directional drilling and jet grouting techniques developed in the oil fields. The unique barrier techniques being developed depend on innovative tooling and special grouts to install a horizontal barrier underground without disturbing the contaminated soils above. The initial tool designs were tested in December 1992 and were encouraging enough that the DOE agreed to fund continued development. A second set of designs were tested in August 1994. The testing results were less than expected but did provide a number of lessons learned. This paper reports on the third set of tool designs and the results of testing these tools prior to the full demonstration project at Fernald.

513 (GJPO-WMP–96) **Geochemical study of groundwater at Sandia National Laboratories/New Mexico and Kirtland Air Force Base.** Rust Geotech, Inc., Grand Junction, CO (United States). Oct 1995. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL96907. Order Number DE96013678. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) Grand Junction Projects Office (GJPO) and its contractor, Rust Geotech, support the Kirtland Area Office by assisting Sandia National Laboratories/New Mexico (Sandia/NM) with remedial action, remedial design, and technical support of its Environmental Restoration Program. To aid in determining groundwater origins and flow paths, the GJPO was tasked to provide interpretation of groundwater geochemical data. The purpose of this investigation was to describe and analyze the groundwater geochemistry of the Sandia/NM Kirtland Air Force Base (KAFB). Interpretations of groundwater origins are made by using these data and the results of "mass balance" and "reaction path' modeling. Additional maps and plots were compiled to more fully comprehend the geochemical distributions. A more complete set of these data representations are provided in the appendices. Previous interpretations of groundwater-flow paths that were based on well-head, geologic, and geochemical data are presented in various reports and were used as the basis for developing the models presented in this investigation.

514 (INEL–94/0012-Rev.3) **Overview of groundwater and surface water standards pertinent to the Idaho National Engineering Laboratory. Revision 3.** Lundahl, A.L.; Williams, S.; Grizzle, B.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Sep 1995. 318p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Contract C95-175686. Order Number DE96009711. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents an overview of groundwater- and surface water-related laws, regulations, agreements, guidance documents, Executive Orders, and DOE orders pertinent to the Idaho National Engineering Laboratory. This document is a summary and is intended to help readers understand which regulatory requirements may apply to their particular circumstances. However, the document is not intended to be used in lieu of applicable regulations. Unless otherwise noted, the information in this report reflects a summary and evaluation completed July 1, 1995. This document is considered a Living Document, and updates on changing laws and regulations will be provided.

515 (INEL–95/0169-Rev.1) **Development of a regional groundwater flow model for the area of the Idaho National Engineering Laboratory, Eastern Snake River Plain Aquifer.** McCarthy, J.M. (and others); Arnett, R.C.; Neupauer, R.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1995. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002196. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents a study conducted to develop a regional groundwater flow model for the Eastern Snake River Plain Aquifer in the area of the Idaho National Engineering Laboratory. The model was developed to support Waste Area Group 10, Operable Unit 10-04 groundwater flow and transport studies. The products of this study are this report and a set of computational tools designed to numerically model the regional groundwater flow in the Eastern Snake River Plain aquifer. The objective of developing the current model was to create a tool for defining the regional groundwater flow at the INEL. The model was developed to (a) support future transport modeling for WAG 10-04 by providing the regional groundwater flow information needed for the WAG 10-04 risk assessment, (b) define the regional groundwater flow setting for modeling groundwater contaminant transport at the scale of the individual WAGs, (c) provide a tool for improving the understanding of the groundwater flow system below the INEL, and (d) consolidate the existing regional groundwater modeling information into one usable model. The current model is appropriate for defining the regional flow setting for flow submodels as well as hypothesis testing to better understand the regional groundwater flow in the area of the INEL. The scale of the submodels must be chosen based on accuracy required for the study.

516 (INEL–95/00230) **Design considerations for pump-and-treat remediation based on characterization of industrial injection wells: Lessons learned from the groundwater interim action at the test area north of the Idaho National Engineering Laboratory.** Cotten, G.B. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950868–27: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96004003. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory (INEL) is a 2,305 km^2 (890 mi^2) Federal Facility operated by the U.S. Department of Energy, Idaho Operations Office. The Test Area North (TAN) complex is located approximately 80 km (50 mi) northwest of Idaho Falls in the northern portion of the HSTEL and extends over an area of approximately 30 km^2 (12 mi^2). The Technical Support Facility (TSF) is centrally located within TAN and consists of several experimental and support facilities for conducting research and development activities on nuclear reactor performance. Operations at TAN were initiated in the early 1950s to support the U.S. Air Force aircraft nuclear propulsion project and have continued over the years with various experimental and testing facilities. The TSF-05 Injection well was used from 1953 to 1972 to dispose of TAN liquid wastes in the fractured basalt of the Snake River Plain Aquifer. Trichloroethylene (TCE) was first identified as a groundwater contaminant in 1987 when it was found in the TAN drinking water above acceptable levels. The TAN Groundwater Interim Action at the INEL was intended to provide both interim containment and clean-up of contaminated groundwater resulting from the 40-year old injection well, TSF-05. The primary decontamination objective of the Groundwater Treatment Facility (GWTF) is to remove volatile organic compounds, primarily TCE. A pump-and-treat technology using air stripping, carbon adsorption, and resin ion exchange for strontium-90 (^{90}Sr) was selected in the Operable Unit 1-07A Groundwater Interim Action Record of Decision. Operations started on February 16, 1994 and activities were suspended on January 23, 1995 due to the inability to meet Remedial Action Objectives (RAOs).

517 (INEL–95/0546) **Determination of radium in water.** Hohorst, F.A.; Huntley, M.W.; Hartenstein, S.D. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Oct 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96004072. Source: OSTI; NTIS; INIS; GPO Dep.

These detailed work instructions (DWIs) are tailored for the analysis of radium-226 and radium-228 in drinking water supplies from ground water and surface water sources and composites derived from them. The instructions have been adapted from several sources, including a draft EPA method. One objective was to minimize the generation of mixed wastes. Quantitative determinations of actinium-228 are made at 911 keV. The minimum detection level (MDL) for the gamma spectrometric measurements at this energy vary with matrix, volume, geometry, detector, background, and counting statistics. The range of MDL's for current detectors is 0.07 to 0.5 Bq/sample. Quantitative determinations of radium-226 are made by counting the high energy alpha particles which radium-226 progeny emit using liquid scintillation counting (LSC). The minimum detectable activity (MDA) is 3.8 E-3 Bq/sample. The maximum concentration which may be counted on available instruments without dilution is about 2 E + 5 Bq/sample. Typically, this determination of radium in a 2 L sample has a yield of 80%. If radium-228 is determined using a 16 h count after 50 h grow-in, the typical MDL is 1 E-9 to 8 E-9 μCi/mL (1 to 8 pCi/L). If radium-226 is determined using a 2.5 h count after 150 h grow-in, the typical MDA is about 1 E-10 μCi/mL (0. 1 pCi/L).

518 (INEL–95/0583) **Storm water monitoring report for the 1995 reporting period.** Braun, D.R.; Brock, T.A. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Oct 1995. 161p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96009938. Source: OSTI; NTIS; INIS; GPO Dep.

This report includes sampling results and other relevant information gathered in the past year by LITCO's Environmental Monitoring and Water Resources Unit. This report presents analytical data collected from storm water discharges as a part of the Environmental Monitoring Storm Water Monitoring Program for 1994–1995 for facilities located on the Idaho National Engineering Laboratory (INEL). The 1995 reporting period is October 1, 1994 through September 30, 1995. The storm water monitoring program tracks information about types and amounts of pollutants present. Data are required for the Environmental Protection Agency and are transmitted via Discharge Monitoring Reports. Additional information resulting from the program contributes to Best Management Practice to control pollution in runoff as well as Storm Water Pollution Prevention Plans.

519 (INEL–95/0596) **UNSAT-H infiltration model calibration at the Subsurface Disposal Area, Idaho National Engineering Laboratory.** Martian, P. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Oct 1995. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003993. Source: OSTI; NTIS; INIS; GPO Dep.

Soil moisture monitoring data from the expanded neutron probe monitoring network located at the Subsurface Disposal Area (SDA) of the Idaho National Engineering Laboratory (INEL) were used to calibrate numerical infiltration models for 15 locations within and near the SDA. These calibrated models were then used to simulate infiltration into the SDA surficial sediments and underlying basalts for the entire operational period of the SDA (1952–1995). The purpose of performing the simulations was to obtain a time variant infiltration source term for future subsurface pathway modeling efforts as part of baseline risk assessment or performance assessments. The simulation results also provided estimates of the average recharge rate for the simulation period and insight into infiltration patterns at the SDA. These results suggest that the average aquifer recharge rate below the SDA may be at least 8 cm/yr and may be as high as 12 cm/yr. These values represent 38 and 57% of the average annual precipitation occurring at the INEL, respectively. The simulation results also indicate that the maximum evaporative depth may vary between 28 and 148 cm and is highly dependent on localized lithology within the SDA.

520 (INEL–95/0633) **Dig-face monitoring during excavation of a radioactive plume at Mound Laboratory, Ohio.** Josten, N.E.; Gehrke, R.J.; Carpenter, M.V. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Dec 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96007527. Source: OSTI; NTIS; INIS; GPO Dep.

A dig-face monitoring system consists of onsite hardware for collecting information on changing chemical, radiological, and physical conditions in the subsurface soil during the hazardous site excavation. A prototype dig-face system was take to Mount Laboratory for a first trial. Mound Area 7 was the site of historical disposals of ^{232}Th, ^{227}Ac, and assorted debris. The system was used to monitor a deep excavation aimed at removing ^{227}Ac-contaminated soils. Radiological, geophysical, and topographic sensors were used to scan across the excavation dig-face at four successive depths as soil was removed. A 3-D image of the contamination plumes was developed; the radiation sensor data indicated that only a small portion of the excavated soil volume was contaminated. The spatial information produced by the dig-face system was used to direct the excavation activities into the area containing the ^{227}Ac and to evaluate options for handling the separate ^{232}Th plume.

521 (INEL–95/0637) **Inverse modeling for field-scale hydrologic and transport parameters of fractured basalt.** Magnuson, S.O. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Dec 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96006028. Source: OSTI; NTIS; INIS; GPO Dep.

A large-scale test of infiltration into a thick sequence Of fractured Snake River Plain basalts was performed during the summer of 1994 on the Idaho National Engineering Laboratory. Monitoring of moisture and tracer movement during this test provided a set of quantitative measurements from which to obtain a field-scale hydrologic description of the fractured basalts. An inverse modeling study using these quantitative measurements was performed to obtain the representative hydrologic description. This report describes the results of the inverse modeling study and includes the background and motivation for conducting the infiltration test; a brief overview of the infiltration test; descriptions of the calibration targets chosen for the simulation study, the simulation model, and the model implementation; and the simulation results with comparisons to hydrologic and tracer breakthrough data obtained from the infiltration test.

522 (INEL–96/0176) **The efficiency calibration and development of environmental correction factors for an in situ high-resolution gamma spectroscopy well logging system.** Giles, J.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). May 1996. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96013315. Source: OSTI; NTIS; INIS; GPO Dep.

A Gamma Spectroscopy Logging System (GSLS) has been developed to study sub-surface radionuclide contamination. Absolute efficiency calibration of the GSLS was performed using simple cylindrical borehole geometry. The calibration source incorporated naturally occurring radioactive material (NORM) that emitted photons ranging from 186-keV to 2,614-keV. More complex borehole geometries were modeled using commercially available shielding software. A linear relationship was found between increasing source thickness and relative photon fluence rates at the detector. Examination of varying porosity and moisture content showed that as porosity increases, relative photon fluence rates increase linearly for all energies. Attenuation effects due to iron, water, PVC, and concrete cylindrical shields were found to agree with previous studies. Regression analyses produced energy-dependent equations for efficiency corrections applicable to spectral gamma-ray well logs collected under non-standard borehole conditions.

523 (IS–5117) **Zero-tension lysimeters: An improved design to monitor colloid-facilitated contaminant transport in the vadose zone.** Thompson, M.L.; Scharf, R.L.; Shang, C. Ames Lab., IA (United States). 24 Apr 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE96000214. Source: OSTI; NTIS; INIS; GPO Dep.

There is increasing evidence that mobile colloids facilitate the long-distance transport of contaminants. The mobility of fine particles and macromolecules has been linked to the movement of actinides, organic contaminants, and heavy metals through soil. Direct evidence for colloid mobility includes the presence of humic materials in deep aquifers as well as coatings of accumulated clay, organic matter, or sesquioxides on particle or aggregate surfaces in subsoil horizons of many soils. The potential for colloid-facilitated transport of contaminants from hazardous-waste sites requires adequate monitoring before, during, and after in-situ remediation treatments. Zero-tension lysimeters (ZTLs) are especially appropriate for sampling water as it moves through saturated soil, although some unsaturated flow events may be sampled as well. Because no ceramic barrier or fiberglass wick is involved to maintain tension on the water (as is the case with other lysimeters), particles suspended in the water as well as dissolved species may be sampled with ZTLs. In this report, a ZTL design is proposed that is more suitable for monitoring colloid-facilitated contaminant migration. The improved design consists of a cylinder made of polycarbonate or polytetrafluoroethylene (PTFE) that is placed below undisturbed soil material. In many soils, a hydraulically powered tube may be used to extract an undisturbed core of soil before placement of the lysimeter. In those cases, the design has significant advantages over conventional designs with respect to simplicity and speed of installation. Therefore, it will allow colloid-facilitated transport of contaminants to be monitored at more locations at a given site.

524 (K/ER–306) **Microgravity survey of the Oak Ridge K-25 Site, Oak Ridge, Tennessee.** Kaufmann, R.D. Oak Ridge K-25 Site, TN (United States). May 1996. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96010210. Source: OSTI; NTIS; INIS; GPO Dep.

Karst features are known to exist within the carbonate bedrock of the Oak Ridge K-25 Site and may play an important role in groundwater flow and contaminant migration. This report discusses the results of a microgravity survey of the Oak Ridge K-25 Site. The main objective of the survey is to identify areas containing bedrock cavities. Secondary objectives included correlating the observed gravity to the geology and to variations in overburden thickness. The analysis includes 11 profile lines that are oriented perpendicular to the geologic strike and major structures throughout the K-25 Site. The profile lines are modeled in an effort to relate gravity anomalies to karst features such as concentrations of mud-filled cavities. Regolith thickness and density data provided by boreholes constrain the models. Areally distributed points are added to the profile lines to produce a gravity contour map of the site. In addition, data from the K-901 area are combined with data from previous surveys to produce a high resolution map of that site. The K-25 Site is located in an area of folded and faulted sedimentary rocks within the Appalachian Valley and Ridge physiographic province. Paleozoic age rocks of the Rome Formation, Knox Group, and Chickamauga Supergroup underlie the K-25 Site and contain structures that include the Whiteoak Mountain Fault, the K-25 Fault, a syncline, and an anticline. The mapped locations of the rock units and complex structures are currently derived from outcrop and well log analysis.

525 (LA–12912-MS) **Environmental geochemistry for surface and subsurface waters in the Pajarito Plateau and outlying areas, New Mexico.** Blake, W.D.; Goff, F.; Adams, A.I.; Counce, D. Los Alamos National Lab., NM (United States). May 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015015. Source: OSTI; NTIS; GPO Dep.

This report provides background information on waters in the Los Alamos and Santa Fe regions of northern New Mexico. Specifically, the presented data include major element, trace element, and isotope analyses of 130 water samples from 94 different springs, wells, and water bodies in the area. The region considered in this study extends from the western edge of the Valles Caldera to as far east as Santa Fe Lake. For each sample, the presented analysis includes fourteen different major elements, twenty-six trace elements, up to five stable isotopes, and tritium. In addition, this data base contains certain characteristics of the water that are calculated from the aforementioned raw data, including the water's maximum and minimum residence times, as found from tritium levels assuming no contamination, the water's recharge elevation, as found from stable isotopes, and the charge balance of the water. The data in this report are meant to provide background information for investigations in groundwater hydrology and geochemistry, and for environmental projects. For the latter projects, the presented information would be useful for determining the presence of contamination it any one location by enabling one to compare potential contaminant levels to the background levels presented here. Likely locations of interest are those possibly effected by anthropogenic activities, including locations in and around Los Alamos National Laboratory, White Rock Canyon, and developed areas in the Rio Grande Valley.

526 (LA–12913-MS) **Natural background geochemistry, geomorphology, and pedogenesis of selected soil profiles and Bandelier Tuff, Los Alamos, New Mexico.** Longmire, P.A.; Reneau, S.L.; Watt, P.M.; McFadden, L.D.; Gardner, J.N.; Duffy, C.J.; Ryti, R.T. Los Alamos National Lab., NM (United States). May 1996. 186p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96010649. Source: OSTI; NTIS; GPO Dep.

To determine the environmental impact of Los Alamos National Laboratory's activities on surface waters, groundwaters, soils, sediments, and Bandelier Tuff requires thorough knowledge of the background-element chemistry for both geological and hydrological media. Background media are defined as soils, sediments, rocks, surface waters, and groundwaters unaffected by Laboratory operations. Background element concentrations in soils and the Bandelier Tuff are presented in this report; element and solute distributions within sediments, surface waters, and groundwaters will be addressed in future studies. Statistical and geochemical comparisons of background samples and contaminated or nonbackground samples are needed to identify and evaluate environmental contamination.

527 (LA–12968-MS) **The unsaturated hydraulic characteristics of the Bandelier Tuff.** Rogers, D.B.; Gallaher, B.M. Los Alamos National Lab., NM (United States). Sep 1995. 138p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96000894. Source: OSTI; NTIS; GPO Dep.

Report includes diskette designed to run on IBM PC compatible equipment.

This report summarizes the physical and, unsaturated hydraulic properties of the Bandelier Tuff determined from laboratory measurements made on core samples collected at Los Alamos National Laboratory. We fit new van Genuchten-type moisture retention curves to this data, which was categorized according to member of the Bandelier Tuff and subunit of the Tshirege Member. Reasonable consistency was observed for hydraulic properties and retention curves within lithologic units, while distinct differences were observed for those properties between units. With the moisture retention data, we constructed vertical profiles of in situ matric suction and hydraulic head. These profiles give an indication of the likely direction of liquid water movement within the unsaturated zone and allow comparison of core-scale and field-scale estimates of water flow and solute transport parameters. Our core-derived transport velocities are much smaller than values estimated from tritium, Cl, and NO_3 contamination found recently in boreholes. The contaminant tracer-derived transport velocities from Los Alamos Canyon are greater than corederived values found for the Otowi Member, and for Mortandad Canyon, greater than core-derived values for that borehole. The significant difference found for Mortandad Canyon suggests that fracture or other fast-path transport may be important there. The relatively small difference between observed and predicted velocities at Los Alamos Canyon may mean that vadose zone transport there occurs by unsaturated matrix flow.

528 (LA–12978-MS) **Cesium sorption and desorption on selected Los Alamos soils.** Kung, K.S.; Chan, J.; Longmire, P.; Fowler, M. Los Alamos National Lab., NM (United States). Aug 1995. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95016709. Source: OSTI; NTIS; INIS; GPO Dep.

Laboratory experiments were conducted to evaluate the sorptivity of cesium onto Los Alamos soils under controlled experimental conditions. Four soil profiles were collected and each soil profile which is broken into layers according to previously identified soil horizons were studied. Batch sorption isotherms were studied to quantify the chemical reactivity of each soil horizon toward cesium ion. Radioactive cesium-137 was used as sorbent and gamma counting was used to quantify the amount of sorption. Desorption experiments were conducted after the sorption experiments. Batch desorption isotherms were studied to quantify the desorption of presorbed cesium from these Los Alamos soils. This study suggests cesium may sorb strongly and irreversibly on most Los Alamos soils. The amount of cesium sorption and desorption is possibly related to the clay content of the soil sample since subsurface sample has a higher clay content than that of surface sample.

529 (LA–13108-MS) **Sorption and desorption of cesium and strontium on TA-2 and TA-41 soils and sediments.** Kung, K. Stephen; Li, Benjamin W.; Longmire, P.A.; Fowler, M.M. Los Alamos National Lab., NM (United States). Apr 1996. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96009346. Source: OSTI; NTIS; INIS; GPO Dep.

Current environmental monitoring has detected radioactive contaminants in alluvial groundwater, soils, and sediments in the TA-2 and TA-41 areas along the north central edge of Los Alamos National Laboratory. Because of this contamination, this study was initiated. The objective of this study is to quantify the sorptivity of cesium and strontium onto TA-2 and TA-41 site specific soil samples under a controlled environment in the laboratory. The purposes of this work are to determine cesium and strontium sorption coefficient for these sit specific soils and to evaluate the potential transport of cesium and strontium. Based on this information, a risk assessment and remediation strategy can be developed.

530 (LA-SUB–95-27-1) **SAMFT1D: Single-phase and multiphase flow and transport in 1 dimension. Version 2.0, Documentation and user's guide.** Wu, Y.S. (HydroGeoLogic, Inc., Herndon, VA (United States)); Huyakorn, P.S.; Panday, S.; Park, N.S.; Kool, J.B. Los Alamos National Lab., NM (United States); HydroGeoLogic, Inc., Herndon, VA (United States). Sep 1991. 297p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007639. Source: OSTI; NTIS; GPO Dep.

This report documents a one-dimensional numerical model, SAMFT1D, developed to simulate single-phase and multiphase fluid flow and solute transport in variably saturated porous media. The formulation of the governing equations and the numerical procedures used in the code for single-phase and multiphase flow and transport are presented. The code is constructed to handle single-phase as well as two or three-phase flow conditions using two integrated sets of computational modules. The fully implicit scheme is used in the code for both single-phase and multiphase flow simulations. Either the Crank-Nicholson scheme or the fully implicit scheme may be used in the transport simulation. The single-phase modules employ the Galerkin and upstream weighted residual finite element techniques to model flow and transport of water (aqueous phase) containing dissolved single-species contaminants concurrently or sequentially, and include the treatment of various boundary conditions and physical processes. The multiphase flow modules use block-centered finite difference techniques to simulate two or three-phase flow problems, and treat different boundary conditions in terms of source/sink terms fully implicitly. Whereas the multiphase solute transport modules employ finite element schemes to handle single-species transport in multiphase fluid systems. This document has been produced as a user's manual. It contains detailed information on the code structure along with instructions for input data preparation and sample input and printed output for selected test problems. Also included are instructions for job set up and simulation restart procedures.

531 (LA-SUB--95-27-2) **SAMFT2D: Single-phase and multiphase flow and transport in 2 dimensions. Version 2, Documentation and user's guide.** Huyakorn, P.S. (HydroGeoLogic, Inc., Herndon, VA (United States)); Wu, Y.S.; Panday, S.; Park, N.S.; Kool, J.B. Los Alamos National Lab., NM (United States); HydroGeoLogic, Inc., Herndon, VA (United States). Sep 1991. 317p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95013053. Source: OSTI; NTIS; GPO Dep.

This report documents a two-dimensional finite element model, SAMFT2D, developed to simulate single-phase and multiphase fluid flow and solute transport in variably saturated porous media. The formulations of the governing equations and the numerical procedures used in the code for single-phase and multiphase flow and transport are presented. The code is constructed to handle single-phase as well as two- or three-phase flow conditions using two integrated sets of computational modules. A fully implicit time-stepping scheme is used in the code for both single-phase and multiphase flow simulations. Either the Crank-Nicholson scheme or the fully implicit scheme may be used in the transport simulation. The single-phase modules employ the conventional Galerkin and upstream-weighted residual finite element techniques to model flow and transport of water (aqueous phase) containing dissolved single-species contaminants concurrently or sequentially, and include the treatment of various boundary conditions and physical processes. The multiphase flow modules use the Galerkin schemes with upstream weighting of phase mobilities to simulate two- or three-phase flow problems, and treat different boundary conditions in terms of source/sink terms fully implicitly. The multiphase solute transport modules employ the upstream-weighted residual schemes to handle single-species transport in multiphase fluid systems. Several example problems are presented to verify the code and to demonstrate its utility. These problems range from one-phase unsaturated flow and transport to two- and three-phase flow problems including gravity and capillary effects and associated transport simulations.

532 (LA-SUB--95-27-3) **SAMFT3D: Single-phase and multiphase flow and transport in 3 dimensions. Version 1.0, Documentation and user's guide.** Los Alamos National Lab., NM (United States); HydroGeoLogic, Inc., Herndon, VA (United States). Sep 1991. 190p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95013054. Source: OSTI; NTIS; GPO Dep.

SAMFT3D is a three-dimensional, finite element code designed to simulate single-phase and multiphase fluid flow and contaminant transport in porous media. This report documents the single-phase version of the code. The single-phase computational modules have been developed to simulate flow and solute transport in fully or variable saturated porous media. The formulation of the governing equations and the numerical procedures used in these modules are presented. The flow equation is approximated using the Galerkin finite element method. For variably saturated flow problems, nonlinearities due to unsaturated soil properties are treated using Picard or Newton-Raphson iterations. The contaminant transport simulation can account for advection, hydrodynamic dispersion, linear equilibrium sorption, and first-order degradation. Transport of a single component can be handled. The transport equation is approximated using a upstream weighted residual method. Several test problems are presented to verify the code and to demonstrate its utility. These problems range from single one-dimensional to complex three-dimensional problems. This document has been produced as a user's manual. It contains brief information on the code structure along with detailed instructions for input data preparation and sample input and printed output for selected test problems. Also included are instructions for setting up a simulation run and restart procedures.

533 (LA-SUB--96-77-Vol.1) **Laboratory analysis of soil hydraulic properties of TA-49 soil samples. Volume I: Report summary.** Los Alamos National Lab., NM (United States); Stephens (Daniel B.) and Associates, Inc., Albuquerque, NM (United States). Apr 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96011888. Source: OSTI; NTIS; INIS; GPO Dep.

The Hydrologic Testing Laboratory at Daniel B. Stephens & Associates, Inc. (DBS&A) has completed laboratory tests on TA-49 soil samples as specified by Mr. Daniel A. James and summarized in Table 1. Tables 2 through 12 give the results of the specified analyses. Raw laboratory data and graphical plots of data (where appropriate) are contained in Appendices A through K. Appendix L lists the methods used in these analyses. A detailed description of each method is available upon request. Thermal properties were calculated using methods reviewed by Campbell and covered in more detail in Appendix K. Typically, soil thermal conductivities are determined using empirical fitting parameters (five in this case), Some assumptions are also made in the equations used to reduce the raw data. In addition to the requested thermal property measurements, calculated values are also presented as the best available internal check on data quality. For both thermal conductivities and specific heats, calculated and measured values are consistent and the functions often cross. Interestingly, measured thermal conductivities tend to be higher than calculated thermal conductivities around typically encountered in situ moisture contents (±5 percent). While we do not venture an explanation of the difference, sensitivity testing of any problem requiring nonisothermal modeling across this range is in order.

534 (LA-SUB--96-77-Vol.2) **Measurement of unsaturated hydraulic conductivity in the Bandelier Tuff at Los Alamos.** Conca, J. (Northwest Environmental Services, Testing and Training, Richland, WA (United States)); Mockler, T.J. Los Alamos National Lab., NM (United States); Stephens (Daniel B.) and Associates, Inc., Albuquerque, NM (United States). Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96011887. Source: OSTI; NTIS; INIS; GPO Dep.

Hydraulic conductivities, K, were experimentally determined as a function of volumetric water content, θ, in Bandelier Tuff cores from Los Alamos, New Mexico. These data were used to determine the feasibility of applying a new unsaturated flow technology (UFA™) to further hydrologic studies of tuffaceous rocks at Los Alamos. The $K(\theta)$ relationships for eight cores of Bandelier Tuff from boreholes AAA and AAB were measured using the UFA and, together with their in situ water contents, were used to determine transient water flux into these samples at the time of sampling. If the system is at steady-state, then these flux values correspond to the recharge through those points, a situation often encountered in semi-arid to arid regions such as Los

Alamos and other sites in the western United States. Samples AAA 9956, AAB 0011, AAB 0012 and AAB 0040 exhibited fluxes of 6 x 10^{-8} cm/s, 4.8 x 10^{-7} cm/s, 2.8 x 10^{-7} cm/s and 2.4 x 10^{-8} cm/s, respectively, indicating significant flux. Samples AAB 0063, AAB 0065, AAB 0072 and AAB 0081 had very low water contents suggesting fluxes less than 10^{-10} cm/s, and appear to be close to their residual water contents. Assuming that the samples AAB 0063, AAB 0065, AAB 0072 and AAB 0081 were not accidentally dried out during handling, these results imply that these samples have zero recharge and that redistribution of moisture at these horizons is controlled more by vapor diffusion than by advection. The vapor diffusivities in these cores can be determined using the new UFA gas permeameter. Samples AAA 9956, AAB 0011, AAB 0012 and AAB 0040 appear to be controlled by advection.

535 (LA-UR--95-2467) **Cost effectiveness of in situ bioremediation at Savannah River.** Saaty, R.P.; Showalter, W.E.; Booth, S.R. Los Alamos National Lab., NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950483--6: 3. international in situ and on-site bioreclamation symposium, San Diego, CA (United States), 24-27 Apr 1995). Order Number DE95016900. Source: OSTI; NTIS; INIS; GPO Dep.

In situ bioremediation (ISBR) is an innovative new remediation technology for the removal of chlorinated solvents from contaminated soils and groundwater. The principal contaminant at the Savannah River Integrated Demonstration is tricloroethylene (TCE) a volatile organic compound (VOC). A 384-day test run at Savannah River, sponsored by the US Department of Energy (DOE), Office of Technology Development (EM-50), furnished information about the performance and applications of ISBR. In situ bioremediation, as tested, is based on two distinct processes occurring simultaneously; the physical process of in situ air stripping and the biological process of bioremediation. Both processes have the potential to remediate some amount of contamination. A quantity of VOCs, directly measured from the extracted airstream, was removed from the test area by the physical process of air stripping. The biological process is difficult to examine. However, the results of several tests performed at the SRID and independent numerical modeling determined that the biological process remediated an additional 40% above the physical process. Given these data, the cost effectiveness of this new technology can be evaluated.

536 (LA-UR--96-512) **Rectangular Schlumberger resistivity arrays for delineating vadose zone clay-lined fractures in shallow tuff.** Miele, M. (ICF Kaiser, Rancho Cordova, CA (United States)); Laymon, D.; Gilkeson, R.; Michelotti, R. Los Alamos National Lab., NM (United States). 1996. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960477--2: 9. annual symposium on the application of geophysics to engineering and environmental problems, Denver, CO (United States), 15 Apr - 1 May 1996). Order Number DE96008703. Source: OSTI; NTIS; INIS; GPO Dep.

Rectangular Schlumberger arrays can be used for 2-dimensional lateral profiling of apparent resistivity at a unique current electrode separation, hence single depth of penetration. Numerous apparent resistivity measurements are collected moving the potential electrodes (fixed MN spacing) within a rectangle of defined dimensions. The method provides a fast, cost-effective means for the collection of dense resistivity data to provide high-resolution information on subsurface hydrogeologic conditions. Several rectangular Schlumberger resistivity arrays were employed at Los Alamos National Laboratory (LANL) from 1989 through 1995 in an area adjacent to and downhill from an outfall pipe, septic tank, septic drainfield, and sump. Six rectangular arrays with 2 AB spacings were used to delineate lateral low resistivity anomalies that may be related to fractures that contain clay and/or vadose zone water. Duplicate arrays collected over a three year time period exhibited very good data repeatability. The properties of tritium make it an excellent groundwater tracer. Because tritium was present in discharged water from all of the anthropogenic sources in the vicinity it was used for this purpose. One major low resistivity anomaly correlates with relatively high tritium concentrations in the tuff. This was determined from borehole samples collected within and outside of the anomalous zone. The anomaly is interpreted to be due to fractures that contain clay from the soil profile. The clay was deposited in the fractures by aeolian processes and by surface water infiltration. The fractures likely served as a shallow vadose zone groundwater pathway.

537 (LA-UR--96-1723) **Radionuclides in an underground environment.** Thompson, J.L. Los Alamos National Lab., NM (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9609156--1: NRC-4/nuclear and radiochemistry meeting, St. Malo (France), Sep 1996). Order Number DE96011294. Source: OSTI; NTIS; INIS; GPO Dep.

In the 100 years since Becquerel recognized radioactivity, mankind has been very successful in producing large amounts of radioactive materials. We have been less successful in reaching a consensus on how to dispose of the billions of curies of fission products and transuranics resulting from nuclear weapons testing, electrical power generation, medical research, and a variety of other human endeavors. Many countries, including the United States, favor underground burial as a means of disposing of radioactive wastes. There are, however, serious questions about how such buried wastes may behave in the underground environment and particularly how they might eventually contaminate water, air and soil resources on which we are dependent. This paper describes research done in the United States in the state of Nevada on the behavior of radioactive materials placed underground. During the last thirty years, a series of "experiments" conducted for other purposes (testing of nuclear weapons) have resulted in a wide variety of fission products and actinides being injected in rock strata both above and below the water table. Variables which seem to control the movement of these radionuclides include the physical form (occlusion versus surface deposition), the chemical oxidation state, sorption by mineral phases of the host rock, and the hydrologic properties of the medium. The information gained from these studies should be relevant to planning for remediation of nuclear facilities elsewhere in the world and for long-term storage of nuclear wastes.

538 (LBL--36739) **Injectable barriers for waste isolation.** Persoff, P. (Lawrence Berkeley National Lab., CA (United States). Earth Sciences Div.); Finsterle, S.; Moridis, G.J.; Apps, J.; Pruess, K.; Muller, S.J. Lawrence Berkeley Lab., CA (United States). Mar 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950828--19: 1995 National heat transfer conference, Portland, OR (United States), 5-9 Aug

1995). Order Number DE96000134. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper the authors report laboratory work and numerical simulation done in support of development and demonstration of injectable barriers formed from either of two fluids: colloidal silica or polysiloxane. Two principal problems addressed here are control of gel time and control of plume emplacement in the vadose zone. Gel time must be controlled so that the viscosity of the barrier fluid remains low long enough to inject the barrier, but increases soon enough to gel the barrier in place. During injection, the viscosity must be low enough to avoid high injection pressures which could uplift or fracture the formation. To test the grout gel time in the soil, the injection pressure was monitored as grouts were injected into sandpacks. When grout is injected into the vadose zone, it slumps under the influence of gravity, and redistributes due to capillary forces as it gels. The authors have developed a new module for the reservoir simulator TOUGH2 to model grout injection into the vadose zone, taking into account the increase of liquid viscosity as a function of gel concentration and time. They have also developed a model to calculate soil properties after complete solidification of the grout. The numerical model has been used to design and analyze laboratory experiments and field pilot tests. The authors present the results of computer simulations of grout injection, redistribution, and solidification.

539 (LBL–37067) **Air barriers for waste containment in the subsurface.** Moridis, G.J.; Pruess, K. Lawrence Berkeley Lab., CA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9503116–9: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95012373. Source: OSTI; NTIS; GPO Dep.

The increase of air saturation in a soil alters significantly its hydraulic characteristics by reducing its the relative permeability to liquids. This realization led to the concept that air injection could be used in the context of remedial strategies to create low permeability barriers to contaminated water and NAPL migration. Air offers a number of significant advantages as a barrier fluid: it is not a contaminant, already exists in the vadose zone, is abundant, easily available, free of charge, and has well-known thermodynamic properties. This report provides a brief summary of air barrier modeling results to date.

540 (LBL–37380) **Radionuclide behavior in water saturated porous media: Diffusion and infiltration coupling of thermodynamically and kinetically controlled radionuclide water - mineral interactions.** Spasennykh, M.Yu. (Vernadsky Institute of Geochemistry and Analytical Chemistry, Moscow (Russian Federation)); Apps, J.A. Lawrence Berkeley Lab., CA (United States). May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95016529. Source: OSTI; NTIS; INIS; GPO Dep.

A model is developed describing one dimensional radionuclide transport in porous media coupled with locally reversible radionuclide water-mineral exchange reactions and radioactive decay. Problems are considered in which radionuclide transport by diffusion and infiltration processes occur in cases where radionuclide water-solid interaction are kinetically and thermodynamically controlled. The limits of Sr-90 and Cs-137 migration are calculated over a wide range of the problem variables (infiltration velocity, distribution coefficients, and rate constants of water-mineral radionuclide exchange reactions).

541 (LBL–38095) **Analog site for fractured rock characterization. Annual report FY 1995.** Long, J.C.S. (and others); Loughty, C.; Faybishenko, B. Lawrence Berkeley Lab., CA (United States). Oct 1995. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE96008559. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the accomplishments of the Analog Site for Fracture Rock Characterization Project during fiscal year 1995. This project is designed to address the problem of characterizing contaminated fractured rock. In order to locate contaminant plumes, develop monitoring schemes, and predict future fate and transport, the project will address the following questions: What parts of the system control flow-geometry of a fracture network? What physical processes control flow and transport? What are the limits on measurements to determine the above? What instrumentation should be used? How should it be designed and implemented? How can field tests be designed to provide information for predicting behavior? What numerical models are good predictors of the behavior of the system? The answers to these question can be used to help plan drilling programs that are likely to intersect plumes and provide effective monitoring of plume movement. The work is done at an "analogue" site, i.e., a site that is not contaminated, but has similar geology to sites that are contaminated, in order to develop tools and techniques without the financial, time and legal burdens of a contaminated site. The idea is to develop conceptual models and investigations tools and methodology that will apply to the contaminated sites in the same geologic regimes. The Box Canyon site, chosen for most of this work represents a unique opportunity because the Canyon walls allow us to see a vertical plane through the rock. The work represents a collaboration between the Lawrence Berkeley National Laboratory (LBL), Stanford University (Stanford), Idaho National Engineering Laboratory (INEL) and Parsons Environmental Engineering (Parsons). LBL and Stanford bring extensive experience in research in fractured rock systems. INEL and Parsons bring significant experience with the contamination problem at INEL.

542 (LBL–38262) **Numerical modeling of the groundwater contaminant transport for the Lake Karachai Area: The methodological approach and the basic two- dimensional regional model.** Petrov, A.V. (Ministry for Atomic Energy in Russia (Russian Federation)); Samsonova, L.M.; Vasil'kova, N.A.; Zinin, A.I.; Zinina, G.A. Lawrence Berkeley Lab., CA (United States). Jun 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE96009141. Source: OSTI; NTIS; INIS; GPO Dep.

Methodological aspects of the numerical modeling of the groundwater contaminant transport for the Lake Karachay area are discussed. Main features of conditions of the task are the high grade of non-uniformity of the aquifer in the fractured rock massif and the high density of the waste solutions, and also the high volume of the input data: both on the part of parameters of the aquifer (number of pump tests) and on the part of observations of functions of processes (long-time observations by the monitoring well grid). The modeling process for constructing the two dimensional regional model is described, and this model is presented as the basic model for subsequent full three-dimensional modeling in sub-areas of interest. Original powerful mathematical apparatus and computer codes for finite-difference numerical modeling are used.

543 (LBNL–38825-Pt.1-2) **Two-dimensional analytical solutions for chemical transport in aquifers. Part 1. Simplified solutions for sources with constant concentration. Part 2. Exact solutions for sources with constant flux rate.** Shan, C.; Javandel, I. Lawrence Berkeley Lab., CA (United States). May 1996. 66p. Sponsored by USDOE, Washington, DC (United States);California State Government, Sacramento, CA (United States). DOE Contract AC03-76SF00098. Order Number DE96013125. Source: OSTI; NTIS; INIS; GPO Dep.

Analytical solutions are developed for modeling solute transport in a vertical section of a homogeneous aquifer. Part 1 of the series presents a simplified analytical solution for cases in which a constant-concentration source is located at the top (or the bottom) of the aquifer. The following transport mechanisms have been considered: advection (in the horizontal direction), transverse dispersion (in the vertical direction), adsorption, and biodegradation. In the simplified solution, however, longitudinal dispersion is assumed to be relatively insignificant with respect to advection, and has been neglected. Example calculations are given to show the movement of the contamination front, the development of concentration profiles, the mass transfer rate, and an application to determine the vertical dispersivity. The analytical solution developed in this study can be a useful tool in designing an appropriate monitoring system and an effective groundwater remediation method.

544 (ORNL/ER–203/R1) **Groundwater Quality Sampling and Analysis Plan for Environmental Monitoring Waste Area Grouping 6 at Oak Ridge National Laboratory. Environmental Restoration Program.** CDM Federal Programs Corp., Oak Ridge, TN (United States). Sep 1995. 113p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006582. Source: OSTI; NTIS; INIS; GPO Dep.

This Sampling and Analysis Plan addresses groundwater quality sampling and analysis activities that will be conducted in support of the Environmental Monitoring Plan for Waste Area Grouping (WAG) 6. WAG 6 is a shallow-burial land disposal facility for low-level radioactive waste at the Oak Ridge National Laboratory, a research facility owned by the US Department of Energy and managed by Martin Marietta Energy Systems, Inc. (Energy Systems). Groundwater sampling will be conducted by Energy Systems at 45 wells within WAG 6. The samples will be analyzed for various organic, inorganic, and radiological parameters. The information derived from the groundwater quality monitoring, sampling, and analysis will aid in evaluating relative risk associated with contaminants migrating off-WAG, and also will fulfill Resource Conservation and Recovery Act (RCRA) interim permit monitoring requirements. The sampling steps described in this plan are consistent with the steps that have previously been followed by Energy Systems when conducting RCRA sampling.

545 (ORNL/ER–300) **Work plan for the Oak Ridge National Laboratory groundwater program: Continuous groundwater collection.** Oak Ridge National Lab., TN (United States). Aug 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006537. Source: OSTI; NTIS; INIS; GPO Dep.

The continuous collection of groundwater data is a basic and necessary part of Lockeheed Martin Energy Systems' ORNL Environmental Restoration Area-Wide Groundwater Program. Continuous groundwater data consist primarily of continually recorded groundwater levels, and in some instances, specific conductivity, pH, and/or temperature measurements. These data will be collected throughout the ORNL site. This Work Plan (WP) addresses technical objectives, equipment requirements, procedures, documentation requirements, and technical instructions for the acquisition of the continuous groundwater data. Intent of this WP is to provide an approved document that meets all the necessary requirements while retaining the flexibility necessary to effectively address ORNL's groundwater problems.

546 (ORNL/ER–313) **Hydrologic data summary for the White Oak Creek watershed at Oak Ridge National Laboratory, Oak Ridge, Tennessee, January–December 1994.** Borders, D.M.; Ziegler, K.S.; Reece, D.K.; Watts, J.A.; Frederick, B.J.; McCalla, W.L.; Pridmore, D.J. Oak Ridge National Lab., TN (United States). Aug 1995. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006585. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication 4437.

This report summarizes, for the 12-month period January through December 1994, the available dynamic hydrologic data collected on the White Oak Creek (WOC) watershed as well as information collected on surface flow systems in the surrounding vicinity that may affect the quality or quantity of surface water in the watershed. The collection of hydrologic data is one component of numerous, ongoing Oak Ridge National Laboratory (ORNL) environmental studies and monitoring programs and is intended to characterize the quantity and quality of water in the surface flow system, assist with the planning and assessment of remedial action activities, provide long-term availability of data and quality assurance of these data, and support long-term measures of contaminant fluxes at a spatial scale to provide a comprehensive picture of watershed performance that is commensurate with future remedial actions.

547 (ORNL/ER–337) **Evaluation of ground freezing for environmental restoration at waste area grouping 5, Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Gates, D.D. Oak Ridge National Lab., TN (United States). Sep 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96011793. Source: OSTI; NTIS; INIS; GPO Dep.

A study to evaluate the feasibility of using ground freezing technology to immobilize tritium contaminants was performed as part of the Waste Area Grouping (WAG) 6 Technology Demonstrations initiated by the WAG 6 Record of Agreement. The study included a review of ground freezing technology, evaluation of this technology for environmental restoration, and identification of key technical issues. A proposed ground freezing demonstration for containment of tritium at a candidate Oak Ridge National Laboratory site was developed. The planning requirements for the demonstration were organized into seven tasks including site selection, site characterization, conceptual design, laboratory evaluation, demonstration design, field implementation, and monitoring design. A brief discussion of each of these tasks is provided. Additional effort beyond the scope of this study is currently being directed to the selection of a demonstration site and the identification of funding.

548 (ORNL/ER—350) **Wetland survey of the X-10 Bethel Valley and Melton Valley groundwater operable units at Oak Ridge National Labortory Oak Ridge, Tennessee.** Rosensteel, B.A. Oak Ridge National Lab., TN

(United States). Mar 1996. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96008143. Source: OSTI; NTIS; INIS; GPO Dep.

Executive Order 11990, Protection of Wetlands, (May 24, 1977) requires that federal agencies avoid, to the extent possible, adverse impacts associated with the destruction and modification of wetlands and that they avoid direct and indirect support of wetlands development when there is a practicable alternative. In accordance with Department of Energy (DOE) Regulations for Compliance with Floodplains and Wetlands Environmental Review Requirements (Subpart B, 10 CFR 1022.11), surveys for wetland presence or absence were conducted in both the Melton Valley and the Bethel Valley Groundwater Operable Units (GWOU) on the DOE Oak Ridge Reservation (ORR) from October 1994 through September 1995. As required by the Energy and Water Development Appropriations Act of 1992, wetlands were identified using the criteria and methods set forth in the Wetlands Delineation Manual (Army Corps of Engineers, 1987). Wetlands were identified during field surveys that examined and documented vegetation, soils, and hydrologic evidence. Most of the wetland boundary locations and wetland sizes are approximate. Boundaries of wetlands in Waste Area Grouping (WAG) 2 and on the former proposed site of the Advanced Neutron Source in the upper Melton Branch watershed were located by civil survey during previous wetland surveys; thus, the boundary locations and areal sizes in these areas are accurate. The wetlands were classified according to the system developed by Cowardin et al. (1979) for wetland and deepwater habitats of the United States. A total of 215 individual wetland areas ranging in size from 0.002 ha to 9.97 ha were identified in the Bethel Valley and Melton Valley GWOUs. The wetlands are classified as palustrine forested broad-leaved deciduous (PFO1), palustrine scrub-shrub broad-leaved deciduous (PSS1), and palustrine persistent emergent (PEM1).

549 (ORNL/ER–366) **Waste area grouping 2 Phase I task data report: Ecological risk assessment and White Oak Creek watershed screening ecological risk assessment.** Efroymson, R.A. (and others); Jackson, B.L.; Jones, D.S. Oak Ridge National Lab., TN (United States). May 1996. 267p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96011794. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents an ecological risk assessment for Waste Area Grouping (WAG) 2 based on the data collected in the Phase I remedial investigation (RI). It serves as an update to the WAG 2 screening ecological risk assessment that was performed using historic data. In addition to identifying potential ecological risks in WAG 2 that may require additional data collection, this report serves to determine whether there are ecological risks of sufficient magnitude to require a removal action or some other expedited remedial process. WAG 2 consists of White Oak Creek (WOC) and its tributaries downstream of the Oak Ridge National Laboratory (ORNL) main plant area, White Oak Lake (WOL), the White Oak Creek Embayment of the Clinch River, associated flood plains, and the associated groundwater. The WOC system drains the WOC watershed, an area of approximately 16.8 km^2 that includes ORNL and associated WAGs. The WOC system has been exposed to contaminants released from ORNL and associated operations since 1943 and continues to receive contaminants from adjacent WAGs.

550 (ORNL/GWPO–0010) **CHEMFORM user's guide.** Sjoreen, A.; Toran, L. Oak Ridge National Lab., TN (United States). Jan 1996. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. (ORNL/M–4988). Order Number DE96010092. Source: OSTI; NTIS; GPO Dep.

CHEMFORM is a DOS-based program which converts geochemical data files into the format read by the U.S. Geological Survey family of models: WATEQ4F, PHREEQE, or NETPATH. These geochemical models require data formatted in a particular order, which typically does not match data storage. CHEMFORM converts geochemical data that are stored in an ASCII file to input files that can be read by these models, without being re-entered by hand. The data may be in any order and format in the original file, as long as they are separated by blanks. The location of each data element in the input file is entered in CHEMFORM. Any required data that are not present in your file may also be entered. The positions of the data in the input file are saved to be used as defaults for the next run. CHEMFORM runs in two modes. In the first mode, it will read one input file and write one output file. The input file may contain data on multiple lines, and the user will specify both line number and position of each item in CHEMFORM. This mode facilitates the conversion of the input from one model to the format needed by another model. In the second mode, the CHEMFORM input files contains more than one water analysis. All the geochemical data for a given sample are stored on one line, and CHEMFORM writes an output file for each line. This mode is useful when many samples are available for a site in the same format (different monitoring points or samples taken at different times from one monitoring point).

551 (ORNL/GWPO–015) **Murt user's guide: A hybrid Lagrangian-Eulerian finite element model of multiple-pore-region solute transport through subsurface media.** Gwo, J.P. (Oak Ridge National Lab., TN (United States)); Jardine, P.M.; Yeh, G.T.; Wilson, G.V. Oak Ridge National Lab., TN (United States). Apr 1995. 124p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/M–4592). Order Number DE95017048. Source: OSTI; NTIS; INIS; GPO Dep.

Matrix diffusion, a diffusive mass transfer process,in the structured soils and geologic units at ORNL, is believe to be an important subsurface mass transfer mechanism; it may affect off-site movement of radioactive wastes and remediation of waste disposal sites by locally exchanging wastes between soil/rock matrix and macropores/fractures. Advective mass transfer also contributes to waste movement but is largely neglected by researchers. This report presents the first documented 2-D multiregion solute transport code (MURT) that incorporates not only diffusive but also advective mass transfer and can be applied to heterogeneous porous media under transient flow conditions. In this report, theoretical background is reviewed and the derivation of multiregion solute transport equations is presented. Similar to MURF (Gwo et al. 1994), a multiregion subsurface flow code, multiplepore domains as suggested by previous investigators (eg, Wilson and Luxmoore 1988) can be implemented in MURT. Transient or steady-state flow fields of the pore domains can be either calculated by MURF or by modelers. The mass transfer process is briefly discussed through a three-pore-region multiregion solute transport mechanism. Mass transfer equations that describe mass flux across pore region interfaces are also presented and parameters needed to calculate mass transfer coefficients detailed. Three applications of MURT (tracer injection problem, sensitivity analysis of advective and diffusive mass transfer, hillslope ponding infiltration and secondary source problem) were simulated and results discussed. Program structure of MURT and functions of MURT subroutiness are discussed so that users can adapt the code; guides for input data preparation are provided in appendices.

552 (ORNL/GWPO–0017) **An economic decision framework using modeling for improving aquifer remediation design.** James, B.R.; Gwo, J.P.; Toran, L.E. Oak Ridge National Lab., TN (United States). Nov 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006190. Source: OSTI; NTIS; INIS; GPO Dep.

Reducing cost is a critical challenge facing environmental remediation today. One of the most effective ways of reducing costs is to improve decision-making. This can range from choosing more cost- effective remediation alternatives (for example, determining whether a groundwater contamination plume should be remediated or not) to improving data collection (for example, determining when data collection should stoop). Uncertainty in site conditions presents a major challenge for effective decision-making. We present a framework for increasing the effectiveness of remedial design decision-making at groundwater contamination sites where there is uncertainty in many parameters that affect remediation design. The objective is to provide an easy-to-use economic framework for making remediation decisions. The presented framework is used to 1) select the best remedial design from a suite of possible ones, 2) estimate if additional data collection is cost-effective, and 3) determine the most important parameters to be sampled. The framework is developed by combining elements from Latin-Hypercube simulation of contaminant transport, economic risk-cost-benefit analysis, and Regional Sensitivity Analysis (RSA).

553 (ORNL/GWPO–019) **Determination of effective porosity of mudrocks: a feasibility study.** Dorsch, J. Oak Ridge National Lab., TN (United States). Nov 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006034. Source: OSTI; NTIS; GPO Dep.

Matrix diffusion is believed to be an important transport process within the double-porosity (primary sedimentary porosity and secondary fracture porosity) mudrock-dominated stratigraphic units on the Oak Ridge Reservation (ORR). Effective porosity is identified as an important parameter for evaluating and modeling matrix diffusion as a transport process. This report identifies, summarizes and evaluates petrophysical techniques, which can be used to determine the effective porosity of mudrock. Most of the techniques found their original application in the petroleum industry for the evaluation of reservoir rocks.

554 (ORNL/GWPO–023) **Simulation of a field scale tritium tracer experiment in a fractured, weathered shale using discrete-fracture/matrix-diffusion and equivalent porous medium models.** Stafford, P.L. (Univ. of Tennessee, Knoxville, TN (United States). Dept. of Geological Sciences). Oak Ridge National Lab., TN (United States). May 1996. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. (ORNL/M–4987). Order Number DE96009666. Source: OSTI; NTIS; INIS; GPO Dep.

Thesis submitted to Univ. of Tennessee, Knoxville, TN (US).

Simulations of a tritium tracer experiment in fractured shale saprolite, conducted at the Oak Ridge National Laboratory, were performed using 1D and 2D equivalent porous medium (EPM) and discrete-fracture/matrix-diffusion (DFMD) models. The models successfully reproduced the general shape of the breakthrough curves in down-gradient monitoring wells which are characterized by rapid first arrival, a slow-moving center of mass, and a persistent "tail" of low concentration. In plan view, the plume shows a large degree of transverse spreading with the width almost as great as the length. EPM models were sensitive to dispersivity coefficient values which had to be large (relative to the 3.7m distance between the injection and monitoring wells) to fit the tail and transverse spreading. For example, to fit the tail a longitudinal dispersivity coefficient, α_L, of 0.8 meters for the 2D simulations was used. To fit the transverse spreading, a transverse dispersivity coefficient, α_T, of 0.8 to 0.08 meters was used indicating an α_L/α_T ratio between 10 and 1. Transverse spreading trends were also simulated using a 2D DFMD model using a few larger aperture fractures superimposed onto an EPM. Of the fracture networks studied, only those with truncated fractures caused transverse spreading. Simulated tritium levels in all of the cases were larger than observed values by a factor of approximately 100. Although this is partly due to input of too much tritium mass by the models it appears that dilution in the wells, which were not purged prior to sampling, is also a significant factor. The 1D and 2D EPM models were fitted to monitoring data from the first five years of the experiment and then used to predict future tritium concentrations.

555 (ORNL/GWPO–025) **Effective porosity and pore-throat sizes of mudrock saprolite from the Nolichucky Shale within Bear Creek Valley on the Oak Ridge Reservation: Implications for contaminant transport and retardation through matrix diffusion.** Dorsch, J. (Oak Ridge National Laboratory, TN (United States)); Katsube, T.J. Oak Ridge National Lab., TN (United States). May 1996. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96014595. Source: OSTI; NTIS; GPO Dep.

Specimens of saprolite developed from mudrock of the Nolichucky Shale (Upper Cambrian, Conasauga Group) from the Whiteoak Mountain thrust sheet on the Oak Ridge Reservation (ORR) were analyzed. Petrophysical techniques include helium porosimetry and mercury porosimetry. Petrophysical data obtained from the laboratory experiments include effective porosity, pore-throat sizes and their distribution, specimen bulk-density, and specimen grain-density. It is expected that the data from this study will significantly contribute to constraining the modeling of the hydrologic behavior of saprolite developed from mudrock of the Conasauga Group in general and from the Nolichucky Shale specifically.

556 (ORNL/TM–12851) **Cometabolic bioreactor demonstration at the Oak Ridge K-25 Site: Final report.** Lucero, A.J.; Donaldson, T.L.; Jennings, H.L.; Morris, M.I.; Palumbo, A.V.; Herbes, S.E. Oak Ridge National Lab., TN (United States). Aug 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96000848. Source: OSTI; NTIS; INIS; GPO Dep.

The Oak Ridge National Laboratory (ORNL) conducted a demonstration of cometabolic technology for bioremediation of groundwater contaminated with trichloroethylene (TCE) and other chlorinated solvents. The technology demonstration was located at a seep from the K-1070-C/D Classified Burial Ground at the Oak Ridge K-25 Site. The technology demonstration was designed to evaluate the performance of two different types of cometabolic processes. In both cases, the TCE is cometabolized in the sense that utilization of a different primary substrate is necessary to obtain the simultaneous cometabolism of TCE. Trichloroethylene alone is unable to support growth and maintenance of the microorganisms. Methanotrophic (methane-utilizing) technology was demonstrated first; aromatic-utilizing microorganisms were demonstrated later. The demonstration was based on scaleup of laboratory and bench-scale prototype equipment that was used to establish the technical feasibility of the processes.This report documents the operation of the methanotrophic bioreactor system to treat the seep water at the demonstration site. The initial objectives were to demonstrate stable operation of the bioreactors and associated equipment, including the pretreatment and effluent polishing steps; and evaluate the biodegradation of TCE and other organics in the seep water for the three operating modes–air oxidation pretreatment, steam-stripping pretreatment, and no pretreatment.

557 (ORNL/TM–12903) **Evaluation of improved techniques for the removal of ^{90}Sr and ^{137}Cs from process wastewater and groundwater: Chabazite zeolite baseline study.** Bostick, D.T.; Arnold, W.D. Jr.; Taylor, P.A.; McTaggart, D.R.; Burgess, M.W.; Guo, B. Oak Ridge National Lab., TN (United States). Apr 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011627. Source: OSTI; NTIS; INIS; GPO Dep.

Standard waste treatment procedures for the removal of ^{90}Sr and ^{137}Cs from contaminated groundwater and process wastewaters generate large volumes of secondary contaminated wastes. Several new sorbent materials, ion exchangers, and other processes hold the promise of treating large volumes of contaminated water while minimizing the generation of secondary low-level radioactive wastes. As part of the Efficient Separations/Processes-Integrated Program (ESPIP), these new treatment techniques will be compared with standard processes to define their effectiveness for the removal of radioactive strontium (Sr) and cesium (Cs), as well as to gauge the quantity of secondary radioactive waste generated by the new processes. This report summarizes the efforts made to design standardized testing procedures to evaluate the sorption characteristics of a baseline wastewater treatment technique. Definition of the experimental procedures, as well as a summary of the benchmark sorption technique, will provide the framework with which to compare newly evolving treatment technologies. Accomplishments include selecting the feed strewn to the Process Waste Treatment Plant (PWTP) at Oak Ridge National Laboratory as representative of the prototypical contaminated wastewater of many DOE sites. Samples from the PWTP feed stream were collected and analyzed for metals, anions, total Sr and Cs, radioactive Sr and Cs, alkalinity, pH, and density. The cumulative sample data were used to formulate a simulant that will be used as a standard waste surrogate for comparative testing of selected treatment methods.

558 (ORNL/TM–12912) **Dual wall reverse circulation drilling with multi-level groundwater sampling for groundwater contaminant plume delineation at Paducah Gaseous Diffusion Plant, Paducah, Kentucky.** Smuin, D.R.; Morti, E.E.; Zutman, J.L.; Pickering, D.A. Oak Ridge National Lab., TN (United States). [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95015798. Source: OSTI; NTIS; INIS; GPO Dep.

Dual wall reverse circulation (DWRC) drilling was used to drill 48 borings during a groundwater contaminant investigation at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky. This method was selected as an alternative to conventional hollow stem auger drilling for a number of reasons, including the expectation of minimizing waste, increasing the drilling rate, and reducing the potential for cross contamination of aquifers. Groundwater samples were collected from several water-bearing zones during drilling of each borehole. The samples were analyzed for volatile organic compounds using a field gas chromatograph. This approach allowed the investigation to be directed using near-real-time data. Use of downhole geophysical logging, in conjunction with lithologic descriptions of borehole cuttings, resulted in excellent correlation of the geology in the vicinity of the contaminant plume. The total volume of cuttings generated using the DWRC drilling method was less than half of what would have been produced by hollow stem augering; however, the cuttings were recovered in slurry form and had to be dewatered prior to disposal. The drilling rate was very rapid, often approaching 10 ft/min; however, frequent breaks to perform groundwater sampling resulted in an average drilling rate of < 1 ft/min. The time required for groundwater sampling could be shortened by changing the sampling methodology. Analytical results indicated that the drilling method successfully isolated the various water bearing zones and no cross contamination resulted from the investigation.

559 (ORNL/TM–13003) **Refinement of the Kansas City Plant site conceptual model with respect to dense non-aqueous phase liquids (DNAPL).** Korte, N.E. (Oak Ridge National Lab., TN (United States)); Hall, S.C.; Baker, J.L. Oak Ridge National Lab., TN (United States). [1995]. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96000846. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents a refinement of the site conceptual model with respect to dense non-aqueous phase liquid (DNAPL) at the US Department of Energy Kansas City Plant (KCP). This refinement was prompted by a review of the literature and the results of a limited study that was conducted to evaluate whether pools of DNAPL were present in contaminated locations at the KCP. The field study relied on the micropurge method of sample collection. This method has been demonstrated as a successful approach for obtaining discrete samples within a limited aquifer zone. Samples were collected at five locations across 5-ft well screens located at the base of the alluvial aquifer at the KCP. The hypothesis was that if pools of DNAPL were present, the dissolved concentration would increase with depth. Four wells with highly contaminated groundwater were selected for the test. Three of the wells were located in areas where DNAPL was suspected, and one where no DNAPL was believed to be present. The results demonstrated no discernible pattern with depth for the four wells tested. A review of the data in light of the available technical literature suggests that the fine-grained nature of the aquifer materials precludes the formation of pools. Instead, DNAPL is trapped as discontinuous ganglia that are probably widespread throughout the aquifer. The discontinuous nature of the DNAPL distribution prevents the collection of groundwater samples with concentrations approaching saturation. Furthermore, the results indicate that attempts to remediate the aquifer with conventional approaches will not result in restoration to pristine conditions because the tortuous groundwater flow paths will inhibit the efficiency of fluid-flow-based treatments.

560 (ORNL/TM–13055) **Groundwater, A century of word evolution.** Diefendorf, A.F. Oak Ridge National Lab., TN (United States). Aug 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96000315. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 4446.

Words, especially those that apply directly to more than one discipline, often become the object of intense debate among professionals in those disciplines. This is particularly true with those people who have to deal with technical jargon on a day-to-day basis and who are concerned that scientific facts get communicated in as clear and concise a manner as possible. Communications regarding environmental restoration projects for the US Department of Energy are no exception. Lockheed Martin Energy Systems, Inc., its subcontractors and other prime contractors often disagree about the spelling and use of compound words. This frequently results in inconsistent spelling between project reports and incorrect spelling of referenced document titles. The following discussion is an attempt to provide an objective, in-depth examination of the evolution of one particular word and recommendations for its proper and consistent use. This discussion is the result of an extensive literature search conducted within the library system at Oak Ridge National Laboratory as well as the personal geologic libraries of the author and colleagues. The author has attempted to cite only those works produced by recognized names in the related disciplines or those works that constitute common references or glossaries.

561 (ORNL/TM–13099) **Evaluation of improved technologies for the removal of ^{90}Sr and ^{137}Cs from process wastewater and groundwater: FY 1995 status.** Bostick, D.T. (Oak Ridge National Lab., TN (United States)); Arnold, W.D. Jr.; Burgess, M.W.; McTaggart, D.R.; Taylor, P.A.; Guo, B. Oak Ridge National Lab., TN (United States). Mar 1996. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96009669. Source: OSTI; NTIS; INIS; GPO Dep.

A number of new sorbents are currently being developed for the removal of ^{90}Sr and ^{137}Cs from contaminated, caustic low-level liquid waste (LLLW). These sorbents are potentially promising for use in the cleanup of contaminated groundwater and process wastewater containing the two radionuclides. The goal of this subtask is to evaluate the new sorbents to determine whether their associated treatment technology is more selective for the decontamination of wastewater streams than that of currently available processes. Activities during fiscal year 1995 have included completing the characterization of the standard treatment technology, ion exchange on chabazite zeolite. Strontium and cesium sorption on sodium-modified zeolite was observed in the presence of elevated concentrations of wastewater components: sodium, potassium, magnesium, and calcium. The most significant loss of nuclide sorption was noted in the first 0- to 4-meq/L addition of the cations to a wastewater simulant. Radionuclide sorption on the pretreated zeolite was also determined under dynamic flow conditions. Resorcinol-formaldehyde (R-F) resin, which was developed at the Savannah River Site, was selected as the first new sorbent to be evaluated for wastewater treatment. Nuclide sorption on this resin was greater when the resin had been washed with ultrapure water and air dried prior to use.

562 (PNL–10522) **Hanford stakeholder participation in evaluating innovative technologies: VOC product line, Passive soil vapor extraction using borehole flux tunable hybrid plasma.** Peterson, T.; McCabe, G.; Niesen, K.; Serie, P. Pacific Northwest Lab., Richland, WA (United States). May 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95011869. Source: OSTI; NTIS; INIS; GPO Dep.

A three-phased stakeholder participation program was conducted to support the Volatile Organic Compounds Arid Site Integrated Demonstration (VOC-Arid ID). The US DOE's Office of Technology Development (OTD) sponsored and directed the VOC-Arid ID. Its purpose was to develop and demonstrate new technologies for remediating VOC contamination in soil and ground water. The integrated demonstration, hosted by the Hanford site in Washington State, is being transitioned into the Department of Energy's (DOE) Plume Focus Area. The Plume Focus Area has the same basic objectives as the ID, but is broader in scope and is a team effort with technology developers and technology users. The objective is to demonstrate a promising technology once, and if results warrant deploy it broadly across the DOE complex and in private sector applications.

563 (PNL–10605) **Hanford Site Long-term Surface Barrier Development Program: Fiscal year 1994 highlights.** Petersen, K.L.; Link, S.O.; Gee, G.W. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016683. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site Surface Barrier Development Program was organized in 1985 to test the effectiveness of various barrier designs in minimizing the effects of water infiltration; plant, animal and human intrusion; and wind and water erosion on buried wastes, plus preventing or minimizing the emanation of noxious gases. A team of scientists from the Pacific Northwest Laboratory (PNL) and engineers from Westinghouse Hanford Company (WHC) direct the barrier development effort. ICF Kaiser Hanford Company, in conjunction with WHC and PNL, developed design drawings and construction specifications for a 5-acre prototype barrier. The highlight of efforts in FY 1994 was the construction of the prototype barrier. The prototype barrier was constructed on the Hanford Site at the 200 BP-1 Operable Unit of the 200 East Area. Construction was completed in August 1994 and monitoring instruments are being installed so experiments on the prototype barrier can begin in FY 1995. The purpose of the prototype barrier is to provide insights and experience with issues regarding barrier design, construction, and performance that have not been possible with individual tests and experiments conducted to date. Additional knowledge and experience was gained in FY 1994 on erosion control, physical stability, water infiltration control, model testing, Resource Conservation and Recovery Act (RCRA) comparisons, biointrusion control, long-term performance, and technology transfer.

564 (PNL–10698) **Hanford Site ground-water monitoring for 1994.** Dresel, P.E. (and others); Thorne, P.D.;

Luttrell, S.P. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 370p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001345. Source: OSTI; NTIS; INIS; GPO Dep.

Report includes diskette designed to run on IBM PC or compatible equipment.

This report presents the results of the Ground-Water Surveillance Project monitoring for calendar year 1994 on the Hanford Site, Washington. Hanford Site operations from 1943 onward produced large quantities of radiologic and chemical waste that have impacted ground-water quality on the Site. Monitoring of water levels and ground-water chemistry is performed to track the extent of contamination and trends in contaminant concentrations. The 1994 monitoring was also designed to identify emerging ground-water quality problems. The information obtained is used to verify compliance with applicable environmental regulations and to evaluate remedial actions. Data from other monitoring and characterization programs were incorporated to provide an integrated assessment of Site ground-water quality. Additional characterization of the Site's geologic setting and hydrology was performed to support the interpretation of contaminant distributions. Numerical modeling of sitewide ground-water flow also supported the overall project goals. Water-level monitoring was performed to evaluate ground-water flow directions, to track changes in water levels, and to relate such changes to changes in site disposal practices. Water levels over most of the Hanford Site continued to decline between June 1993 and June 1994. These declines are part of the continued response to the cessation of discharge to U Pond and other disposal facilities. The low permeability in this area which enhanced mounding of waste-water discharge has also slowed the response to the reduction of disposal.

565 (PNL–10786) **Clean option: Berkeley Pit water treatment and resource recovery strategy.** Gerber, M.A.; Orth, R.J.; Elmore, M.R.; Monzyk, B.F. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000746. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE), Office of Technology Development, established the Resource Recovery Project (RRP) in 1992 as a five-year effort to evaluate and demonstrate multiple technologies for recovering water, metals, and other industrial resources from contaminated surface and groundwater. Natural water resources located throughout the DOE complex and the and western states have been rendered unusable because of contamination from heavy metals. The Berkeley Pit, a large, inactive, open pit copper mine located in Butte, Montana, along with its associated groundwater system, has been selected by the RRP for use as a feedstock for a test bed facility located there. The test bed facility provides the infrastructure needed to evaluate promising technologies at the pilot plant scale. Data obtained from testing these technologies was used to assess their applicability for similar mine drainage water applications throughout the western states and at DOE. The objective of the Clean Option project is to develop strategies that provides a comprehensive and integrated approach to resource recovery using the Berkeley Pit water as a feedstock. The strategies not only consider the immediate problem of resource recovery from the contaminated water, but also manage the subsequent treatment of all resulting process streams. The strategies also employ the philosophy of waste minimization to optimize reduction of the waste volume requiring disposal, and the recovery and reuse of processing materials.

566 (PNL–10817) **Hydrochemistry and hydrogeologic conditions within the Hanford Site upper basalt confined aquifer system.** Spane, F.A. Jr.; Webber, W.D. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96001153. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Hanford Site Ground-Water Surveillance Project, Flow System Characterization Task. Pacific Northwest Laboratory examines the potential for offsite migration of contamination within the upper basalt confined aquifer system for the US Department of Energy (DOE). As part of this activity, groundwater samples were collected over the past 2 years from selected wells completed in the upper Saddle Mountains Basalt. The hydrochemical and isotopic information obtained from these groundwater samples provides hydrologic information concerning the aquifer-flow system. Ideally, when combined with other hydrologic property information, hydrochemical and isotopic data can be used to evaluate the origin and source of groundwater, areal groundwater-flow patterns, residence and groundwater travel time, rock/groundwater reactions, and aquifer intercommunication for the upper basalt confined aquifer system. This report presents the first comprehensive Hanford Sitewide summary of hydrochemical properties for the upper basalt confined aquifer system. This report provides the hydrogeologic characteristics (Section 2.0) and hydrochemical properties (Section 3.0) for groundwater within this system. A detailed description of the range of the identified hydrochemical parameter subgroups for groundwater in the upper basalt confined aquifer system is also presented in Section 3.0. Evidence that is indicative of aquifer contamination/aquifer intercommunication and an assessment of the potential for offsite migration of contaminants in groundwater within the upper basalt aquifer is provided in Section 4.0. The references cited throughout the report are given in Section 5.0. Tables that summarize groundwater sample analysis results for individual test interval/well sites are included in the Appendix.

567 (PNL–10835) **Comparison of constant-rate pumping test and slug interference test results at the Hanford Site B pond multilevel test facility.** Spane, F.A. Jr.; Thorne, P.D. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96002033. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory (PNL), as part of the Hanford Site Ground-Water Surveillance Project, is responsible for monitoring the movement and fate of contamination within the unconfined aquifer to ensure that public health and the environment are protected. To support the monitoring and assessment of contamination migration on the Hanford Site, a sitewide 3-dimensional groundwater flow model is being developed. Providing quantitative hydrologic property data is instrumental in development of the 3-dimensional model. Multilevel monitoring facilities have been installed to provide detailed, vertically distributed hydrologic characterization information for the Hanford Site unconfined aquifer. In previous reports, vertically distributed water-level and hydrochemical data obtained over time from these multi-level monitoring facilities have been evaluated and reported. This report describes the B pond facility in Section 2.0. It also provides analysis results for a constant-rate pumping test (Section 3.0) and slug interference test (Section 4.0) that were conducted at a multilevel test facility located near B Pond (see Figure 1. 1) in the central part of the Hanford Site. A hydraulic test summary (Section 5.0) that focuses on the comparison of hydraulic property estimates obtained using the two test methods is also presented. Reference materials are listed in Section 6.0.

568 (PNL–10886) **Development of a three-dimensional ground-water model of the Hanford Site unconfined aquifer system: FY 1995 status report.** Wurstner, S.K.; Thorne, P.D.; Chamness, M.A.; Freshley, M.D.; Williams, M.D. Pacific Northwest Lab., Richland, WA (United States). Dec 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003996. Source: OSTI; NTIS; INIS; GPO Dep.

A three-dimensional numerical model of ground-water flow was developed for the uppermost unconfined aquifer at the Hanford Site in south-central Washington. Development of the model is supported by the Hanford Site Ground-Water Surveillance Project, managed by the Pacific Northwest National Laboratory, which is responsible for monitoring the sitewide movement of contaminants in ground water beneath the Hanford Site. Two objectives of the Ground-Water Surveillance Project are to (1) identify and quantify existing, emerging, or potential ground-water quality problems, and (2) assess the potential for contaminants to migrate from the Hanford Site through the ground-water pathway. Numerical models of the ground-water flow system are important tools for estimating future aquifer conditions and predicting the movement of contaminants through ground water. The Ground-Water Surveillance Project has supported development and maintenance of a two-dimensional model of the unconfined aquifer. This report describes upgrade of the two-dimensional model to a three-dimensional model. The numerical model is based on a three-dimensional conceptual model that will be continually refined and updated as additional information becomes available. This report presents a description of the three-dimensional conceptual model of ground-water flow in the unconfined aquifer system and then discusses the cur-rent state of the three-dimensional numerical model.

569 (PNL-SA–23468) **A demonstration of in situ bioremediation of CCL_4 at the Hanford Site.** Hooker, B.S.; Skeen, R.S.; Truex, M.J.; Peyton, B.M. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-951171–1: 23. Hanford symposium on health and the environment conference, Richland, WA (United States), 7-11 Nov 1995). Order Number DE95011412. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy's VOC-Arid Integrated Demonstration Program (VOC/Arid-ID) is developing an in situ bioremediation technology to meet the need for a cost-effective method to clean ground water contaminated with chlorinated solvents, nitratés, or other organic and inorganic contaminants. Currently, a field demonstration of the technology is being conducted at the Hanford site in southeastern Washington state. The goal of this demonstration is to stimulate native denitrifying microorganisms to destroy carbon tetrachloride and nitrate. Contaminants are destroyed by mixing an electron donor (acetate) and an electron acceptor (nitrate) into the aquifer, using a matrix of recirculation wells. This work also evaluates the effectiveness.of applying scale-up techniques developed in the petrochemical industry to bioremediation. The scale-up process is based on combining fluid mixing and transport predictions with numerical descriptions for biological transport and reaction kinetics. This paper focuses on the necessity of this design approach to select nutrient feeding strategies that limit biofouling while actively destroying contaminants.

570 (PNL-SA–25595) **Theory and numerical application of subsurface flow and transport for transient freezing conditions.** White, M.D. (Pacific Northwest Lab., Richland, WA (United States). Earth and Environmental Sciences Center). Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9504192–1: 15. annual hydrology days conference, Ft. Collins, CO (United States), 3-7 Apr 1995). Order Number DE95014182. Source: OSTI; NTIS; INIS; GPO Dep.

Protective barriers are being investigated for the containment of radioactive waste within subsurface environments. Predicting the effectiveness of cryogenic barriers and near-surface barriers in temperate or arctic climates requires capabilities for numerically modeling subsurface flow and transport for freezing soil conditions. A predictive numerical model is developed herein to simulate the flow and transport of radioactive solutes for three-phase (water-ice-air) systems under freezing conditions. This physically based model simulates the simultaneous flow of water, air, heat, and radioactive solutes through variably saturated and variably frozen geologic media. Expressions for ice (frozen water) and liquid water saturations as functions of temperature, interfacial pressure differences, and osmotic potential are developed from nonhysteretic versions of the Brooks and Corey and van Genuchten functions for soil moisture retention. Aqueous relative permeability functions for variably saturated and variably frozen geologic media are developed from the Mualem and Burdine theories for predicting relative permeability of unsaturated soil. Soil deformations, caused by freezing and melting transitions, are neglected. Algorithms developed for predicting ice and liquid water saturations and aqueous-phase permeabilities were incorporated into the finite-difference based numerical simulator STOMP (Subsurface Transport Over Multiple Phases). Application of the theory is demonstrated by the solution of heat and mass transport in a horizontal cylinder of partially saturated porous media with differentially cooled ends, with the colder end held below the liquid water freezing point. This problem represents án essential capability for modeling cryogenic barriers in variably saturated geologic media.

571 (PNL-SA–25678) **The use of bench- and field-scale data for design of an in situ carbon tetrachloride bioremediation system.** Peyton, B.M. (and others); Truex, M.J.; Skeen, R.S. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950483–5: 3. international in situ and on-site bioreclamation symposium, San Diego, CA (United States), 24-27 Apr 1995). Order Number DE95014194. Source: OSTI; NTIS; INIS; GPO Dep.

A suite of simulation models were developed as a design tool in support of an in situ bioremediation demonstration at the Hanford site in Washington state. The design tool, calibrated with field - and bench-scale data, was used to answer four field-scale system design questions: (1) What are the important reaction processes and kinetics? (2) How will biomass distribute in the aquifer in response to injected substrate? (3) What well configuration best ensures proper nutrient transport and process control? (4) What operating and monitoring strategy should be used to confirm effective remediation? This paper does not describe the design tool itself, but describes how the design tool was used to optimize field site design parameters such as well spacing, hydraulic control, contaminant destruction, and nutrient injection strategies.

572 (PNL-SA–25679) **Modeling biologically reactive transport in porous media.** Clement, T.P.; Hooker, B.S.; Skeen, R.S. Pacific Northwest Lab., Richland, WA (United States); Associated Western Universities, Inc., Salt Lake City, UT (United States). Apr 1995. 10p. Sponsored by USDOE, Washington, DC (United States);Associated Western Universities, Inc., Salt Lake City, UT (United States). DOE Contract AC06-76RL01830 ; FG07-93ER75912. (CONF-950420–27: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 May 1995). Order Number DE95014195. Source: OSTI; NTIS; INIS; GPO Dep.

A one-dimensional biofilm-based reactive transport model is developed to simulate biologically mediated substrate metabolism and contaminant destruction in saturated porous media. The resulting equations are solved by a finite-difference based, three-level, operator-split approach. The numerical solution procedure is stable, easy-to-code, and computationally efficient. As an example problem, biological denitrification and fortuitous CT destruction processes in one-dimensional porous media is studied. The simulation results of the example problem show that the present model can be successfully used to predict biological processes and nutrient/contaminant transport in saturated porous media.

573 (PNL-SA–26258) **Bench-scale/field-scale interpretations: Session overview.** Cunningham, A.B.; Peyton, B.M. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950483–4: 3. international in situ and on-site bioreclamation symposium, San Diego, CA (United States), 24-27 Apr 1995). Order Number DE95014637. Source: OSTI; NTIS; INIS; GPO Dep.

In situ bioremediation involves complex interactions between biological, chemical, and physical processes and requires integration of phenomena operating at scales ranging from that of a microbial cell (10^{-6}) to that of a remediation site (10 to 1000 m). Laboratory investigations of biodegradation are usually performed at a relatively small scale, governed by convenience, cost, and expedience. However, extending the results from a laboratory-scale experimental system to the design and operation of a field-scale system introduces (1) additional mass transport mechanisms and limitations; (2) the presence of multiple phases, contants, and competing microorganisms (3) spatial geologic heterogeneities; and (4) subsurface environmental factors that may inhibit bacterial growth such as temperature, pH, nutrient, or redox conditions. Field bioremediation rates may be limited by the availability of one of the necessary constituents for biotransformation: substrate, contaminant, electron acceptor, nutrients, or microorganisms capable of degrading the target compound. The factor that limits the rate of bioremediation may not be the same in the laboratory as it is in the field, thereby leading, to development of unsuccessful remediation strategies.

Other requestors should be directed to Pacific Northwest National Laboratory.

Report and referenced software both copyrighted and available to government agencies and their contractors.

This report describes the mathematical formulations used for contaminant fate and transport in the groundwater pathway of the Multimedia Environmental Pollutant Assessment System (MEPAS). It is one in a series of reports that collectively describe the components of MEPAS. The groundwater component of the MEPAS methodology models solute transport through the groundwater environment (i.e., partially saturated and saturated zones). Specifically, this component provides estimates of groundwater contaminant fluxes at various transporting medium interfaces (e.g., water table or aquifer/river interface) and contaminant concentrations at withdrawal wells. Contaminant fluxes at transporting medium interfaces represent boundary conditions for the next medium in which contaminant migration and fate is to be simulated (e.g., groundwater contamination entering a surface-water environment). Contaminant concentrations at withdrawal wells provide contaminant levels for the exposure assessment component of MEPAS. A schematic diagram illustrating the groundwater environment is presented. The migration and fate of contaminants through the groundwater environment are described by the three-dimensional, advective-dispersive equation for solute transport. The results are based on semianalytical solutions (i.e., solutions that require numerical integration) that are well established in the scientific literature. To increase computational efficiency, limits of integration are also identified.

575 (PNNL–10912) **Stakeholder acceptance analysis: In-well vapor stripping, in-situ bioremediation, gas membrane separation system (membrane separation).** Peterson, T. Battelle Seattle Research Center, WA (United States). Dec 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (BSRC–800/95/021). Order Number DE96005841. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides stakeholder evaluations on innovative technologies to be used in the remediation of volatile organic compounds from soils and ground water. The technologies evaluated are; in-well vapor stripping, in-situ bioremediation, and gas membrane separation.

576 (PNNL–10914) **Stakeholder acceptance analysis ResonantSonic drilling.** Peterson, T. (Battelle Seattle Research Center, WA (United States)). Pacific Northwest Lab., Richland, WA (United States). Dec 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (BSRC–800/95/019). Order Number DE96006114. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents evaluations, recommendations, and requirements concerning ResonantSonic Drilling (Sonic Drilling), derived from a three-year program of stakeholder involvement. Sonic Drilling is an innovative method to reach contamination in soil and groundwater. The resonant sonic drill rig uses counter-rotating weights to generate energy, which causes the drill pipe to vibrate elastically along its entire length. In the resonant condition, forces of up to 200,000 pounds are transmitted to the drill bit face to create a cutting action. The resonant energy causes subsurface materials to move back into the adjacent formation, permitting the drill pipe to advance. This report is for technology developers and those responsible for making decisions about the use of technology to remediate contamination by volatile organic compounds. Stakeholders' perspectives help those responsible for technology deployment to make good decisions concerning the acceptability and applicability of sonic drilling to the remediation problems they face.

577 (PNNL–10950) **Environmental surveillance master sampling schedule.** Bisping, L.E. Pacific Northwest Lab., Richland, WA (United States). Feb 1996. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96007517. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental surveillance of the Hanford Site and surrounding areas is conducted by the Pacific Northwest National Laboratory (PNNL) for the US Department of Energy (DOE). This document contains the planned 1996 schedules for routine collection of samples for the Surface Environmental Surveillance Project (SESP), Drinking Water Project, and Ground-Water Surveillance Project.

578 (PNNL–10977) **Laboratory testing of the in-well vapor-stripping system.** Gilmore, T.J.; Francois, O. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008811. Source: OSTI; NTIS; INIS; GPO Dep.

The Volatile organic Compounds-Arid Integrated Demonstration (VOC-Arid ID) was implemented by the US Department of Energy's (DOE's) Office of Technology Development to develop and test new technologies for the remediation of organic chemicals in the subsurface. One of the technologies being tested under the VOC-Arid ID is the in-well vapor-stripping system. The in-well vapor-stripping concept was initially proposed by researchers at Stanford University and is currently under development through a collaboration between workers at Stanford University and DOE's Pacific Northwest National Laboratory. The project to demonstrate the in-well vapor-stripping technology is divided into three phases: (1) conceptual model and computer simulation, (2) laboratory testing, and (3) field demonstration. This report provides the methods and results of the laboratory testing in which a full-scale replica was constructed and tested above ground in a test facility located at DOE's Hanford Site, Washington. The system is a remediation technology designed to preferentially extract volatile organic compounds (VOCs) from contaminated groundwater by converting them to a vapor phase.

579 (SAND–93-7038) **South Fence Road – Phase 1 field operations summary.** McCord, J.P. (INTERA, Inc., Albuquerque, NM (United States)); Neel, D. Sandia National Labs., Albuquerque, NM (United States); INTERA, Inc., Albuquerque, NM (United States); GRAM, Inc., Albuquerque, NM (United States). Mar 1996. 160p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010868. Source: OSTI; NTIS; INIS; GPO Dep.

The South Fence Road (SFR) project is part of the Sandia National Laboratories, New Mexico (SNL/NM) Site-Wide Hydrogeologic Characterization (SWHC) task. The SWHC task has as its objective the reduction of uncertainty about the rate and direction of groundwater flow in the SNL/NM/Kirtland Air Force Base (KAFB) area. The SFR project area is located along the southern boundary of SNL/KAFB. This project area was selected to provide site-specific information related to geology and groundwater hydrology within the Hubbell Spring/Tijeras/Sandia fault complex. Specific objectives included determining the depth to the Santa Fe Group/bedrock contact, the depth to the water table, and the hydrogeologic complexities related to faulting. This report is a basic data report from the first phase of field operations associated with the drilling, logging, completion, and development of South Fence Road Wells SFR-1D and SFR-1S, SFR-2, SFR-3D and SFR-3S, and SFR-4. These test/monitoring wells were installed as part of Sandia National Laboratories, New Mexico, Environmental Restoration Project.

580 (SAND–94-2094) **Assessment of dry barriers for containment of mobile constituents in the unsaturated zone.** Morris, C.E. (Univ. of New Mexico, Albuquerque, NM (United States)); Thomson, B.M.; Stormont, J.C. Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010512. Source: OSTI; NTIS; INIS; GPO Dep.

A dry barrier may be formed by circulating dry air through a soil layer above or below a waste disposal site, thus reducing the soil moisture content to very low values. Drying a horizontal soil layer creates a barrier to vertical water movement in three ways. First, the drying removes water from the system, intercepting water infiltrating down from the surface. Second, drying a soil layer increases its water storage capacity so the soil will tend to retain rather than transmit water. Third, as a soil layer dries, moisture is removed from progressively smaller interstitial pores so that the hydraulic conductivity of the formation (for liquid flow) decreases. For example, the hydraulic conductivity of a typical sand may decrease by three orders of magnitude as its moisture content is reduced from 20 to 10 percent. This study analyzed the technical and economic feasibility of the subsurface dry barrier concept for containment of a migrating contaminant plume in unsaturated soil. The concept was shown to be a viable option for limiting aqueous migration of pollutants through unsaturated media, with estimated capital costs of between $130,000 and $260,000 for a 1-hectare barrier, and annual operating costs of $10,000 per year.

581 (SAND–95-2187) **Ground water flow velocity in the bank of the Columbia River, Hanford, Washington.** Ballard, S. (Sandia National Labs., Albuquerque, NM (United States). Geophysics Dept.). Sandia National Labs., Albuquerque, NM (United States). Dec 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96005044. Source: OSTI; NTIS; INIS; GPO Dep.

To properly characterize the transport of contaminants from the sediments beneath the Hanford Site into the Columbia River, a suite of In Situ Permeable Flow Sensors was deployed to accurately characterize the hydrologic regime in the banks of the river. The three dimensional flow velocity was recorded on an hourly basis from mid May to mid July, 1994 and for one week in September. The first data collection interval coincided with the seasonal high water level in the river while the second interval reflected conditions during relatively low seasonal river stage. Two flow sensors located approximately 50 feet from the river recorded flow directions which correlated very well with river stage, both on seasonal and diurnal time scales. During time intervals characterized by falling river stage, the flow sensors recorded flow toward the river while flow away from the river was recorded during times of rising river stage. The flow sensor near the river in the Hanford Formation recorded a component of flow oriented vertically downward, probably reflecting the details of the hydrostratigraphy in close proximity to the probe. The flow sensor near the river in the Ringold Formation recorded an upward component of flow which dominated the horizontal components most of the time. The upward flow in the Ringold probably reflects regional groundwater flow into the river. The magnitudes of the flow velocities recorded by the flow sensors were lower than expected, probably as a result of drilling induced disturbance of the hydraulic properties of the sediments around the probes. The probes were installed with resonant sonic drilling which may have compacted the sediments immediately surrounding the probes, thereby reducing the hydraulic conductivity adjacent to the probes and diverting the groundwater flow away from the sensors.

582 (SAND–96-0163) **Summary of field operations, well TRN-1.** Fritts, J.E. (GRAM, Inc., Albuquerque, NM (United States)); Thomas, E.; McCord, J.P. Sandia National Labs., Albuquerque, NM (United States); GRAM, Inc., Albuquerque, NM (United States); INTERA, Inc., Albuquerque, NM (United States). Mar 1996. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010967. Source: OSTI; NTIS; INIS; GPO Dep.

TRN-1 was drilled near the SE corner of Kirtland Air Force Base to a depth of 510 feet. This well is in the Site-Wide Hydrogeologic Characterization task field program, which is part of Sandia's Environmental Restoration Project. After drilling, the borehole was logged, plugged to a depth of 352 ft, and completed as a monitoring well. Sand pack interval is from 305 to 352 ft and the screen interval is from 320 to 340 ft. During field operations, important subsurface geologic and hydrologic data were obtained (drill cuttings, geophysical logs of alluvial cover). Identification of the Abo formation in the subsurface will be useful. The subsurface hydrologic data will help define the local hydrostratigraphic framework within the bedrock. Future aquifer testing will be conducted for transmissivity, etc.

583 (SAND–96-0164) **Summary of field operations Powerline Wells PL-1, PL-2, PL-3.** Foutz, W.L. (Lamb Associates, Inc., Albuquerque, NM (United States)). Sandia National Labs., Albuquerque, NM (United States); Lamb Associates, Inc., Albuquerque, NM (United States). Mar 1996. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010910. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes field operations and hydrogeologic data obtained during installation of the Powerline monitoring/test wells near the western boundary of Kirtland Air Force Base. These wells were installed in 1994 as part of the Site-Wide Hydrogeologic Characterization Project saturated zone investigation. The Site-Wide Hydrogeologic Characterization Project is part of Sandia National Laboratories, New Mexico, Environmental Restoration Project. Three wells were drilled and completed at this location, and named PL-1, PL-2, and PL-3. They are located northwest of Tech Area 3, and are named after a high-voltage powerline located just south of the wells. The objectives of the Powerline wells were to determine the depth to water, complete 2 water table wells and a deeper Santa Fe Group well, to determine the geologic provenance of Santa Fe Group sediments at this location, and to obtain background core samples for radiological analysis. During these field operations, important subsurface hydrogeologic data were obtained. These data include drill cuttings and lithologic descriptions, core samples with background analytical data, geophysical logs, water quality parameters, and water levels. Aquifer tests at the Powerline location will generate data that may yield information on anisotropy in the Santa Fe Group and constrain numerical modeling results that indicate that there is a major northward component of groundwater flow from McCormick Ranch and Tech Area 3 test sites toward City of Albuquerque and KAFB well fields.

584 (SAND–96-0165) **Summary of field operations Magazine Road North Wells MRN-1 and MRN-2.** Fritts, J.E. (GRAM, Inc., Albuquerque, NM (United States)); McCord, J.P. Sandia National Labs., Albuquerque, NM (United States); GRAM, Inc., Albuquerque, NM (United States); INTERA, Inc., Albuquerque, NM (United States). Mar 1996. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010869. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a summary of the field operations associated with the installation of the MRN-1 and MRN-2 test/monitoring wells. These wells were installed in December 1994 and January 1995 as part of the Site-Wide Hydrogeologic Characterization (SWHC) task field program. The SWHC task is part of the Sandia National Laboratories, New Mexico, Environmental Restoration Project carried out by the Environmental Operations Center, 7500. MRN-1 and MRN-2 are paired wells located near the western edge of Kirtland Air Force Base (KAFB), west of Technical Area 3 (TA3), and north of Magazine Road. (Note: MRN stands for Magazine Road North). During the MRN field operations, important subsurface geologic, hydrologic, chemical, and radiological data were obtained. Subsurface geologic data include descriptions of drill cuttings, core, and geophysical logs of the upper unit of the Santa Fe Group. The geology identified here can help determine the eastern limit of the ancestral Rio Grande lithofacies. Subsurface hydrologic data include borehole geophysical logs, and qualitative information obtained during well completion and development. In addition, future aquifer testing at the MRN site will generate data for the interpretation of aquifer parameters such as transmissivity. Samples were taken from core every 100 feet at MRN-1 for chemical and radiological analysis to provide background data for the Environmental Restoration Project.

585 (SAND–96-1031) **Recommendations for computer modeling codes to support the UMTRA groundwater restoration project.** Tucker, M.D. (Sandia National Labs., Albuquerque, NM (United States)); Khan, M.A. Sandia National Labs., Albuquerque, NM (United States). Apr 1996. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010899. Source: OSTI; NTIS; INIS; GPO Dep.

The Uranium Mill Tailings Remediation Action (UMTRA) Project is responsible for the assessment and remedial action at the 24 former uranium mill tailings sites located in the US. The surface restoration phase, which includes containment and stabilization of the abandoned uranium mill tailings piles, has a specific termination date and is nearing completion. Therefore, attention has now turned to the groundwater restoration phase, which began in 1991. Regulated constituents in groundwater whose concentrations or activities exceed maximum contaminant levels (MCLs) or background levels at one or more sites include, but are not limited to, uranium, selenium, arsenic, molybdenum, nitrate, gross alpha, radium-226 and radium-228. The purpose of this report is to recommend computer codes that can be used to assist the UMTRA groundwater restoration effort. The report includes a survey of applicable codes in each of the following areas: (1) groundwater flow and contaminant transport modeling codes, (2) hydrogeochemical modeling codes, (3) pump and treat optimization codes, and (4) decision support tools. Following the survey of the applicable codes, specific codes that can best meet the needs of the UMTRA groundwater restoration program in each of the four areas are recommended.

586 (SAND–96-1459) **Technical considerations for the implementation of subsurface microbial barriers for restoration of groundwater at UMTRA sites.** Tucker, M.D. Sandia National Labs., Albuquerque, NM (United States). Jan 1996. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96012418. Source: OSTI; NTIS; INIS; GPO Dep.

The Uranium Mill Tailings Remediation Action (UMTRA) Program is responsible for the assessment and remedial action at the 24 former uranium mill tailings sites located in the United States. The surface remediation phase, which has primarily focused on containment and stabilization of the abandoned uranium mill tailings piles, is nearing completion. Attention has now turned to the groundwater restoration phase. One alternative under consideration for groundwater restoration at UMTRA sites is the use of in-situ permeable reactive subsurface barriers. In this type of a system, contaminated groundwater will be allowed to flow naturally through a barrier filled with material which will remove hazardous constituents from the water by physical, chemical or microbial processes while allowing passage of the pore water. The subject of this report is a reactive barrier which would remove uranium and other contaminants of concern from groundwater by microbial action (i.e., a microbial barrier). The purpose of this report is to assess the current state of this technology and to determine issues that must be addressed in order to use this technology at UMTRA sites. The report focuses on six contaminants of concern at UMTRA sites including uranium, arsenic, selenium, molybdenum, cadmium and chromium. In the first section of this report, the fundamental chemical and biological processes that must occur in a microbial barrier to control the migration of contaminants are described. The second section contains a literature review of research which has been conducted on the use of microorganisms to immobilize heavy metals. The third section addresses areas which need further development before a microbial barrier can be implemented at an UMTRA site.

587 (UCRL-ID–120416) **Summary of the LLNL gasoline spill demonstration - dynamic underground stripping project.** Newmark, R.L.; Aines, R.D. Lawrence Livermore National Lab., CA (United States). 3 Apr 1995. 36p. Sponsored by USDOE, Washington, DC (United States);National Inst. of Environmental Health Sciences, Research Triangle Park, NC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011415. Source: OSTI; NTIS; GPO Dep.

Underground spills of volatile hydrocarbons (solvents or fuels) can be difficult to clean up when the hydrocarbons are present both above and below the water table and are found in relatively impermeable clays. Years of groundwater pumping may not completely remove the contamination. Researchers at Lawrence Livermore National Laboratory (LLNL) and the College of Engineering at the University of California at Berkeley (UCB) have collaborated to develop a technique called Dynamic Underground Stripping to remove localized underground spills in a relatively short time. The U.S. Department of Energy's Office of Environmental Restoration and Waste Management has sponsored a full-scale demonstration of this technique at the LLNL gasoline spill site. When highly concentrated contamination is found above the standing water table, vacuum extraction has been very effective at both removing the contaminant and enhancing biological remediation through the addition of oxygen. Below the water table, however, these advantages cannot be obtained. For such sites where the contamination is too deep for excavation, there are currently no widely applicable cleanup methods. Dynamic Underground Stripping removes separate-phase organic contaminants below the water table by heating the subsurface above the boiling point of water, and then removing both contaminant and water by vacuum extraction. The high temperatures both convert the organic to vapor and enhance other removal paths by increasing diffusion and eliminating sorption. Because this method uses rapid, high-energy techniques in cleaning the soil, it requires an integrated system of underground monitoring and imaging methods to control and evaluate the process in real time.

588 (UCRL-JC–122299) **Effect of subsurface electrical heating and steam injection on the indigenous microbial community.** Krauter, P.; MacQueen, D.; Horn, J.; Bishop, D. Colorado School of Mines, Golden, CO (United States). Research Inst. Nov 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-960804–25: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96010702. Source: OSTI; NTIS; GPO Dep.

Since the potential for contaminant bioremediation in steam treated subsurface environments has not been explored, the thermal remedial treatment of a gasoline spill at Lawrence Livermore National Laboratory's (LLNL) Livermore site provided an opportunity to study microbial community changes in the subsurface environment. Many terrestrial microorganisms die or become metabolically inactive if heated for a sufficient time at temperatures of 62-100°C thus thermal remediation techniques are expected to significantly alter the microbial community structure. We studied changes in community structure and population abundance as well as the characteristics of indigenous heat-tolerant microorganisms before and after steam treatment. Using fatty acid profiles from culturable microorganisms obtained from sediment cores before and after thermal treatment, a 90-98% decline in total microorganism populations in hot subsurface sediments (up to 94°C) was found. Surviving heat-tolerant microorganisms were found to possess elevated concentrations of saturated fatty acids in their lipid membranes. We also observed that some heat-tolerant microorganisms were capable of degrading gasoline compounds.

589 (UCRL-JC–122874) **Complex electrical resistance tomography of a subsurface PCE plume.** Ramirez,

A.; Daily, W,; LeBrecque, D. Lawrence Livermore National Lab., CA (United States). Jan 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-960477–5: 9. annual symposium on the application of geophysics to engineering and environmental problems, Denver, CO (United States), 15 Apr - 1 May 1996). Order Number DE96010245. Source: OSTI; NTIS; GPO; GPO Dep.

A controlled experiment was conducted to evaluate the performance of complex electrical resistivity tomography (CERT) for detecting and delineating free product dense non-aqueous phase liquid (DNAPL) in the subsurface. One hundred ninety liters of PCE were released at a rate of 2 liters per hour from a point 0.5 m below ground surface. The spill was conducted within a double walled tank where saturated layers of sand, bentonite and a sand/bentonite mixture were installed. Complex electrical resistance measurements were performed. Data were taken before the release, several times during, and then after the PCE was released. Magnitude and phase were measured at 1 and 64 Hz. Data from before the release were compared with those during the release for the purpose of imaging the changes in conductivity resulting from the plume. Conductivity difference tomographs showed a decrease in electrical conductivity as the DNAPL penetrated the soil. A pancake-shaped anomaly developed on the top of a bentonite layer at 2 m depth. The anomaly grew in magnitude and extent during the release and borehole television surveys data confirmed the anomaly to be free-product PCE whose downward migration was stopped by the low permeability clay. The tomographs clearly delineated the plume as a resistive anomaly.

590 (USGS-OFR–95-160) **Ground-water data for the Nevada Test Site and selected other areas in South-Central Nevada, 1992–1993.** Geological Survey, Denver, CO (United States). 1995. 50p. Sponsored by Department of the Interior, Washington, DC (United States);USDOE, Washington, DC (United States). DOE Contract AI08-86NV10583. Order Number DE96000244. Source: OSTI; NTIS; INIS; U.S. Geological Survey, Information Services, Box 25286, MS 517, Denver Federal Center, Denver, CO (United States) 80225-0046; GPO Dep.

The US Geological Survey, in support of the US Department of Energy Environmental Restoration and Hydrologic Resources Management Programs, collects and compiles hydrogeologic data to aid in characterizing the regional and local ground-water flow systems underlying the Nevada Test Site and vicinity. This report presents selected ground-water data collected from wells and test holes at and in the vicinity of the Nevada Test Site. Depth-to-water measurements were made during water year 1993 at 55 sites at the Nevada Test Site and 43 regional sites in the vicinity of the Nevada Test Site. Depth to water ranged from 87.7 to 674.6 meters below land surface at the Nevada Test Site and from 6.0 to 444.7 meters below land surface at sites in the vicinity of the Nevada Test Site. Depth-to-water measurements were obtained using the wire-line, electric-tape, air-line, and steel-tape devices. Total measured ground-water withdrawal from the Nevada Test Site during the 1993 calendar year was 1,888.04 million liters. Annual ground-water withdrawals from 14 wells ranged from 0.80 million to 417.20 million liters. Tritium concentrations from four samples at the Nevada Test Site and from three samples in the vicinity of the Nevada Test Site collected during water year 1993 ranged from near 0 to 27,676.0 becquerels per liter and from near 0 to 3.9 becquerels per liter, respectively.

591 (USGS-OFR–95-284) **Ground-water data for the Nevada Test Site 1992, and for selected other areas in South-Central Nevada, 1952–1992.** Geological Survey, Denver, CO (United States). [1992]. 60p. Sponsored by Department of the Interior, Washington, DC (United States);USDOE, Washington, DC (United States). DOE Contract AI08-86NV10583. Order Number DE96000243. Source: OSTI; NTIS; INIS; U.S. Geological Survey, Information Services, Box 25286, MS 517, Denver Federal Center, Denver, CO (United States) 80225-0046; GPO Dep.

Ground-water data collected from wells and test holes at and in the vicinity of the Nevada Test Site have been compiled in a recently released report. These data were collected by the US Geological Survey, Department of the Interior, in support of the US Department of Energy, Environmental Restoration and Hydrologic Resources Management Programs. Depth-to-water measurements were made at 53 sites at the Nevada Test Site from October 1, 1991, to September 30, 1992, and at 60 sites in the vicinity of the Nevada Test Site from 1952 to September 30, 1992. For water year 1992, depth to water ranged from 288 to 2,213 feet below land surface at the Nevada Test Site and from 22 to 1,460 feet below land surface at sites in the vicinity of the Nevada Test Site. Total ground-water withdrawal data compiled for 12 wells at the Nevada Test Site during calendar year 1992 was more than 400 million gallons. Tritium concentrations in water samples collected from five test holes at the Nevada Test Site in water year 1992 did not exceed the US Environmental Protection Agency drinking, water limit.

592 (WHC-EP–0394-10) **Groundwater maps of the Hanford Site, December 1994.** Serkowski, J.A.; Hartman, M.J.; Sweeney, M.D. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95017147. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a continuation of a series of reports (see Serkowski et al 1994) that the configuration of the uppermost unconfined aquifer beneath the Hanford Site. This series presents the results of the semiannual water level measurement program and the water table maps generated from these measurements. The reports document the changes in the groundwater level at the Hanford Site during the transition from nuclear material production to environmental restoration and remediation. In addition, these reports provide water level data to support the various site characterization and groundwater monitoring programs currently in progress on the Hanford Site.

593 (WHC-SA–2665) **Modeling groundwater contamination transport for the Hanford Environmental Disposal Facility.** Finfrock, S.H. Westinghouse Hanford Co., Richland, WA (United States). Oct 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950420–31: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 May 1995). Order Number DE95015741. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary groundwater analyses were performed for the Hanford Environmental Restoration Disposal Facility (ERDF) to demonstrate compliance With dose limit performance objectives in DOE Order 5820.2A. These analyses were designed to determine peak radionuclide concentrations in a theoretical drinking-water well 100 m downstream from the facility. The resulting peak concentrations can be used to determine inventory limits for the facility.

594 (WHC-SD-EN-AP-165-Rev.1) **Interim-status groundwater monitoring plan for the 216-B-63 trench. Revision 1.** Sweeney, M.D. Westinghouse Hanford Co., Richland, WA (United States). 13 Jun 1995. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015656. Source: OSTI; NTIS; INIS; GPO Dep.

This document outlines the groundwater monitoring plan for interim-status detection-level monitoring of the 216-B-63 Trench. This is a revision of the initial groundwater monitoring plan prepared for Westinghouse Hanford Company (WHC) by Bjornstad and Dudziak (1989). The 216-B-63 Trench, located at the Hanford Site in south-central Washington State, is an open, unlined, earthern trench approximately 1.2 m (4 ft) wide at the bottom, 427 m (1400 ft) long, and 3 m (10 ft) deep that received wastewater containing hazardous waste and radioactive materials from B Plant, located in the 200 East Area. Liquid effluent discharge to the 216-B-63 Trench began in March 1970 and ceased in February 1992. The trench is now managed by Waste Tank Operations.

595 (WHC-SD-EN-AP-174) **Groundwater monitoring and assessment plan for the 100-K Area fuel storage basins.** Johnson, V.G.; Chou, C.J.; Lindberg, J.W. Westinghouse Hanford Co., Richland, WA (United States). 19 Sep 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050009. Source: OSTI; NTIS; INIS; GPO Dep.

The Data Quality Objectives (DQO) process was used to develop a cost- effective groundwater monitoring and assessment plan for the nuclear fuel storage basins in the 100-K Area of the Hanford Site. The use of predicted contaminant dispersal rates and directions, indicator or surrogate measurements and proposed field screening measurements contribute to significantly reduced operational costs. A subsurface characterization logic is also presented for locating possible sources of strontium-90 and other contaminants in the soil column and groundwater in the vicinity of suspected sources.

596 (WHC-SD-EN-AP-180) **Groundwater Monitoring Plan for the 183-H Solar Evaporation Basins.** Hartman, M.J. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1995. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050004. Source: OSTI; NTIS; INIS; GPO Dep.

Groundwater monitoring at the 183-H Solar Evaporation Basins is regulated under Washington Administrative Code (WAC) 173-303-645. This document proposes a final-status, compliance monitoring program for the site. The monitoring network consists of eight existing wells: H4-6 and H3-2A (upgradient), H4-3, H4-4, H4-9, H4-12A, H4-18, and H4-12C (downgradient). Well H4-12C is completed at the base of the unconfined aquifer; the other wells are screened at the water table. Concentration limits are identified for 4 contaminants of concern: chromium (122 ppb), nitrate (45,000 ppb), technetium-99 (900 pCi/L), and uranium (20 μg/L). The limit for chromium was based on background concentrations because there are upgradient sources of chromium. The limits for the other constituents are maximum contaminant levels or drinking water standards. A set of four independent groundwater samples will be collected from each well semiannually. Samples will be analyzed for the following: * The constituents of concern (i.e., nitrate, chromium, uranium, and technetium-99) * Additional constituents to aid data interpretation (alkalinity, anions, and metals) * Field parameters routinely acquired at the well head (e.g., pH, conductivity, turbidity, and temperature). The tolerance-interval approach is the recommended statistical method. If concentration limits are exceeded, confirmation samples will be collected to reduce the chance of a false positive.

597 (WHC-SD-EN-AP-185) **Groundwater monitoring plan for the 300 Area process trenches.** Lindberg, J.W.; Chou, C.J.; Johnson, V.G. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 162p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013880. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the groundwater monitoring program for the Hanford Site 300 Area Process Trenches (300 APT). The 300 APT are a Resource Conservation and Recovery Act of 1976 (RCRA) regulated unit. The 300 APT are included in the Dangerous Waste Portion of the Resource Conservation and Recovery Act Permit for the Treatment, Storage, and Disposal of Dangerous Waste, Permit No. WA890008967, and are subject to final-status requirements for groundwater monitoring. This document describes a compliance monitoring program for groundwater in the uppermost aquifer system at the 300 APT. This plan describes the 300 APT monitoring network, constituent list, sampling schedule, statistical methods, and sampling and analysis protocols that will be employed for the 300 APT. This plan will be used to meet groundwater monitoring requirements from the time the 300 APT becomes part of the Permit and through the postclosure care period until certification of final closure.

598 (WHC-SD-EN-WP-012-Rev.1) **Groundwater screening evaluation/monitoring plan: 200 Area Treated Effluent Disposal Facility (Project W-049H). Revision 1.** Barnett, D.B.; Davis, J.D.; Collard, L.B.; Freeman, P.B.; Chou, C.J. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 225p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014429. Source: OSTI; NTIS; INIS; GPO Dep.

This report consists of the groundwater screening evaluation required by Section S.8 of the State Waste Discharge Permit for the 200 Area TEDF. Chapter 1.0 describes the purpose of the groundwater monitoring plan. The information in Chapter 2.0 establishes a water quality baseline for the facility and is the groundwater screening evaluation. The following information is included in Chapter 2.0: Facility description;Well locations, construction, and development data; Geologic and hydrologic description of the site and affected area; Ambient groundwater quality and current use; Water balance information; Hydrologic parameters; Potentiometric map, hydraulic gradients, and flow velocities; Results of infiltration and hydraulic tests; Groundwater and soils chemistry sampling and analysis data; Statistical evaluation of groundwater background data; and Projected effects of facility operation on groundwater flow and water quality. Chapter 3.0 defines, based on the information in Chapter 2.0, how effects of the TEDF on the environment will be evaluated and how compliance with groundwater quality standards will be documented in accordance with the terms and conditions of the permit. Chapter 3.0 contains the following information:

Media to be monitored; Wells proposed as the point of compliance in the uppermost aquifer; Basis for monitoring well network and evidence of monitoring adequacy; Contingency planning approach for vadose zone monitoring wells; Which field parameters will be measured and how measurements will be made; Specification of constituents to be sampled and analyzed; and Specification of the sampling and analysis procedures that will be used. Chapter 4.0 provides information on how the monitoring results will be reported and the proposed frequency of monitoring and reporting. Chapter 5.0 lists all the references cited in this monitoring plan. These references should be consulted for additional or more detailed information.

599 (WHC-SD-ER5480-ER–001-Rev.1) **Hanford facilities tracer study report (315 Water Treatment Facility). Revision 1.** Ambalam, T. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). May 1995. 96p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012799. Source: OSTI; NTIS; GPO Dep.

Reported are the results and findings of a tracer study to determine contact time for the disinfection process of 315 Water Treatment Facility at 300 Area. The study utilized fluoride as the tracer and contact times were determined for two flow rates. Interpolation of data and short circuiting effects are also discussed.

600 (WHC-SD-LEF-PLN–002-Rev.1) **200 Area TEDF effluent sampling and analysis plan.** Alaconis, W.C. (and others); Ballantyne, N.A.; Boom, R.J. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016342. Source: OSTI; NTIS; INIS; GPO Dep.

This sampling analysis sets forth the effluent sampling requirements, analytical methods, statistical analyses, and reporting requirements to satisfy the State Waste Discharge Permit No. ST4502 for the Treated Effluent Disposal Facility. These requirements are listed below: Determine the variability in the effluent of all constituents for which enforcement limits, early warning values and monitoring requirements; demonstrate compliance with the permit; and verify that BAT/AKART (Best Available Technology/All know and Reasonable Treatment) source, treatment, and technology controls are being met.

601 (WHC-SD-LEF-RPT–001) **Liquid effluent Sampling and Analysis Plan (SAP) implementation summary report.** Lueck, K.J. Westinghouse Hanford Co., Richland, WA (United States). 26 Apr 1995. 118p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011677. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes liquid effluent analytical data collected during the Sampling and Analysis Plan (SAP) Implementation Program, evaluates whether or not the sampling performed meets the requirements of the individual SAPs, compares the results to the WAC 173-200 Ground Water Quality Standards. Presented in the report are results from liquid effluent samples collected (1992-1994) from 18 of the 22 streams identified in the Consent Order (No. DE 91NM-177) requiring SAPs.

602 (WHC-SD-SNF-ATR–004) **Acceptance test procedure for the 105-KW isolation barrier leak rate.** McCracken, K.J. Westinghouse Hanford Co., Richland, WA (United States). 19 May 1995. 292p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013345. Source: OSTI; NTIS; INIS; GPO Dep.

This acceptance test procedure shall be used to: First establish a basin water loss rate prior to installation of the two isolation barriers between the main basin and the discharge chute in K-Basin West. Second, perform an acceptance test to verify an acceptable leakage rate through the barrier seals. This Acceptance Test Procedure (ATP) has been prepared in accordance with CM-6-1 EP 4.2, Standard Engineering Practices.

603 (WHC-SD-SNF-ER–006-Rev.1) **105-KE Basin isolation barrier leak rate test analytical development. Revision 1.** Irwin, J.J. Westinghouse Hanford Co., Richland, WA (United States). 9 May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015599. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides an analytical development in support of the proposed leak rate test of the 105-KE Basin. The analytical basis upon which the K-basin leak test results will be used to determine the basin leakage rates is developed in this report. The leakage of the K-Basin isolation barriers under postulated accident conditions will be determined from the test results. There are two fundamental flow regimes that may exist in the postulated K-Basin leakage: viscous laminar and turbulent flow. An analytical development is presented for each flow regime. The basic geometry and nomenclature of the postulated leak paths are denoted.

604 (WHC-SD-SNF-TRP–006) **105 K East isolation barrier acceptance analysis report.** McCracken, K.J. (ICF Kaiser Hanford Co., Richland, WA (United States)); Irwin, J.J. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014431. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this document is to report and interpret the findings of the isolation barrier acceptance tests performed in 105KE/100K. The tests were performed in accordance with the test plan (McCracken 1995c) and acceptance test procedure (McCracken 1995a). The test report (McCracken 1995b) contains the test data. This document compares the test data (McCracken 1995b) against the criteria (McCracken 1995a, c). A discussion of the leak rate analytical characterization (Irwin 1995) describes how the flow characteristics and the flow rate will be determined using the test data from the test report (McCracken 1995b). The barriers must adequately control the leakage from the main basin to the discharge chute to less than the 1,500 gph (5,680 lph) Safety Analysis Report (SAR 1994) limit.

605 (WHC-SD-WM-OTR–171) **Operability test report for the TK-900 effluent monitoring station.** Weissenfels, R.D. Westinghouse Hanford Co., Richland, WA (United States). 6 Apr 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010595. Source: OSTI; NTIS; INIS; GPO Dep.

This operability test report provides the results of the operability test performed on the TK-900 liquid effluent collection system, installed near the east end of the 6 inch chemical sewer header, by Project W-007H. The system is part of BAT/AKART for the BCE liquid effluent stream.

606 (WSRC-MS--95-0187) **The Speciation of Groundwater Contaminated with Coal Pile Leachate at the Savannah River Site, South Carolina.** Denham, M.E.; Nichols, R.L. Westinghouse Savannah River Co., Aiken, SC (United States). 15 May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9506198–1: International Association of Hydro-Geologists Congress: solutions, Edmonton (Canada), 4-10 Jun 1995). Order Number DE95060146. Source: OSTI; NTIS; INIS; GPO Dep.

Modeling the transport of contaminant metals and designing systems for their remediation requires an understanding of the metal's speciation. Thus, analysis of contaminant speciation and evaluation of the processes that can change the speciation should be done during characterization of the contaminated site. This approach is being used at the Savannah River Site for a metals contaminated site that will serve as a test platform for metals remediation technologies. The site is adjacent to a coal storage pile and the basin that contains the coal pile runoff. A network of well clusters allows definition of the plume, including profiles of contamination with depth. The groundwater is acidic (pH $\approx$ 2) and contains high concentrations of sulfate (up to 2300 mg/l) and metals, with chromium, nickel, cadmium and lead exceeding drinking water standards. Aluminum and total iron concentrations range up to 1326 mg/l and 7991 mg/l, respectively. Speciation calculations on dissolved contaminants indicate that as much as 65% of the lead, 54% of the cadmium, and 34% of the nickel may be present in sulfate complexes. Chromium occurs predominantly as Cr^{+3}. There is evidence that some contaminant metals may be associated with colloidal material. Contamination in the groundwater is stratified with concentrations decreasing over a depth range of 3 meters (10 feet). Fluid-rock interactions explain the non-uniform behavior of dissolved components with depth. Mass balance considerations suggest that the interactions are dominated by Kaolinite dissolution coupled with precipitation of phases containing aluminum, ferric iron, silica, and sulfate, as well as co- precipitation of contaminant metals.

607 (WSRC-MS--95-0303) **In situ bioremediation of chlorinated solvent with natural gas.** Rabold, D.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96002956. Source: OSTI; NTIS; INIS; GPO Dep.

A bioremediation system for the removal of chlorinated solvents from ground water and sediments is described. The system involves the the in-situ injection of natural gas (as a microbial nutrient) through an innovative configuration of horizontal wells.

608 (WSRC-MS--96-0042) **Effects of closure cap and liner on contaminant release rates from grouted wastes.** Yu, A.D.; Fowler, J.R.; Bignell, D.T. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960482–9: Society of Computer Simulation (SCS) multiconference: high performance computing, New Orleans, LA (United States), 8-11 Apr 1996). Order Number DE96012429. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a groundwater modeling study of waste disposal concepts using grouted waste forms. The focus of the study is on the effects of clay caps and concrete vaults on contaminant migration. The authors modeled three waste disposal scenarios: (1) Grouted waste was solidified in an earthen trench and covered with soil, there was no vault and no cap; (2) grouted waste was solidified in an earthen trench, the entire waste disposal facility was then closed under a clay cap; (3) grouted waste was solidified in a concrete vault and protected by the same closure as in 2. Because of the huge contrast in hydraulic conductivities and highly non-linear multi-phase flow characteristics, these waste disposal concepts presented a difficult problem for numerical simulation. Advanced fluid flow and contaminant transport codes were used to solve the problem. Among the codes tested, ECLIPSE out-performed other codes in speed, accuracy (smaller material balance errors) and capability in handling sophisticated scenarios. The authors used nitrate as a tracer for the simulation. Nitrate does not absorb in the solid phase and does not decay. As a result, predicted release rate based on nitrate is conservative. They also assumed that the facility is intact for 10,000 years. In other words, properties of the materials used for this study do not change with time. Predicted peak flux for the no vault and no closure case was 5.8×10^{-4} per year at 12 years. If a clay cap was installed, predicted peak flux was 8.5×10^{-5} per year at 110 years. If the grout was disposed in a concrete vault and covered by a clay cap, predicted peak flux became 4.4×10^{-6} per year at 8,000 years. Both concrete liner and clay cap can reduce the rate of contaminant release to the water table and delay the peak time.

609 (WSRC-RP--95-237) **Groundwater model recalibration and remediation well network design at the F-Area Seepage Basins.** Sadler, W.R. Westinghouse Savannah River Co., Aiken, SC (United States). Apr 1995. 124p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96002957. Source: OSTI; NTIS; INIS; GPO Dep.

On September 30, 1992, the South Carolina Department of Health and Environmental Control (SCDHEC) issued a Resource Conservation and Recovery Act (RCRA) Hazardous Waste Part B Permit prescribing remediation of contaminated groundwater beneath and downgradient of the F- and H-Area Seepage Basins at the Savannah River Site. The remediation outlined in the Part B Permit calls for a three phase approach. For the F-Area Seepage Basins, the first phase requires the "installation of an adequate number of pumping and injection wells or trenches, as appropriate, to capture and remediate those portions of-the contaminant plume delineated by the 10,000 pCi/ml tritium isoconcentration contour." Geochemical results from 1992 groundwater monitoring were used to delineate this isoconcentration contour in the Corrective Action Program (CAP) (WSRC, 1992a). The 1992 results were used based on SCDHEC written requirement to use the most recent data available at the time the CAP was formulated. The rationale used by SCDHEC in selecting the 10,000 pCi/ml tritium isoconcentration contour was that it also encompassed most of the other contaminants listed in the Groundwater Protection Standards. After extraction and treatment, the water is required to be reinjected into the aquifer due to the high levels of tritium still present in the treated water. The conceptual plan is to have recirculation of the tritium (as much as can practically be accomplished) to allow more time for radioactive decay before natural discharge to surface water.

610 (WSRC-TR-94-0616) **H-Area, K-Area, and Par Pond Sewage Sludge Application Sites Groundwater Monitoring Report. Fourth quarter 1994 and 1994 summary.** Chase, J.A. Westinghouse Savannah River Co., Aiken, SC (United States). Apr 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060134. Source: OSTI; NTIS; GPO Dep.

Groundwater samples from the three wells at the H-Area Sewage Sludge Application Site (HSS wells) are analyzed quarterly for constituents as required by South Carolina Department of Health and Environmental Control Construction Permit 12,076. Samples from the three wells at the K-Area Sewage Sludge Application Site (KSS wells) and the three wells at the Par Pond Sewage Sludge Application Site (PSS wells) are analyzed quarterly for constituents required by SCDHEC Construction Permit 13,173. All samples are also analyzed as requested for other constituents as part of the Savannah River Site Groundwater Monitoring Program. Annual analyses for other constituents, primarily metals. also are required by the permits.

611 (WSRC-TR-95-0139-1) **Mixed Waste Management Facility groundwater monitoring report. First quarter 1995.** Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1995. 600p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96001684. Source: OSTI; NTIS; INIS; GPO Dep.

During first quarter 1995, eleven constituents exceeded final Primary Drinking Water Standards (PDWS) in groundwater samples from downgradient monitoring wells at the mixed Waste Management Facility, the Old Burial Ground, the E-Area Vaults, the proposed Hazardous Waste/Mixed Waste Disposal Vaults, and the F-Area Sewage Sludge Application Site. No constituents exceeded final PDWS in samples from the upgradient monitoring wells during first quarter 1995. As in previous quarters, tritium and trichloroethylene were the most widespread elevated constituents. Antimony, chloroethene, copper, dichloromethane, gross alpha, lead, mercury, nonvolatile beta, and tetrachloroethylene also exceeded final PDWS in one or more wells. Elevated constituents were found in numerous Aquifer Zone IIB_2 (Water Table) and Aquifer Zone IIB_1 (Barnwell/McBean)wells. Elevated constituents were found in five Aquifer Unit IIA (Congaree) wells. The groundwater flow directions and rates in the three hydrostratigraphic units were similar to those of previous quarters.

612 (WSRC-TR-95-0144-1) **Metallurgical Laboratory Hazardous Waste Management Facility groundwater monitoring report. First quarter 1995.** Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96001687. Source: OSTI; NTIS; INIS; GPO Dep.

During first quarter 1995, samples from AMB groundwater monitoring wells at the Metallurgical Laboratory Hazardous Waste Management Facility (Met Lab HWMF) were analyzed for selected heavy metals, field measurements, radionuclides, volatile organic compounds, and other constituents. Six parameters exceeded standards during the quarter. As in previous quarters, tetrachloroethylene and trichloroethylene exceeded final Primary Drinking Water Standards (PDWS). Total organic halogens exceeded its Savannah River Site (SRS) Flag 2 criterion during first quarter 1995 as in fourth quarter 1994. Aluminum, iron, and manganese, which were not analyzed for during fourth quarter 1994, exceeded the Flag 2 criteria in at least two wells each during first quarter 1995. Groundwater flow direction and rate in the M-Area Aquifer Zone were similar to previous quarters. Conditions affecting the determination of groundwater flow directions and rates in the Upper Lost Lake Aquifer Zone, Lower Lost Lake Aquifer Zone, and the Middle Sand Aquifer Zone of the Crouch Branch Confining Unit were also similar to previous quarters.

613 (WSRC-TR-95-0349) **Analysis of volatile organic compounds in groundwater samples by gas chromatography-mass spectrometry.** Bernhardt, J. Westinghouse Savannah River Co., Aiken, SC (United States). 23 Aug 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96003015. Source: OSTI; NTIS; GPO Dep.

The Savannah River Site contains approximately 1500 monitoring wells from which groundwater samples are collected. Many of these samples are sent off-site for various analyses, including the determination of trace volatile organic compounds (VOCs). This report describes accomplishments that have been made during the past year which will ultimately allow VOC analysis to be performed on-site using gas chromatography-mass spectrometry. Through the use of the on-site approach, it is expected that there will be a substantial cost savings. This approach will also provide split-sample analysis capability which can serve as a quality control measure for off-site analysis.

614 (WSRC-TR-95-0350) **Z-Area Saltstone Disposal Facility groundwater monitoring report. Second quarter 1995.** Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96006494. Source: OSTI; NTIS; GPO Dep.

The three monitoring wells at the Z-Area Saltstone Disposal Facility, ZBG 1, 1A, and 2, are sampled quarterly as part of the Savannah River Site Groundwater Monitoring Program and to comply with conditions of the facility's Industrial Waste Permit IWP-217, issued by the South Carolina Department of Health and Environmental Control (SCDHEC). During second quarter 1995, samples from wells ZBG 1 and 2 were analyzed for selected inorganic constituents, volatile organic compounds, selected radionuclides, and other constituents. Well ZBG 1A was dry and could not be sampled. Dichloromethane, a common laboratory contaminant, was detected above final Primary Drinking Water Standards (PDWS) in well ZBG 1 and was detected in this well's associated method blank during second quarter 1995. No other constituents exceeded final PDWS, SCDHEC proposed groundwater monitoring standards, or Savannah River Site flagging criteria in the ZBG wells during second quarter 1995. In previous quarters, wells ZBG 1 and 2 contained slightly elevated levels of tritium, similar to the tritium levels detected before Z Area began radioactive operations. The Z-Area Saltstone Disposal Facility blends low-level salt solutions with cement, slag, and flyash to form a nonhazardous cementitious waste that is pumped to aboveground disposal vaults.

MIXED WASTE CHARACTERIZATION, TREATMENT, AND DISPOSAL

615 (ANL/ACL–95/4) **A comparison of continuous pneumatic nebulization and flow injection-direct injection nebulization for sample introduction in inductively coupled plasma-mass spectrometry.** Crain, J.S.; Kiely, J.T. Argonne National Lab., IL (United States). Aug 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96009562. Source: OSTI; NTIS; INIS; GPO Dep.

Dilute nitric acid blanks and solutions containing Ni, Cd, Pb, and U (including two laboratory waste samples) were analyzed eighteen times over a two-month period using inductively coupled plasma-mass spectrometry (ICP-MS). Two different sample introduction techniques were employed: flow injection-direct injection nebulization (FI-DIN) and continuous pneumatic nebulization (CPN). Using comparable instrumental measurement procedures, FI-DIN analyses were 33% faster and generated 52% less waste than CPN analyses. Instrumental limits of detection obtained with FI-DIN and CPN were comparable but not equivalent (except in the case of Pb) because of nebulizer-related differences in sensitivity (i.e., signal per unit analyte concentration) and background. Substantial and statistically significant differences were found between FI-DIN and CPN Ni determinations, and in the case of the laboratory waste samples, there were also small but statistically significant differences between Cd determinations. These small (2 to 3%) differences were not related to polyatomic ion interference (e.g., $^{95}Mo^{16}O^{+}$), but in light of the time savings and waste reduction to be realized, they should not preclude the use of FI-DIN in place of CPN for determination of Cd, Pb, U and chemically.

616 (ANL/CMT-ACL/VU–83809) **Waste minimization via preparative scale high performance gel permeation chromatography.** Boparai, A.S.; Parish, K.J.; Kent, S.D.; Tsai, Y.; Joe, D.A. Argonne National Lab., IL (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950389–2-Vugraphs: Pittsburgh conference and exhibition on analytical chemistry and applied spectroscopy: stimulating the minds of today's and tomorrow's scientists, New Orleans, LA (United States), 5-10 Mar 1995). Order Number DE95011797. Source: OSTI; NTIS; INIS; GPO Dep.

The procedures developed here allow removal of radioactivity, as judged by removal of ^{152}Europium (III) from methylene chloride solutions of CLP analytes without significantly reducing recovery of organic compounds. This allows analysis of nonradioactive extracts on instrumentation maintained in a regular nonradioactive laboratory, resulting in a significant savings in cost.

617 (ANL/CMT/CP–84846) **Vitrification as a low-level radioactive mixed waste treatment technology at Argonne National Laboratory.** Mazer, J.J.; No, Hyo J. Argonne National Lab., IL (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950877–14: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95015713. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory-East (ANL-E) is developing plans to use vitrification to treat low-level radioactive mixed wastes (LLMW) generated onsite. The ultimate objective of this project is to install a full-scale vitrification system at ANL-E capable of processing the annual generation and historic stockpiles of selected LLMW streams. This project is currently in the process of identifying a range of processible glass compositions that can be produced from actual mixed wastes and additives, such as boric acid or borax. During the formulation of these glasses, there has been an emphasis on maximizing the waste content in the glass (70 to 90 wt %), reducing the overall final waste volume, and producing a stabilized low-level radioactive waste glass. Crucible glass studies with actual mixed waste streams have produced alkali borosilicate glasses that pass the Toxic Characteristic Leaching Procedure (TCLP) test. These same glass compositions, spiked with toxic metals well above the expected levels in actual wastes, also pass the TCLP test. These results provide compelling evidence that the vitrification system and the glass waste form will be robust enough to accommodate expected variations in the LLMW streams from ANL-E. Approximately 40 crucible melts will be studied to establish a compositional envelope for vitrifying ANL-E mixed wastes. Also being determined is the identity of volatilized metals or off-gases that will be generated.

618 (ANL/CMT/CP–85434) **Development of low-level radioactive waste disposal capacity in the United States - progress or stalemate?.** Devgun, J.S. (Argonne National Lab., IL (United States)); Larson, G.S. Argonne National Lab., IL (United States). 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950917–19: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE96005280. Source: OSTI; NTIS; INIS; GPO Dep.

It has been fifteen years since responsibility for the disposal of commercially generated low-level radioactive waste (LLW) was shifted to the states by the United States Congress through the Low-Level Radioactive Waste Policy Act of 1980 (LLRWPA). In December 1985, Congress revisited the issue and enacted the Low-Level Radioactive Waste Policy Amendments Act of 1985 (LLRWPAA). No new disposal sites have opened yet, however, and it is now evident that disposal facility development is more complex, time-consuming, and controversial than originally anticipated. For a nation with a large nuclear power industry, the lack of availability of LLW disposal capacity coupled with a similar lack of high-level radioactive waste disposal capacity could adversely affect the future viability of the nuclear energy option. The U.S. nuclear power industry, with 109 operating reactors, generates about half of the LLW shipped to commercial disposal sites and faces dwindling access to waste disposal sites and escalating waste management costs. The other producers of LLW - industries, government (except the defense related research and production waste), academic institutions, and medical institutions that account for the remaining half of the commercial LLW - face the same storage and cost uncertainties. This paper will summarize the current status of U.S. low-level radioactive waste generation and the status of new disposal facility development efforts by the states. The paper will also examine the factors that have contributed to delays, the most frequently suggested alternatives, and the likelihood of change.

619 (ANL/CMT/CP--85710) **Vitrification of low-level radioactive mixed waste at Argonne National Laboratory.** Mazer, J.J.; Rosine, S.D.; No, H.J. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216--137: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95012217. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory-East (ANL-E) is proceeding with plans to use vitrification to treat low-level radioactive mixed wastes (LLMW) generated on-site. The objective is to install a full-scale vitrification system at ANL-E capable of processing the entire annual generation of selected LLMW streams. Crucible glass studies with actual mixed waste streams have produced sodium borosilicate glasses under conditions achievable in commercially available melters. These same glass compositions, spiked with toxic metals above the expected levels in actual wastes, pass the Toxicity Characteristic Leaching Procedure (TCLP) test. Earlier evaluations of the likely off-gases that will result from vitrification indicated that the primary off-gases will include compounds of SO_x, NO_x, and CO_2. These evaluations are being experimentally confirmed with a mass spectrometer analysis of the gases evolved from samples of the ANL-E wastes. The composition of the melter feed can be adjusted to minimize volatilization of some components, if necessary. The full-scale melter will be designed to handle the annual generation of at least three LLMW waste streams: evaporator concentrator bottoms sludge (ECB), storage tank sludge (STS), and HEPA filter media. Each waste stream is mixed waste by virtue of its failure to pass the TCLP test with respect to toxic metal leaching. Additional LLMW streams under consideration for vitrification include historical mixed waste glass from past operations and spent abrasive from a planned decontamination facility.

620 (ANL/CMT/CP--86906) **Apatite- and monazite-bearing glass-crystal composites for the immobilization of low-level nuclear and hazardous wastes.** Wronkiewicz, D.J.; Wolf, S.F.; DiSanto, T.S. Argonne National Lab., IL (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-951155--62: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96007217. Source: OSTI; NTIS; INIS; GPO Dep.

This study demonstrates that glass-crystal composite waste forms can be produced from waste streams containing high proportions of phosphorus, transition metals, and/or halides. The crystalline phases produced in crucible-scale melts include apatite, monazite, spinels, and a Zr-Si-Fe-Ti phase. These phases readily incorporated radionuclide and toxic metals into their crystal structures, while corrosion tests have demonstrated that glass-crystal composites can be up to 300-fold more durable than simulated high-level nuclear waste glasses, such as SRL 202U.

621 (ANL/DIS/CP--85160) **Applying automated data acquisition and management technology to bioremediation.** Widing, M.A.; Leser, C. Argonne National Lab., IL (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505101--2: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE95013370. Source: OSTI; NTIS; GPO Dep.

Operating a bioremediation process requires timely and accurate analysis of physical and chemical parameters that can affect the system. At a fuel oil spill site, the operation of an in-situ bioremediation system, consisting of fluid and nutrient injection, fluid withdrawal, and aeration cycles, is monitored by means of electronic downhole sensors and onsite chemical analysis. A data acquisition and management system was designed and implemented to rapidly analyze data for operational decision malting. A hardware suite, containing an electronic monitoring system data acquisition computer, and data analysis workstation, was also developed. Through the use of both commercial software products and custom software, suites of data management and analysis tools were provided. The data acquisition suite of software tools assisted in programming dataloggers, automatically recording monitored data, and integrating these data with manually sampled chemical data. The data analysis suite of software tools assisted in downloading data to remote workstations, sampling the database for trend analysis, and automating the interface to commercial analysis packages.

622 (ANL/DIS/CP--87032) **Factors affecting acceptability of radioactive metal recycling to the public and stakeholders.** Nieves, L.A.; Burke, C.J. Argonne National Lab., IL (United States). 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950786--2: 3. annual conference on the recycle and reuse of radioactive scrap metal, Knoxville, TN (United States), 31 Jul - 3 Aug 1995). Order Number DE95015643. Source: OSTI; NTIS; INIS; GPO Dep.

The perception of risk takes place within a cultural context that is affected by individual and societal values, risk information, personal experience, and the physical environment. Researchers have found that measures of "voluntariness of risk assumption," of "disaster potential," and of "benefit" are important in explaining risk acceptability. A review of cross-cultural studies of risk perception and risk acceptance, as well as an informal stakeholder survey, are used to assess the public acceptability of radioactive scrap metal recycling.

623 (ANL/DIS/CP--87708) **Accident analysis for the low-level mixed waste "No-Flame" option in the U.S. Department of Energy Waste Management Programmatic Environmental Impact Statement.** Folga, S. (Argonne National Lab., Argonne, IL (United States)); Kohout, E.; Mueller, C.J.; Nabelssi, B.; Wilkins, B.; Mishima, J. Argonne National Lab., IL (United States). 1996. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-960212--17: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). . Order Number DE96006903. Source: OSTI; NTIS; INIS; GPO Dep.

This paper outlines the various steps pursued in performing a generic safety assessment of the various technologies considered for the low-level mixed waste (LLMW) "No-Flame" option in the US Department of Energy (DOE) Waste

Management Programmatic Environmental Impact Statement (WM PEIS). The treatment technologies for the "No-Flame" option differ from previous LLMW technologies analyzed in the WM PEIS in that the incineration and thermal desorption technologies are replaced by sludge washing, soil washing, debris washing, and organic destruction. A set of dominant waste treatment processes and accident scenarios were selected for analysis by means of a screening process. A subset of results (release source terms) from this analysis is presented.

624 (ANL/DIS/CP–89084) **Waste management facility accident analysis (WASTE ACC) system: software for analysis of waste management alternatives.** Kohout, E.F.; Folga, S.; Mueller, C.; Nabelssi, B. Argonne National Lab., IL (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-960212–32: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006913. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the Waste Management Facility Accident Analysis (WASTE_ACC) software, which was developed at Argonne National Laboratory (ANL) to support the US Department of Energy's (DOE's) Waste Management (WM) Programmatic Environmental Impact Statement (PEIS). WASTE_ACC is a decision support and database system that is compatible with Microsoft® Windows™. It assesses potential atmospheric releases from accidents at waste management facilities. The software provides the user with an easy-to-use tool to determine the risk-dominant accident sequences for the many possible combinations of process technologies, waste and facility types, and alternative cases described in the WM PEIS. In addition, its structure will allow additional alternative cases and assumptions to be tested as part of the future DOE programmatic decision-making process. The WASTE_ACC system demonstrates one approach to performing a generic, systemwide evaluation of accident risks at waste management facilities. The advantages of WASTE_ACC are threefold. First, the software gets waste volume and radiological profile data that were used to perform other WM PEIS-related analyses directly from the WASTE_MGMT system. Second, the system allows for a consistent analysis across all sites and waste streams, which enables decision makers to understand more fully the trade-offs among various policy options and scenarios. Third, the system is easy to operate; even complex scenario runs are completed within minutes.

625 (ANL/EA/CP–84132) **Computer-aided waste management strategic planning and analysis.** Avci, H.I.; Kotek, T.J.; Koebnick, B.L. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–140: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95012466. Source: OSTI; NTIS; INIS; GPO Dep.

A computational model called WASTE-MGMT has been developed to assist in the evaluation of alternative waste management approaches in a complex setting involving multiple sites, waste streams, and processing options. The model provides the quantities and characteristics of wastes processed at any facility or shipped between any two sites as well as environmental emissions at any facility within the waste management system. The model input is defined by three types of fundamental waste management data: (1) waste inventories and characteristics at the point of generation; (2) treatment, storage, and disposal facility characteristics; and (3) definitions of alternative management approaches. The model has been successfully used in the preparation of the US Department of Energy (DOE) Environmental Management Programmatic.Environmental Impact Statement (EM PEIS). Certain improvements are either being implemented or planned that would extend the usefulness and applicability of the WASTE-MGMT model beyond the EM PEIS and info the. strategic planning for management of wastes under the responsibility of DOE or other agencies.

626 (ANL/EA/CP–84317) **Facility accident analysis for low-level waste management alternatives in the US Department of Energy Waste Management Program.** Roglans-Ribas, J.; Mueller, C.; Nabelssi, B.; Folga, S.; Tompkins, M. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950216–143: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95012287. Source: OSTI; NTIS; INIS; GPO Dep.

The risk to human health of potential radiological releases resulting from facility accidents constitutes an important consideration in the US Department of Energy (DOE) waste management program. The DOE Office of Environmental Management (EM) is currently preparing a Programmatic Environmental Impact Statement (PEIS) that evaluates the risks associated with managing five types of radiological and chemical wastes in the DOE complex. Several alternatives for managing each of the five waste types are defined and compared in the EM PEIS. The alternatives cover a variety of options for storing, treating, and disposing of the wastes. Several treatment methods and operation locations are evaluated as part of the alternatives. The risk induced by potential facility accidents is evaluated for storage operations (current and projected waste storage and post-treatment storage) and for waste treatment facilities. For some of the five waste types considered, facility accidents cover both radiological and chemical releases. This paper summarizes the facility accident analysis that was performed for low-level (radioactive) waste (LLW). As defined in the EM PEIS, LLW includes all radioactive waste not classified as high-level, transuranic, or spent nuclear fuel. LLW that is also contaminated with chemically hazardous components is treated separately as low-level mixed waste (LLMW).

627 (ANL/EA/CP–84357) **Characterization of hazardous waste residuals from Environmental Restoration Program activities at DOE installations: Waste management implications.** Lazaro, M.A.; Esposito, M.P. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950216–146: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95012939. Source: OSTI; NTIS; INIS; GPO Dep.

Investigators at Argonne National Laboratory (ANL), with support from associates at the Pacific Northwest Laboratory (PNL), have assembled an inventory of the types and volumes of radioactive, toxic or hazardous, and mixed waste likely to be generated over the next 30 years as the US Department of Energy (DOE) implements its nationwide Environmental Restoration (ER) Program. The inventory and related analyses are being considered for integration into DOE's Programmatic Environmental Impact Statement

(PEIS) covering the potential environmental impacts and risks associated with alternative management practices and programs for wastes generated from routine operations. If this happens, the ER-generated waste could be managed under a set of alternatives considered under the PEIS and selected at the end of the current National Environmental Policy Act process.

628 (ANL/EA/CP–86211) **Developing RESRAD-BASELINE for environmental baseline risk assessment.** Cheng, Jing-Jy. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950868–41: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96007239. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

RESRAD-BASELINE is a computer code developed at Argonne developed at Argonne National Laboratory for the US Department of Energy (DOE) to perform both radiological and chemical risk assessments. The code implements the baseline risk assessment guidance of the US Environmental Protection Agency (EPA 1989). The computer code calculates (1) radiation doses and cancer risks from exposure to radioactive materials, and (2) hazard indexes and cancer risks from exposure to noncarcinogenic and carcinogenic chemicals, respectively. The user can enter measured or predicted environmental media concentrations from the graphic interface and can simulate different exposure scenarios by selecting the appropriate pathways and modifying the exposure parameters. The database used by PESRAD-BASELINE includes dose conversion factors and slope factors for radionuclides and toxicity information and properties for chemicals. The user can modify the database for use in the calculation. Sensitivity analysis can be performed while running the computer code to examine the influence of the input parameters. Use of RESRAD-BASELINE for risk analysis is easy, fast, and cost-saving. Furthermore, it ensures in consistency in methodology for both radiological and chemical risk analyses.

629 (ANL/EA/CP–86212) **A simplified model to estimate radiological doses from incineration of radioactive waste.** Stevens, L.E. (USDOE, Washington, DC (United States)); Ma, C.W.; Wheeler, T.; Nimmagadda, M.; LePoire, D.; Chen, S.Y.; Owens, K.W. Argonne National Lab., IL (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950542–1: 14. international symposium on thermal treatment technologies: incineration conference, Seattle, WA (United States), 8-12 May 1995). Order Number DE95013413. Source: OSTI; NTIS; INIS; GPO Dep.

A simplified calculational model permits a rapid yet realistic estimate of small, but potential radiological doses to onsite workers and the offsite public as a result of transportation, handling, storage, incineration, and maintenance of waste containing trace amount of radioactive materials which is to be processed at a treatment, storage, and disposal (TSD) facility. The model was developed on the basis of previous detailed studies of eight TSD facilities and builds in the essential features of a TSD facility. The model would provide an understanding of the potential human exposure associated with the radioactive contents in the chemical wastes.

630 (ANL/EA/CP–86245) **Issues related to estimating potential radiological doses from treatment, storage, and disposal facilities handling waste containing trace amounts of radioactive material.** Stevens, L.E. (USDOE, Washington, DC (United States)); Nimmagadda, M.; LePoire, D.; Chen, S.Y.; Ma, C.W.; Wheeler, T.; Owens, K.W. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950868–12: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE95015636. Source: OSTI; NTIS; INIS; GPO Dep.

A simplified calculational model has been developed to permit a rapid, yet realistic, estimate of potential radiological doses to on-site workers and the off-site public from waste-handling operations at a treatment, storage, and disposal (TSD) facility. The waste-handling operations include transport, handling, storage, incineration, and landfilling of waste containing trace amounts of radioactive materials. The main objective of the model is to provide a radiological assessment methodology that can be used in a waste clearance strategy that addresses US Department of Energy mixed-waste moratorium issues. The model was developed on the basis of previous detailed studies of eight TSD facilities and incorporates the essential features of such a facility. The model provides a simplified physical concept of the potential human exposure associated with the radioactive contents of the chemical wastes. Issues pertaining to the development of the model, as well as application and future use, are discussed. Specifically, these issues include physical model approximations, isotope selection, waste-handling operations, and selection of input parameters. Also, pathway and isotope selection criteria are discussed relative to the previous TSD sites studied. This model is being considered for additional development as a waste clearance strategy tool.

631 (ANL/EA/CP–87799) **Potential waste-clearance strategy for U.S. Department of Energy waste processed at treatment, storage, and disposal facilities.** Stevens, L. (Dept. of Energy, Germantown, MD (United States). Office of Environmental Restoration and Waste Management); Chen, S.Y.; Pfingston, M. Argonne National Lab., IL (United States). 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960212–40: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006730. Source: OSTI; NTIS; INIS; GPO Dep.

Past practices at U.S. Department of Energy (DOE) field facilities may have resulted in the presence of minute amounts of radioactive contamination in some hazardous wastes shipped from these facilities. In May 1991, the DOE Office of Waste Operations issued a nationwide moratorium on shipping potentially mixed waste from DOE facilities to commercial treatment, storage, and disposal (TSD) facilities. A potential waste-clearance strategy was developed to address the DOE mixed-waste moratorium issues, which had resulted from a lack of existing regulations regarding volume contamination. A radiological assessment model was developed on the basis of the detailed radiological assessment performed for eight commercial hazardous waste TSD facilities. The model incorporates waste- and site-specific data to estimate potential radiological doses to on-site workers and the off-site public from waste-handling operations at a TSD facility. The described waste-clearance strategy would provide both DOE and commercial TSD facilities with a rapid and cost-effective methodology for assessing potential human exposures from the processing of chemical wastes contaminated with trace amounts of radionuclides. This strategy also has important potential applications for establishing site clearance limits to ensure that worker and public risks would remain well below regulatory limits. The clearance strategy issues pertaining to current free-release practice, dose limits, data requirements, and conservatism are discussed.

632 (ANL/EA/CP--88217) **Cost savings associated with landfilling wastes containing very low levels of uranium.** Boggs, C.J. (Argonne National Lab., Germantown, MD (United States)); Shaddoan, W.T. Argonne National Lab., IL (United States). 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960110--3: 29. midyear topical meeting of the Health Physics Society: naturally occuring and accelerator produced radioactive material - regulation and risk assessment, Scottsdale, AZ (United States), 7-10 Jan 1996). Order Number DE96006692. Source: OSTI; NTIS; INIS; GPO Dep.

The Paducah Gaseous Diffusion Plant (PGDP) has operated captive landfills (both residential and construction/demolition debris) in accordance with the Commonwealth of Kentucky regulations since the early 1980s. Typical waste streams allowed in these landfills include nonhazardous industrial and municipal solid waste (such as paper, plastic, cardboard, cafeteria waste, clothing, wood, asbestos, fly ash, metals, and construction debris). In July 1992, the U.S. Environmental Protection Agency issued new requirements for the disposal of sanitary wastes in a "contained landfill." These requirements were promulgated in the 401 Kentucky Administrative Record Chapters 47 and 48 that became effective 30 June 1995. The requirements for a new contained landfill include a synthetic liner made of high-density polyethylene in addition to the traditional 1-meter (3-foot) clay liner and a leachate collection system. A new landfill at Paducah would accept waste streams similar to those that have been accepted in the past. The permit for the previously existing landfills did not include radioactivity limits; instead, these levels were administratively controlled. Typically, if radioactivity was detected above background levels, the waste was classified as low-level waste (LLW), which would be sent off-site for disposal.

633 (ANL/EA/CP--88903) **Waste-clearance strategy for DOE waste processed at commercial facilities.** Chen, S.Y.; Pfingston, M.; LePoire, D. Argonne National Lab., IL (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9606116--26: Annual meeting of the American Nuclear Society (ANS), Reno, NV (United States), 16-20 Jun 1996). Order Number DE96010769. Source: OSTI; NTIS; INIS; GPO Dep.

In May 1991, a moratorium was issued on shipping potentially mixed waste from DOE facilities nationwide to commercial treatment, storage, and disposal facilities. A potential waste-clearance strategy was developed to address the DOE mixed-waste moratorium issues, which had resulted from a lack of exisitng volume contamination regulations. This strategy also has important potential applications for establishing site clearance limits that ensure worker and public risks remain well below regulatory limits.

634 (ANL/EA/CP--89877) **A review of the radiological treatment.** Mueller, C.J.; Folga, S.; Nabelssi, B.; Kohout, E. Argonne National Lab., IL (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960804--43: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96012700. Source: OSTI; NTIS; INIS; GPO Dep.

The Draft Waste Management Programmatic Environmental Impact Statement (WM PEIS) was released by the U.S. Department of Energy (DOE) for public comment on September 22, 1995. Prepared in accordance with the National Environmental Policy Act (NEPA), the Final WM PEIS is currently scheduled for release in late summer 1996. The Draft WM PEIS was published after about 3 years of effort to select and evaluated the best alternatives for treating, storing, and disposing of the 50-year legacy of radioactive and chemically hazardous wastes existing within the DOE complex. The evaluation examined the potential health and environmental impacts of integrated waste management alternatives for five categories of waste types at 54 DOE sites. A primary consideration as a potential source of human health impacts at all sites is that of radiological releases resulting from postulated accidents involving facilities used to treat radioactive wastes. This paper first provides a brief, updated summary of the approach used to define and perform treatment facility accident analyses in the Draft WM PEIS. It reviews the selection of dominant sequences for the major sites most affected by the preferred waste management alternatives and highlights the salient accident analysis results. Finally, it summarizes and addresses key public and state and federal agency comments relating to accident analysis that were received in the public comment process.

635 (ANL/EAD/TM--20-Draft) **Low-level waste inventory, characteristics, generation, and facility assessment for treatment, storage, and disposal alternatives considered in the U.S. Department of Energy Waste Management Programmatic Environmental Impact Statement.** Goyette, M.L. (Argonne National Lab., IL (United States). Environmental Assessment Div.). Argonne National Lab., IL (United States). Apr 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017832. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides technical support information for use in analyzing environmental impacts associated with US Department of Energy (DOE) low-level radioactive waste (LLW) management alternatives in the Waste Management (WM) Programmatic Environmental Impact Statement (PEIS). Waste loads treated and disposed of for each of the LLW alternatives considered in the DOE WM PEIS are presented. Waste loads are presented for DOE Waste Management (WM) wastes, which are generated from routine operations. Radioactivity concentrations and waste quantities for treatment and disposal under the different LLW alternatives are described for WM waste. Waste loads treated and disposed of for the LLW alternatives and subalternatives, or cases, addressed in the WM PEIS but not included in this report are presented in the Addendum.

636 (ANL/EAD/TM--23-Draft) **Supplemental information related to risk assessment for the off-site transportation of low-level waste for the U.S. Department of Energy Waste Management Programmatic Environmental Impact Statement.** Monette, F.A. (Argonne National Lab., IL (United States). Environmental Assessment Div.); Biwer, B.M.; LePoire, D.J.; Chen, S.Y. Argonne National Lab., IL (United States). Apr 1995. 481p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract W-31109-ENG-38. Order Number DE95017831. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents supplemental information to support the human health risk assessment conducted for the transportation of low-level waste (LLW) in support of the US Department of Energy Waste Management Programmatic Environmental Impact Statement (WM PEIS). Detailed descriptions of the transportation health risk assessment method and results of the assessment are presented in Appendix E of the WM PEIS and are not repeated in this report. This report presents additional information that is not presented in Appendix E but is necessary to conduct the transportation risk assessment for Waste Management (WM) LLW. Included are definitions of the LLW alternatives considered in the WM PEIS, data related to the inventory and to the physical and radiological characteristics of WM LLW, an overview of the risk assessment method, and detailed results of the assessment for each WM LLW case considered.

Environmental Assessment Div.); Antonopoulos, A.A.; Policastro, A.J.; Esposito, M.P. Argonne National Lab., IL (United States). Apr 1995. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017830. Source: OSTI; NTIS; INIS; GPO Dep.

This report focuses on the generation of hazardous waste (HW) and the treatment, storage, and disposal (TSD) of HW being generated by routine US Department of Energy (DOE) facility operations. The wastes to be considered are managed by the DOE Waste Management (WM) Division (WM HW). The waste streams are to be sent to WM operations throughout the DOE complex under four management alternatives: No Action, Decentralization, Regionalized 1, and Regionalized 2. On-site and off-site capabilities for TSD are examined for each alternative. This report (1) summarizes the HW inventories and generated amounts resulting from WM activities, focusing on the largest DOE HW generators; (2) presents estimates of the annual amounts shipped off-site, as well as the amounts treated by various treatment technology groups; (3) describes the existing and planned treatment and storage capabilities of the largest HW-generating DOE installations, as well as the use of commercial TSD facilities by DOE sites; (4) presents applicable technologies (destruction of organics, deactivation/neutralization of waste, removal/recovery of organics, and aqueous liquid treatment); and (5) describes the four alternatives for consideration for future HW management, and for each alternative provides the HW loads and the approach used to estimate the source term for routine TSD operations. In addition, potential air emissions, liquid effluents, and solid residuals associated with each alternative are presented. Furthermore, this report is supplemented with an addendum that includes detailed information related to HW inventory, characteristics, generation, and facility assessment for the TSD alternatives. The addendum also presents source terms, emission rates, and throughput totals by alternative and treatment installation.

638 (ANL/EAD/TM–29-Draft-Vol.2) **Analysis of accident sequences and source terms at waste treatment and storage facilities for waste generated by USDOE Waste Management Operations: Volume 2, Appendixes A and B.** Mueller, C. (Argonne National Lab., IL (United States)); Nabelssi, B.; Roglans-Ribas, J.; Folga, S.; Policastro, A.; Freeman, W.; Jackson, R.; Turner, S.; Mishima, J. Argonne National Lab., IL (United States). Apr 1995. 165p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95017803. Source: OSTI; NTIS; INIS; GPO Dep.

This volume comprises two appendixes: Chemical source terms for low-level mixed waste accidents, and radionuclide releases from facility accidents (HLW, LLW, LLMW(alpha and nonalpha)).

639 (ANL/EAD/TM–29-Draft-Vol.3) **Analysis of accident sequences and source terms at waste treatment and storage facilities for waste generated by U.S. Department of Energy Waste Management Operations, Volume 3: Appendixes C-H.** Mueller, C. (and others); Nabelssi, B.; Roglans-Ribas, J. Argonne National Lab., IL (United States). Apr 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017804. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the Appendices for the Analysis of Accident Sequences and Source Terms at Waste Treatment and Storage Facilities for Waste Generated by the U.S. Department of Energy Waste Management Operations. The main report documents the methodology, computational framework, and results of facility accident analyses performed as a part of the U.S. Department of Energy (DOE) Waste Management Programmatic Environmental Impact Statement (WM PEIS). The accident sequences potentially important to human health risk are specified, their frequencies are assessed, and the resultant radiological and chemical source terms are evaluated. A personal computer-based computational framework and database have been developed that provide these results as input to the WM PEIS for calculation of human health risk impacts. This report summarizes the accident analyses and aggregates the key results for each of the waste streams. Source terms are estimated and results are presented for each of the major DOE sites and facilities by WM PEIS alternative for each waste stream. The appendices identify the potential atmospheric release of each toxic chemical or radionuclide for each accident scenario studied. They also provide discussion of specific accident analysis data and guidance used or consulted in this report.

640 (ANL/EAD/TM–30-Draft) **Waste-Mgmt: A computer model for calculation of waste loads, profiles, and emissions.** Kotek, T.J.; Avci, H.I.; Koebnick, B.L. Argonne National Lab., IL (United States). Apr 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017800. Source: OSTI; NTIS; INIS; GPO Dep.

WASTE-MGMT is a computational model that provides waste loads, profiles, and emissions for the U.S. Department of Energy's Waste Management Programmatic Environmental Impact Statement (WM PEIS). The model was developed to account for the considerable variety of waste types and processing alternatives evaluated by the WM PEIS. The model is table-driven, with three types of fundamental waste management data defining the input: (1) waste inventories and characteristics; (2) treatment, storage and disposal facility characteristics; and (3) alternative definition. The primary output of the model consists of tables of waste loads and contaminant profiles at facilities, as well as contaminant air releases for each treatment and storage facility at each site for each waste stream. The model is implemented in Microsoft® FoxPro® for MS-DOS® version 2.5 and requires a microcomputer with at least a 386 processor and a minimum 6 MBytes of memory and 10 MBytes of disk space for temporary storage.

641 (ANL/EAD/TM–32-Draft) **Information related to low-level mixed waste inventory, characteristics, generation, and facility assessment for treatment, storage, and disposal alternatives considered in the U.S. Department of Energy Waste Management programmatic environmental impact statement.** Wilkins, B.D.; Dolak, D.A.; Wang, Y.Y.; Meshkov, N.K. Argonne National Lab., IL (United States). Apr 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017802. Source: OSTI; NTIS; INIS; GPO Dep.

This report was prepared to support the analysis of risks and costs associated with the proposed treatment of low-level mixed waste (LLMW) under management of the U.S. Department of Energy (DOE). The various waste management alternatives for treatment of LLMW have been defined in the DOE's Office of Waste Management Programmatic Environmental Impact Statement. This technical memorandum estimates the waste material throughput expected at each proposed LLMW treatment facility and analyzes potential radiological and chemical releases at each DOE site resulting from treatment of these wastes. Models have been developed to generate site-dependent radiological profiles and waste-stream-dependent chemical profiles for these wastes. Current site-dependent inventories and estimates for future generation of LLMW have been obtained from DOE's 1994 Mixed Waste Inventory Report (MWIR-2). Using treatment procedures developed by the Mixed Waste Treatment Project, the MWIR-2 database was analyzed to provide waste throughput and emission estimates for each of the different waste types assessed in this report. Uncertainties in the estimates at each site are discussed for waste material throughputs and radiological and chemical releases.

642 (ANL/EAD/TM–50) **Evaluation of radioactive scrap metal recycling.** Nieves, L.A.; Chen, S.Y.; Kohout, E.J.; Nabelssi, B.; Tilbrook, R.W.; Wilson, S.E. Argonne National Lab., IL (United States). Dec 1995. 471p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96005712. Source: OSTI; NTIS; INIS; GPO Dep.

This report evaluates the human health risks and environmental and socio-political impacts of options for recycling radioactive scrap metal (RSM) or disposing of and replacing it. Argonne National Laboratory (ANL) is assisting the US Department of Energy (DOE), Office of Environmental Restoration and Waste Management, Oak Ridge Programs Division, in assessing the implications of RSM management alternatives. This study is intended to support the DOE contribution to a study of metal recycling being conducted by the Task Group on Recycling and Reuse of the Organization for Economic Cooperation and Development. The focus is on evaluating the justification for the practice of recycling RSM, and the case of iron and steel scrap is used as an example in assessing the impacts. To conduct the evaluation, a considerable set of data was compiled and developed. Much of this information is included in this document to provide a source book of information.

643 (ANL/EMO/CP–85698) **Mixed and low-level radioactive waste disposal from the Argonne National Laboratory-East Map Tube Facility.** Wescott, J.B.; Moos, L.P. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950877–16: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95014096. Source: OSTI; NTIS; INIS; GPO Dep.

The Map Tube Facility was a storage unit for small, highly radioactive objects. The facility consisted of 129 cast-iron pipes cast vertically in a concrete monolithic structure. The objects were packaged and placed into the pipes for storage prior to disposal or reuse in research experiments. Deterioration of the facility allowed water to enter the pipes. Release of this contaminated water has resulted in radiological contamination of underlying soil and groundwater. Sediment, principally corrosion products, collected in the bottom of the pipes. Decontamination and decommissioning of the Map Tube Facility generated a large quantity of radioactive mixed and low-level waste. All low-level and mixed waste that can not be treated on-site is sent to the Westinghouse Hanford Company (WHC) in Richland, Washington for storage or disposal. Because of the difficulty and cost of disposing radioactive mixed waste, a great amount of effort was expended to limit the mixed waste volume. The final volume of mixed waste was approximately 99 percent less than originally generated with total waste disposal costs being reduced by roughly two-thirds.

644 (ANL/EMO/CP–89921) **Mixed waste disposal at Argonne National Laboratory-East.** Wescott, J. Argonne National Lab., IL (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960648–6: 21. annual conference of the National Association of Environmental Professionals: practical environmental directions - a changing agenda, Houston, TX (United States), 2-6 Jun 1996). Order Number DE96010800. Source: OSTI; NTIS; INIS; GPO Dep.

Off-site disposal of mixed waste was severely curtailed at the beginning of FY 96. During FY 95 Argonne National Laboratory-East (ANL-E) conducted a comprehensive characterization and packaging project to remove mixed waste from the ANL-E inventory. The mixed wastes were primarily historic material which had been stored on-site since 1987. The waste consisted of solid debris, sludges, ignitable and corrosive liquids, and water-reactive metal. All of the waste was contaminated with varying degrees of radioactivity. The first step in the characterization process was to review available documentation on the waste. Because of the historic nature of the material, most records were incomplete. Using the records as a guide, the waste was divided into groups that could each be sampled according to the physical nature of the material. Worker safety was an important consideration during the sampling phase, therefore, several precautions were taken to prevent spills or cause unnecessary chemical reactions in the material. Characterization activities were either completed entirely by ANL-E technicians or with assistance from specialized contractors. Once characterization of the waste was complete it was packaged for shipment to other DOE facilities for storage and eventual treatment. Because most of the mixed waste treatment systems were not yet operational, waste was packaged to ensure integrity for a long period of time. Fifty-five cubic meters of mixed waste was characterized and packaged during FY 95. Most of this material was sent off-site. However, the remainder was stored in a configuration that will provide better health and safety protection than previously afforded.

645 (ANL/EMO/CP–90484) **Solvent usage and recycling potential in a research and development setting.** Vivio, F.; Thuot, J.R.; Peters, R.W. Argonne National Lab., IL (United States). [1996]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960741–12: Pollution prevention conference, Chicago, IL (United States), 9-11 Jul 1996). Order Number DE96012758. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory utilizes thousands of gallons of chemicals each year. Laboratory wastes can be broadly characterized as coming from three focus areas: (1) restoration and decommissioning associated wastes generate larger quantities of waste on a one-time basis. The wastes may be non-hazardous to highly toxic and the quantities are variable. (2) Laboratory operations generate approximately 50% of all waste disposed. Operational waste can be characterized as less hazardous, reasonably consistent in nature, generally in larger quantities. (3) the final waste stream is small quantities of many different materials coming from many different waste streams. This waste stream is at the center of ANL's pollution prevention program. The research areas have implemented many pollution prevention techniques. Solvent substitution has been effective in reducing hazardous cleaning wastes, scintillation cocktail wastes, and other chlorinated wastes. Micro chemistry is effective at minimizing certain chemical process wastes, developing new analytical chemistry procedures has reduced and eliminated other waste forms. New instrumentation has provided first level reductions in many waste streams. Despite these new techniques solvent usage remains the largest research related waste stream. The present solvents are generated from instruments such as electrophoresis and high pressure liquid chromatographs (HPLC), solvent extractions, biological staining and cleaning practices. ANL recognizes the significant role recycling this waste stream is in Pollution Prevention Program implementation. ANL initiated a study to quantify solvent usage, characterization of the waste solvent, and match the purity requirements exploring all opportunities to substitute and recycle.

646 (ANL/ET/CP–87963) **Effects of aqueous environment on long-term durability of phosphate-bonded ceramic waste forms.** Singh, D.; Wagh, A.S.; Jeong, S.Y. Argonne National Lab., IL (United States). [1996]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-960212–33: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006736. Source: OSTI; NTIS; INIS; GPO Dep.

Over the last few years, Argonne National Laboratory has been developing room-temperature-setting chemically-bonded phosphate ceramics for solidifying and stabilizing low-level mixed wastes. This technology is crucial for stabilizing waste streams that contain volatile species and off-gas secondary waste streams generated by high-temperature treatment of such wastes. Magnesium phosphate ceramic has been developed to treat mixed wastes such as ash, salts, and cement sludges. Waste forms of surrogate waste streams were fabricated by acid-base reactions between the mixtures of magnesium oxide powders and the wastes, and phosphoric acid or acid phosphate solutions. Dense and hard ceramic waste forms are produced in this process. The principal advantage of this technology is that the contaminants are immobilized by both chemical stabilization and subsequent microencapsulation of the reaction products. This paper reports the results of durability studies conducted on waste forms made with ash waste streams spiked with hazardous and radioactive surrogates. Standard leaching tests such as ANS 16.1 and TCLP were conducted on the final waste forms. Fates of the contaminants in the final waste forms were established by electron microscopy. In addition, stability of the waste forms in aqueous environments was evaluated with long-term water-immersion tests.

647 (ANL/ET/CP–88272) **Chemically bonded phosphate ceramics for stabilizing low-level radioactive wastes.** Jeong, S.; Wagh, A.S.; Singh, D. Argonne National Lab., IL (United States). Apr 1996. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9604124–7: 98. annual meeting of the American Ceramic Society, Indianapolis, IN (United States), 14-17 Apr 1996). Order Number DE96009457. Source: OSTI; NTIS; INIS; GPO Dep.

Because phosphates. are natural mineral analogs of radioactive elements, chemically bonded phosphate ceramics were developed to stabilize low-level radioactive waste. Ash, Fe_2O_3, and $FePO_4$ wastes with 0.5 wt.% Ce^{3+}, added as a surrogate for U^{3+} and Pu^{3+} were stabilized in an $Mg_3(PO_4)_2$ ceramic at room temperature. The final waste forms exhibited high strength and low permeability to water. Cerium leaching from the final ash, Fe_2O_3, and $FePO_4$ waste forms, determined by the toxicity characteristic leaching procedure, was 0.095, 0.39, and 0.49 ppb, respectively. These values are several orders of magnitude below those of Ce from untreated waste. Detailed solubility characteristics of $CePO_4$ and microscopy of the waste form indicate that the extremely low leaching rate of Ce may be due to its chemical fixation as a monazite in the phosphate matrix, accompanied by its microencapsulation in the dense ceramic matrix of $Mg_3(PO_4)_2$ that contained very low solubility phases. These observations suggest that chemically bonded phosphate ceramics may be excellent candidate materials for stabilizing radioactive contaminants such as U and Pu.

648 (ANL/ET/CP–88344) **Leaching behavior of phosphate-bonded ceramic waste forms.** Singh, D.; Wagh, A.S.; Jeong, S.Y.; Dorf, M. Argonne National Lab., IL (United States). Apr 1996. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9604124–5: 98. annual meeting of the American Ceramic Society, Indianapolis, IN (United States), 14-17 Apr 1996). Order Number DE96009416. Source: OSTI; NTIS; INIS; GPO Dep.

Over the last few years, Argonne National Laboratory has been developing room-temperature-setting chemically bonded phosphate ceramics for solidifying and stabilizing low-level mixed wastes. This technology is crucial for stabilizing waste streams that contain volatile species and off-gas secondary waste streams generated by high-temperature treatment of such wastes. We have developed a magnesium phosphate ceramic to treat mixed wastes such as ash, salts, and cement sludges. Waste forms of surrogate waste streams were fabricated by acid-base reactions between the mixtures of magnesium oxide powders and the wastes, and phosphoric acid or acid phosphate solutions. Dense and hard ceramic waste forms are produced in this process. The principal advantage of this technology is that the contaminants are immobilized by both chemical stabilization and subsequent microencapsulation of the reaction products.

This paper reports the results of durability studies conducted on waste forms made with ash waste streams spiked with hazardous and radioactive surrogates. Standard leaching tests such as ANS 16.1 and TCLP were conducted on the final waste forms. Fates of the contaminants in the final waste forms were established by electron microscopy. In addition, stability of the waste forms in aqueous environments was evaluated with long-term water-immersion tests.

649 (ANL/ET/CP--88412) **Zirconium phosphate waste forms for low-temperature stabilization of cesium-137-containing waste streams.** Singh, D.; Wagh, A.S.; Tlustochowicz. Argonne National Lab., IL (United States). Apr 1996. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9604124--6: 98. annual meeting of the American Ceramic Society, Indianapolis, IN (United States), 14-17 Apr 1996). Order Number DE96009415. Source: OSTI; NTIS; INIS; GPO Dep.

Novel chemically bonded phosphate ceramics are being developed and fabricated for low-temperature stabilization and solidification of waste streams that are not amenable to conventional high-temperature stabilization processes because volatiles are present in the wastes. A composite of zirconium-magnesium phosphate has been developed and shown to stabilize ash waste contaminated with a radioactive surrogate of ^{137}Cs. Excellent retainment of cesium in the phosphate matrix system was observed in Toxicity Characteristic Leaching Procedure tests. This was attributed to the capture of cesium in the layered zirconium phosphate structure by intercalation ion-exchange reaction. But because zirconium phosphate has low strength, a novel zirconium/magnesium phosphate composite waste form system was developed. The performance of these final waste forms, as indicated by compression strength and durability in aqueous environments, satisfy the regulatory criteria. Test results indicate that zirconium-magnesium-phosphate-based final waste forms present a viable technology for treatment and solidification of cesium-contaminated wastes.

650 (ANL/RE/CP--85598) **Structural and seismic analyses of waste facility reinforced concrete storage vaults.** Wang, C.Y. Argonne National Lab., IL (United States). [1995]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950740--86: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014091. Source: OSTI; NTIS; INIS; GPO Dep.

Facility 317 of Argonne National Laboratory consists of several reinforced concrete waste storage vaults designed and constructed in the late 1940's through the early 1960's. In this paper, structural analyses of these concrete vaults subjected to various natural hazards are described, emphasizing the northwest shallow vault. The natural phenomenon hazards considered include both earthquakes and tornados. Because these vaults are deeply embedded in the soil, the SASSI (System Analysis of Soil-Structure Interaction) code was utilized for the seismic calculations. The ultimate strength method was used to analyze the reinforced concrete structures. In all studies, moment and shear strengths at critical locations of the storage vaults were evaluated. Results of the structural analyses show that almost all the waste storage vaults meet the code requirements according to ACI 349--85. These vaults also satisfy the performance goal such that confinement of hazardous materials is maintained and functioning of the facility is not interrupted.

651 (BHI--00010-Rev.1) **Hanford Site Asbestos Abatement Plan (HSAAP). Revision 1.** Mewes, B.S. Bechtel Hanford, Inc., Richland, WA (United States). Nov 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005706. Source: OSTI; NTIS; GPO Dep.

The Hanford Site Asbestos Abatement Plan lists priorities for asbestos abatement activities to be conducted in Hanford Site facilities. This plan is based on original asbestos assessment data gathered in fiscal year 1989, and revised during fiscal year 1995 that evaluated 438 Hanford Site facilities for the presence and condition of asbestos. During fiscal year 1995, 18 facilities were omitted from the Hanford Site Asbestos Abatement Plan as a result of building demolition and asbestos abatement efforts. Asbestos-containing buildings are classified according to the potential risk asbestos poses to building personnel. This plan requires that asbestos condition update reports be prepared for all affected facilities. The reporting is completed by the asbestos coordinator for each of the affected facilities and transmitted to the Hanford Site Asbestos Abatement Plan manager annually. The plan manager uses this information to reprioritize future project lists. Currently, one facility is determined to be Class AI, indicating the highest potential for asbestos exposure. Class AI, A2, and BI facilities are the highest priority for asbestos abatement. Abatement of the Class AI and A2 facilities is scheduled through fiscal year 1996. Abatement activity in B1 facilities will reduce the risk for further Class "A" conditions to arise.

652 (BHI--00053) **Qualitative risk assessment for the 100-FR-1 source operable unit.** Corporation, I.T. Bechtel Hanford, Inc., Richland, WA (United States). Aug 1994. 190p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005868. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides the Qualitative risk assessment (QRA) for the waste sites associated with the 100-FR-1 Operable Unit. The QRA is an evaluation of risk for a predefined set of human and ecological exposure scenarios. It is not intended to replace or be a substitute for a baseline risk assessment. The QRA is streamlined to consider only two human health scenarios (frequent-and occasional-use) with four exposure pathways (soil ingestion, fugitive dust inhalation, inhalation of volatile organics, and external radiation exposure) and a limited ecological evaluation. The use of these scenarios and pathways was agreed to by the 100 Area Tri-Party unit managers.

653 (BHI--00117-Rev.2) **Nonradioactive Dangerous Waste Landfill supplemental information to the Hanford Facility Contingency Plan (DOE/RL-93-75).** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012110. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a unit-specific contingency plan for the Nonradioactive Dangerous Waste Landfill and is intended to be used as a supplement to DOE/RL-93-75, 'Hanford Facility Contingency Plan.' This unit-specific plan is to be used to demonstrate compliance with the contingency plan requirements of the Washington Administrative Code, Chapter 173-303 for certain Resource, Conservation and Recovery Act of 1976 waste management units. The Nonradioactive

Dangerous Waste Landfill (located approximately 3.5 miles southeast of the 200 East Area at the Hanford Site) was used for disposal of nonradioactive dangerous waste from January 1975 to May 1985. Currently, there are no dangerous waste streams disposed in the Nonradioactive Dangerous Waste Landfill. Dangerous waste management activities are no longer required at the landfill. The landfill does not present a significant hazard to adjacent units, personnel, or the environment. It is unlikely that incidents presenting hazards to public health or the environment would occur at the Nonradioactive Dangerous Waste Landfill.

654 (BHI–00139-Rev.1) **Environmental Restoration Disposal Facility waste acceptance criteria. Revision 1.** Corriveau, C.E. Bechtel Hanford, Inc., Richland, WA (United States). [1996]. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005936. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Restoration Disposal Facility (ERDF) is designed to be an isolation structure for low-level radioactive remediation waste, chemically contaminated remediation waste, and remediation waste that contains both chemical and radioactive constituents (i.e., mixed remediation waste) produced during environmental remediation of Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) past-practice units at the Hanford Site. Remedial action wastes, which will become a structural component of the ERDF, include bulk soil, demolition debris, and miscellaneous wastes from burial grounds. These wastes may originate from CERCLA past-practice sites (i.e., operable units) in the 100 Areas, the 200 Areas, and the 300 Area of the Hanford Site.

655 (BHI–00141) **RARA FY 1994 summary report.** Hayward, W.M. Bechtel Hanford, Inc., Richland, WA (United States). Dec 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005060. Source: OSTI; NTIS; INIS; GPO Dep.

Radiation Area Remedial Action (RARA) is responsible for the interim stabilization and maintenance of the majority of the inactive waste sites at Hanford. This equates to approximately 400 individual sites and 4,000 acres. Examples of waste sites include cribs, ponds, ditches, burial grounds, tanks, french drains, and unplanned release sites. Consistent with the site effort to reduce liquid waste disposal to the soil column and the site transition from production activities to environmental restoration, several new sites were deactivated, isolated, and transferred into the RARA project in July 1994. They were all Resource Conservation and Recovery Act of 1976 (RCRA) Treatment Storage and Disposal (TSD) Units: 216-A-36 B Crib, 216-A-37-1 Crib, 216-B-3 Pond and Ditch, 216-S-10 ditch, 216-U-12 Crib, and the Non-Radioactive Dangerous Waste Landfill. RARA activities are broken into two broad categories, interim stabilization and surveillance and maintenance. Interim stabilization addresses major corrective action for sites with radioactive surface contamination. Surface contamination is handled two ways. First, surface contamination may be collected using heavy equipment, and consolidated (preferably) on the waste site from which it originated then covered with a layer of soil or other material. Secondly, surface contamination may be covered with a layer of soil or other material. The method employed is dictated by whether surface contamination is associated with a waste site or has migrated onto areas not associated with a waste site. Waste sites are then revegetated or receive treatments of nonselective herbicide. Interim stabilization is required to minimize the spread of radioactive material from these individual waste sites. RARA has interim stabilized or decontaminated approximately 1,400 acres at Hanford over the last 14 years.

656 (BHI–00352-Rev.2) **Final hazard classification for N basin water filtration and sediment relocation operations.** Pisarcik, D.J.; Kretzschmar, S.P. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005935. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides an auditable safety analysis and hazard classification for the filtration of basin water and the relocation of 105-N basin solids to the North Cask Pit within the basin complex. This report assesses the operation of the Water Filtration System and the Remotely Operated Sediment Extraction Equipment (ROSEE). These activities have an activity hazard classification of radiological. Inventories of potentially releasable nonradioactive hazardous materials are far below the reportable quantities of 40 CFR 302. No controls are required to maintain the releasable inventories of these materials below the reportable quantities. Descriptive material is included to provide a general understanding of the water filtration and sediment relocation processes. All equipment will be operated as described in work instructions and/or applicable procedures. Special controls associated with these activities are as follows: (1) A leak inspection of the ROSEE system shall be performed at least once every 5-hour period of sediment relocation operation. (2) A berm must be in place around the North Cask Pit to redirect a potential abovewater ROSEE system leak back to the basin.

657 (BHI–00395) **Design, operations, and maintenance of the soil vapor extraction systems for the 200 West Area Carbon Tetrachloride Expedited Response Action.** Tranbarger, R.K. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012119. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides the design, operating, and maintenance guidelines for the soil vapor extraction (SVE) systems implemented as part of the 200 West Area Carbon Tetrachloride ERA. Additionally, this document provides general information regarding the ERA, the SVE system design, and the general approach towards soil vapor extraction. The remaining content of this document includes the following: regulatory compliance; summary of vadose zone physical and containment characteristics; past and present SVE system designs and potential design upgrades; general design and monitoring considerations for the SVE systems; descriptions of the SVE system components and their respective functions; safety requirements; operation of the SVE systems including startup, surveillances, shutdown, GAC canister changeouts, and wellfield characterization; monitoring requirements; SVE optimization; and instrument calibrations, preventive maintenance, and spare parts and site inventory requirements.

658 (BHI–00541-Rev.) **Radiological and hazardous material characterization report for the south portion of the 313 Building.** Harris, R.A. Bechtel Hanford, Inc., Richland, WA (United States). Dec 1995. 160p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005933. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of the characterization was to determine the extent of radiological contamination and presence of hazardous materials, to allow the preparation of an accurate cost estimate, and to plan for pre-demolition cleanup work to support building isolation. The scope of services for the project included the following tasks: Records Review and Interviews; Site Reconnaissance; Radiological Survey; and Sampling and Analysis.

659 (BHI–00639-Rev.1) **120-D-1 (100-D) Ponds training plan. Revision 1.** Mitchem, G.B. Bechtel Hanford, Inc., Richland, WA (United States). Nov 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005879. Source: OSTI; NTIS; INIS; GPO Dep.

This is the Environmental Restoration Contractor Team personnel training plan for the 100-D Ponds treatment, storage and disposal unit. This plan is intended to meet the requirements of the WAC 173-303-330 and Hanford Dangerous Waste Permit. The Ponds received nonradioactive and nondangerous wastes as part of the Water Treatment Facility. However, sampling data have indicated a radioactive 'crust' over most of the settling pond bottom and radioactive contamination in the soils beneath the pond, as well as contamination by polychlorinated biphenyls and metals.

660 (BHI–00735) **202-S Hexone Facility supplemental information to the Hanford Facility Contingency Plan.** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008012. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a unit-specific contingency plan for the 202-S Hexone Facility and is intended to be used as a supplement to the Hanford Facility Contingency Plan. This unit-specific plan is to be used to demonstrate compliance with the contingency plan requirements of WAC 173-303 for certain Resource Conservation and Recovery Act of 1976 (RCRA) waste management units. The 202-S Hexone Facility is not used to process radioactive or nonradioactive hazardous material. Radioactive, dangerous waste material is contained in two underground storage tanks, 276-S-141 and 276-S-142. These tanks do not present a significant hazard to adjacent facilities, personnel, or the environment. Currently, dangerous waste management activities are not being applied at the tanks. It is unlikely that any incidents presenting hazards to public health or the environment would occur at the 202-S Hexone Facility.

661 (BHI–00736) **Bechtel Hanford, Inc./ERC team health and safety plan Environmental Restoration Disposal Facility operations.** Turney, S.R. Bechtel Hanford, Inc., Richland, WA (United States). Feb 1996. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009916. Source: OSTI; NTIS; INIS; GPO Dep.

A comprehensive safety and health program is essential for reducing work-related injuries and illnesses while maintaining a safe and health work environment. This document establishes Bechtel Hanford, Inc. (BHI)/Environmental Restoration Contractor (ERC) team requirements, policies, and procedures and provides preliminary guidance to the Environmental Restoration Disposal Facility (ERDF) subcontractor for use in preparing essential safety and health documents. This health and safety plan (HASP) defines potential safety and health issues associated with operating and maintaining the ERDF. A site-specific HASP shall be developed by the ERDF subcontractor and shall be implemented before operations and maintenance work can proceed. An activity hazard analysis (AHA) shall also be developed to provide procedures to identify, assess, and control hazards or potential incidents associated with specific operations and maintenance activities.

662 (BHI–00747) **General design criteria for Richland Environmental Restoration Project.** Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008962. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides uniform general design criteria based on national consensus and commercial codes and standards for use in design, construction, and maintenance of facilities to support Richland Environmental Restoration Project activities at the Hanford Site. This general design criteria does not address high-level waste (HLW), as it is anticipated that HLW will not be encountered during Environmental Restoration Contractor (ERC) activities; however, should HLW be encountered relevant and appropriate design requirements will be addressed in site- or task-specific design basis documents. These criteria establish the basis for preparing performance-based specifications, subcontracts, and other work controlling documents. Required performance and Hanford Site-specific information, and a compilation of potentially applicable codes and standards, will be delineated by Bechtel Hanford, Inc. (BHI) in work controlling documents. The subcontractor or vendor will be required to identify the codes and standards used in designing, fabricating, erecting, installing, inspecting, testing, deactivating, decommissioning, demolishing, and operating facilities and equipment as appropriate, and submit to BHI for review.

663 (BHI–00752) **100-B/C demonstration project final report.** April, J.G.; Galbraith, M.J.; Lowe, J.A.; Naiknimbalkar, N.M. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 203p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009061. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the 100-B/C Demonstration Project was to initiate remedial action (RA) in the 100 Area source sites and to address uncertainties in remedial design (RD) planning. An engineering evaluation/cost analysis was performed on the 116-B-4, 116-B-5, and 116-C-1 sites within the 100-B/C Reactor Area and submitted for a 30-day public comment period starting on May 15, 1995. An action memorandum for this expedited response action was issued on June 28, 1995 for these three sites. A Streamlined Approach for Environmental Restoration (SAFER) workshop was conducted during April 1995 by the Tri-Parties to develop objectives for what is termed the 100-B/C Demonstration Project. The main objective of the 100-B/C Demonstration Project was to implement RA in the 100 Areas on selected waste sites, achieve cleanup standards, and address RD/RA uncertainties.

664 (BHI–00768) **100 and 300 Area Burial Ground remediation study.** Chiaramonte, G.R. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012134. Source: OSTI; NTIS; INIS; GPO Dep.

This burial ground study report documents the results of an evaluation of alternatives for remediation of Hanford 100 and 300 Area burial grounds. The current remediation baseline assumes that the contents of all burial grounds will be removed and disposed at the Environmental Restoration Disposal Facility (ERDF). This baseline assumes that this approach will remediate the sites to a level that "does not preclude any future use." This study evaluates alternatives to this approach which provide overall protection of human health and the environment, pose less worker risk, and are more cost effective, but may require some restrictions on the use of portions of the 100 and 300 Areas. Information is provided in this report to support future decision-making by the US Department of Energy (DOE), the regulators, and stakeholders.

665 (BHI–00774) **1907-DR Process Sewer Outfall soil contamination assessment sampling and analysis plan.** Hope, S.J. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1996. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012126. Source: OSTI; NTIS; INIS; GPO Dep.

This sampling and analysis plan contains the field sampling plan (FSP) and the quality assurance project plan (QAPjP) for the sampling and analytical activities planned for the 1907-DR Process Sewer outfall soil contamination assessment. This sampling and analysis plan is presented in two sections: the FSP and the QAPjP. The FSP defines the sampling and analytical methodologies to be preformed during the assessment. The QAPjP provides information on the quality assurance/quality control parameters related to the sampling and analytical methodologies.

666 (BHI–00777) **Work plan for the excavation of contaminated materials from 100-D Ponds.** Ludowise, J.D.; Blumenkranz, B.D.; Moore, R.T.; Stankovich, M.T. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012127. Source: OSTI; NTIS; INIS; GPO Dep.

The D Ponds were used as a treatment, storage and/or disposal (TSD) facility under the Resource Conservation and Recovery Act of 1976 (OKRA). The D-Ponds waste site is located in the 100-DR-1 Operable Unit of the 100 Area at the Hanford Reservation. The site consists of two surface ponds (now dry) separated by an earthen dike. the south pond was used as a settling pond for waste water from the 100-D Area and contains the sediment material to be removed. The north pond was used as a percolation pond and received clarified overflow from the settling pond. Two horizontal pipes, buried in the earthen dike, connect the two ponds and allowed the water to overflow from the settling pond to the percolation pond. This work plan describes the work required to remediate the D-Ponds waste site. The actions needed to remediate the site include the removal and disposal of contaminated sediments, piping and debris. This remedial action is required to be complete by 1998. The U.S. Department of Energy, Richland Operations Office is voluntarily accelerating the cleanup.

667 (BHI–00789) **Final hazard classification of the 100-D Pond voluntary remediation project.** Adam, W.J. Bechtel Hanford, Inc., Richland, WA (United States). May 1996. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96012128. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to provide the final hazard classification for the voluntary remediation activities to be conducted at the 100-D Pond Treatment, Storage, and Disposal Facility. Based on the inventories calculated from characterization data and the releasable inventory, these activities are classified as radiological.

668 (BHI–00806) **126-F-1 radiological investigation and downposting. Final report.** Smith, D.L. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96009927. Source: OSTI; NTIS; INIS; GPO Dep.

The 126-F-1 ashpit is located in the 100 F Area of the Hanford Site, in the 100-FR-2 operable unit. This waste site is managed under the Radiation Area Remedial Action (RARA) project. As such, the area has undergone routine surveillance which indicated that the site may have been improperly posted as a contamination area. The ashpit was the result of coal fired plant operations in the 100 F Area. Coal ash contains various amounts of fly ash, bottom ash, and boiler slag. From 1944 to 1971, reactor cooling water was discharged to the 107-F retention basins via an above grade pipe. This paper traversed the north edge of the 126-F-1 ash pit. Effluent leakage from the pipeline led to the formation of a pond north of the pipeline. In addition, effluent flowed south into the ashpit. Ultimately, the pipeline was removed. The area north of the pipeline was included inside the 100 F concrete marker posts and as such was posted as an underground radioactive material area. At a later unspecified date, the entire ashpit was posted "Surface Contamination Area", then later as a "Contamination Area". Routine surveys indicated that radioactive contamination levels were low. This report details efforts that lead to the downposting of the 126-F-1 ashpit from contamination area to no posting or underground radioactive material.

669 (BNL–52478) **Polyethylene encapsulation full-scale technology demonstration. Final report.** Kalb, P.D.; Lageraaen, P.R. Brookhaven National Lab., Upton, NY (United States). Oct 1994. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE96001638. Source: OSTI; NTIS; INIS; GPO Dep.

A full-scale integrated technology demonstration of a polyethylene encapsulation process, sponsored by the US Department of Energy (DOE) Office of Technology Development (OTD), was conducted at the Environmental & Waste Technology Center at Brookhaven National Laboratory (BNL.) in September 1994. As part of the Polymer Solidification National Effort, polyethylene encapsulation has been developed and tested at BNL as an alternative solidification technology for improved, cost-effective treatment of low-level radioactive (LLW), hazardous and mixed wastes. A fully equipped production-scale system, capable of processing 900 kg/hr (2000 lb/hr), has been installed at BNL. The demonstration covered all facets of the integrated processing system including pre-treatment of aqueous wastes, precise feed metering, extrusion processing, on-line quality control monitoring, and process control.

670 (BNL–62863) **Three multimedia models used at hazardous and radioactive waste sites.** Moskowitz, P.D. (Brookhaven National Lab., Upton, NY (United States)); Pardi, R.; Fthenakis, V.M.; Holtzman, S.; Sun, L.C.; Rambaugh, J.O.; Potter, S. Brookhaven National Lab., Upton, NY (United States). Feb 1996. 86p. Sponsored by USDOE,

Washington, DC (United States);Environmental Protection Agency, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE96008725. Source: OSTI; NTIS; INIS; GPO Dep.

Multimedia models are used commonly in the initial phases of the remediation process where technical interest is focused on determining the relative importance of various exposure pathways. This report provides an approach for evaluating and critically reviewing the capabilities of multimedia models. This study focused on three specific models MEPAS Version 3.0, MMSOILS Version 2.2, and PRESTO-EPA-CPG Version 2.0. These models evaluate the transport and fate of contaminants from source to receptor through more than a single pathway. The presence of radioactive and mixed wastes at a site poses special problems. Hence, in this report, restrictions associated with the selection and application of multimedia models for sites contaminated with radioactive and mixed wastes are highlighted. This report begins with a brief introduction to the concept of multimedia modeling, followed by an overview of the three models. The remaining chapters present more technical discussions of the issues associated with each compartment and their direct application to the specific models. In these analyses, the following components are discussed: source term; air transport; ground water transport; overland flow, runoff, and surface water transport; food chain modeling; exposure assessment; dosimetry/risk assessment; uncertainty; default parameters. The report concludes with a description of evolving updates to the model; these descriptions were provided by the model developers.

671 (BNL–62901) **Gamma irradiation testing of montan wax barrier materials for in-situ waste containment.** Soo, P.; Heiser, J. Brookhaven National Lab., Upton, NY (United States). Feb 1996. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE96009939. Source: OSTI; NTIS; INIS; GPO Dep.

A scoping study was carried out to quantify the potential use of a montan wax as a barrier material for subsurface use. If it possesses resistance to chemical and structural change, it could be used in a barrier to minimize the migration of contaminants from their storage or disposal locations. Properties that were evaluated included hardness, melting point, molecular weight, and biodegradation as a function of gamma radiation dose. The main emphasis was to quantify the wax's long-term ability to withstand radiation-induced mechanical, chemical, and microbial degradation.

672 (CONF-9001183–Exec.Summ.) **LLW Forum meeting report, January 24–26 1990.** Afton Associates, Inc., Washington, DC (United States). [1990]. 51p. Sponsored by USDOE, Washington, DC (United States). From Low level radioactive waste meeting; San Francisco, CA (United States); 24-26 Jan 1990. Order Number DE96013291. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level Radioactive waste Forum is an association of representatives of states and compacts established to facilitate state and compact commission implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The Forum provides an opportunity for states and compacts to share information with one another and to exchange views with officials of federal agencies. LLW Forum participants include representatives from regional compacts, designated host states, unaffiliated states, and states with currently-operating low-level radioactive waste facilities. This quarterly meeting was held January 24-26, 1990.

673 (CONF-9004379–Exec.Summ.) **Low-Level Waste Forum meeting report. Quarterly meeting, April 25–27, 1990.** Afton Associates, Inc., Washington, DC (United States). [1990]. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste meeting; Austin, TX (United States); 25-27 Apr 1990. Order Number DE96013290. Source: OSTI; NTIS; GPO Dep.

The Low-Level Radioactive Waste Forum is an association of representatives of states and compacts established to facilitate state and compact commission implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The Forum provides an opportunity for states and compacts to share information with one another and to exchange views with officials of federal agencies. The Forum participants include representatives from regional compacts, designated host states, unaffiliated states, and states with currently-operating low-level radioactive waste facilities. This report contains information synthesizing the accomplishments of the Forum, as well as any new advances that have been made in the management of low-level radioactive wastes.

674 (CONF-9007264–Exec.Summ.) **Low-Level Waste Forum meeting report. Quarterly meeting, July 23–24, 1990.** Afton Associates, Inc., Washington, DC (United States). [1990]. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste meeting; Minneapolis, MN (United States); 23-24 Jul 1990. Order Number DE96013289. Source: OSTI; NTIS; GPO Dep.

The Low-Level Radioactive Waste Forum is an association of representatives of states and compacts established to facilitate state and compact commission implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The Forum provides an opportunity for states and compacts to share information with one another and to exchange views with officials of federal agencies. The Forum participants include representatives from regional compacts, designated host states, unaffiliated states, and states with currently-operating low-level radioactive waste facilities. This report contains information synthesizing the accomplishments of the Forum, as well as any new advances that have been made in the management of low-level radioactive wastes.

675 (CONF-9010566–Exec.Summ.) **Low-level waste forum meeting reports.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 1990. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste meeting; Miami, FL (United States); 17-19 Oct 1990. Order Number DE96013288. Source: OSTI; NTIS; GPO Dep.

This paper provides highlights from the October 1990 meeting of the Low Level Radioactive Waste Forum. Topics of discussion included: a special session on liability and financial assurance needs; proposal to dispose of mixed waste at federal facilities; state plans for interim storage; and hazardous materials legislation.

676 (CONF-9104440–Exec.Summ.) **LLW Forum meeting report, April 18–19, 1991.** Afton Associates, Inc., Washington, DC (United States). [1991]. 64p. Sponsored by USDOE, Washington, DC (United States). From Low level radioactive waste meeting; New Orleans, LA (United States); 18-19 Apr 1991. Order Number DE96013286. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level Radioactive Waste Forum is an association of representatives of states and compacts established to facilitate state and compact commission implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The Forum provides an opportunity for states and compacts to share information with one another and to exchange views with officials of federal agencies. LLW Forum participants include representatives from regional compacts, designated host states, unaffiliated states, and states with currently- operating low-level radioactive waste facilities. This quarterly meeting was held on April 18-19, 1991.

677 (CONF-9107286–Exec.Summ.) **Low-level Waste Forum meeting report. Quarterly meeting, July 25–26, 1991.** Afton Associates, Inc., Washington, DC (United States). [1991]. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste meeting; Seattle, WA (United States); 25-26 Jul 1991. Order Number DE96013285. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level Radioactive Waste Forum is an association of representatives of states and compacts established to facilitate state and compact commission implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The Forum provides an opportunity for states and compacts to share information with one another and to exchange views with officials of federal agencies. The Forum participants include representatives from regional compacts, designated host states, unaffiliated states, and states with currently-operating low-level radioactive waste facilities. This report contains information synthesizing the accomplishments of the Forum, as well as any new advances that have been made in the management of low-level radioactive wastes.

678 (CONF-9110558–Exec.Summ.) **Low-level waste forum meeting reports.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 1991. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste meeting; Las Vegas, NV (United States); 10-11 Oct 1991. Order Number DE96013284. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains highlights from the 1991 fall meeting of the Low Level Radioactive Waste Forum. Topics included legal updates; US NRC updates; US EPA updates; mixed waste issues; financial assistance for waste disposal facilities; and a legislative and policy report.

679 (CONF-9204311–Summ.) **Low-level waste forum meeting reports.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 1992. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste spring meeting; Williamsburg, VA (United States); 27-29 Apr 1992. Order Number DE96013282. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides highlights from the spring meeting of the Low Level Radioactive Waste Forum. Topics of discussion included: state and compact reports; New York's challenge to the constitutionality of the Low-Level Radioactive Waste Amendments Act of 1985; DOE technical assistance for 1993; interregional import/export agreements; Department of Transportation requirements; superfund liability; nonfuel bearing components; NRC residual radioactivity criteria.

680 (CONF-9207253–Summ.) **Low-level waste forum meeting reports.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 1992. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste summer meeting; Leystone, CO (United States); 23-24 Jul 1992. Order Number DE96013281. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides highlights from the summer meeting of the Low Level Radioactive Waste Forum. Topics of discussion included: responsibility for nonfuel component disposal; state experiences in facility licensing; and volume projections.

681 (CONF-9210513–Summ.) **Low-level waste forum meeting reports.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 1992. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste fall meeting; Savannah, GA (United States); 22-23 Oct 1992. Order Number DE96013280. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides highlights from the 1992 fall meeting of the Low LEvel Radioactive Waste Forum. Topics included: disposal options after 1992; interregional agreements; management alternatives; policy; and storage.

682 (CONF-9301164–Summ.) **Low-level waste forum meeting reports.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 1993. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste winter meeting; San Diego, CA (United States); 27-29 Jan 1993. Order Number DE96013279. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides the results of the winter meeting of the Low Level Radioactive Waste Forum. Discussions were held on the following topics: new developments in states and compacts; adjudicatory hearings; information exchange on siting processes, storage surcharge rebates; disposal after 1992; interregional access agreements; and future tracking and management issues.

683 (CONF-9304305–Summ.) **Low-level Waste Forum meeting report. Spring meeting, April 28–30, 1993.** Afton Associates, Inc., Washington, DC (United States). [1993]. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste spring meeting; Austin, TX (United States); 28-30 Apr 1993. Order Number DE96013278. Source: OSTI; NTIS; INIS; GPO Dep.

686 (CONF-9401133–Summ.) **Low-level Waste Forum meeting report. Winter meeting, January 26–28, 1994.** Afton Associates, Inc., Washington, DC (United States). [1994]. 77p. Sponsored by USDOE, Washington, DC (United States);Washington State Government, Olympia, WA (United States). DOE Contract AC07-94ID13223. Contract C9400065. From Low level radioactive waste winter meeting; San Diego, CA (United States); 24-28 Jan 1994. Order Number DE96013275. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level Radioactive Waste Forum is an association of representatives of states and compacts established to facilitate state and compact commission implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The Forum provides an opportunity for states and compacts to share information with one another and to exchange views with officials of federal agencies. The Forum participants include representatives from regional compacts, designated host states, unaffiliated states, and states with currently-operating low-level radioactive waste facilities. This report contains information synthesizing the accomplishments of the Forum, as well as any new advances that have been made in the management of low-level radioactive wastes.

687 (CONF-9404126–6) **Mixed Waste Integrated Program – Problem-oriented technology development.** Hart, P.W. (Dept. of Energy, Germantown, MD (United States)); Wolf, S.W.; Berry, J.B. Oak Ridge National Lab., TN (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Mixed waste thermal treatment symposium; Denver, CO (United States); 12-14 Apr 1994. Order Number DE96009999. Source: OSTI; NTIS; INIS; GPO Dep.

The Mixed Waste Integrated Program (MWIP) is responding to the need for DOE mixed waste treatment technologies that meet these dual regulatory requirements. MWIP is developing emerging and innovative treatment technologies to determine process feasibility. Technology demonstrations will be used to determine whether processes are superior to existing technologies in reducing risk, minimizing life-cycle cost, and improving process performance. Technology development is ongoing in technical areas required to process mixed waste: materials handling, chemical/physical treatment, waste destruction, off-gas treatment, final forms, and process monitoring/control. MWIP is currently developing a suite of technologies to process heterogeneous waste. One robust process is the fixed-hearth plasma-arc process that is being developed to treat a wide variety of contaminated materials with minimal characterization. Additional processes encompass steam reforming, including treatment of waste under the debris rule. Advanced off-gas systems are also being developed. Vitrification technologies are being demonstrated for the treatment of homogeneous wastes such as incinerator ash and sludge. An alternative to conventional evaporation for liquid removal–freeze crystallization–is being investigated. Since mercury is present in numerous waste streams, mercury removal technologies are being developed.

688 (CONF-9404319–Summ.) **LLW Forum meeting report, April 25–27, 1994.** Afton Associates, Inc., Washington, DC (United States). [1994]. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste spring meeting; New Orleans, LA (United States); 25-27 Apr 1994. Order Number DE96013274. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level radioactive Waste Forum is an association of representatives of states and compacts established to facilitate state and compact commission implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The Forum provides an opportunity for states and compacts to share information with one another and to exchange views with officials of federal agencies. LLW Forum participants include representatives from regional compacts, designated host states, unaffiliated states, and states with currently-operating low-level radioactive waste facilities. This quarterly meeting was held April 25-27, 1994 and activities during the first quarter of 1994 are detailed..

689 (CONF-940729–1) **Characterization of mercury forms in contaminated floodplain soils.** Barnett, M.O. (Oak Ridge National Lab., TN (United States)); Turner, R.R.; Henson, T.J.; Harris, L.A.; Melton, R.E.; Stevenson, R.J. Oak Ridge National Lab., TN (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on mercury as a global pollutant; Whistler (Canada); 10-14 Jul 1994. Order Number DE96009632. Source: OSTI; NTIS; INIS; GPO Dep.

The chemical form or speciation of Hg in the floodplain soils of the East Fork Poplar Creek in Oak Ridge TN, a site contaminated from past industrial activity, was investigated. Hg speciation in the soils is an important factor in controlling the fate and effect of mercury at the site and in assessing human health and ecological risk. Application of 3 different sequential extraction speciation schemes indicated the Hg at the site was predominantly relatively insoluble mercuric sulfide or metallic Hg, though the relative proportions of each did not agree well between procedures. Application of x-ray and electron beam studies to site soils confirmed the presence of metacinnabar, a form of mercuric sulfide, the first known evidence of authigenic mercuric sulfide formation in soils.

690 (CONF-9407212–Summ.) **LLW Forum meeting report, July 20–22, 1994.** Afton Associates, Inc., Washington, DC (United States). [1994]. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste summer meeting; Seattle, WA (United States); 20-22 Jul 1994. Order Number DE96013273. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level Radioactive Waste Forum (LLW Forum) is an association of state and compact representative, appointed by governors and compact commissions, established to facilitate state and compact commission implementation of the Low-Level radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The forum provides an opportunity for states and compacts to share information with one another and to exchange views with officials of federal agencies. This report details activities of the meeting held July 20-22, 1994.

691 (CONF-940815–114) **Uncertainty analysis for low-level radioactive waste disposal performance assessment at Oak Ridge National Laboratory.** Lee, D.W.; Yambert, M.W.; Kocher, D.C. Oak Ridge National Lab., TN (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From SPECTRUM '94: international nuclear and hazardous waste management conference; Atlanta, GA (United States); 14-18 Aug 1994. Order Number DE95014030. Source: OSTI; NTIS; INIS; GPO Dep.

A performance assessment of the operating Solid Waste Storage Area 6 (SWSA 6) facility for the disposal of low-level radioactive waste at the Oak Ridge National Laboratory has been prepared to provide the technical basis for demonstrating compliance with the performance objectives of DOE Order 5820.2A, Chapter 111.2 An analysis of the uncertainty incorporated into the assessment was performed which addressed the quantitative uncertainty in the data used by the models, the subjective uncertainty associated with the models used for assessing performance of the disposal facility and site, and the uncertainty in the models used for estimating dose and human exposure. The results of the uncertainty analysis were used to interpret results and to formulate conclusions about the performance assessment. This paper discusses the approach taken in analyzing the uncertainty in the performance assessment and the role of uncertainty in performance assessment.

692 (CONF-940815–118) **Case study of ^{137}Cesium plots remediation at Oak Ridge National Laboratory.** Bednarz, C.A.; Garrett, D.L. Oak Ridge National Lab., TN (United States). May 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From SPECTRUM '94: international nuclear and hazardous waste management conference; Atlanta, GA (United States); 14-18 Aug 1994. Order Number DE96009621. Source: OSTI; NTIS; INIS; GPO Dep.

The primary goal of the experiment was to evaluate the long-term, low-dose effect of radiation to the environment, particularly to vegetation i.e., fescue and insects in the event of a nuclear attack. In 1968, ^{137}Cs was fused at high temperatures with silica sand particles (100 uCi/g) and applied to the surface of four 33 x 33 ft plots. Four other plots were constructed at the site to serve as background controls and were not contaminated with ^{137}Cs. The particles ranged from 88 to 177 { micro} m in diameter and were spread at a load of 72 g/m^2 over the plots. The particle size distribution was selected to simulate particle diameters characteristic of weapons fallout. Each plot received approximately 2.2 Ci of ^{137}Cs, which resulted in a total of 8.8 Ci applied to the site. The cesium plots occupy approximately 6 acres of grassy fields 330 ft north of the Clinch River. The plots are enclosed by a perimeter fence approximately 1,000 ft x 250 ft. Each of the eight plots was enclosed with sheet metal that extended 18 in. below and 24 in. above the ground surface. ORNL researchers involved with the application of the cesium (circa 1968) believed the cesium fused silica particles would not migrate vertically more than 6 to 12 in. nor migrate horizontally in any direction because of the plot metal enclosures. However, soil samples taken from the plots revealed the cesium had migrated vertically to depths of 3 to 4 ft. and horizontally in a northwest plume of several feet. Because of direct radiation exposure concerns to workers and the public, a CERCLA interim action was taken to remediate the plots. The intent of the paper will be to explain the remediation and examine the challenges associated with the remediation focusing primarily on lessons learned.

693 (CONF-9410466–Summ.) **LLW Forum meeting report, October 26–27, 1994.** Afton Associates, Inc., Washington, DC (United States). [1994]. 66p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste meeting; Williamsburg, VA (United States); 26-27 Oct 1994. Order Number DE96013272. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level Radioactive Waste Forum (LLW Forum) is an association of state and compact representatives, appointed by governors and compact commissions, established to facilitate state and compact implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. This report details activities of the meeting held October 26-27, 1994.

694 (CONF-941102–46) **Determination of operating limits for radionuclides for a proposed landfill at Paducah Gaseous Diffusion Plant.** Wang, J.C.; Lee, D.W.; Ketelle, R.H.; Lee, R.R.; Kocher, D.C. Oak Ridge National Lab., TN (United States). 24 May 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society (ANS); Washington, DC (United States); 13-18 Nov 1994. Order Number DE95014032. Source: OSTI; NTIS; INIS; GPO Dep.

The operating limits for radionuclides in sanitary and industrial wastes were determined for a proposed landfill at the Paducah Gaseous Diffusion Plant (PGDP), Kentucky. These limits, which may be very small but nonzero, are not mandated by law or regulation but are needed for rational operation. The approach was based on analyses of the potential contamination of groundwater at the plant boundary and the potential exposure to radioactivity of an intruder at the landfill after closure. The groundwater analysis includes (1) a source model describing the disposal of waste and the release of radionuclides from waste to the groundwater, (2) site-specific groundwater flow and contaminant transport calculations, and (3) calculations of operating limits from the dose limit and conversion factors. The intruder analysis includes pathways through ingestion of contaminated vegetables and soil, external exposure to contaminated soil, and inhalation of suspended activity from contaminated soil particles. In both analyses, a limit on annual effective dose equivalent of 4 mrem (0.04 mSv) was adopted. The intended application of the results is to refine the radiological monitoring standards employed by the PGDP Health Physics personnel to determine what constitutes radioactive wastes, with concurrence of the Commonwealth of Kentucky.

695 (CONF-950171–3) **Aluminum removal from washed sludge.** Egan, B.Z. (Oak Ridge National Lab., TN (United States)); Collins, J.L.; Ensor, D.D. Oak Ridge National Lab., TN (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Efficient Separations and Processing Integrated Program (ESPIP) technical integration and exchange (TIE) meeting; Gaithersburg, MD (United States); 24-26 Jan 1995. Order Number DE96008642. Source: OSTI; NTIS; INIS; GPO Dep.

Purpose of this project is to reduce the volume of storage tank sludge to be treated by removing the Al and other nonradioactive components. In initial sludge surrogate studies, Al, Cr, and Zn showed the highest solubility in NaOH solutions; Ce and Zr were the least soluble of the elements tested. Removal of Fe and Bi approached 2%, the rest of the elements studied showed <1% removal. Amount of Al removed increased as the NaOH conc. increased from 0.1 to 6 M. Sequential washing of the sludge surrogate with 3 M NaOH removed 84% of the Al, 39% of the Cr, and 65% of the Zn. Surrogate sludges containing U and Th were also studied.

696 (CONF-9501137–Summ.) **LLW Forum meeting report, January 31–February 3, 1995.** Afton Associates, Inc., Washington, DC (United States). [1995]. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste meeting; San Diego, CA (United States); 31 Jan - 3 Feb 1995. Order Number DE96013271. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level Radioactive Waste Forum (LLW) is an association of state and compact representatives, appointed by governors and compact commissions, established to facilitate state and compact implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The LLW Forum provides an opportunity for state and compact officials to share information with one another and to exchange views with officials of federal agencies and other interested parties. 697 (CONF-950216–161) **The effect of chemical composition on the PCT durability of mixed waste glasses from wastewater treatment sludges.** Resce, J.L. (Clemson Univ., SC (United States)); Ragsdale, R.G.; Overcamp, T.J.; Bickford, D.F.; Cicero, C.A. Westinghouse Savannah River Co., Aiken, SC (United States). 25 Jan 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. From Waste management '95; Tucson, AZ (United States); 26 Feb - 2 Mar 1995. Order Number DE96011209. Source: OSTI; NTIS; INIS; GPO Dep.

An experimental program has been designed to examine the chemical durability of glass compositions derived from the vitrification of simulated wastewater treatment sludges. These sludges represent the majority of low-level mixed wastes currently in need of treatment by the US DOE. The major oxides in these model glasses included SiO_2, Al_2O_3, B_2O_3, Na_2O, CaO and Fe_2O_3. In addition, three minor oxides, BaO, NiO, and PbO, were added as hazardous metals. The major oxides were each varied at two levels resulting in 32 experimental glasses. The chemical durability was measured by the 7-Day Product Consistency Test (PCT). The normalized sodium release rates (NRR_{Na}) of these glasses ranged from 0.01 to 4.99 g/m^2. The molar ratio of the glass-former to glass-modifier (F/M) was found to have the greatest effect on PCT durability. Glass-formers included SiO_2, Al_2O_3, and B_2O_3, while Na_2O, CaO, BaO, NiO, and PbO were glass-modifiers. As this ratio increased from 0.75 to 2.0, NRR_{Na} was found to decrease between one and two orders of magnitude. Another important effect on NRR_{Na} was the Na_2O/CaO ratio. As this ratio increased from 0.5 to 2.0, NRR_{Na} increased up to two orders of magnitude for the glasses with the low F/M ratio but almost no effect was observed for the glasses with the high F/M ratio. Increasing the iron oxide content from 2 to 18 mole% was found to decrease NRR_{Na} one order of magnitude for the glasses with low F/M but iron had little effect on the glasses with the high

F/M ratio. The durability also increased when 10 mole percent Al_2O_3 was included in low iron oxide glasses but no effect was observed with the high iron glasses. The addition of B_2O_3 had little effect on durability. The effects of other composition parameters on durability are discussed as well.

698 (CONF-950483–8) **Degradation of high concentrations of glycols, antifreeze, and deicing fluids.** Strong-Gunderson, J.M.; Wheelis, S.; Carroll, S.L.; Waltz, M.D.; Palumbo, A.V. Oak Ridge National Lab., TN (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. 699 (CONF-9504255–1) **The selective removal of ^{90}Sr and ^{137}Cs from liquid low-level waste at Oak Ridge National Laboratory.** Bostick, D.T.; Arnold, W.D.; Burgess, M.W.; Taylor, P.A.; Kent, T.E. Oak Ridge National Lab., TN (United States). 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From ESPIP task review meeting; Gaithersburg, MD (United States); 25 Apr 1995 - 26 Apr 1996. Order Number DE96010577. Source: OSTI; NTIS; INIS; GPO Dep.

Methods are being developed for the selective removal of the two principal radioactive contaminants, ^{90}Sr and ^{137}Cs, from liquid low-level waste generated and/or stored at Oak Ridge National Laboratory. These methods are to be used in a future centralized treatment facility at ORNL. Removal of ^{90}Sr in the proposed treatment flashed is based on coprecipitation from strongly alkaline waste by adding stable strontium to the waste solution. Ferric sulfate, added with the stable strontium, improves the ^{90}Sr removal and aids in the flocculation of the strontium carbonate ($SrCO_3$) precipitate. After separation of the solids, the resultant supernate is adjusted to pH 8 for the cesium removal treatment. Upon pH adjustment, aluminum originally present in the untreated alkaline waste precipitates and sorbs an additional amount of ^{90}Sr. Cesium is removed from the neutralized waste by two sequential treatments with potassium cobalt hexacyanoferrate (KCCF) slurry formed by the addition of potassium ferrocyanide ($K_4Fe(CN)_6$) and cobalt nitrate ($Co(NO_3)_2$) solutions. The cumulative decontamination factors (DFs) for ^{90}Sr and ^{137}Cs in benchscale studies are 4900 and 1×10^6, respectively, if high speed centrifugation is used for the liquid/solid separations. Efforts are now underway to evaluate process-scale techniques to perform the liquid/solid separations required for removal of $SrCO_3$ and ^{137}Cs-bearing hexacyanoferrate solids from the treated waste solution.

700 (CONF-9505359–Summ.) **Low-level waste forum meeting reports.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 1995. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste meeting; Knoxville, TN (United States); 6-8 May 1995. Order Number DE96013270. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides highlights from the 1995 summer meeting of the Low Level radioactive Waste Forum. Topics included: new developments in state and compacts; federal waste management; DOE plans for Greater-Than-Class C waste management; mixed wastes; commercial mixed waste management; international export of rad wastes for disposal; scintillation cocktails; license termination; pending legislation; federal radiation protection standards.

701 (CONF-950828–6) **Rheological properties of the product slurry of the Nitrate to Ammonia and Ceramic (NAC) process.** Muguercia, I. (Florida International Univ., Miami, FL (United States). Dept. of Mechanical Engineering); Yang, G.; Ebadian, M.A.; Lee, D.D.; Mattus, A.J.; Hunt, R.D. Oak Ridge National Lab., TN (United States). [1995]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1995 National heat transfer conference; Portland, OR (United States); 5-9 Aug 1995. Order Number DE95007407. Source: OSTI; NTIS; INIS; GPO Dep.

The Nitrate to Ammonia and Ceramic (NAC) process is an innovative technology for immobilizing the liquid from Low Level radioactive Waste (LLW). An experimental study was conducted to measure the rheological properties of the pipe flow of the NAC product slurry. Test results indicate that the NAC product slurry has a profound rheological behavior. At low solids concentration, the slurry exhibits a typical dilatant fluid (or shear thinning)fluid. The transition from dilatant fluid to pseudo-plastic fluid will occur at between 25% to 30% solids concentration in temperature ranges of 50–80°C. Correlation equations are developed based on the test data.

702 (CONF-950828–25) **Convective heat transfer behavior of the product slurry of the nitrate to ammonia and ceramic (NAC) process.** Muguercia, I. (Florida International Univ., Miami, FL (United States). Dept. of Mechanical Engineering); Yang, G.; Ebadian, M.A.; Lee, D.D.; Mattus, A.J.; Hunt, R.D. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1995 National heat transfer conference; Portland, OR (United States); 5-9 Aug 1995. Order Number DE96003049. Source: OSTI; NTIS; INIS; GPO Dep.

The Nitrate to Ammonia and Ceramic (NAC) process is an innovative technology for immobilizing liquid form low level radioactive waste (LLW). An experimental study has been conducted to measure the heat transfer properties of the NAC product slurry. The results indicate that the heat transfer coefficient for both concentration slurries is much higher than that of pure water, which may be due to the higher conductivity of the gibbsite powder. For the 20% concentration slurry, the heat transfer coefficient increased as the generalized Reynolds number and slurry temperature increased. The heat transfer coefficient of 40% is a function of the Reynolds number only. The test results also indicate that the thermal entrance region can be observed only when the generalized Reynolds number is smaller than 1,000. The correlation equation is also developed based on the experimental data in this paper.

703 (CONF-950868–40) **A rational approach for evaluation and screening of treatment and disposal options for the solar pond sludges at Rocky Flats.** Dickerson, K.S. Oak Ridge National Lab., TN (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From ER '95: environmental remediation conference: committed to results; Denver, CO (United States); 13-18 Aug 1995. Order Number DE96005460. Source: OSTI; NTIS; INIS; GPO Dep.

This document consists of information about the treatment options for the sludge that is located in the evaporation ponds at the Rocky Flats Plant. The sludges are mixed low-level radioactive wastes whose composition and character were variable. Sludges similar to these are typically treated prior to ultimate disposal. Disposal of treated sludges includes both on-site and off-site options. The rational approach described in this paper is useful for technology evaluation and screening because it provides a format for developing objectives, listing alternatives, and weighing the alternatives against the objectives and against each other.

704 (CONF-9509377–Exc.) **Low-Level Waste (LLW) forum meeting report.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low-level radioactive waste forum; Salt Lake City, UT (United States); 26-28 Sep 1995. Order Number DE96013269. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level Radioactive Waste Forum (LLW Forum) is an association of state and compact representatives, appointed by governors and compact commissions, established to facilitate state and compact implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The LLW Forum provides an opportunity for state and compact officials to share information with one another and to exchange views with officials of federal agencies and other interested parties.

705 (CONF-9510319–1) **National procurement of private-sector treatment for U.S. Department of Energy mixed low-level wastes.** Berry, J.B. (Oak Ridge National Lab., TN (United States)); Jones, D.W.; Seeker, W.R.; Alex, L.J. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 11. annual model conference; Oak Ridge, TN (United States); 16-18 Oct 1995. Order Number DE96005733. Source: OSTI; NTIS; INIS; GPO Dep.

The cost of bringing DOE into compliance with the Federal Facilities Compliance Act may be dramatically reduced if the private sector treats DOE mixed low level waste. If the DOE clearly defines this market by using national procurement contracts, the private sector will be able to decide if investing in DOE waste treatment contracts is good business. DOE can structure the mixed waste treatment market to influence the profitability of the contracts and to influence the quality of private sector responses. National procurement contracts will incorporate advice from the private sector so that issues of concern to industry are adequately incorporated.

706 (CONF-951209–) **Proceedings: 17th annual US Department of Energy low-level radioactive waste management conference.** Lake, D. (ed.). Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 480p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From 17. low-level radioactive waste management conference; Phoenix, AZ (United States); 12-14 Dec 1995. Order Number DE96005882. Source: OSTI; NTIS; INIS; GPO Dep.

Proceedings includes 4 diskettes designed to run on IBM PC compatible equipment.

Selected papers have been processed separately for inclusion in the Energy Science and Technology database. Also included are four 3.5' discs that are to accompany the report.

707 (CONF-951209–9) **Recent improvements to the SOURCE1 and SOURCE2 computer codes.** Icenhour, A.S.; Tharp, M.L. Oak Ridge National Lab., TN (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 17. low-level radioactive waste management conference; Phoenix, AZ (United States); 12-14 Dec 1995. Order Number DE96005645. Source: OSTI; NTIS; INIS; GPO Dep.

Performance assessments of low-level radioactive waste (LLW) disposal facilities often involve the use of computer codes to describe radionuclide releases from a waste form and the subsequent transport of radionuclides through the environment. The SOURCE1 and SOURCE2 computer codes are used to calculate radionuclide release rates (i.e., source terms) for LLW disposal facilities. These codes have been used to evaluate the source terms for Oak Ridge National Laboratory performance assessments. SOURCE1 is applicable to tumulus-type facilities, while SOURCE2 can be applied to silo, well-in-silo, well, and trench-type facilities. In addition to the calculation of radionuclide release rates, both SOURCE1 and SOURCE2 calculate the degradation of engineered barriers. This paper provides an overview of these codes and a description of recent improvements to the codes. Major improvements include incorporation of a new advective transport model into SOURCE1 and SOURCE2, development of a new model for SOURCE1 that calculates the degradation and failure of the tumulus pad and leachate collection system, improvement of routines for controlling water infiltration inputs, expansion of options for obtaining output summaries, and restructuring of SOURCE1 and SOURCE2 for sensitivity and uncertainty analyses. The status of code verification efforts is also presented.

708 (CONF-951209–10) **Analysis of operating costs a Low-Level Mixed Waste Incineration Facility.** Loghry, S.L.; Salmon, R.; Hermes, W.H. Oak Ridge National Lab., TN (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 17. low-level radioactive waste management conference; Phoenix, AZ (United States); 12-14 Dec 1995. Order Number DE96005554. Source: OSTI; NTIS; INIS; GPO Dep.

By definition, mixed wastes contain both chemically hazardous and radioactive components. These components make the treatment and disposal of mixed wastes expensive and highly complex issues because the different regulations which pertain to the two classes of contaminants frequently conflict. One method to dispose of low-level mixed wastes (LLMWs) is by incineration, which volatizes and destroys the organic (and other) hazardous contaminants and also greatly reduces the waste volume. The US Department of Energy currently incinerates liquid LLMW in its Toxic Substances Control Act (TSCA) Incinerator, located at the K-25 Site in Oak Ridge, Tennessee. This incinerator has been fully permitted since 1991 and to date has treated approximately 7×10^6 kg of liquid LLMW. This paper presents an analysis of the budgeted operating costs by category (e.g., maintenance, plant operations, sampling and analysis, and utilities) for fiscal year 1994 based on actual operating experience (i.e., a "bottoms-up" budget). These costs provide benchmarking guidelines which could be used in comparing incinerator operating costs with those of other technologies designed to dispose of liquid LLMW. A discussion of the current upgrade status and future activities are included in this paper. Capital costs are not addressed.

709 (CONF-960110–1) **Operating limit evaluation for disposal of uranium enrichment plant wastes.** Lee, D.W.; Kocher, D.C.; Wang, J.C. Oak Ridge National Lab., TN (United States). [1996]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 29. midyear topical meeting of the Health Physics Society: naturally occuring and accelerator produced radioactive material - regulation and risk assessment; Scottsdale, AZ (United States); 7-10 Jan 1996. Order Number DE96004924. Source: OSTI; NTIS; INIS; GPO Dep.

A proposed solid waste landfill at Paducah Gaseous Diffusion Plant (PGDP) will accept wastes generated during normal plant operations that are considered to be non-radioactive. However, nearly all solid waste from any source or facility contains small amounts of radioactive material, due to the presence in most materials of trace quantities of such naturally occurring radionuclides as uranium and thorium. This paper describes an evaluation of operating limits, which are protective of public health and the environment, that would allow waste materials containing small amounts of radioactive material to be sent to a new solid waste landfill at PGDP. The operating limits are expressed as limits on concentrations of radionuclides in waste materials that could be sent to the landfill based on a site-specific analysis of the performance of the facility. These limits are advantageous to PGDP and DOE for several reasons. Most importantly, substantial cost savings in the management of waste is achieved. In addition, certain liabilities that could result from shipment of wastes to a commercial off-site solid waste landfill are avoided. Finally, assurance that disposal operations at the PGDP landfill are protective of public health and the environment is provided by establishing verifiable operating limits for small amounts of radioactive material; rather than relying solely on administrative controls. The operating limit determined in this study has been presented to the Commonwealth of Kentucky and accepted as a condition to be attached to the operating permit for the solid waste landfill.

710 (CONF-960212–74) **Effective use of risk assessments and the public comment process to achieve acceptable remediation goals for mercury-contaminated sites.** Miller, J.Q.; Barnett, M. Lockheed Martin Energy Systems, Inc., Oak Ridge, TN (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment; Tucson, AZ (United States); 25-29 Feb 1996. Order Number DE96008680. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of recalculating risk levels using new information, the remediation goals and cleanup strategy for the Lower East Fork Poplar Creek floodplains have been significantly changed to reflect an important reduction in cleanup costs while ensuring protectionof human health and the environment. This project and its stakeholders have made the risk assessment more effective by better defining the contaminant and adjusting assessment parameters. As a result, the remediation goal initially set at 50 ppM Hg has been changed to 400 ppM, resulting in significant reductions in both the destruction of the floodplain landscape and project costs. Volume of soils to be excavated has been decreased from 1 million cubic yards to 25,000 cubic yards, and the cost has been reduced from about $1 billion to less than $20 million. The Record of Decision for Lower East Fork Poplar Creek was approved in August 1995.

711 (CONF-960271–5) **Treatment of spent electropolishing solution for removal of cobalt-60.** Taylor, P.A.; Youngblood, E.L.; Macon, R.J. Oak Ridge National Lab., TN (United States). Feb 1996. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From American Institute of Chemical Engineers (AIChE) spring meeting; New Orleans, LA (United States); 26-29 Feb 1996. Order Number DE96006725. Source: OSTI; NTIS; INIS; GPO Dep.

The Irradiated Materials Examination and Testing (IMET) Facility at Oak Ridge National Laboratory electropolishes various types of irradiated metal specimens prior to examination of metallurgical and mechanical properties. The standard electropolishing solution used at IMET for most specimens consists of a 7:1 methanol/sulfuric acid mixture, with smaller amounts of a 3:1 methanol/nitric acid solution and a 10:6:1 methanol/2-butoxyethanol/perchloric acid solution also being used. Cobalt-60 is the primary source of gamma radiation in the spent solutions, with lesser amounts from manganese-54 and iron-59. A treatment method is needed to remove most of the Co-60 from these solutions to allow the waste solutions to be contact-handled for disposal. A wide range of adsorbents was tested for removing cobalt from the electropolishing solutions. No adsorbent was found that would treat full strength solution, but a complexing ion exchange resin (Chelex 100, BioRad Labs, or Amberlite IRC-718, Rohm and Haas Co.) will remove cobalt and other heavy metals from partially neutralized (pH=3) solution. A 5 wt% sodium hydroxide solution is used for pH adjustment, since more concentrated caustic caused sodium sulfate precipitates to form. Lab-scale column tests have shown that about 10 bed volumes of methanol/sulfuric acid solution, 30 bed volumes of methanol/nitric acid solution or 15 bed volumes of methanol/2-butoxyethanol/perchloric acid solution can be treated prior to initial Co-60 breakthrough.

712 (CONF-9602110–Summ.) **LLW Forum meeting report, February 13–16, 1996.** Afton Associates, Inc., Washington, DC (United States). [1996]. 57p. Sponsored by USDOE, Washington, DC (United States). From Low level radioactive waste meeting; San Diego, CA (United States); 13-16 Feb 1996. Order Number DE96013268. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level Radioactive Waste Forum (LLW Forum) is an association of state and compact representatives, appointed by governors and compact commissions, established to facilitate state and compact implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The LLW forum provides an opportunity for state and compact officials to share information with one another and to exchange views with officials of federal agencies and other interested parties. This report details activities at the meeting held February 13-16, 1996.

713 (CONF-9603137–2) **An experimental investigation of the reaction of hydrogen chloride with lead oxide under simulated hazardous waste incineration conditions.** Shor, J.T. (Oak Ridge National Lab., TN (United States)); Frazier, G.C. Oak Ridge National Lab., TN (United States). 1996. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Western States section meeting; Tempe, AZ (United States); 11-12 Mar 1996. Order Number DE96008664. Source: OSTI; NTIS; GPO Dep.

To simulate the behavior of lead during hazardous waste incineration, pellets of sintered lead oxide were treated with hydrogen chloride at concentrations of 2000 and 4000 ppm in air in a laboratory tube furnace. The chemical reaction kinetics and mass transfer properties of the solid-gas and solid-liquid reactions were examined at temperatures between 260 and 680°C. Lead dichloride was found to form and became more volatile at elevated temperatures. At temperatures above 300°C, chemical reaction kinetic limitations were absent and mass transfer resistance in the developing liquid lead oxide, lead dichloride eutectic phases were controlling. Above 590°C, a curious anomaly occurred: The observed global reaction rate appeared to increase slightly while the volatilization of lead dichloride dropped during the initial stages of the reaction. A thick film of a lead oxychloride compound was found which displayed low lead dichloride activity. Below 590°C, a different lead oxychloride compound was identified by x-ray diffraction in which lead dichloride activity was high, and this compound was much more volatile than the oxychloride formed above 5900°C.

714 (CONF-9605200–Summ.) **LLW Forum meeting report.** Afton Associates, Inc., Washington, DC (United States). [1996]. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. From Low level radioactive waste forum meeting; Annapolis, MD (United States); 29-31 May 1996. Order Number DE96013267. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the Low-Level Radioactive Waste Forum (LLW Forum) meeting on May 29 through May 31, 1996.The LLW Forum is an association of state and compact representatives, appointed by governors and compact commissions, established to facilitate state and compact implementation of the Low-Level Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The LLW forum provides an opportunity for state and compact officials to share information with one another and to exchange views with officials of federal agencies and other interested parties.

715 (CONF-9606125–4) **An exposure assessment of radionuclide emissions associated with potential mixed-low level waste disposal facilities at fifteen DOE sites.** Lombardi, D.A.; Socolof, M.L. Oak Ridge National Lab., TN (United States). [1996]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From Air and Waste Management (AWM) annual meeting; Nashville, TN (United States); 23-28 Jun 1996. Order Number DE96008619. Source: OSTI; NTIS; INIS; GPO Dep.

A screening method was developed to compare the doses received via the atmospheric pathway at 15 potential DOE MLLW (mixed low-level waste) sites. Permissible waste concentrations were back calculated using the radioactivity NESHAP (National Emissions Standards for Hazardous Air Pollutants) in 40 FR 61 (DOE Order 5820.2A performance objective). Site-specific soil and meteorological data were used to determine permissible waste concentrations (PORK). For a particular radionuclide, perks for each site do not vary by more than one order of magnitude. perks of ^{14}C are about six orders of magnitude more restrictive than perks of ^{3}H because of differences in liquid/vapor partitioning, decay, and exposure dose. When comparing results from the atmospheric pathway to the water and intruder pathways, ^{14}C disposal concentrations were limited by the atmospheric pathway for most arid sites; for ^{3}H, the atmospheric pathway was not limiting at any of the sites. Results of this performance evaluation process are to be used for planning for siting of disposal facilities.

716 (CONF-960741–2) **Applying a life cycle decision methodology to Fernald waste management alternatives.** Yuracko, K.L. (Oak Ridge National Lab., TN (United States)); Gresalfi, M.; Yerace, P. Oak Ridge National Lab., TN (United States). 1996. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From Pollution prevention conference; Chicago, IL (United States); 9-11 Jul 1996. Order Number DE96011932. Source: OSTI; NTIS; INIS; GPO Dep.

During the past five years, a number of U.S. Department of Energy (DOE) funded efforts have demonstrated the technical efficacy of converting various forms of radioactive scrap metal (RSM) into useable products. From the development of large accelerator shielding blocks, to the construction of low-level waste containers, technology has been applied to this fabrication process in a safe and stakeholder supported manner. The potential health and safety risks to both workers and the public have been addressed. The question remains: can products be fabricated from RSM in a cost efficient and market competitive manner? This paper presents a methodology for use within DOE to evaluate the costs and benefits of recycling and reusing some RSM, rather than disposing of this RSM in an approved burial site. This life cycle decision methodology, developed by both the Oak Ridge National Laboratory (ORNL) and DOE Fernald, is the focus of the following analysis.

717 (CONF-960804–10) **Fernald's dilemma: Do we recycle the radioactively contaminated metals, or do we bury them?.** Yuracko, K.L. (and others); Hadley, S.W.; Perlack, R.D. Oak Ridge National Lab., TN (United States). 1996. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From SPECTRUM '96: international conference on nuclear and hazardous waste management; Seattle, WA (United States); 18-23 Aug 1996. Order Number DE96009396. Source: OSTI; NTIS; INIS; GPO Dep.

718 (DOE/EIS–0200-D-Summ.) **Draft Waste Management Programmatic Environmental Impact Statement for managing treatment, storage, and disposal of radioactive and hazardous waste. Summary.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Aug 1995. 70p. Sponsored by

USDOE, Washington, DC (United States). Order Number DE95017564. Source: OSTI; NTIS; INIS; GPO Dep.

This is a summary of the Draft klaste Management Programmatic Environmental Impact Statement, which has been prepared in accordance with the National Environmental Policy Act to evaluate management and siting alternatives for the treatment, storage and/or disposal of five types of radioactive and/or hazardous wastes. These waste types are: low-level radioactive waste; low-level mixed (with hazardous components) waste; transuranic waste; high-level radioactive waste; an hazardous waste. The alternatives were evaluated for waste stored, buried or to be generated from future operations over the next 20 years at 54 sites. For each waste type, the analyses contained in this document examined the potential health and environmental impacts of integrated waste management program alternatives involving multiple sites, as well as the potential cumulative impacts.

719 (DOE/EIS–0200-D-Vol.1) **Draft Waste Management Programmatic Environmental Impact Statement for managing treatment, storage, and disposal of radioactive and hazardous waste. Volume 1.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Aug 1995. 600p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95017608. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Waste Management Programmatic Environmental Impact Statement (WM PEIS) is to provide environmental input for the Department of Energy's (DOE) proposed action of identifying future configurations for selected waste management facilities. Each future configuration considered is based on a different waste type. These include: low-level mixed waste, low-level waste, transuranic waste, high-level waste, and hazardous waste. The selected waste management facilities being considered for these different waste types are treatment and disposal facilities for low-level mixed waste; treatment and disposal facilities for low-level waste; treatment and storage facilities for transuranic waste in the event that treatment is required before disposal; storage facilities for treated (vitrified) high-level waste canisters; and treatment of nonwastewater hazardous waste by DOE and commercial vendors. In addition to the no action alternative, which includes only existing or approved waste management facilities, the alternatives evaluated in this PEIS for each of the waste type configurations include decentralized, regionalized, and centralized alternatives for using existing and operating new waste management facilities. The evaluation of environmental consequences in this PEIS includes the cumulative impacts of combining future configurations for the five waste types and analyzed the collective impacts of other past, present, and reasonably foreseeable future activities. Other issues associated with implementing the proposed action are also discussed. Discussion of these issues is included to provide further understanding of the decisions to be reached and to provide the opportunity for public input on improving DOE's Environmental Management Program.

720 (DOE/EIS–0200-D-Vol.2) **Draft Waste Management Programmatic Environmental Impact Statement for managing treatment, storage, and disposal of radioactive and hazardous waste. Volume 2, Site data tables.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Aug 1995. 400p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95017609. Source: OSTI; NTIS; INIS; GPO Dep.

Volume 2 is an integral part of the Office of Environmental Managements (EM's) Waste Management Programmatic Environmental Impact Statement (WM PEIS), which portrays the impacts of EM's waste management activities at each of the 17 major DOE sites evaluated in the WM PEIS. Impacts are displayed for each of the 17 major sites in tabular form as a complement to the impact discussions in waste-type Chapters 6 through 10. The chapters present background information on each waste type, volume data, existing capacities for managing the wastes, and assumptions used in the waste-type analysis. Readers should refer to these chapters and to Chapter 5, "Impact Analysis Methodologies," for a more thorough discussion of the methodologies, assumptions and definitions associated with these impacts. A synopsis of key definitions and assumptions is also presented at the rear of this introductory section.

721 (DOE/EIS–0200-D-Vol.3) **Draft Waste Management Programmatic Environmental Impact Statement for managing treatment, storage, and disposal of radioactive and hazardous waste. Volume 3, Appendix A: Public response to revised NOI, Appendix B: Environmental restoration, Appendix C, Environmental impact analysis methods, Appendix D, Risk.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Aug 1995. 600p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95017610. Source: OSTI; NTIS; INIS; GPO Dep.

Volume three contains appendices for the following: Public comments do DOE's proposed revisions to the scope of the waste management programmatic environmental impact statement; Environmental restoration sensitivity analysis; Environmental impacts analysis methods; and Waste management facility human health risk estimates.

722 (DOE/EIS–0200-D-Vol.4) **Draft Waste Management Programmatic Environmental Impact Statement for managing treatment, storage, and disposal of radioactive and hazardous waste. Volume 4, Appendix E: Transportation, Appendix F: Accidents, Appendix G: Waste minimization, Appendix H: Technology development, Appendix I: Minority and low-income population distribution.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Aug 1995. 250p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95017611. Source: OSTI; NTIS; INIS; GPO Dep.

Volume four contains appendices for the following: radioactive and hazardous waste transportation risk assessments; treatment and storage facility accidents; waste minimization; technology development; and distribution of minority and low-income populations at the 17 major waste management sites.

723 (DOE/EM–0251) **Landfill stabilization focus area: Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of the Deputy Assistant Secretary for Technology Development. Jun 1995. 166p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016176. Source: OSTI; NTIS; INIS; GPO Dep.

Landfills within the DOE Complex as of 1990 are estimated to contain 3 million cubic meters of buried waste. The DOE facilities where the waste is predominantly located are at Hanford, the Savannah River Site (SRS), the Idaho National Engineering Laboratory (INEL), the Los Alamos National Laboratory (LANL), the Oak Ridge Reservation (ORR), the Nevada Test Site (NTS), and the Rocky Flats Plant (RFP). Landfills include buried waste, whether on pads or in trenches, sumps, ponds, pits, cribs, heaps and piles, auger holes, caissons, and sanitary landfills. Approximately half of all DOE buried waste was disposed of before 1970. Disposal regulations at that time permitted the commingling of various types of waste (i.e., transuranic, low-level radioactive, hazardous). As a result, much of the buried waste throughout the DOE Complex is presently believed to be contaminated with both hazardous and radioactive materials. DOE buried waste typically includes transuranic-contaminated radioactive waste (TRU), low-level radioactive waste (LLW), hazardous waste per 40 CFR 26 1, greater-than-class-C waste per CFR 61 55 (GTCC), mixed TRU waste, and mixed LLW. The mission of the Landfill Stabilization Focus Area is to develop, demonstrate, and deliver safer,more cost-effective and efficient technologies which satisfy DOE site needs for the remediation and management of landfills. The LSFA is structured into five technology areas to meet the landfill remediation and management needs across the DOE complex. These technology areas are: assessment, retrieval, treatment, containment, and stabilization. Technical tasks in each of these areas are reviewed.

724 (DOE/EM–0252) **Mixed waste characterization, treatment, and disposal focus area. Technology summary.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. Jun 1995. 116p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016003. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents details about the technology development programs of the Department of Energy. In this document, waste characterization, thermal treatment processes, non-thermal treatment processes, effluent monitors and controls, development of on-site innovative technologies, and DOE business opportunities are applied to environmental restoration. The focus areas for research are: contaminant plume containment and remediation; mixed waste characterization, treatment, and disposal; high-level waste tank remediation; landfill stabilization; and decontamination and decommissioning.

725 (DOE/EM–0262) **Depleted uranium: A DOE management guide.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Oct 1995. 15p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96002432. Source: OSTI; INIS; NTIS; GPO Dep.

The U.S. Department of Energy (DOE) has a management challenge and financial liability in the form of 50,000 cylinders containing 555,000 metric tons of depleted uranium hexafluoride (UF_6) that are stored at the gaseous diffusion plants. The annual storage and maintenance cost is approximately $10 million. This report summarizes several studies undertaken by the DOE Office of Technology Development (OTD) to evaluate options for long-term depleted uranium management. Based on studies conducted to date, the most likely use of the depleted uranium is for shielding of spent nuclear fuel (SNF) or vitrified high-level waste (HLW) containers. The alternative to finding a use for the depleted uranium is disposal as a radioactive waste. Estimated disposal costs, utilizing existing technologies, range between $3.8 and $11.3 billion, depending on factors such as applicability of the Resource Conservation and Recovery Act (RCRA) and the location of the disposal site. The cost of recycling the depleted uranium in a concrete based shielding in SNF/HLW containers, although substantial, is comparable to or less than the cost of disposal. Consequently, the case can be made that if DOE invests in developing depleted uranium shielded containers instead of disposal, a long-term solution to the UF_6 problem is attained at comparable or lower cost than disposal as a waste. Two concepts for depleted uranium storage casks were considered in these studies. The first is based on standard fabrication concepts previously developed for depleted uranium metal. The second converts the UF_6 to an oxide aggregate that is used in concrete to make dry storage casks.

726 (DOE/EM–0268) **Integrated Thermal Treatment Systems study: US Department of Energy Internal Review Panel report.** Cudahy, J. (and others); Escarda, T.; Gimpel, R. USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of the Deputy Assistant Secretary for Technology Development. Apr 1995. 96p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96010685. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy's (DOE) Office of Technology Development (OTD) commissioned two studies to uniformly evaluate nineteen thermal treatment technologies. These studies were called the Integrated Thermal Treatment System (ITTS) Phase I and Phase II. With the advice and guidance of the DOE Office of Environmental Management's (EM's) Mixed Waste Focus Group, OTD formed an ITTS Internal Review Panel, composed of scientists and engineers from throughout the DOE complex, the U.S. Environmental Protection Agency (EPA), the California EPA, and private experts. The Panel met from November 15-18, 1994, to review and comment on the ITTS studies, to make recommendations on the most promising thermal treatment systems for DOE mixed low level wastes (MLLW), and to make recommendations on research and development necessary to prove the performance of the technologies on MLLW.

727 (DOE/EM–0268-96003365) **Integrated thermal treatment systems study. Internal review panel report.** Cudahy, J. (and others); Escarda, T.; Gimpel, R. USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Apr 1995. 95p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96003365. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) Office of Technology Development (OTD) commissioned two studies to evaluate nineteen thermal treatment technologies for treatment of DOE mixed low-level waste. These studies were called the Integrated Thermal Treatment System (ITTS) Phase I and Phase II. With the help of the DOE Office of Environmental Management (EM) Mixed Waste Focus Group, OTD formed an ITTS Internal Review Panel to review and comment on the ITTS studies. This Panel was composed of scientists and engineers from throughout the DOE complex, the U.S. Environmental Protection Agency, the California EPA, and private experts. The Panel met from November 15-18, 1994 to review the ITTS studies and to make recommendations on the most promising thermal treatment systems for DOE mixed low-level wastes and on research and development necessary to prove the performance of the technologies. This report describes the findings and presents the recommendations of the Panel.

728 (DOE/EM–0277) **1994 annual report on low-level radioactive waste management progress.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Apr 1995. 123p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96008370. Source: OSTI; NTIS; INIS; GPO Dep.

This report for calendar year 1994 summarizes the progress that states and compact regions made during the year in establishing new low-level radioactive waste disposal facilities. Although events that have occurred in 1995 greatly alter the perspective in terms of storage versus disposal, the purpose of this report is to convey the concerns as evidenced during calendar year 1994. Significant developments occurring in 1995 are briefly outlined in the transmittal letter and will be detailed in the report for calendar year 1995. The report also provides summary information on the volume of low-level radioactive waste received for disposal in 1994 by commercially operated low-level radioactive waste disposal facilities, and is prepared is in response to Section 7(b) of Title I of Public Law 99-240, the Low-Level Radioactive Waste Policy Amendments Act of 1985.

729 (DOE/EM–0280-Vol.1) **Complex-wide review of DOE's Low-Level Waste Management ES&H vulnerabilities. Volume I. Final report.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). May 1996. 67p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96011889. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) conducted a comprehensive complex-wide review of its management of low-level waste (LLW) and the radioactive component of mixed low-level waste (MLLW). This review was conducted in response to a recommendation from the Defense Nuclear Facilities Safety Board (DNFSB) which was established and authorized by Congress to oversee DOE. The DNFSB's recommendation concerning conformance with safety standards at DOE LLW sites was issued on September 8, 1994 and is referred to as Recommendation 94-2. DOE's Implementation Plan for its response to Recommendation 94-2 was submitted to the DNFSB on March 31, 1995. The DNFSB recommended that a complex-wide review of DOE's LLW management be initiated. The goal of the complex-wide review of DOE's LLW management system was to identify both programmatic and physical vulnerabilities that could lead to unnecessary radiation exposure of workers or the public or unnecessary releases of radioactive materials to the environment. Additionally, the DNFSB stated that an objective of the complex-wide review should be to establish the dimensions of the DOE LLW problem and support the identification of corrective actions to address safe disposition of past, present, and future volumes of LLW. The complex-wide review involved an evaluation of LLW management activities at 38 DOE facilities at 36 sites that actively manage LLW and MLLW.

730 (DOE/EM–0280-Vol.2) **Complex-wide review of DOE's Low-Level Waste Management ES&H vulnerabilities. Volume II. Final report.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). May 1996. 77p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96011890. Source: OSTI; NTIS; INIS; GPO Dep.

Volume I of this report presents a summary of DOE's complex-wide review of its low-level waste management system, including the assessment scope and methodology, site-specific and complex-wide vulnerabilities, and DOE's conclusions and recommendations. Volume II presents a more detailed discussion of the assessment methodology and evaluation instruments developed by the Assessment Working Group for identifying site-specific vulnerabilities, categorizing and classifying vulnerabilities, and identifying and analyzing complex-wide vulnerabilities. Attachments A and B of this volume contain, respectively, the Site Evaluation Survey and the Vulnerability Assessment Form used in those processes. Volume III contains the site-specific assessment reports for the 36 sites (38 facilities) assessed in the complex-wide review from which the complex-wide vulnerabilities were drawn.

731 (DOE/EM–0280-Vol.3) **Complex-wide review of DOE's low-level waste management ES&H vulnerabilities. Volume III. Final report.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). May 1996. 479p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96011891. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) conducted a comprehensive complex-wide review of the environment, safety, and health (ES&H) vulnerabilities associated with its management of low-level waste (LLW) and the radioactive component of mixed low-level waste (MLLW). This review was conducted in response to a recommendation from the Defense Nuclear Facilities Safety Board (DNFSB). The DNFSB's recommendation concerning conformance with safety standards at DOE LLW sites was issued on September 8, 1994 and is referred to as Recommendation 94-2. DOE submitted an Implementation Plan for its response to Recommendation 94-2 to the DNFSB on March 31, 1995. DOE has conducted this complex-wide review in accordance with that Implementation Plan and subsequent revisions. Among its conclusions and recommendations, the DNFSB recommended that a complex-wide review of LLW management, similar to that conducted by DOE for spent nuclear fuel, be initiated. As with the Spent Nuclear Fuel assessment and other recent vulnerability assessments conducted by DOE, the goal of the complex-wide review of DOE's LLW management system was to identify vulnerabilities that could lead to unnecessary radiation exposure of workers or the public or unnecessary releases of radioactive materials to the environment. Additionally, the DNFSB stated that an objective of the complex-wide review should be to establish the dimensions of the DOE LLW problem and support the identification of corrective actions to address safe disposition of past, present, and future volumes of LLW.

732 (DOE/EM–0280-Vol.3-App.) **Complex-wide review of DOE's Low-Level Waste Management ES&H vulnerabilities. Volume III appendices. Final report.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). May 1996. 298p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96011892. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) conducted a comprehensive complex-wide review of the environment, safety, and health (ES&H) vulnerabilities associated with its management of low-level waste (LLW) and the radioactive component of mixed low-level waste (MLLW). This review was conducted in response to a recommendation from the Defense Nuclear Facilities Safety Board (DNFSB). The DNFSB's recommendation concerning conformance with safety standards at DOE LLW sites was issued on September 8, 1994 and is referred to as Recommendation 94-2. DOE submitted an Implementation Plan for its response to Recommendation 94-2 to the DNFSB on March 31, 1995. DOE has conducted this complex-wide review in accordance with that Implementation Plan and subsequent revisions. Among its conclusions and recommendations, the DNFSB recommended that a complex-wide review of LLW management, similar to that conducted by DOE for spent nuclear fuel, be initiated. This document contains the Volume III Appendices.

733 (DOE/EM–0281) **Overview of non-thermal mixed waste treatment technologies: Treatment of mixed waste (ex situ); Technologies and short descriptions.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Science and Technology. Jul 1995. 57p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96009146. Source: OSTI; NTIS; INIS; GPO Dep.

This compendium contains brief summaries of new and developing non- thermal treatment technologies that are candidates for treating hazardous or mixed (hazardous plus low-level radioactive) wastes. It is written to be all-encompassing, sometimes including concepts that presently constitute little more than informed "ideas". It bounds the universe of existing technologies being thought about or considered for application on the treatment of such wastes. This compendium is intended to be the very first step in a winnowing process to identify non-thermal treatment systems that can be fashioned into complete "cradle-to-grave" systems for study. The purpose of the subsequent systems paper studies is to investigate the cost and likely performance of such systems treating a representative sample of U.S. Department of Energy (DOE) mixed low level wastes (MLLW). The studies are called Integrated Non-thermal Treatment Systems (INTS) Studies and are being conducted by the Office of Science and Technology (OST) of the Environmental Management (EM) of the US Department of Energy. Similar studies on Integrated Thermal Treatment Systems have recently been published. These are not designed nor intended to be a "downselection" of such technologies; rather, they are simply a systems evaluation of the likely costs and performance of various non- thermal technologies that have been arranged into systems to treat sludges, organics, metals, soils, and debris prevalent in MLLW.

734 (DOE/EM–0282) **Description of recommended non-thermal mixed waste treatment technologies: Version 1.0.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of the Deputy Assistant Secretary for Technology Development. Aug 1995. 184p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96009149. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains description of the technologies selected for inclusions in the Integrated Nonthermal Treatment Systems (INTS) Study. The purpose of these descriptions is to provide a more complete description of the INTS technologies. It supplements the summary descriptions of candidate nonthermal technologies that were considered for the INTS.

735 (DOE/EM–0292) **Report to Congress: 1995 Annual report on low-level radioactive waste management progress.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Jun 1996. 38p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013349. Source: OSTI; NTIS; INIS; GPO Dep.

This report is prepared in response to the Low-Level Radioactive Waste Policy Act, Public Law 96-573, 1980, as amended by the Low-Level Radioactive Waste Policy Amendments Act of 1985, Public Law 99-240. The report summarizes the progress of states and compact regions during calendar year 1995 in establishing new disposal facilities for commercially-generated low-level radioactive waste. The report emphasizes significant issues and events that have affected progress, and also includes an introduction that provides background information and perspective on United States policy for low-level radioactive waste disposal.

736 (DOE/EM–0293) **Mixed waste characterization, treatment & disposal focus area.** USDOE Office of Science and Technology, Washington, DC (United States). Office of Program Analysis. Aug 1996. 126p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013523. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Mixed Waste Characterization, Treatment, and Disposal Focus Area (referred to as the Mixed Waste Focus Area or MWFA) is to provide treatment systems capable of treating DOE's mixed waste in partnership with users, and with continual participation of stakeholders, tribal governments, and regulators. The MWFA deals with the problem of eliminating mixed waste from current and future storage in the DOE complex. Mixed waste is waste that contains both hazardous chemical components, subject to the requirements of the Resource Conservation and Recovery Act (RCRA), and radioactive components, subject to the requirements of the Atomic Energy Act. The radioactive components include transuranic (TRU) and low-level waste (LLW). TRU waste primarily comes from the reprocessing of spent fuel and the use of plutonium in the fabrication of nuclear weapons. LLW includes radioactive waste other than uranium mill tailings, TRU, and high-level waste, including spent fuel.

737 (DOE/EW/50614–T1) **Technical evaluation report for the demonstration of radio frequency soil decontamination at Site S-1.** Lyon, C.R. (Halliburton NUS Environmental Corp., Oak Ridge, TN (United States)); Blanchard, C.F.; Whitt, L.H. Halliburton NUS Environmental Corp., Oak Ridge, TN (United States); Air Force Air Materiel Command, Kelly AFB, TX (United States). Apr 1995. 600p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI01-92EW50614. Order Number DE96001698. Source: OSTI; NTIS; GPO Dep.

The Air Force's Armstrong Laboratory at Tyndall Air Force Base, Florida, has supported the research and development of Radio Frequency Soil Decontamination. Radio frequency soil decontamination is essentially a heat-assisted soil vapor extraction process. Site S-1 at Kelly Air Force Base, San Antonio, Texas, was selected for the demonstration of two patented techniques. The site is a former sump that collected spills and surface run-off from a waste petroleum, oils, and lubricants and solvent storage and transfer area. In 1993, a technique developed by the IIT Research Institute using an array of electrodes placed in the soil was demonstrated. In 1994, a technique developed by KAI Technologies, Inc. using a single applicator placed in a vertical borehole was demonstrated. Approximately 120 tons of soil were heated during each demonstration to a temperature of about 150 degrees Celsius.

738 (DOE/EW/53023–T10) **Tulane/Xavier University Hazardous Materials in Aquatic Environments of the Mississippi River Basin. Quarterly progress report, January 1, 1995–March 31, 1995.** Tulane Univ., New Orleans, LA (United States). [1995]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-93EW53023. Order Number DE95011930. Source: OSTI; NTIS; INIS; GPO Dep.

This progress report covers activities for the period January 1 - March 31, 1995 on project concerning 'Hazardous Materials in Aquatic Environments of the Mississippi River Basin.' The following activities are each summarized by bullets denoting significant experiments/findings: biotic and abiotic studies on the biological fate, transport and ecotoxicity of toxic and hazardous waste in the Mississippi River Basin; assessment of mechanisms of metal-induced reproductive toxicity in quatic species as a biomarker of exposure; hazardous wastes in aquatic environments: biological uptake and metabolism studies; ecological sentinels of aquatic contamination in the lower Mississippi River system; bioremediation of selected contaminants in aquatic environments of the Mississippi River Basin; a sensitive rapid on-sit immunoassay for heavy metal contamination; pore-level flow, transport, agglomeration and reaction kinetics of microorganism; biomarkers of exposure and ecotoxicity in the Mississippi River Basin; natural and active chemical remediation of toxic metals, organics and radionuclides in the aquatic environment; expert geographical information systems for assessing hazardous wastes in aquatic environments; enhancement of environmental education; and a number of just initiated projects including fate and transport of contaminants in aquatic environments; photocatalytic remediation; radionuclide fate and modeling from Chernobyl.

739 (DOE/ID–10057(94)) **Idaho National Engineering Laboratory nonradiological waste management information for 1994 and record to date.** French, D.L.; Lisee, D.J.; Taylor, K.A. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Aug 1995. 170p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002209. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides detailed data and graphics on airborne and liquid effluent releases, fuel oil and coal consumption, water usage, and hazardous and mixed waste generated for calendar year 1994. This report summarizes industrial waste data records compiled since 1971 for the Idaho National Engineering Laboratory (INEL). The data presented are from the INEL Nonradiological Waste Management Information System.

740 (DOE/ID–10512) **Department of Energy Idaho Operations Office evaluation of feasibility studies for private sector treatment of alpha and TRU mixed wastes.** EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1995. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002208. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory (INEL) is currently storing a large quantity of alpha contaminated mixed low level waste which will require treatment prior to disposal. The DOE Idaho Operations Office (DOE-ID) recognized that current knowledge and funding were insufficient to directly pursue services for the requisite treatment. Therefore, it was decided that private sector studies would be funded to clarify cost, regulatory, technology, and contractual issues associated with procuring treatment services. This report analyzes the three private sector studies procured and recommends a path forward for DOE in procuring retrieval, assay, characterization, and treatment services for INEL transuranic and alpha contaminated mixed low level waste. This report was prepared by a team of subject matter experts from the INEL referred to as the DOE-ID Evaluation Team.

741 (DOE/ID–10521/1) **Performance evaluation of the technical capabilities of DOE sites for disposal of mixed low-level waste. Volume 1: Executive summary.** Sandia National Labs., Albuquerque, NM (United States). Mar 1996. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–96-0721/1). Order Number DE96009068. Source: OSTI; NTIS; INIS; GPO Dep.

A team of analysts designed and conducted a performance evaluation (PE) to estimate the technical capabilities of fifteen Department of Energy sites for disposal of mixed low-level waste (i.e., waste that contains both low-level radioactive materials and hazardous constituents). Volume 1 summarizes the process for selecting the fifteen sites, the methodology used in the evaluation, and the conclusions derived from the evaluation. Volume 1 is an executive summary both of the PE methodology and of the results obtained from the PEs. While this volume briefly reviews the scope and method of analyses, its main objective is to emphasize the important insights and conclusions derived from the conduct of the PEs. Volume 2 provides details about the site-selection process, the performance-evaluation methodology, and the overall results of the analysis. Volume 3 contains detailed evaluations of the fifteen sites and discussions of the results for each site.

742 (DOE/ID–10521/2) **Performance evaluation of the technical capabilities of DOE sites for disposal of mixed low-level waste. Volume 2: Technical basis and discussion of results.** Waters, R.D. (and others); Gruebel, M.M.; Hospelhorn, M.B. Sandia National Labs., Albuquerque, NM (United States). Mar 1996. 215p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–96-0721/2). Order Number DE96008580. Source: OSTI; NTIS; INIS; GPO Dep.

A team of analysts designed and conducted a performance evaluation to estimate the technical capabilities of fifteen Department of Energy sites for disposal of mixed low-level waste (i.e., waste that contains both low-level radioactive materials and hazardous constituents). Volume 1 summarizes the process for selecting the fifteen sites, the methodology used in the evaluation, and the conclusions derived from the evaluation. Volume 2 first describes the screening process used to determine the sites to be considered in the PEs. This volume then provides the technical details of the methodology for conducting the performance evaluations. It also provides a comparison and analysis of the overall results for all sites that were evaluated. Volume 3 contains detailed evaluations of the fifteen sites and discussions of the results for each site.

743 (DOE/ID–10521/3) **Performance evaluation of the technical capabilities of DOE sites for disposal of mixed low-level waste: Volume 3, Site evaluations.** Waters, R.D.; Gruebel, M.M. (eds.). Sandia National Labs., Albuquerque, NM (United States). Mar 1996. 750p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–96-0721/3). Order Number DE96009804. Source: OSTI; NTIS; INIS; GPO Dep.

A team of analysts designed and conducted a performance evaluation to estimate the technical capabilities of fifteen Department of Energy sites for disposal of mixed low-level waste (i.e., waste that contains both low-level radioactive materials and hazardous constituents). Volume 1 summarizes the process for selecting the fifteen sites, the methodology used in the evaluation, and the conclusions derived from the evaluation. Volume 2 provides details about the site-selection process, the performance-evaluation methodology, and the overall results of the analysis. Volume 3 contains detailed evaluations of the fifteen sites and discussion of the results for each site.

744 (DOE/ID–10524-Vol.1) **Mixed Waste Focus Area integrated technical baseline report, Phase 1: Volume 1.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 16 Jan 1996. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96007509. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) established the Mixed Waste Characterization, Treatment, and Disposal Focus Area (MWFA) to develop and facilitate implementation of technologies required to meet the Department's commitments for treatment of mixed low-level and transuranic wastes. The mission of the MWFA is to provide acceptable treatment systems, developed in partnership with users and with participation of stakeholders, tribal governments, and regulators, that are capable of treating DOE's mixed waste. These treatment systems include all necessary steps such as characterization, pretreatment, and disposal. To accomplish this mission, a technical baseline is being established that forms the basis for determining which technology development activities will be supported by the MWFA. The technical baseline is the prioritized list of deficiencies, and the resulting technology development activities needed to overcome these deficiencies. This document presents Phase I of the technical baseline development process, which resulted in the prioritized list of deficiencies that the MWFA will address. A summary of the data and the assumptions upon which this work was based is included, as well as information concerning the DOE Office of Environmental Management (EM) mixed waste technology development needs. The next phase in the technical baseline development process, Phase II, will result in the identification of technology development activities that will be conducted through the MWFA to resolve the identified deficiencies.

745 (DOE/ID–10524-Vol.2) **Mixed waste focus area integrated technical baseline report. Phase I, Volume 2: Revision 0.** Idaho National Engineering Lab., Idaho Falls, ID (United States). 16 Jan 1996. 360p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96007510. Source: OSTI; NTIS; INIS; GPO Dep.

This document (Volume 2) contains the Appendices A through J for the Mixed Waste Focus Area Integrated Technical Baseline Report Phase I for the Idaho National Engineering Laboratory. Included are: Waste Type Managers' Resumes, detailed information on wastewater, combustible organics, debris, unique waste, and inorganic homogeneous solids and soils, and waste data information. A detailed list of technology deficiencies and site needs identification is also provided.

746 (DOE/ID/12584–132) **Mixed-waste treatment – What about the residuals? A comparative analysis of MSO and incineration.** Oak Ridge National Lab., TN (United States); Rust Geotech, Inc., Grand Junction, CO (United States); USDOE Albuquerque Operations Office, NM (United States); USDOE Grand Junction Projects Office, CO (United States). Jun 1993. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86ID12584. (GJPO–114). Order Number DE96003843. Source: OSTI; NTIS; INIS; GPO Dep.

This report examines the issues concerning final waste forms, or residuals, that result from the treatment of mixed waste in molten salt oxidation (MSO) and incinerator systems. MSO is a technology with the potential to treat a certain segment of the waste streams at US Department of Energy (DOE) sites. MSO was compared with incineration because incineration is the best demonstrated available technology (BDAT) for the same waste streams. The Grand Junction Projects Office (GJPO) and Oak Ridge National Laboratory (ORNL) prepared this report for the DOE Office of Environmental Restoration (OER). The goals of this study are to objectively evaluate the anticipated residuals from MSO and incineration, examine regulatory issues for these final waste forms, and determine secondary treatment options. This report, developed to address concerns that MSO residuals present unique disposal difficulties, is part of a larger effort to successfully implement MSO as a treatment technology for mixed and hazardous waste. A Peer Review Panel reviewed the MSO technology in November 1991, and the implementation effort is ongoing under the guidance of the MSO Task Force.

747 (DOE/ID/12584–239) **Thermal desorption treatability test conducted with VAC*TRAX Unit.** Rust Geotech, Inc., Grand Junction, CO (United States). Jan 1996. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86ID12584. (GJPO-MWTP–05). Order Number DE96005952. Source: OSTI; NTIS; INIS; GPO Dep.

In 1992, Congress passed the Federal Facilities Compliance Act, requiring the U.S. Department of Energy (DOE) to treat and dispose of its mixed waste in accordance with Resource Conservation and Recovery Act (RCRA) treatment standards. In response to the need for mixed-waste treatment capacity, where off-site commercial treatment facilities do not exist or cannot be used, the DOE Albuquerque Operations Office (DOE-AL) organized a Treatment Selection Team to match mixed waste with treatment options and develop a strategy for treatment of mixed waste. DOE-AL manages nine sites with mixed-waste inventories. The Treatment Selection Team determined a need to develop mobile treatment units (MTUs) to treat waste at the sites where the wastes are generated. Treatment processes used for mixed wastes must remove the hazardous component (i.e., meet RCRA treatment standards) and contain the radioactive component in a form that will protect the worker, public, and environment. On the basis of the recommendations of the Treatment Selection Team, DOE-AL assigned projects to the sites to bring mixed-waste treatment capacity on-line. The three technologies assigned to the DOE Grand Junction Projects Office (DOE-GJPO) include thermal desorption (TD), evaporative oxidation, and waste water evaporation.

748 (DOE/ID/12584–263) **U.S. Department of Energy Grand Junction Projects Office site environmental report for calendar year 1995.** Rust Geotech, Inc., Grand Junction, CO (United States). May 1996. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86ID12584. (GJPO-ES–17). Order Number DE96013700. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents information pertaining to environmental activities conducted during calendar year 1995 at the US Department of Energy (DOE) Grand Junction Projects Office (GJPO) facility in Grand Junction, Colorado. Environmental activities conducted at the GJPO facility during 1995 were associated with mixed-waste treatment, site remediation, off-site dose modeling, and radiological and nonradiological monitoring. As part of the GJPO Mixed-Waste Treatment Program, on-site treatability studies were conducted in 1995 that made use of pilot-scale evaporative-oxidation and thermal-desorption units and bench-scale stabilization. DOE-GJPO used some of its own mixed-waste as well as samples received from other DOE sites for these treatability studies. These studies are expected to conclude in 1996. Removal of radiologically contaminated materials from GJPO facility buildings was conducted under the provisions of the Grand Junction Projects Office Remedial Action Project. Remediation activities included the removal of 394 metric tons of contaminated material from Buildings 18 and 28 and revegetation activities on the GJPO site; remediation was conducted in compliance with applicable permits.

749 (DOE/ID/12735–T36) **Projects at the Western Environmental Technology Office. Quarterly technical progress report, April 1–June 30, 1995.** MSE, Inc., Butte, MT (United States). [1995]. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88ID12735. (MSE–14). Order Number DE95016479. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains brief outlines of the multiple projects under the responsibility of the Western Environmental Technology Office in Butte Montana. These projects include biomass remediation, remediation of contaminated soils, mine waste technology, and several other types of remediation.

750 (DOE/ID/12735–T37) **Projects at the Western Environmental Technology Office. Quarterly technical progress report, July 1, 1995–September 30, 1995.** MSE, Inc., Butte, MT (United States). [1996]. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88ID12735. Order Number DE96004110. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this project is to demonstrate the technical and economic feasibility of commercializing a biotechnology that uses plants to remediate soils, sediments, surface waters, and groundwaters contaminated by heavy metals and radionuclides. This technology, known as phytoremediation, is particularly suited to remediation of soils or water where low levels of contaminants are widespread. Project objectives are to provide an accurate estimate of the capability and rate of phytoremediation for removal of contaminants of concern from soils and groundwaters at Department of Energy (DOE) sites and to develop data suitable for engineering design and economic feasibility evaluations, including methods for destruction or final disposition of plants containing contaminants of concern. The bioremediation systems being evaluated could be less expensive than soil removal and treatment systems, given the areal extent and topography of sites under consideration and the investment of energy and money in soil-moving and -treating processes. In situ technology may receive regulatory acceptance more easily than ex situ treatments requiring excavation, processing, and replacement of surface soils. In addition, phytoremediation may be viable for cleanup of contaminated waters, either as the primary treatment or the final polishing stage, depending on the contaminant concentrations and process economics considerations.

751 (DOE/ID/12735–T38) **Feasibility analysis of recycling radioactive scrap steel.** Nichols, F. (Manufacturing Sciences Corp., Woodland, WA (United States)); Balhiser, B.; Cignetti, N. MSE, Inc., Butte, MT (United States); Manufacturing Sciences Corp., Oak Ridge, TN (United States); Lockwood Greene Engineering, Oak Ridge, TN (United States); Centerline Engineering Corp., Wexford, PA (United States). Sep 1995. 170p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88ID12735. Order Number DE96004568. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study is to: (1) establish a conceptual design that integrates commercial steel mill technology with radioactive scrap metal (RSM) processing to produce carbon and stainless steel sheet and plate at a grade suitable for fabricating into radioactive waste containers; (2) determine the economic feasibility of building a micro-mill in the Western US to process 30,000 tons of RSM per year from both DOE and the nuclear utilities; and (3) provide recommendations for implementation. For purposes of defining the project, it is divided into phases: economic feasibility and conceptual design; preliminary design; detail design; construction; and operation. This study comprises the bulk of Phase 1. It is divided into four sections. Section 1 provides the reader with a complete overview extracting pertinent data, recommendations and conclusions from the remainder of the report. Section 2 defines the variables that impact the design requirements. These data form the baseline to create a preliminary conceptual design that is technically sound, economically viable, and capitalizes on economies of scale. Priorities governing the design activities are: (1) minimizing worker exposure to radionuclide hazards, (2) maximizing worker safety, (3) minimizing environmental contamination, (4) minimizing secondary wastes, and (5) establishing engineering controls to insure that the plant will be granted a license in the state selected for operation. Section 3 provides details of the preliminary conceptual design that was selected. The cost of project construction is estimated and the personnel needed to support the steel-making operation and radiological and environmental control are identified. Section 4 identifies the operational costs and supports the economic feasibility analysis. A detailed discussion of the resulting conclusions and recommendations is included in this section.

752 (DOE/ID/12915–4) **Assessment for development of an industrial wet oxidation system for burning waste and low-grade fuels. Final report, October 18, 1989–February 28, 1995.** Sundback, C. Modell Environmental Corp., Waltham, MA (United States). May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-90ID12915. Order Number DE96013300. Source: OSTI; NTIS; INIS; GPO Dep.

The ultimate goal of this program was to demonstrate safe, reliable, and effective operation of the supercritical water oxidation process (SCWO) at a pilot plant-level throughput. This program was a three phase program. Phase 1 of the program preceded MODEC's participation in the program. MODEC did participate in Phases 2 and 3 of the program. In Phase 2, the target waste and industry were pulp mill sludges from the pulp and paper industry. In Phase 3, the target was modified to be DOE-generated mixed low level waste; wastes containing RCRA hazardous constituents and radionuclide surrogates were used as model wastes. The paper describes the research unit planning and design; bench-scale development of SCWO; research and development of wet oxidation of fuels; and the design of a super-critical water pilot plant.

753 (DOE/LLW–114A-1) **Greater-than-Class C low-level radioactive waste characterization. Appendix A-1: Nuclear utility data outputs from the GNUPS database.** EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1994. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002383. Source: OSTI; NTIS; INIS; GPO Dep.

The Greater-Than-Class C Nuclear Utility Projections System (GNUPS) was developed as a database for the GTCC LLW Program to estimate future volumes and radionuclide activities of nuclear utility GTCC LLW. Detailed printouts from the GNUPS database are presented in this appendix. The GNUPS projects nuclear utility volumes and activities for three cases: low, base, and high. In addition, the projections can be adjusted to account for the effects of packaging, concentration averaging, and plant operating lifetime. A brief description of how the GNUPS performs calculations of volumes and activities is given.

754 (DOE/LLW–114A-2) **Greater-than-Class C low-level radioactive waste characterization. Appendix A-2: Timing of greater-than-Class C low-level radioactive waste from nuclear power plants.** Steinke, W.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002384. Source: OSTI; NTIS; INIS; GPO Dep.

Planning for the storage or disposal of greater-than-Class C low-level radioactive waste (GTCC LLW) requires characterization of that waste. Timing, or the date the waste will require storage or disposal, is an integral aspect of that planning. The majority of GTCC LLW is generated by nuclear power plants, and the length of time a reactor remains operational directly affects the amount of GTCC waste expected from that reactor. This report uses data from existing literature to develop high, base, and low case estimates for the number of plants expected to experience (a) early shutdown, (b) 40-year operation, or (c) life extension to 60-year operation. The discussion includes possible effects of advanced light water reactor technology on future GTCC LLW generation. However, the main focus of this study is timing for shutdown of current technology reactors that are under construction or operating.

755 (DOE/LLW–114A-3) **Greater-than-Class C low-level radioactive waste characterization. Appendix A-3: Basis for greater-than-Class C low-level radioactive waste light water reactor projections.** Mancini, A.; Tuite, P.; Tuite, K.; Woodberry, S. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1994. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002385. Source: OSTI; NTIS; INIS; GPO Dep.

This study characterizes low-level radioactive waste types that may exceed Class C limits at light water reactors, estimates the amounts of waste generated, and estimates radionuclide content and distribution within the waste. Waste types that may exceed Class C limits include metal components that become activated during operations, process wastes such as cartridge filters and decontamination resins, and activated metals from decommissioning activities. Operating parameters and current management practices at operating plants are reviewed and used to estimate the amounts of low-level waste exceeding Class C limits that is generated per fuel cycle, including amounts of routinely generated activated metal components and process waste. Radionuclide content is calculated for specific activated metals components. Empirical data from actual low-level radioactive waste are used to estimate radionuclide content for process wastes. Volumes and activities are also estimated for decommissioning activated metals that exceed Class C limits. To estimate activation levels of decommissioning waste, six typical light water reactors are modeled and analyzed. This study does not consider concentration averaging.

756 (DOE/LLW–114D-3) **Greater-than-Class C low-level radioactive waste characterization. Appendix D-3: Characterization of greater-than-Class C low-level radioactive waste from other generators.** Fish, L.W. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002386. Source: OSTI; NTIS; INIS; GPO Dep.

The Other Generators category includes all greater-than-Class C low-level radioactive waste (GTCC LLW) that is not generated or held by nuclear utilities or sealed sources licensees or that is not stored at Department of Energy facilities. To determine the amount of waste within this category, 90 LLW generators were contacted; 13 fit the Other Generators category. Based on information received from the 13 identified Other Generators, the GTCC LLW Management Program was able to (a) characterize the nature of industries in this category, (b) estimate the 1993 inventory of Other Generator waste for high, base, and low cases, and (c) project inventories to the year 2035 for high, base, and low cases. Assumptions were applied to each of the case estimates to account for generators who may not have been identified in this study.

757 (DOE/LLW–114E-1) **Greater-than-Class C low-level radioactive waste characterization. Appendix E-1: Historical development of GTCC LLW characterization.** EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002387. Source: OSTI; NTIS; INIS; GPO Dep.

By the late 1980s, it was apparent that there was little support for any of the volume projections of greater-than-Class C low-level radioactive waste (GTCC LLW) thus far predicted. It had also become clear that the amount of GTCC LLW to be generated in the future was highly dependent on a number of specific technical and policy issues unrelated to past generation rates. In 1990, DOE's EM-35 organization requested that the GTCC LLW Management Program at the INEL conduct a systematic exercise designed to achieve a degree of consensus around a narrower range of volume projections. Following the series of workshops, the INEL and subcontractors conducted technical studies to associate specific waste volume projections with the various scenarios developed by the panels. The results of these studies were reported in Greater-Than-Class C Low-Level Radioactive Waste Characterization: Estimated Volumes, Radionuclide Activities, and Other Characteristics (DOE/LLW-114, August 1991). This appendix briefly describes the historical development of the GTCC LLW project.

758 (DOE/LLW–114E-2) **Greater-than-Class C low-level radioactive waste characterization. Appendix E-2:**

Mixed GTCC LLW assessment. Kirner, N.P. (Ebasco Environmental, Idaho Falls, ID (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States); Ebasco Environmental, Idaho Falls, ID (United States). Sep 1994. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002388. Source: OSTI; NTIS; INIS; GPO Dep.

Mixed greater-than-Class C low-level radioactive waste (mixed GTCC LLW) is waste that combines two characteristics: it is radioactive, and it is hazardous. This report uses information compiled from Greater-Than-Class C Low-Level Radioactive Waste Characterization: Estimated Volumes, Radionuclide Activities, and Other Characteristics (DOE/LLW 1 14, Revision 1), and applies it to the question of how much and what types of mixed GTCC LLW are generated and are likely to require disposal in facilities jointly regulated by the DOE and the NRC. The report describes how to classify a RCRA hazardous waste, and then applies that classification process to the 41 GTCC LLW waste types identified in the DOE/LLW-114 (Revision 1). Of the 41 GTCC LLW categories identified, only six were identified in this study as potentially requiring regulation as hazardous waste under RCRA. These wastes can be combined into the following three groups: fuel-in decontamination resins, organic liquids, and process waste consisting of lead scrap/ shielding from a sealed source manufacturer. For the base case, no mixed GTCC LLW is expected from nuclear utilities or sealed source licensees, whereas only 177 ml of mixed GTCC LLW are expected to be produced by other generators through the year 2035. This relatively small volume represents approximately 40% of the base case estimate for GTCC wastes from other generators. For these other generators, volume estimates for mixed GTCC LLW ranged from less than 1 m^3 to 187 m^3, depending on assumptions and treatments applied to the wastes.

759 (DOE/LLW–114E-3) **Greater-than-Class C low-level radioactive waste characterization. Appendix E-3: GTCC LLW assumptions matrix.** EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002389. Source: OSTI; NTIS; INIS; GPO Dep.

This study identifies four categories of GTCC LLW: nuclear utility; sealed sources; DOE-held; and other generators. Within each category, inventory and projection data are modeled in three scenarios: (1) Unpackaged volume–this is the unpackaged volume of waste that would exceed Class C limits if the waste calculation methods in 10 CFR 61.55 were applied to the discrete items before concentration averaging methods were applied to the volume; (2) Not-concentration-averaged (NCA) packaged volume–this is the packaged volume of GTCC LLW assuming that no concentration averaging is allowed; and (3) After-concentration-averaging (ACA) packaged volume–this is the packaged volume of GTCC LLW, which, for regulatory or practical reasons, cannot be disposed of in a LLW disposal facility using allowable concentration averaging practices. Three cases are calculated for each of the volumes described above. These values are defined as the low, base, and high cases. The following tables explain the assumptions used to determine low, base, and high case estimates for each scenario, within each generator category. The appendices referred to in these tables are appendices to Greater-Than-Class C Low-Level Radioactive Waste Characterization: Estimated Volumes, Radionuclide Activities, and Other Characteristics (DOE/LLW-114, Revision 1).

760 (DOE/LLW–114E-4) **Greater-than-Class C low-level radioactive waste characterization. Appendix E-4: Packaging factors for greater-than-Class C low-level radioactive waste.** Quinn, G.; Grant, P.; Winberg, M.; Williams, K. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1994. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002390. Source: OSTI; NTIS; INIS; GPO Dep.

This report estimates packaging factors for several waste types that are potential greater-than-Class C (GTCC) low-level radioactive waste (LLW). The packaging factor is defined as the volume of a GTCC LLW disposal container divided by the as-generated or "unpackaged" volume of the waste loaded into the disposal container. Packaging factors reflect any processes that reduce or increase an original unpackaged volume of GTCC LLW, the volume inside a waste container not occupied by the waste, and the volume of the waste container itself. Three values are developed that represent (a) the base case or most likely value for a packaging factor, (b) a high case packaging factor that corresponds to the largest anticipated disposal volume of waste, and (c) a low case packaging factor for the smallest volume expected. GTCC LLW is placed in three categories for evaluation in this report: activated metals, sealed sources, and all other waste.

761 (DOE/LLW–114E-5) **Greater-than-Class C low-level radioactive waste characterization. Appendix E-5: Impact of the 1993 NRC draft Branch Technical Position on concentration averaging of greater-than-Class C low-level radioactive waste.** Tuite, P. (Waste Management Group, Inc., Peekskill, NY (United States)); Tuite, K.; Harris, G. EG and G Idaho, Inc., Idaho Falls, ID (United States); Waste Management Group, Peekskill, NY (United States). Sep 1994. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002391. Source: OSTI; NTIS; INIS; GPO Dep.

This report evaluates the effects of concentration averaging practices on the disposal of greater-than-Class C low-level radioactive waste (GTCC LLW) generated by the nuclear utility industry and sealed sources. Using estimates of the number of waste components that individually exceed Class C limits, this report calculates the proportion that would be classified as GTCC LLW after applying concentration averaging; this proportion is called the concentration averaging factor. The report uses the guidance outlined in the 1993 Nuclear Regulatory Commission (NRC) draft Branch Technical Position on concentration averaging, as well as waste disposal experience at nuclear utilities, to calculate the concentration averaging factors for nuclear utility wastes. The report uses the 1993 NRC draft Branch Technical Position and the criteria from the Barnwell, South Carolina, LLW disposal site to calculate concentration averaging factors for sealed sources. The report addresses three waste groups: activated metals from light water reactors, process wastes from light-water reactors, and sealed sources. For each waste group, three concentration averaging cases are considered: high, base, and low. The base case, which is the most likely case to occur, assumes using the specific guidance given in the 1993 NRC draft Branch Technical Position on concentration averaging. To project future GTCC LLW generation, each waste category is assigned a concentration averaging factor for the high, base, and low cases.

762 (DOE/LLW–114F) **Greater-than-Class C low-level waste characterization. Appendix F: Greater-than-Class C low-level radioactive waste light water reactor projections.** Tuite, P.; Tuite, K.; Levin, A.; O'Kelley, M. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1991. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002307. Source: OSTI; NTIS; INIS; GPO Dep.

This study characterizes potential greater-than-Class C low-level radioactive waste streams, estimates the amounts of waste generated, and estimates their radionuclide content and distribution. Several types of low-level radioactive wastes produced by light water reactors were identified in an earlier study as being potential greater-than-Class C low-level waste, including specific activated metal components and certain process wastes in the form of cartridge filters and decontamination resins. Light water reactor operating parameters and current management practices at operating plants were reviewed and used to estimate the amounts of potential greater-than-Class C low-level waste generated per fuel cycle. The amounts of routinely generated activated metal components and process waste were estimated as a function of fuel cycle. Component-specific radionuclide content and distribution was calculated for activated metals components. Empirical data from actual low-level radioactive waste streams were used to estimate radionuclide content and distribution for process wastes. The greater-than-Class C low-level waste volumes that could be generated through plant closure were also estimated, along with volumes and activities for potential greater-than-Class C activated metals generated at decommissioning.

763 (DOE/LLW–114G) **Greater-than-Class C low-level waste characterization. Appendix G: Evaluation of potential for greater-than-Class C classification of irradiated hardware generated by utility-operated reactors.** Cline, J.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1991. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002308. Source: OSTI; NTIS; INIS; GPO Dep.

This study compiles and evaluates data from many sources to expand a base of data from which to estimate the activity concentrations and volumes of greater-than-Class C low-level waste that the Department of Energy will receive from the commercial power industry. Sources of these data include measurements of irradiated hardware made by or for the utilities that was classified for disposal in commercial burial sites, measurements of neutron flux in the appropriate regions of the reactor pressure vessel, analyses of elemental constituents of the particular structural material used for the components, and the activation analysis calculations done for hardware. Evaluations include results and assumptions in the activation analyses. Sections of this report and the appendices present interpretation of data and the classification definitions and requirements.

764 (DOE/LLW–114H) **Greater-than-Class C low-level radioactive waste characterization. Appendix H: Packaging factors for greater-than-Class C low-level radioactive waste.** Quinn, G.; Grant, P. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1991. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002381. Source: OSTI; NTIS; INIS; GPO Dep.

This report develops and presents estimates for a set of three values that represent a reasonable range for the packaging factors for several waste streams that are potential greater-than-Class C low-level radioactive waste. The packaging factor is defined as the volume of a greater-than-Class C low-level waste disposal container divided by the original, as-generated or "unpackaged," volume of the wastes loaded into the disposal container. Packaging factors take into account any processes that reduce or increase an original unpackaged volume of a greater-than-Class C low-level radioactive waste, the volume inside a waste container not occupied by the waste, and the volume of the waste container itself. The three values developed represent (a) the base case or most likely value for a packaging factor, (b) a high case packaging factor that corresponds to the largest anticipated volume of waste for disposal, and (c) a low case packaging factor for the smallest volume expected. Three categories of greater-than-Class C low-level waste are evaluated in this report: activated metals, sealed sources, and all other wastes. Estimates of reasonable packaging factors for the low, base, and high cases for the specific waste streams in each category are shown in Table H-1.

765 (DOE/LLW–114I) **Greater-than-Class C low-level waste characterization. Appendix I: Impact of concentration averaging low-level radioactive waste volume projections.** Tuite, P.; Tuite, K.; O'Kelley, M.; Ely, P. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1991. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002382. Source: OSTI; NTIS; INIS; GPO Dep.

This study provides a quantitative framework for bounding unpackaged greater-than-Class C low-level radioactive waste types as a function of concentration averaging. The study defines the three concentration averaging scenarios that lead to base, high, and low volumetric projections; identifies those waste types that could be greater-than-Class C under the high volume, or worst case, concentration averaging scenario; and quantifies the impact of these scenarios on identified waste types relative to the base case scenario. The base volume scenario was assumed to reflect current requirements at the disposal sites as well as the regulatory views. The high volume scenario was assumed to reflect the most conservative criteria as incorporated in some compact host state requirements. The low volume scenario was assumed to reflect the 10 CFR Part 61 criteria as applicable to both shallow land burial facilities and to practices that could be employed to reduce the generation of Class C waste types.

766 (DOE/LLW–127) **National Low-Level Waste Management Program radionuclide report series. Volume 2, Niobium-94.** Adams, J.P.; Carboneau, M.L. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Apr 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002298. Source: OSTI; NTIS; INIS; GPO Dep.

The Purpose of the National Low-Level Waste Management Program Radionuclide Report Series is to provide information to, state representatives and developers of low-level radioactive waste disposal facilities about the radiological chemical, and physical characteristics of selected radionuclides and their behavior in the low-level radioactive waste disposal facility environment. Extensive surveys of available literature provided information used to produce this series of reports and an introductory report. This report is Volume 11 of the series. It outlines the basic radiological, chemical, and physical characteristics of niobium-94, waste types and forms that contain it, and its behavior in environmental media such as soils, plants, groundwater, air, animals and the human body.

767 (DOE/LLW–128) **National Low-Level Waste Management Program Radionuclide Report Series: Volume 12, Cobalt-60.** Adams, J.P. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95017655. Source: OSTI; NTIS; INIS; GPO Dep.

This report outlines the basic radiological and chemical characteristics of cobalt-60 (^{60}Co) and examines how these characteristics affect the behavior of ^{60}Co in various environmental media, such as soils, groundwater, plants, animals, the atmosphere, and the human body. Discussions also include methods of ^{60}Co production, waste types, and waste forms that contain ^{60}Co. All cobalt atoms contain 27 protons ($Z = 27$) and various numbers of neutrons (typically $N = 27$ to 37 neutrons) within the atom's nucleus. There is only one stable isotope of cobalt, namely ^{59}Co. All other cobalt isotopes, including ^{60}Co, are radioactive. The radioactive isotopes of cobalt have half-lives ranging from less than a second (^{54}Co-0.19 s) to 5.2 years (^{60}Co). The radioactive isotopes of cobalt are not a normal constituent of the natural environment and are generated as a result of human activities. The primary source of ^{60}Co in the environment has been low-level radioactive waste material generated as a result of neutron activation of stable ^{59}Co that is present in the structural components of nuclear reactor vessels. This isotope is also intentionally produced, usually in reactors but also to some degree in accelerators for industrial and medical uses, such as for radiation sources for cancer treatment and nondestructive testing of metals and welds. ^{60}Co may enter the environment as a result of the activities associated with nuclear reactor operations and decommissioning and when industrial and medical sources are being used, manufactured, or disposed.

768 (DOE/LLW–129-Vol.13) **National Low-Level Waste Management Program radionuclide report series. Volume 13, Curium-242.** Adams, J.P. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Aug 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001323. Source: OSTI; NTIS; INIS; GPO Dep.

This report, Volume 13 of the National Low-Level Waste Management Program Radionuclide Report Series, discusses the radiological and chemical characteristics of curium-242 (^{242}Cm). This report also includes discussions about waste types and forms in which ^{242}Cm can be found and ^{242}Cm behavior in the environment and in the human body.

769 (DOE/LLW–130) **National low-level waste management program radionuclide report series, Volume 14: Americium-241.** Winberg, M.R.; Garcia, R.S. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002366. Source: OSTI; NTIS; INIS; GPO Dep.

This report, Volume 14 of the National Low-Level Waste Management Program Radionuclide Report Series, discusses the radiological and chemical characteristics of americium-241 (^{241}Am). This report also includes discussions about waste types and forms in which ^{241}Am can be found and ^{241}Am behavior in the environment and in the human body.

770 (DOE/LLW–131) **National low-level waste management program radionuclide report series, Volume 15: Uranium-238.** Adams, J.P. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002365. Source: OSTI; NTIS; INIS; GPO Dep.

This report, Volume 15 of the National Low-Level Waste Management Program Radionuclide Report Series, discusses the radiological and chemical characteristics of uranium-238 (^{238}U). The purpose of the National Low-Level Waste Management Program Radionuclide Report Series is to provide information to state representatives and developers of low-level radioactive waste disposal facilities about the radiological, chemical, and physical characteristics of selected radionuclides and their behavior in the waste disposal facility environment. This report also includes discussions about waste types and forms in which ^{238}U can be found, and ^{238}U behavior in the environment and in the human body.

771 (DOE/LLW–147-Rev.1) **Evaluation of Department of Energy-Held Potential Greater-Than-Class C Low-Level Radioactive Waste. Revision 1.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Sep 1994. 464p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002370. Source: OSTI; NTIS; INIS; GPO Dep.

A number of commercial facilities have generated potential greater-than-Class C low-level radioactive waste (GTCC LLW), and, through contractual arrangements with the US Department of Energy (DOE) or for health and safety reasons, DOE is storing the waste. This report presents the results of an assessment conducted by the GTCC LLW Management Program to consider specific circumstances under which DOE accepted the waste, and to determine whether disposal in a facility licensed by the US Nuclear Regulatory Commission, or by DOE in a nonlicensed facility, is appropriate. Input from EG&G Idaho, Inc., and DOE Idaho Operations Office legal departments concerning the disposal requirements of this waste were the basis for the decision process used in this report.

772 (DOE/LLW–153) **Commercial low-level radioactive waste transportation liability and radiological risk.** Quinn, G.J.; Brown, O.F. II; Garcia, R.S. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1992. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96005883. Source: OSTI; NTIS; INIS; GPO Dep.

This report was prepared for States, compact regions, and other interested parties to address two subjects related to transporting low-level radioactive waste to disposal facilities. One is the potential liabilities associated with low-level radioactive waste transportation from the perspective of States as hosts to low-level radioactive waste disposal facilities. The other is the radiological risks of low-level radioactive waste transportation for drivers, the public, and disposal facility workers.

773 (DOE/LLW–160-Rev.1) **Savannah River Site off-site hazardous waste shipment data validation report. Revision 1.** Casey, C.; Kudera, D.E.; Page, L.A.; Rohe, M.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). May 1995. 200p. Sponsored by USDOE,

Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001157. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this data validation is to verify that waste shipments reported in response to the US Department of Energy Headquarters data request are properly categorized according to DOE-HQ definitions. This report documents all findings and actions resulting from the independent review of the Savannah River Site data submittal, and provides a summary of the SRS data submittal and data validation strategy. The overall hazardous waste management and offsite release process from 1987–1991 is documented, along with an identification and description of the hazardous waste generation facilities. SRS did not ship any hazardous waste offsite before 1987. Sampling and analysis and surface surveying procedures and techniques used in determining offsite releasability of the shipments are also described in this report. SRS reported 150 manifested waste shipments from 1984 to 1991 that included 4,755 drums or lab packs and 13 tankers. Of these waste items, this report categorizes 4,251 as clean (including 12 tankers), 326 as likely clean, 138 as likely radioactive, and 55 as radioactive (including one tanker). Although outside the original scope of this report, 14 manifests from 1992 and 1993 are included, covering 393 drums or lab packs and seven tankers. From the 1992–1993 shipments, 58 drums or lab packs are categorized as radioactive and 16 drums are categorized as likely radioactive. The remainder are categorized as clean.

774 (DOE/LLW–179) **Transportation and disposal configuration for DOE-managed low-level and mixed low-level waste.** Johnsen, T. EG and G Idaho, Inc., Idaho Falls, ID (United States). Idaho National Engineering Lab. Jun 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96008980. Source: OSTI; NTIS; INIS; GPO Dep.

This report briefly examines the current U.S. Department of Energy complex-wide configuration for transportation and disposal of low-level and mixed low-level waste, and also retraces the historical sequence of events and rationale that has guided its development. The study determined that Nevada Test Site and the Hanford Site are the only two sites that currently provide substantial disposal services for offsite low-level waste generators. It was also determined that mixed low-level waste shipments are infrequent and are generally limited to shipments to offsite commercial treatment facilities or other Department of Energy sites for storage. The current alignment of generator to disposal site for low-level waste shipments is generally consistent with the programmatic mission of the generator; that is, defense-generated waste is shipped to the Nevada Test Site and research-generated waste is transported to the Hanford Site. The historical development of the current configuration was resurrected by retrieving Department of Energy documentation and interviewing both current and former department and contractor personnel. According to several accounts, the basic framework of the system was developed during the late 1970s, and was reportedly based on the ability of the disposal site to manage a given waste form. Documented evidence to support this reasoning, however, could not be uncovered.

775 (DOE/LLW–185) **Methods for verifying compliance with low-level radioactive waste acceptance criteria.** USDOE Idaho Operations Office, Idaho Falls, ID (United States); Dames and Moore, Denver, CO (United States). Sep 1993. 309p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002302. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the methods that are currently employed and those that can be used to verify compliance with low-level radioactive waste (LLW) disposal facility waste acceptance criteria (WAC). This report presents the applicable regulations representing the Federal, State, and site-specific criteria for accepting LLW. Typical LLW generators are summarized, along with descriptions of their waste streams and final waste forms. General procedures and methods used by the LLW generators to verify compliance with the disposal facility WAC are presented. The report was written to provide an understanding of how a regulator could verify compliance with a LLW disposal facility's WAC. A comprehensive study of the methodology used to verify waste generator compliance with the disposal facility WAC is presented in this report. The study involved compiling the relevant regulations to define the WAC, reviewing regulatory agency inspection programs, and summarizing waste verification technology and equipment. The results of the study indicate that waste generators conduct verification programs that include packaging, classification, characterization, and stabilization elements. The current LLW disposal facilities perform waste verification steps on incoming shipments. A model inspection and verification program, which includes an emphasis on the generator's waste application documentation of their waste verification program, is recommended. The disposal facility verification procedures primarily involve the use of portable radiological survey instrumentation. The actual verification of generator compliance to the LLW disposal facility WAC is performed through a combination of incoming shipment checks and generator site audits.

776 (DOE/LLW–186) **Social and institutional evaluation report for Greater-Than-Class C Low-Level Radioactive Waste Disposal.** Anderson, T.L. (Dames and Moore, Denver, CO (United States)); Lewis, B.E.; Turner, K.H.; Rozelle, M.A. EG and G Idaho, Inc., Idaho Falls, ID (United States); Dames and Moore, Denver, CO (United States). Oct 1993. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95017654. Source: OSTI; NTIS; INIS; GPO Dep.

This report identifies and characterizes social and institutional issues that would be relevant to the siting, licensing, construction, closure, and postclosure of a Greater-Than-Class-C low-level radioactive waste (GTCC LLW) disposal facility. A historical perspective of high-level radioactive waste (HLW) and LLW disposal programs is provided as an overview of radioactive waste disposal and to support the recommendations and conclusions in the report. A characterization of each issue is provided to establish the basis for further evaluations. Where applicable, the regulatory requirements of 10 CFR 60 and 61 are incorporated in the issue characterizations. The issues are used to compare surface, intermediate depth, and deep geologic disposal alternatives. The evaluation establishes that social and institutional issues do not significantly discriminate among the disposal alternatives. Recommendations are provided for methods by which the issues could be considered throughout the lifecycle of a GTCC LLW disposal program.

777 (DOE/LLW–187) **Introduction to radiological performance assessment.** Moss, G. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Feb 1995. 28p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC07-94ID13223. Order Number DE96001326. Source: OSTI; NTIS; INIS; GPO Dep.

A radiological performance assessment is conducted to provide reasonable assurance that performance objectives for low-level radioactive waste (LLW) disposal will be met. Beginning in the early stages of development, a radiological performance assessment continues through the operational phase, and is instrumental in the postclosure of the facility. Fundamental differences exist in the regulation of commercial and defense LLW, but the radiological performance assessment process is essentially the same for both. The purpose of this document is to describe that process in a concise and straightforward manner. This document focuses on radiological performance assessment as it pertains to commercial LLW disposal, but is applicable to US Department of Energy sites as well. Included are discussions on performance objectives, site characterization, and how a performance assessment is conducted. A case study is used to illustrate how the process works as a whole. A bibliography is provided to assist in locating additional information.

778 (DOE/LLW–189) **Developing operating procedures for a low-level radioactive waste disposal facility.** Sutherland, A.A. (Rogers and Associates Engineering Corp., Salt Lake City, UT (United States)); Miner, G.L.; Grahn, K.F.; Pollard, C.G. EG and G Idaho, Inc., Idaho Falls, ID (United States); Rogers and Associates Engineering Corp., Salt Lake City, UT (United States). Oct 1993. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (RAE–9304/1-1). Order Number DE96001576. Source: OSTI; NTIS; INIS; GPO Dep.

This document is intended to assist persons who are developing operating and emergency procedures for a low-level radioactive waste disposal facility. It provides 25 procedures that are considered to be relatively independent of the characteristics of a disposal facility site, the facility design, and operations at the facility. These generic procedures should form a good starting point for final procedures on their subjects for the disposal facility. In addition, this document provides 55 annotated outlines of other procedures that are common to disposal facilities. The annotated outlines are meant as checklists to assist the developer of new procedures.

779 (DOE/LLW–192) **Greater-Than-Class C Low-Level Radioactive Waste Transportation Strategy report and institutional plan.** Schmitt, R.C.; Tyacke, M.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jan 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95017651. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains two parts. Part I, Greater-Than-Class-C Low-Level Radioactive Waste Transportation Strategy, addresses the requirements, responsibilities, and strategy to transport and receive these wastes. The strategy covers (a) transportation packaging, which includes shipping casks and waste containers; (b) transportation operations relating to the five facilities involved in transportation, i.e., waste originator, interim storage, dedicated storage, treatment, and disposal; (c) system safety and risk analysis; (d) routes; (e) emergency preparedness and response; and (o safeguards and security. A summary of strategic actions is provided at the conclusion of Part 1. Part II, Institutional Plan for Greater-Than-Class C Low-Level Radioactive Waste Packaging and Transportation, addresses the assumptions, requirements, and institutional plan elements and actions. As documented in the Strategy and Institutional Plan, the most challenging issues facing the GTCC LLW Program shipping campaign are institutional issues closely related to the strategy. How the Program addresses those issues and demonstrates to the states, local governments, and private citizens that the shipments can and will be made safely will strongly affect the success or failure of the campaign.

780 (DOE/LLW–199) **Comparative approaches to siting low-level radioactive waste disposal facilities.** Newberry, W.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jul 1994. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96001577. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes activities in nine States to select site locations for new disposal facilities for low-level radioactive waste. These nine States have completed processes leading to identification of specific site locations for onsite investigations. For each State, the status, legal and regulatory framework, site criteria, and site selection process are described. In most cases, States and compact regions decided to assign responsibility for site selection to agencies of government and to use top-down mapping methods for site selection. The report discusses quantitative and qualitative techniques used in applying top-down screenings, various approaches for delineating units of land for comparison, issues involved in excluding land from further consideration, and different positions taken by the siting organizations in considering public acceptance, land use, and land availability as factors in site selection.

781 (DOE/LLW–208) **National Institutes of Health: Mixed waste stream analysis.** Kirner, N.P.; Faison, G.P.; Johnson, D.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1994. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95017656. Source: OSTI; NTIS; INIS; GPO Dep.

The Low-Level Radioactive Waste Policy Amendments Act of 1985 requires that the US Department of Energy (DOE) provide technical assistance to host States, compact regions, and unaffiliated States to fulfill their responsibilities under the Act. The National Low-Level Waste Management Program (NLLWMP) operated for DOE by EG&G Idaho, Inc. provides technical assistance in the development of new commercial low-level radioactive waste disposal capacity. The NLLWMP has been requested by the Appalachian Compact to help the biomedical community become better acquainted with its mixed waste streams, to help minimize the mixed waste streams generated by the biomedical community, and to provide applicable treatment technologies to those particular mixed waste streams. Mixed waste is waste that satisfies the definition of low-level radioactive waste (LLW) in the Low-Level Radioactive Waste Policy Act of 1980 (LLRWPA) and contains hazardous waste that either (a) is listed as a hazardous waste in Subpart D of 40 CFR 261, or (b) causes the LLW to exhibit any of the hazardous waste characteristics identified in 40 CFR 261. The purpose of this report is to clearly define and characterize the mixed waste streams generated by the biomedical community so that an identification can be made of the waste streams that can and cannot be minimized and treated by current options. An understanding of the processes and complexities of generation of mixed waste in the biomedical community may encourage more treatment and storage options to become available.

782 (DOE/LLW–210) **Vitrification treatment options for disposal of greater-than-Class-C low-level waste in a deep geologic repository.** Fullmer, K.S.; Fish, L.W.; Fischer, D.K. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Nov 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96009673. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE), in keeping with their responsibility under Public Law 99-240, the Low-Level Radioactive Waste Policy Amendments Act of 1985, is investigating several disposal options for greater-than-Class C low-level waste (GTCC LLW), including emplacement in a deep geologic repository. At the present time vitrification, namely borosilicate glass, is the standard waste form assumed for high-level waste accepted into the Civilian Radioactive Waste Management System. This report supports DOE's investigation of the deep geologic disposal option by comparing the vitrification treatments that are able to convert those GTCC LLWs that are inherently migratory into stable waste forms acceptable for disposal in a deep geologic repository. Eight vitrification treatments that utilize glass, glass ceramic, or basalt waste form matrices are identified. Six of these are discussed in detail, stating the advantages and limitations of each relative to their ability to immobilize GTCC LLW. The report concludes that the waste form most likely to provide the best composite of performance characteristics for GTCC process waste is Iron Enriched Basalt 4 (IEB4).

783 (DOE/LLW–213) **Potential co-disposal of greater-than-class C low-level radioactive waste with Department of Energy special case waste - greater-than-class C low-level waste management program.** Allred, W.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96002367. Source: OSTI; NTIS; INIS; GPO Dep.

This document evaluates the feasibility of co-disposing of greater-than-Class C low-level radioactive waste (GTCC LLW) with U.S. Department of Energy (DOE) special case waste (SCW). This document: (1) Discusses and evaluates key issues concerning co-disposal of GTCC LLW with SCW. This includes examining these issues in terms of regulatory concerns, technical feasibility, and economics; (2) Examines advantages and disadvantages of such co-disposal; and (3) Makes recommendations. Research and analysis of the issues presented in this report indicate that it would be technically and economically feasible to co-dispose of GTCC LLW with DOE SCW. However, a dilemma will likely arise in the current division of regulatory responsibilities between the U.S. Nuclear Regulatory Commission and DOE (i.e., current requirement for disposal of GTCC LLW in a facility licensed by the Nuclear Regulatory Commission). DOE SCW is currently not subject to this licensing requirement.

784 (DOE/LLW–218) **National Institutes of Health: Mixed waste minimization and treatment.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Aug 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002288. Source: OSTI; NTIS; INIS; GPO Dep.

The Appalachian States Low-Level Radioactive Waste Commission requested the US Department of Energy's National Low-Level Waste Management Program (NLLWMP) to assist the biomedical community in becoming more knowledgeable about its mixed waste streams, to help minimize the mixed waste stream generated by the biomedical community, and to identify applicable treatment technologies for these mixed waste streams. As the first step in the waste minimization process, liquid low-level radioactive mixed waste (LLMW) streams generated at the National Institutes of Health (NIH) were characterized and combined into similar process categories. This report identifies possible waste minimization and treatment approaches for the LLMW generated by the biomedical community identified in DOE/LLW-208. In development of the report, on site meetings were conducted with NIH personnel responsible for generating each category of waste identified as lacking disposal options. Based on the meetings and general waste minimization guidelines, potential waste minimization options were identified.

785 (DOE/LLW–220) **Model training curriculum for Low-Level Radioactive Waste Disposal Facility Operations.** Tyner, C.J.; Birk, S.M. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Sep 1995. 494p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002369. Source: OSTI; NTIS; INIS; GPO Dep.

This document is to assist in the development of the training programs required to be in place for the operating license for a low-level radioactive waste disposal facility. It consists of an introductory document and four additional appendixes of individual training program curricula. This information will provide the starting point for the more detailed facility-specific training programs that will be developed as the facility hires and trains new personnel and begins operation. This document is comprehensive and is intended as a guide for the development of a company- or facility-specific program. The individual licensee does not need to use this model training curriculum as written. Instead, this document can be used as a menu for the development, modification, or verification of customized training programs.

786 (DOE/LLW–221) **Impact assessment of draft DOE Order 5820.2B. Radioactive Waste Technical Support Program.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Apr 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95017657. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) has prepared a revision to DOE Order 5820.2A, entitled "Radioactive Waste Management." DOE issued DOE Order 5820.2A in September 1988 and, as the title implies, it covered only radioactive waste forms. The proposed draft order, entitled "Waste Management," addresses the management of both radioactive and nonradioactive waste forms. It also includes spent nuclear fuel, which DOE does not consider a waste. Waste forms covered include hazardous waste, high-level waste, transuranic (TRU) waste, low-level radioactive waste, uranium and thorium mill tailings, mixed waste, and sanitary waste. The Radioactive Waste Technical Support Program (TSP) of Leached Idaho Technologies Company (LITCO) is facilitating the revision of this order. The EM Regulatory Compliance Division (EM-331) has requested that TSP estimate the impacts and costs of compliance with the revised order. TSP requested Dames & Moore to aid in this assessment by comparing requirements in Draft Order 5820.2B to ones in DOE Order 5820.2A and other DOE orders and Federal regulations. The assessment started with a draft version of 5820.2B dated January 14, 1994. DOE has released three updated versions of the draft order since then (dated May

20, 1994; August 26, 1994; and January 23, 1995). Each time DOE revised the order, Dames and Moore updated the assessment work to reflect the text changes. This report reflects the January 23, 1995 version of the draft order.

787 (DOE/LLW-222) **Summary of treatment, storage, and disposal facility usage data collected from U.S. Department of Energy sites.** Jacobs, A. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Oswald, K.; Trump, C. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Apr 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96009663. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents an analysis for the US Department of Energy (DOE) to determine the level and extent of treatment, storage, and disposal facility (TSDF) assessment duplication. Commercial TSDFs are used as an integral part of the hazardous waste management process for those DOE sites that generate hazardous waste. Data regarding the DOE sites' usage have been extracted from three sets of data and analyzed in this report. The data are presented both qualitatively and quantitatively, as appropriate. This information provides the basis for further analysis of assessment duplication to be documented in issue papers as appropriate. Once the issues have been identified and adequately defined, corrective measures will be proposed and subsequently implemented.

788 (DOE/LLW-224) **1994 state-by-state assessment of low-level radioactive wastes received at commercial disposal sites.** EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002357. Source: OSTI; NTIS; INIS; GPO Dep.

Each year the National Low-Level Waste Management Program publishes a state-by-state assessment report. This report provides both national and state-specific disposal data on low-level radioactive waste commercially disposed in the United States. Data in this report are categorized according to disposal site, generator category, waste class, volumes, and radionuclide activity. Included in this report are tables showing the distribution of waste by state for 1994 and a comparison of waste volumes and radioactivity by state for 1990 through 1994; also included is a list of all commercial nuclear power reactors in the United States as of December 31, 1994. This report distinguishes between low-level radioactive waste shipped directly for disposal by generators and waste that was handled by an intermediary, a reporting change introduced in the 1988 state-by-state report.

789 (DOE/LLW-225) **Comparison of selected DOE and non-DOE requirements, standards, and practices for Low-Level Radioactive Waste Disposal.** Cole, L. (Cole and Associates (United States)); Kudera, D.; Newberry, W. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Dec 1995. 138p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96007520. Source: OSTI; NTIS; INIS; GPO Dep.

This document results from the Secretary of Energy's response to Defense Nuclear Facilities Safety Board Recommendation 94-2. The Secretary stated that the US Department of Energy (DOE) would "address such issues as...the need for additional requirements, standards, and guidance on low-level radioactive waste management. " The authors gathered information and compared DOE requirements and standards for the safety aspects Of low-level disposal with similar requirements and standards of non-DOE entities.

790 (DOE/LLW-227) **Lawrence Livermore National Laboratory offsite hazardous waste shipment data validation report.** EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002364. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy Headquarters requested this report to verify that Lawrence Livermore National Laboratory (LLNL) properly categorized hazardous waste shipped offsite from 1984 to 1991. LLNL categorized the waste shipments by the new guidelines provided on the definition of radioactive waste. For this validation, waste that has had no radioactivity added by DOE operations is nonradioactive. Waste to which DOE operations has added or concentrated any radioactivity is radioactive. This report documents findings from the review of available LLNL hazardous waste shipment information and summarizes the data validation strategy. The report discusses administrative and radiological control procedures in place at LLNL during the data validation period. It also describes sampling and analysis and surface survey procedures used in determining radionuclide concentrations for offsite release of hazardous waste shipments. The evaluation team reviewed individual items on offsite hazardous waste shipments and classified them, using the DOE-HQ waste category definitions. LLNL relied primarily on generator knowledge to classify wastes. Very little radioanalytical information exists on hazardous wastes shipped from LLNL. Slightly greater than one-half of those hazardous waste items for which the documentation included radioanalytical data showed concentrations of radioactivity higher than the LLNL release criteria used from 1989 to 1991. Based on this small amount of available radioanalytical data, very little (less than one percent) of the hazardous waste generated at the LLNL main site can be shown to contain DOE added radioactivity. LLNL based the criteria on the limit of analytical sensitivity for gross alpha and gross beta measurements and the background levels of tritium. Findings in this report are based on information and documentation on the waste handling procedures in place before the start of the hazardous waste shipping moratorium in May 1991.

791 (DOE/LLW-228) **Argonne National Laboratory, east hazardous waste shipment data validation.** Casey, C.; Graden, C.; Coveleskie, A. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002189. Source: OSTI; NTIS; INIS; GPO Dep.

At the request of EM-331, the Radioactive Waste Technical Support Program (TSP) is conducting an evaluation of data regarding past hazardous waste shipments from DOE sites to commercial TSDFs. The intent of the evaluation is to find out if, from 1984 to 1991, DOE sites could have shipped hazardous waste contaminated with DOE-added radioactivity to commercial TSDFs not licensed to receive radioactive material. A team visited Argonne National Laboratory, East (ANL-E) to find out if any data existed that would help to make such a determination at ANL-E. The team was unable to find any relevant data. The team interviewed personnel who worked in waste management at the time. All stated that ANL-E did not sample and analyze hazardous waste shipments for radioactivity. Waste generators at ANL-E relied on process knowledge to decide that their waste was not radioactive. Also, any item leaving a building where radioisotopes were used was surveyed using hand-held instrumentation. If radioactivity above the criteria in DOE Order 5400.5 was found, the item was considered radioactive. The only documentation still available is the paperwork filled out by the waste generator and initialed by a health physics technician to show no contamination was found. The team concludes that, since all waste shipped offsite was subjected at least once to health physics instrumentation scans, the waste shipped from ANL-E from 1984 to 1991 may be considered clean.

792 (DOE/LLW–233) **MWIR-1995 DOE national mixed and TRU waste database users guide.** Idaho National Engineering Lab., Idaho Falls, ID (United States). Nov 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96004071. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) National 1995 Mixed Waste Inventory Report (MWIR-1995) Database Users Guide provides information on computer system requirements and describes installation, operation, and navigation through the database. The MWIR-1995 database contains a detailed, nationwide compilation of information on DOE mixed waste streams and treatment systems. In addition, the 1995 version includes data on non- mixed, transuranic (TRU) waste streams. These were added to the data set as a result of coordination of the 1995 update with the National Transuranic Program Office's (NTPO's) data needs to support the Waste Isolation Pilot Plant (WIPP) TRU Waste Baseline Inventory Report (WTWBIR). However, the information on the TRU waste streams is limited to that associated with the core mixed waste data requirements. The additional, non-core data on TRU streams collected specifically to support the WTWBIR is not included in the MWIR-1995 database. With respect to both the mixed and TRU waste stream data, the data set addresses "stored" streams. In this instance, "stored" streams are defined as (a) streams currently in storage at both EM-30 and EM-40 sites and (b) streams that have yet to be generated but are anticipated within the next five years from sources other than environmental restoration and decontamination and decommissioning (ER/D&D) activities. Information on future ER/D&D streams is maintained in the EM-40 core database. The MWIR-1995 database also contains limited information for both waste streams and treatment systems that have been removed or deleted since the 1994 MWIR. Data on these is maintained only through Section 2, Waste Stream Identification/Tracking/Source, to document the reason for removal from the data set.

793 (DOE/LLW–235) **Analysis of the suitability of DOE facilities for treatment of commercial low-level radioactive mixed waste.** Idaho National Engineering Lab., Idaho Falls, ID (United States). Feb 1996. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96008981. Source: OSTI; NTIS; INIS; GPO Dep.

This report evaluates the capabilities of the United States Department of Energy's (DOE's) existing and proposed facilities to treat 52 commercially generated low-level radioactive mixed (LLMW) waste streams that were previously identified as being difficult-to-treat using commercial treatment capabilities. The evaluation was performed by comparing the waste matrix and hazardous waste codes for the commercial LLMW streams with the waste acceptance criteria of the treatment facilities, as identified in the following DOE databases: Mixed Waste Inventory Report, Site Treatment Plan, and Waste Stream and Technology Data System. DOE facility personnel also reviewed the list of 52 commercially generated LLMW streams and provided their opinion on whether the wastes were technically acceptable at their facilities, setting aside possible administrative barriers. The evaluation tentatively concludes that the DOE is likely to have at least one treatment facility (either existing or planned) that is technically compatible for most of these difficult-to-treat commercially generated LLMW streams. This conclusion is tempered, however, by the limited amount of data available on the commercially generated LLMW streams, by the preliminary stage of planning for some of the proposed DOE treatment facilities, and by the need to comply with environmental statutes such as the Clean Air Act.

794 (DOE/LLW–236) **Comparison of low-level waste disposal programs of DOE and selected international countries.** Meagher, B.G. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Cole, L.T. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1996. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96013299. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to examine and compare the approaches and practices of selected countries for disposal of low-level radioactive waste (LLW) with those of the US Department of Energy (DOE). The report addresses the programs for disposing of wastes into engineered LLW disposal facilities and is not intended to address in-situ options and practices associated with environmental restoration activities or the management of mill tailings and mixed LLW. The countries chosen for comparison are France, Sweden, Canada, and the United Kingdom. The countries were selected as typical examples of the LLW programs which have evolved under differing technical constraints, regulatory requirements, and political/social systems. France was the first country to demonstrate use of engineered structure-type disposal facilities. The UK has been actively disposing of LLW since 1959. Sweden has been disposing of LLW since 1983 in an intermediate-depth disposal facility rather than a near-surface disposal facility. To date, Canada has been storing its LLW but will soon begin operation of Canada's first demonstration LLW disposal facility.

795 (DOE/LLW–8843-91-1) **Managing commercial low-level radioactive waste beyond 1992: Issues and potential problems of temporary storage.** Kerr, T.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96005884. Source: OSTI; NTIS; INIS; GPO Dep.

In accordance with the Low-Level Radioactive Waste Policy Amendments Act of 1985, States will become responsible for managing low-level radioactive waste, including mixed waste, generated within their borders as of January 1, 1993. In response to this mandate, many States and compact regions have made substantial progress toward establishing new disposal capacity for these wastes. While this progress is noteworthy, many circumstances can adversely affect States' abilities to meet the 1993 deadline, and many States have indicated that they are considering other waste management options in order to fulfill their responsibilities beyond 1992. Among the options that States are considering for the interim management of low- level radioactive waste is temporary storage. Temporary storage may be either short term or long term and may be at a centralized temporary storage facility provided by the State or a contractor, or may be at the point of generation or collection. Whether States choose to establish a centralized temporary storage facility or choose to rely on generators or brokers to provide additional and problem areas that must be addressed and resolved. Areas with many potential issues associated with the temporary storage of waste include: regulations, legislation, and policy and implementation guidance; economics; public participation; siting, design, and construction; operations; and closure and decommissioning.

796 (DOE/LLW–11026-94-1) **Low-level radioactive waste disposal technologies used outside the United States.** Templeton, K.J.; Mitchell, S.J.; Molton, P.M.; Leigh, I.W. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96007406. Source: OSTI; NTIS; INIS; GPO Dep.

Low-level radioactive waste (LLW) disposal technologies are an integral part of the waste management process. In the United States, commercial LLW disposal is the responsibility of the State or groups of States (compact regions). The United States defines LLW as all radioactive waste that is not classified as spent nuclear fuel, high- level radioactive waste, transuranic waste, or by-product material as defined in Section II(e)(2) of the Atomic Energy Act. LLW may contain some long-lived components in very low concentrations. Countries outside the United States, however, may define LLW differently and may use different disposal technologies. This paper outlines the LLW disposal technologies that are planned or being used in Canada, China, Finland, France, Germany, Japan, Sweden, Taiwan, and the United Kingdom (UK).

797 (DOE/LLW–96007139) **LLW Notes: Volume 10, Number 3.** USDOE, Washington, DC (United States); Afton Associates, Inc., Washington, DC (United States). Apr 1995. 32p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96007139. Source: OSTI; NTIS; INIS.

The Low-Level Radioactive Waste Forum is an association of state and compact representatives, appointed by governors and compact commissions, established to facilitate state and compact implementation of the Low-Level Radioactive Waste Policy Act of 1980 and the Low-Level Radioactive Waste Policy Amendments Act of 1985 and to promote the objectives of low-level radioactive waste regional compacts. The LLW Forum provides an opportunity for state and compact officials to share information with one another and to exchange views with officials of federal agencies and other interested parties.

Sponsored by USDOE, Washington, DC (United States). Order Number DE96013498. Source: OSTI; INIS; NTIS; GPO Dep.

This is a publication of the Low-Level Radioactive Waste Forum Participants. The topics of the publication include DOE policy, state concerns and activities, court hearings and decisions, federal agency activities, US NRC waste management function reorganization, low-level radioactive waste storage and compaction, and US NRC rulemaking and hearings.

804 (DOE/LLW–96013499) **Low-Level Waste Forum notes and summary reports for 1994. Volume 9, Number 3, May-June 1994.** Afton Associates, Inc., Washington, DC (United States). Jun 1994. 41p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013499. Source: OSTI; NTIS; INIS; GPO Dep.

This issue includes the following articles: Vermont ratifies Texas compact; Pennsylvania study on rates of decay for classes of low-level radioactive waste; South Carolina legislature adjourns without extending access to Barnwell for out-of-region generators; Southeast Compact Commission authorizes payments for facility development, also votes on petitions, access contracts; storage of low-level radioactive waste at Rancho Seco removed from consideration; plutonium estimates for Ward Valley, California; judgment issued in Ward Valley lawsuits; Central Midwest Commission questions court's jurisdiction over surcharge rebates litigation; Supreme Court decides commerce clause case involving solid waste; parties voluntarily dismiss Envirocare case; appellate court affirms dismissal of suit against Central Commission; LLW Forum mixed waste working group meets; US EPA Office of Radiation and Indoor Air rulemakings; EPA issues draft radiation site cleanup regulation; EPA extends mixed waste enforcement moratorium; and NRC denies petition to amend low-level radioactive waste classification regulations.

805 (DOE/LLW–96013500) **Low-Level Waste Forum notes and summary reports for 1994. Volume 9, Number 4, July 1994.** Afton Associates, Inc., Washington, DC (United States). Jul 1994. 37p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013500. Source: OSTI; NTIS; INIS; GPO Dep.

This issue includes the following articles: Federal Facility Compliance Act Task Force forms mixed waste workgroup; Illinois Department of Nuclear Safety considers construction of centralized storage facility; Midwest Commission agrees on capacity limit, advisory committee; EPA responds to California site developer's queries regarding application of air pollutant standards; county-level disqualification site screening of Pennsylvania complete; Texas Compact legislation introduced in US Senate; Generators ask court to rule in their favor on surcharge rebates lawsuit; Vermont authority and Battelle settle wetlands dispute; Eighth Circuit affirms decision in Nebraska community consent lawsuit; Nebraska court dismisses action filed by Boyd County local monitoring committee; NC authority, Chem-Nuclear, and Stowe exonerated; Senator Johnson introduces legislation to transfer Ward Valley site; Representative Dingell writes to Clinton regarding disposal of low-level radioactive waste; NAS committee on California site convenes; NRC to improve public petition process; NRC releases draft proposed rule on criteria for decontamination and closure of NRC-licensed facilities; and EPA names first environmental justice federal advisory council.

806 (DOE/MC/27346–5099) **Analysis of international efforts in energy research and development.** Rezaiyan, A.J.; Gill, R.T. K and M Engineering and Consulting Corp., Washington, DC (United States). Sep 1995. 180p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-90MC27346. Order Number DE96000630. Source: OSTI; NTIS; INIS; GPO Dep.

Research and experimental development comprise innovative and creative work undertaken systematically to increase the stock of knowledge of science, engineering, and society. This knowledge reserve is used to improve living conditions and standards, including economic growth. Research and development (R&D) expenditures are useful measures of the scale and direction of technological innovation within a country, industry, or scientific field. Administrators concerned with economic growth and performance rely on R&D statistics as one possible type of indicator of technological change. R&D statistics are an essential tool in many government programs and evaluations (OECD 1993). The objective of the analysis was to identify and evaluate R&D funding sources, levels, and trends in the energy sectors of selected industrialized countries (Australia, Belgium, Canada, Denmark, Finland, France, Germany, Italy, Japan, Netherlands, Norway, Sweden, Switzerland, United Kingdom, United States) and the European Union (EU). Fossil fuel technologies, particularly fuel cells and advanced gas turbines, were the focus of the analysis, whose results are presented in this report.

807 (DOE/MC/28245–5043) **Soil treatment to remove uranium and related mixed radioactive heavy metal contaminants. Quarterly report, January–March 1995.** Atomic Energy of Canada Ltd., Chalk River, ON (Canada). May 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC28245. Order Number DE96000574. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to design and develop a physico- chemical treatment process for the removal of uranium and heavy metals from contaminated soil to achieve target contamination levels below 35 pCi/g of soil and a target for non-radioactive heavy metals below concentration levels permissible for release of the soil. Ex- situ pilot-scale soil decontamination and leachate treatment test using Chalk River Chemical Pit soil are nearing completion. Soil decontamination tests using Fernald Incinerator Area soil originally scheduled for February 1995 was postponed to

May 1995 as result of unexpected delays in the preparation of two drums of soils.

808 (DOE/MC/29105-96/CO563) **VAC*TRAX - Thermal desorption for mixed wastes.** McElwee, M.J.; Palmer, C.R. Rust Federal Services, Inc., Anderson, SC (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29105. (CONF-9510108-12: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003462. Source: OSTI; NTIS; INIS; GPO Dep.

The patented VAC*TRAX process was designed in response to the need to remove organic constituents from mixed waste, waste that contains both a hazardous (RCRA or TSCA regulated) component and a radioactive component. Separation of the mixed waste into its hazardous and radioactive components allows for ultimate disposal of the material at existing, permitted facilities. The VAC*TRAX technology consists of a jacketed vacuum dryer followed by a condensing train. Solids are placed in the dryer and indirectly heated to temperatures as high as 260°C, while a strong vacuum (down to 50 mm Hg absolute pressure) is applied to the system and the dryer is purged with a nitrogen carrier gas. The organic contaminants in the solids are thermally desorbed, swept up in the carrier gas and into the condensing train where they are cooled and recovered. The dryer is fitted with a filtration system that keeps the radioactive constituents from migrating to the condensate. As such, the waste is separated into hazardous liquid and radioactive solid components, allowing for disposal of these streams at a permitted incinerator or a radioactive materials landfill, respectively. The VAC*TRAX system is designed to be highly mobile, while minimizing the operational costs with a simple, robust process. These factors allow for treatment of small waste streams at a reasonable cost. This paper describes the VAC*TRAX thermal desorption process, as well as results from the pilot testing program. Also, the design and application of the full-scale treatment system is presented. Materials tested to date include spiked soil and debris, power plant trash and sludge contaminated with solvents, PCB contaminated soil, solvent-contaminated uranium mill-tailings, and solvent and PCB-contaminated sludge and trash. Over 70 test runs have been performed using the pilot VAC*TRAX system, with more than 80% of the tests using mixed waste as the feed material.

809 (DOE/MC/29107-96/CO567) **Development studies of a novel wet oxidation process.** Rogers, T.W.; Dhooge, P.M. Delphi Research, Inc., Albuquerque, NM (United States). 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29107. (CONF-9510108-11: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003459. Source: OSTI; NTIS; INIS; GPO Dep.

Many DOE waste streams and remediates contain complex and variable mixtures of organic compounds, toxic metals, and radionuclides. These materials are often dispersed in organic or inorganic matrices, such as personal protective equipment, various sludges, soils, and water. Incineration and similar combustive processes do not appear to be viable options for treatment of these waste streams due to various considerations. There is a need for non-combustion processes with a wide application range to treat the large majority of these waste forms. The non-combustion process should also be safe, effective, cost-competitive, permit-able, and preferrably mobile. This paper describes the DETOX process of organic waste oxidation.

810 (DOE/MC/29107-5046) **Development studies for a novel wet oxidation process. Phase 2.** Delphi Research, Inc., Albuquerque, NM (United States). Jul 1994. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29107. Order Number DE96000587. Source: OSTI; NTIS; INIS; GPO Dep.

DETOX^{SM} is a catalyzed wet oxidation process which destroys organic materials in an acidic water solution of iron at 373 to 473 K. The solution can be used repeatedly to destroy great amounts of organic materials. Since the process is conducted in a contained vessel, air emissions from the process can be well controlled. The solution is also capable of dissolving and concentrating many heavy and radioactive metals for eventual stabilization and disposal. The Phase 2 effort for this project is site selection and engineering design for a DETOX demonstration unit. Site selection was made using a set of site selection criteria and evaluation factors. A survey of mixed wastes at DOE sites was conducted using the Interim Mixed Waste Inventory Report. Sites with likely suitable waste types were identified. Potential demonstration sites were ranked based on waste types, interest, regulatory needs, scheduling, ability to provide support, and available facilities. Engineering design for the demonstration unit is in progress and is being performed by Jacobs Applied Technology. The engineering design proceeded through preliminary process flow diagrams (PFDs), calculation of mass and energy balances for representative waste types, process and instrumentation diagrams (P and IDs), preparation of component specifications, and a firm cost estimate for fabrication of the demonstration unit.

811 (DOE/MC/29249-96/CO574) **Electromagnetic mixed waste processing system for asbestos decontamination.** Kasevich, R.S.; Vaux, W.G.; Nocito, T. KAI Technologies, Inc., Portsmouth, NH (United States). 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-94MC29249. (CONF-9510108-15: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003464. Source: OSTI; NTIS; INIS; GPO Dep.

DOE sites contain a broad spectrum of asbestos materials (cloth, pipe lagging, sprayed insulation and other substances) which are contaminated with a combination of hazardous and radioactive wastes due to its use during the development of the U.S. nuclear weapons complex. These wastes consist of cutting oils, lubricants, solvents, PCB's, heavy metals and radioactive contaminants. The radioactive contaminants are the activation, decay and fission products of DOE operations. The asbestos must be converted by removing and separating the hazardous and radioactive materials to prevent the formation of mixed wastes and to allow for both sanitary disposal and effective decontamination. Currently, no technology exists that can meet these sanitary and other objectives.

812 (DOE/MC/29249-4074) **Electromagnetic mixed-waste processing system for asbestos decontamination.** KAI Technologies, Inc., Woburn, MA (United States). Apr 1995. 136p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-94MC29249. Order Number DE95009720. Source: OSTI; NTIS; INIS; GPO Dep.

The first phase of a program to develop and demonstrate a cost-effective, integrated process for remediation of asbestos-containing material that is contaminated with organics, heavy metals, and radioactive compounds was successfully completed. Laboratory scale tests were performed to demonstrate initial process viability for asbestos conversion, organics removal, and radionuclide and heavy metal removal. All success criteria for the laboratory tests were met. (1) Ohio DSI demonstrated greater than 99% asbestos conversion to amorphous solids using their commercial process. (2) KAI demonstrated 90% removal of organics from the asbestos suspension. (3) Westinghouse STC achieved the required metals removal criteria on a laboratory scale (e.g., 92% removal of uranium from solution, resin loadings of 0.6 equivalents per liter, and greater than 50% regeneration of resin in a batch test.) Using the information gained in the laboratory tests, the process was reconfigured to provide the basis for the mixed waste remediation system. An integrated process is conceptually developed, and a Phase 2 program plan is proposed to provide the bench-scale development needed in order to refine the design basis for a pilot processing system.

813 (DOE/MC/30171–96/CO581) **Catalytic extraction processing of contaminated scrap metal.** Griffin, T.P.; Johnston, J.E.; Payea, B.M.; Zeitoon, B.M. Molten Metal Technology, Inc., Waltham, MA (United States). 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30171. (CONF-9510108–3: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003452. Source: OSTI; NTIS; INIS; GPO Dep.

Molten Metal Technology was awarded a contract to demonstrate the applicability of the Catalytic Extraction Process, a proprietary process that could be applied to US DOE's inventory of low level mixed waste. This paper is a description of that technology, and included within this document are discussions of: (1) Program objectives, (2) Overall technology review, (3) Organic feed conversion to synthetic gas, (4) Metal, halogen, and transuranic recovery, (5) Demonstrations, (6) Design of the prototype facility, and (7) Results.

814 (DOE/MC/30173–96/CO584) **Waste Inspection Tomography (WIT).** Bernardi, R.T. Bio-Imaging Research, Inc., Lincolnshire, IL (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30173. (CONF-9510108–9: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003455. Source: OSTI; NTIS; INIS; GPO Dep.

Waste Inspection Tomography (WIT) provides mobile semi-trailer mounted nondestructive examination (NDE) and assay (NDA) for nuclear waste drum characterization. WIT uses various computed tomography (CT) methods for both NDE and NDA of nuclear waste drums. Low level waste (LLW), transuranic (TRU), and mixed radioactive waste can be inspected and characterized without opening the drums. With externally transmitted x-ray NDE techniques, WIT has the ability to identify high density waste materials like heavy metals, define drum contents in two- and three-dimensional space, quantify free liquid volumes through density and x-ray attenuation coefficient discrimination, and measure drum wall thickness. With waste emitting gamma-ray NDA techniques, WIT can locate gamma emitting radioactive sources in two- and three-dimensional space, identify gamma emitting isotopic species, identify the external activity levels of emitting gamma-ray sources, correct for waste matrix attenuation, provide internal activity approximations, and provide the data needed for waste classification as LLW or TRU. The mobile feature of WIT allows inspection technologies to be brought to the nuclear waste drum storage site without the need to relocate drums for safe, rapid, and cost-effective characterization of regulated nuclear waste. The combination of these WIT characterization modalities provides the inspector with an unprecedented ability to non-invasively characterize the regulated contents of waste drums as large as 110 gallons, weighing up to 1,600 pounds. Any objects that fit within these size and weight restrictions can also be inspected on WIT, such as smaller waste bags and drums that are five and thirty-five gallons.

815 (DOE/MC/30361–95/C0498) **Development of components for waste management systems using aerospace technology.** Rousar, D. (Aerojet-General Corp., Sacramento, CA (United States)); Young, M.; Sieger, A. Aerojet-General Corp., Sacramento, CA (United States); Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-93MC30361 ; AC04-94AL85000. (CONF-9510219–1: 46. international astronautical congress, Oslo (Norway), 2-6 Oct 1995). Order Number DE95017866. Source: OSTI; NTIS; GPO Dep.

An aerospace fluid management technology called "platelets" has been applied to components that are critical to the economic operation of waste management systems. Platelet devices are made by diffusion bonding thin metal plates which have been etched with precise flow passage circuitry to control and meter fluid to desired locations. Supercritical water oxidation (SCWO) is a promising waste treatment technology for safe and environmentally acceptable destruction of hazardous wastes. Performance and economics of current SCWO systems are limited by severe salt deposition on and corrosion of the reactor walls. A platelet transpiring-wall reactor has been developed that provides a protective layer of water adjacent to the reactor walls which prevents salt deposition and corrosion. Plasma arc processing is being considered as a method for stabilizing mixed radioactive wastes. Plasma arc torch systems currently require frequent shutdown to replace failed electrodes and this increases operating costs. A platelet electrode design was developed that has more than 10 times the life of conventional electrodes. It has water cooling channels internal to the electrode wall and slots through the wall for injecting gas into the arc.

816 (DOE/MC/30361–4087) **Platelet-cooled plasma arc torch. Final report.** Aerojet-General Corp., Sacramento, CA (United States). Oct 1995. 210p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-93MC30361. Order Number DE95009734. Source: OSTI; NTIS; INIS; GPO Dep.

In this 12-month program sponsored by the DOE Morgantown Energy Technology Center, Aerojet designed, fabricated, and tested six platelet cooled electrodes for a Retech 75T (90 MW) plasma arc torch capable of processing mixed radioactive waste. Two of the electrodes with gas injection through the electrode wall demonstrated between eight and forty times the life of conventional water cooled electrodes. If a similar life increase can be produced in a 1 Mw size electrode, then electrodes possessing thousands, rather than hundreds, of hours of life will be available to

DOE for potential application to mixed radioactive waste processing.

817 (DOE/MC/31188–96/CO629) **Mixed waste treatment using the ChemChar thermolytic detoxification technique.** Kuchynka, D. Mirage Systems, Sunnyvale, CA (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC31188. (CONF-9510108–43: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003735. Source: OSTI; NTIS; INIS; GPO Dep.

The diversity of mixed waste matrices contained at Department of Energy sites that require treatment preclude a single, universal treatment technology capable of handling sludges, solids, heterogeneous debris, aqueous and organic liquids and soils. Versatility of the treatment technology, volume reduction and containment of the radioactive component of the mixed waste streams are three criteria to be considered when evaluating potential treatment technologies. The ChemChar thermolytic detoxification process being developed under this R and D contract is a thermal, chemically reductive technology that converts the organic portion of a mixed waste stream to an energy-rich synthesis gas while simultaneously absorbing volatile inorganic species (metals and acid gases) on a macroporous, carbon-based char. The latter is mixed with the waste stream prior to entering the reactor. Substoichiometric amounts of oxidant are fed into the top portion of the cylindrical reactor generating a thin, radial thermochemical reaction zone. This zone generates all the necessary heat to promote the highly endothermic reduction of the organic components in the waste in the lower portion of the reactor, producing, principally, hydrogen and carbon monoxide. The solid by-product is a regenerated carbon char that, depending on the inorganic loading, is capable for reuse. The in situ scrubbing of contaminants by the char within the reactor coupled with a char filter for final polishing produce an exceptionally clean synthesis gas effluent suitable for on-site generation of heat, steam or electricity. Despite the elevated temperatures in the thermochemical reaction zone, the reductive nature of the process precludes formation of nitrogen oxides and halogenated organic compound by-products.

818 (DOE/MC/31189–5035) **Recovery and removal of mercury from mixed wastes. Final report, September 1994–June 1995.** Sutton, W.F.; Weyand, T.E.; Koshinski, C.J. Mercury Recovery Services, New Brighton, PA (United States). Jun 1995. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-94MC31189. Order Number DE96000557. Source: OSTI; NTIS; INIS; GPO Dep.

In recognition of the major environmental problem created by mercury contamination of wastes and soils at an estimated 200,000 sites along US natural gas and oil pipelines and at a number of government facilities, including Oak Ridge, Savannah River, Hanford, and Rocky Flats, the US Department of Energy (DOE) is seeking an effective and economical process for removing mercury from various DOE waste streams in order to allow the base waste streams to be treated by means of conventional technologies. In response to the need for Unproved mercury decontamination technology, Mercury Recovery Services (MRS) has developed and commercialized a thermal treatment process for the recovery of mercury from contaminated soils and industrial wastes. The objectives of this program were to: demonstrate the technical and economic feasibility of the MRS process to successfully remove and recover mercury from low-level mixed waste containing mercury compounds (HgO, HgS, $HgCl_2$) and selected heavy metal compounds (PbO, CdO); determine optimum processing conditions required to consistently reduce the residual total mercury content to 1 mg/kg while rendering the treated product non-toxic as determined by TCLP methods; and provide an accurate estimate of the capital and operating costs for a commercial processing facility designed specifically to remove and recovery mercury from various waste streams of interest at DOE facilities. These objectives were achieved in a four-stage demonstration program described within with results.

819 (DOE/MC/31388–5030) **Environmental management technology demonstration and commercialization: Tasks 2, 3, 4, and 8. Semiannual report, October 1994–March 1995.** Hawthorne, S.B.; Ness, R.O. Jr.; Nowok, J.W.; Pflughoeft-Hassett, D.; Hurley, J.P.; Steadman, E.N. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. May 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-94MC31388. Order Number DE96000567. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of the Environmental Management program at the Energy and Environmental Research Center (EERC) is to develop, demonstrate, and commercialize technologies that address the environmental management needs of contaminated sites, including characterization, sensors, and monitoring; low-level mixed waste processing; material disposition technology; improved waste forms; in situ containment and remediation; and efficient separation technologies for radioactive wastes. Task 2 is the extraction and analysis of pollutant organics from contaminated solids using off-line supercritical fluid extraction (SFE) and on-line SFE-infrared spectroscopy. Task 3, pyrolysis of plastics, has as its objectives to develop a commercial process to significantly reduce the volume of mixed-plastics-paper-resin waste contaminated with low-level radioactive material; concentrate contaminants in a collectible form; and determine the distribution and form of contaminants after pyrolysis of the mixed waste. Task 4, stabilization of vitrified wastes, has as its objectives to (1) demonstrate a waste vitrification procedure for enhanced stabilization of waste materials and (2) develop a testing protocol to understand the long-term leaching behavior of the stabilized waste form. The primary objective of Task 8, Management and reporting, is coordination of this project with other programs and opportunities. In addition, management oversight will be maintained to ensure that tasks are completed and coordinated as planned and that deliverables are submitted in a timely manner. Accomplishments to date is each task are described. 62 refs.

820 (DOE/METC–96/1021-Vol.1) **Proceedings of the environmental technology through industry partnership conference. Volume 1.** Kothari, V.P. USDOE Morgantown Energy Technology Center, WV (United States). Oct 1995. 312p. Sponsored by USDOE, Washington, DC (United States). (CONF-9510108–Vol.1: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96000551. Source: OSTI; NTIS; INIS; GPO Dep.

The overall objective of this conference was to review the latest environmental and waste management technologies being developed under the sponsorship of METC. The focus of this conference was also to address the accomplishments and barriers affecting private sector, and lay the groundwork for future technology development initiatives and opportunities. 26 presentations were presented in: Mixed waste characterization, treatment, and disposal; Contaminant plume containment and remediation; and Decontamination and decommissioning. In addition there were 10 Focus Area presentations, 31 Poster papers covering all Focus Areas, and two panel discussions on: Mixed waste characterization, treatment, and disposal issues; and the application, evaluation, and acceptance of in-situ and ex-situ plume remediation technologies. Volume 1 contains the keynote address, 15 poster papers, 5 papers on mixed waste characterization, treatment, and disposal, and 13 papers on decontamination and decommissioning. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

821 (DOE/METC-96/1021-Vol.2) **Proceedings of the environmental technology through industry partnership conference. Volume 2.** Kothari, V.P. USDOE Morgantown Energy Technology Center, WV (United States). Oct 1995. 266p. Sponsored by USDOE, Washington, DC (United States). (CONF-9510108-Vol.2: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96000552. Source: OSTI; NTIS; INIS; GPO Dep.

The overall objective of this conference was to review the latest environmental and waste management technologies being developed under the sponsorship of METC. The focus of this conference was also to address the accomplishments and barriers affecting private sector, and lay the groundwork for future technology development initiatives and opportunities. 26 presentations were presented in: Mixed waste characterization, treatment, and disposal; Contaminant plume containment and remediation; and Decontamination and decommissioning. In addition there were 10 Focus Area presentations, 31 Poster papers covering all Focus Areas, and two panel discussions on: Mixed waste characterization, treatment, and disposal issues; and the Application, evaluation, and acceptance of in-situ and ex-situ plume remediation technologies. Volume 2 contains 16 papers in a poster session and 8 papers in the contaminant plume containment and remediation and landfill stabilization Focus Areas. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

822 (DOE/MWIP-26) **Alternatives to incineration. Technical area status report.** Schwinkendorf, W.E. (BDM Federal, Inc., Albuquerque, NM (United States)); McFee, J.; Devarakonda, M.; Nenninger, L.L.; Fadullon, F.S.; Donaldson, T.L.; Dickerson, K. Oak Ridge National Lab., TN (United States). Apr 1995. 474p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95015684. Source: OSTI; NTIS; INIS; GPO Dep.

Recently, the DOE's Mixed Waste Integrated Program (MWIP) (superseded by the Mixed Waste Focus Area) initiated an evaluation of alternatives to incineration to identify technologies capable of treating DOE organically contaminated mixed wastes and which may be more easily permitted. These technologies have the potential of alleviating stakeholder concerns by decreasing off-gas volurties and the associated emissions of particulates, volatilized metals and radionuclides, PICs, NO_x, SO_x, and recombination products (dioxins and furans). Ideally, the alternate technology would be easily permitted, relatively omnivorous and effective in treating a variety of wastes with varying constituents, require minimal pretreatment or characterization, and be easy to implement. In addition, it would produce secondary waste stream volumes significantly smaller than the original waste stream, and would minimize the environmental health and safety effects on workers and the public. The purpose of this report is to provide an up-to-date (as of early 1995) compendium of iternative technologies for designers of mixed waste treatment facilities, and to identify lternate technologies that may merit funding for further development. Various categories of non-thermal and thermal technologies have been evaluated and are summarized in Table ES-1. Brief descriptions of these technologies are provided in Section 1.7 of the Introduction. This report provides a detailed description of approximately 30 alternative technologies in these categories. Included in the report are descriptions of each technology; applicable input waste streams and the characteristics of the secondary, or output, waste streams; the current status of each technology relative to its availability for implementation; performance data; and costs. This information was gleaned from the open literature, governments reports, and discussions with principal investigators and developers.

823 (DOE/OR/21548-584) **Engineering evaluation/cost analysis for the proposed removal action at the Southeast Drainage near the Weldon Spring Site, Weldon Spring, Missouri.** MK-Ferguson Co., St. Charles, MO (United States); Argonne National Lab., IL (United States). Aug 1996. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-86OR21548 ; W-31109-ENG-38. Order Number DE96014288. Source: OSTI; NTIS; INIS; GPO Dep.

The engineering evaluation/cost analysis (EE/CA) has been prepared to support the proposed removal of contaminated sediment from selected portions of the Southeast Drainage as part of cleanup activities being conducted at the Weldon Spring site in St. Charles County, Missouri, by the U.S. Department of Energy (DOE). The cleanup activities are conducted in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, incorporating the values of the National Environmental Policy Act (NEPA). The Weldon Spring site is located near the town of Weldon Spring, about 48 km (30 mi) west of St. Louis. It consists of two noncontiguous areas: the chemical plant area and a limestone quarry about 6.4 km (4 mi) south-southwest of the chemical plant area. The Southeast Drainage is a natural 2.4-km (1.5-mi) channel that carries surface runoff to the Missouri River from the southern portion of the chemical plant area and a small portion of the ordnance works area (part of the Weldon Spring Training Area) south of the groundwater divide. The drainage became contaminated as a result of past activities of the U.S. Army and the DOE (and its predecessors).

824 (DOE/RF/00467-T1) **U.S. Army Engineer Waterways Experiment Station (WES) support to Department of Energy Rocky Flats Facility (DOE RF) saltcrete processing. Progress report, October 1-December 31, 1993.** Army Engineer Waterways Experiment Station, Vicksburg, MS (United States). 24 Jan 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI34-93RF00467. Order Number DE96013635. Source: OSTI; NTIS; GPO Dep.

Accomplishments during this report period for waste cementation/processing operations are summarized. The principal effort of this report period was a review of two documents. These were (1) Sampling and Analysis Plan for Saltcrete Process Inputs and (2) Waste Treatment Spray

Dryer and Saltcrete Process. The WES review report for the latter of these two documents comprises the bulk of this paper.

825 (DOE/RF/00467–T3) **U.S. Army Engineer Waterways Experiment Station (WES) support to Department of Energy Rocky Flats Facility (DOE RF) saltcrete processing. Progress report, April 1–June 30, 1994.** Army Engineer Waterways Experiment Station, Vicksburg, MS (United States). 26 Jul 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI34-93RF00467. Order Number DE96013637. Source: OSTI; NTIS; GPO Dep.

Accomplishments during this report period for waste cementation/processing operations are summarized. During this report period, the team completed an important site visit to the Rocky Flats Facility (RF). This visit focused on extensive interaction with DOE contract personnel about microstructural and phase characterization of saltcrete. A copy of the trip report prepared by the WES team is enclosed. The team prepared a document detailing procedures for sample preparation and analysis to enhance the usefulness of results of the forensic work underway at RF. A copy of this document is enclosed. A proposal was prepared for additional short-term tasks to contribute significantly to gaining the most benefit from data gathered during forensic analyses of saltcrete, and waste-treatment studies, by EG and G. A copy of this proposal was forwarded to RF at the end of May, and it is included.

826 (DOE/RF/00467–T5) **U.S. Army Engineer Waterways Experiment Station (WES) support to Department of Energy Rocky Flats Facility (DOE RF) saltcrete processing. Progress report, October 1–December 31, 1994.** Army Engineer Waterways Experiment Station, Vicksburg, MS (United States). 27 Jan 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI34-93RF00467. Order Number DE96013639. Source: OSTI; NTIS; GPO Dep.

This report summarizes work authorized for technical and scientific support to waste cementation and saltcrete processing operations. During this report period, tasks described in amendment M003 were initiated, some were completed, and an additional task not listed in M003 also was completed at the request of DOE RF. Summaries of task-specific activities are in four enclosures to this progress report. Other activities during this quarter included negotiation and initiation of amendment M004, to extend the period of performance and continue WES assistance to DOE RF. The four enclosures are: continuing support to waste cementation and saltcrete operations at DOE Rocky Flats Facility; review of "Analyses of saltcrete"; review of Connell, et al "Saltcrete evaluation" report dated August 16, 1993; and scoping study of simulated saltcrete.

827 (DOE/RF/00467–T9) **U.S. Army Engineer Waterways Experiment Station (WES) support to Department of Energy Rocky Flats Facility (DOE RFO) saltcrete processing. Progress report, April 15–September 30, 1995.** Army Engineer Waterways Experiment Station, Vicksburg, MS (United States). 29 Apr 1996. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI34-93RF00467. Order Number DE96013643. Source: OSTI; NTIS; GPO Dep.

This report summarizes work authorized for technical and scientific support to waste cementation and saltcrete processing operations. During this report period, the remaining tasks described in the agreement were completed and the project was closed. Accomplishments are summarized. The bulk of this report is a paper entitled "Salt related expansion reactions in portland-cement-based waste forms."

828 (DOE/RL–93-64-Rev.2) **Sodium Dichromate expedited response action assessment. Revision 2.** USDOE, Washington, DC (United States). May 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95012047. Source: OSTI; NTIS; INIS; GPO Dep.

The Washington State Department of Ecology (lead agency) and the US Environmental Protection Agency (support agency) recommended that the US Department of Energy perform an expedited response action (ERA) for the Sodium Dichromate Barrel Disposal Landfill. The ERA goal is to reduce the potential for any contaminant migration from the landfill to the soil column, groundwater, and the Columbia River. Because the Sodium Dichromate Barrel Disposal Landfill is the only waste site within the operable unit, this removal action is the final remediation of the 100-IU-4 Operable Unit. A total of 144 anomalies and 11 subsurface zones were inspected and excavated. various homestead debris (wire fencing, wooden posts, and other miscellaneous debris) and about 5,000 crushed barrels were removed and transported to the Hanford Central Landfill. Besides containing crushed drums, four zones included some loose asbestos, one crushed drum full of asbestos, two 5-gal roofing tar cans, a 12-volt vehicle battery, one empty paint can, and used oil and grease containers (about 0.5 gal total). These materials were placed in three 55-gal drums and sent to an offsite hazardous waste disposal facility permitted to receive hazardous materials. Because the cleanup activities removed all hazardous substances, the site is clean and available for unrestricted land use.

829 (DOE/RL–95-15) **1995 Report on Hanford site land disposal restrictions for mixed waste.** Black, D.G. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 252p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011574. Source: OSTI; NTIS; INIS; GPO Dep.

This report was submitted to meet the requirements of Hanford Federal Facility Agreement and Consent Order Milestone M-26-01E. This milestone requires the preparation of an annual report that covers characterization, treatment, storage, minimization, and other aspects of land disposal restricted mixed waste at the Hanford Site. The U.S. Department of Energy, its predecessors, and contractors at the Hanford Site were involved in the production and purification of nuclear defense materials from the early 1940s to the late 1980s. These production activities have generated large quantities of liquid and solid radioactive mixed waste. This waste is subject to regulation under authority of both the Resource Conservation and Recovery Act of 1976 and Atomic Energy Act of 1954. This report covers mixed waste only. The Washington State Department of Ecology, U.S. Environmental Protection Agency, and U.S. Department of Energy have entered into an agreement, the Hanford Federal Facility Agreement and Consent Order (commonly referred to as the Tri-Party Agreement) to bring the Hanford Site operations into compliance with dangerous waste regulations. The Tri-Party Agreement required development of the original land disposal restrictions (LDRs) plan and its annual updates to comply with LDR requirements for radioactive mixed waste. This report is the fifth update of the plan first issued in 1990. Tri-Party Agreement negotiations completed in 1993 and approved in January 1994 changed and added many new milestones. Most of the changes were related to the Tank Waste Remediation System and these changes are incorporated into this report.

830 (DOE/RL–95-17-VOL.2) **Hanford Site annual dangerous waste report: Volume 2, Generator dangerous waste report, radioactive mixed waste.** USDOE Richland Operations Office, WA (United States). 1994. 331p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012348. Source: OSTI; NT.IS; INIS; GPO Dep.

This report contains information on radioactive mixed wastes at the Hanford Site. Information consists of shipment date, physical state, chemical nature, waste description, waste number, waste designation, weight, and waste designation.

831 (DOE/RL–95-17-Vol.3) **Hanford Site annual dangerous waste report: Volume 3, Part 2, Waste Management Facility report, dangerous waste.** USDOE Richland Operations Office, WA (United States). 1944. 223p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012350. Source: OSTI; NTIS; GPO Dep.

This report contains information on hazardous wastes at the Hanford Site. Information consists of shipment date, physical state, chemical nature, waste description, handling and containment vessel, waste number, waste designation and amount of waste.

832 (DOE/RL–95-17-Vol.3-Pt.1) **Hanford Site annual dangerous waste report: Volume 3, Part 1, Waste Management Facility report, dangerous waste.** USDOE Richland Operations Office, WA (United States). 1994. 225p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012349. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains information on hazardous wastes at the Hanford Site. Information consists of shipment date, physical state, chemical nature, waste description, handling method and containment vessel, waste number, waste designation, and amount of waste.

833 (DOE/RL–95-17-Vol.4) **Hanford Site annual dangerous waste report: Volume 4, Waste Management Facility report, Radioactive mixed waste.** USDOE Richland Operations Office, WA (United States). 1994. 445p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012451. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains information on radioactive mixed wastes at the Hanford Site. Information consists of shipment date, physical state, chemical nature, waste description, handling method and containment vessel, waste number, waste designation and amount of waste.

834 (DOE/RL–95-38) **Approach and plan for cleanup actions in the 100-FR-2 operable unit of the Hanford Site, Revision 0.** USDOE Richland Operations Office, WA (United States). Jun 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95017514. Source: OSTI; NTIS; INIS; GPO Dep.

A new administrative approach is being used to reach a cleanup decision for the 100-FR-2 Operable Unit. The unit, located at the 100-F Area, contains solid waste sites and is one of the remaining operable units scheduled for characterization and cleanup in the 100 Area. This Focus Package (1) describes the new approach and activities needed to reach a decision on cleanup actions for the 100-FR-2 Operable Unit and (2) invites public participation into the planning process. The previous approach included the production of a Work Plan, a Limited Field Investigation Report, a Qualitative Risk Assessment, a Focused Feasibility Study, and a Proposed Plan, all culminating in an interim action Record of Decision. Information gathered to date on other operable units allows the analgous site approach to be used on the 100-FR-2 Operable Unit, and therefore, a reduction in documentation preparation. The U.S. Environmental Protection Agency, Washington State Department of Ecology, and the U.S. Department of Energy (Tri-Party Agreement) believe that the new approach will save time and funding. In the new approach, the Work Plan has been condensed into this 12 page Focus Package. The Focus Package includes a summary of 100-F Area information, a list of waste sites in the 100-FR-2 Operable Unit, a summary of proposed work, and a schedule. The new approach will also combine the Limited Field Investigation and Qualitative Risk Assessment reports into the Focused Feasibility Study. The Focused Feasibility Study will analyze methods and costs to clean up waste sites. Consolidating the documents should reduce the time to complete the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) process by 16 months, compared to the previous approach.

835 (DOE/RL–95-46) **Soil washing pilot plant treatability test for the 100-DR-1 Operable Unit.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Sep 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96000281. Source: OSTI; NTIS; INIS; GPO Dep.

Large volumes of radionuclide contaminated soils remain as a result of past waste disposal practices at the Hanford Site. The amount of contaminated soils requiring remediation in the 100 Area could reach upwards of 10 million yd^3. The proposed plans for the first three source operable units (HR-1, BC-1, DR-1) describe the preferred remediation alternative as remove, treat "as appropriate" and dispose. Soil washing is an alternative that offers an appropriate treatment at a cost comparable to direct disposal. It is an alternative that reduces the problem through treatment, not just moves it to another location. This remediation approach is consistent with the mandate set forth by Congress to treat when possible. Based on results of this and other studies and current knowledge of the soils, soil washing could be applicable to as much as 50% of the contaminated soils in the 100 Area. In addition, one of the recommendations of this report is to continue investigating evolving technologies that could result in further volume reductions and possible recovery of radionuclides for resale.

836 (DOE/RL–96-18) **1995 Tier Two emergency and hazardous chemical inventory. Emergency Planning and Community Right-To-Know Act, Section 312.** USDOE Richland Operations Office, WA (United States). Mar 1996. 115p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96009667. Source: OSTI; NTIS; INIS; GPO Dep.

Tier Two reports are required as part of the Superfund compliance. The purpose is to provide state and local officials and the public with specific information on hazardous chemicals present at a facility during the past year. The facility is required to provide specific information on description, hazards, amounts, and locations of all hazardous materials. This report compiled such information for the Hanford Reservation.

837 (DOE/RL–96-19) **Mitigation action plan for liquid waste sites in the 100-BC-1, 100-DR-1, and 100-HR-1 units.** Weiss, S.G. USDOE Richland Operations Office, WA (United States). May 1996. 22p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013563. Source: OSTI; NTIS; INIS; GPO Dep.

A Record of Decision (ROD) was issued for remediation of waste sites in the 100-BC-1, 100-DR-1, and 100-HR-1 Operable Units in the 100 Area of the Hanford Site. This Mitigation Action Plan (MAP) explains how mitigation measures for these remedial activities will be planned and implemented. The new activities planned in the ROD are not anticipated to result in releases of hazardous substances and will minimize disturbance of currently undisturbed areas. However, certain actions required by the ROD may result in the redisturbance of areas of recovering vegetation. This MAP presents a strategy for limiting disturbances and identifies an opportunity for revegetating a previously disturbed site; the knowledge gained from this demonstration project can be applied to final revegetation of the rest of the remediated sites and sites disturbed during cleanup when remediation of an area is completed. This work will be conducted in coordination with the Natural Resource Trustees Council and Native American Tribes to help minimize impacts to natural resources and cultural resources from project activities and to restore the remediated sites to an appropriate level of habitat.

838 (DOE/RL–364162-1-Vol.1) **Solid waste operations complex W-113: Preliminary design report. Volume I.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Subcontract MJJ-SVV-364162. Order Number DE95010983. Source: OSTI; NTIS; INIS; GPO Dep.

This document is Volume I of a Preliminary Design Report (Title I) for the Solid Waste Retrieval Facilities-Phase I (Project W-113) at Hanford. It was prepared by Raytheon and BNFL Inc. and submitted to Westinghouse Hanford Company in January 1995. This volume provides a project overview and a discussion of the waste handling systems, the data acquisition and control systems, the building systems, and the site/building structure.

839 (DOE/RL–364162-1-Vol.3) **Solid waste operations complex W-113: Specifications. Preliminary design report. Volume III.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 403p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Subcontract MJJ-SVV-364162. Order Number DE95010980. Source: OSTI; NTIS; INIS; GPO Dep.

This document is Volume III of the Preliminary Design report for the Solid Waste Retrieval Facility at Hanford. The report was prepared by Raytheon and BNFL Inc. and submitted to Westinghouse Hanford Company in January 1995. This volume is a complete listing of the specifications for construction and the required material and equipment.

840 (DOE/RL–364162-1-Vol.4) **Solid Waste Operations Complex W-113: Project cost estimate. Preliminary design report. Volume IV.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Subcontract MJJ-SVV-364162. Order Number DE95010981. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains Volume IV of the Preliminary Design Report for the Solid Waste Operations Complex W-113 which is the Project Cost Estimate and construction schedule. The estimate was developed based upon Title 1 material take-offs, budgetary equipment quotes and Raytheon historical in-house data. The W-113 project cost estimate and project construction schedule were integrated together to provide a resource loaded project network.

841 (DOE/RL–364162-1-Vol.5) **Solid waste operations complex W-113: Engineering assessments and lists. Preliminary design report. Volume V.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 270p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Subcontract MJJ-SVV-364162. Order Number DE95010982. Source: OSTI; NTIS; INIS; GPO Dep.

This document is Volume V of the Preliminary Design Report for the Solid Waste Retrieval Facility at Hanford. It was prepared by Raytheon and BNFL Inc. and submitted to Westinghouse Hanford Company in January 1995. This volume contains the engineering assessments and lists (load list, instrument list, master equipment lists, et al).

842 (DOE/S–0118) **Pollution prevention program plan 1996.** USDOE Office of the Secretary, Washington, DC (United States). 1996. 72p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96011033. Source: OSTI; NTIS; INIS; GPO Dep.

This plan serves as the principal crosscutting guidance to Department of Energy (DOE) Headquarters, Operations Office, laboratory, and contractor management to fully implement pollution prevention programs within the DOE complex between now and 2000. To firmly demonstrate DOE's commitment to pollution prevention, the Secretary of Energy has established goals, to be achieved by December 31, 1999, that will aggressively reduce DOE's routine generation of radioactive, mixed, and hazardous wastes, and total releases and offsite transfers of toxic chemicals. The Secretary also has established sanitary waste reduction, recycling, and affirmative procurement goals. Site progress in meeting these goals will be reported annually to the Secretary in the Annual Report on Waste Generation and Waste Minimization Progress, using 1993 as the baseline year. Implementation of this plan will represent a major step toward reducing the environmental risks and costs associated with DOE operations.

843 (EGG-LLW–8843-91-2) **Performance assessments for near-surface low-level radioactive waste disposal facilities.** Kostelnik, K.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96007404. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of a performance assessment for a low-level radioactive waste (LLW) disposal facility is to determine the proposed facility's projected compliance with regulatory limits in terms of doses to the general public and to protect inadvertent intruders. A set of exposure scenarios must be evaluated for each of the various institutional phases of the facility; a quantitative evaluation must be performed for the most probable scenarios. Evaluation of the final conceptual model of the facility and site should involve the use of appropriate computer code and site-specific data. Code selection for a performance assessment should be based on code capabilities as well as on site-specific needs and characteristics. Generally, a single code will not be capable of simulating all relevant scenarios. A review of performance assessments for confirmation of regulatory compliance will be conducted by the NRC or the appropriate Agreement State regulatory agency. Performance assessment codes are tools for evaluating a proposed LLW disposal facility's regulatory compliance. This evaluation should objectively assess the physical properties of the facility and its environment. Calculations in support of this evaluation must be conservative yet realistic and they must also be technically defensible and supported by adequate data.

844 (EGG-LLW-8843-91-3) **Portland cement: A solidification agent for low-level radioactive waste.** McConnell, J.W. Jr. EG and G Idaho, Inc., Idaho Falls, ID (United States). Oct 1991. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96007405. Source: OSTI; NTIS; INIS; GPO Dep.

This bulletin discusses the solidification of waste streams using portland-type cement to provide the structural stability required by 10 CFR 61. Portland cement has been used in this role since early in the commercial nuclear program as a simple and inexpensive solidification medium for immobilization of radioactive wastes. Through the use of additives, most waste streams can be satisfactorily immobilized with portland cement. However, some problem waste streams can not be solidified with portland cement at this time, and those are discussed in this document.

845 (EGG-LLW-10135-92-1) **Managing commercial low-level radioactive waste beyond 1992: Transportation planning for a LLW disposal facility.** Quinn, G.J. (Wastren, Inc. (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96007407. Source: OSTI; NTIS; INIS; GPO Dep.

This technical bulletin presents information on the many activities and issues related to transportation of low-level radioactive waste (LLW) to allow interested States to investigate further those subjects for which proactive preparation will facilitate the development and operation of a LLW disposal facility. The activities related to transportation for a LLW disposal facility are discussed under the following headings: safety; legislation, regulations, and implementation guidance; operations-related transport (LLW and non-LLW traffic); construction traffic; economics; and public involvement.

846 (EGG-LLW-10135-92-2) **Commercial low-level radioactive waste transportation safety history.** Garcia, R.S. EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96007408. Source: OSTI; NTIS; INIS; GPO Dep.

An excellent safety record has been established for the transport of commercial low-level radioactive waste. By using the Radioactive Material Incident Report data base to evaluate transportation accidents involving commercial low-level radioactive waste, it was found that there have been only four transportation accidents involving the release of commercial low-level radioactive waste in the last 20 years. The accidents were minor, and the released materials were quickly repackaged. There has never been a radiologically related injury or death associated with a transportation accident involving commercial low-level radioactive waste.

847 (EGG-LLW-10135-92-3) **Impact of revised 10 CFR 20 on existing performance assessment computer codes used for LLW disposal facilities.** Leonard, P.R.; Seitz, R.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Apr 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96007409. Source: OSTI; NTIS; INIS; GPO Dep.

The US Nuclear Regulatory Commission (NRC) recently announced a revision to Chapter 10 of the Code of Federal Regulations, Part 20 (10 CFR 20) "Standards for Protection Against Radiation," which incorporates recommendations contained in Publications 26 and 30 of the International Commission on Radiological Protection (ICRP), issued in 1977 and 1979, respectively. The revision to 10 CFR 20 was also developed in parallel with Presidential Guidance on occupational radiation protection published in the Federal Register. Thus, this study concludes that the issuance of the revised 10 CFR 20 will not affect calculations using the computer codes considered in this report. In general, the computer codes and EPA and DOE guidance on which computer codes are based were developed in a manner consistent with the guidance provided in ICRP 26/30, well before the revision of 10 CFR 20.

848 (EGG-WM-11118) **Preliminary siting activities for new waste handling facilities at the Idaho National Engineering Laboratory.** Taylor, D.D.; Hoskinson, R.L.; Kingsford, C.O.; Ball, L.W. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1994. 500p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96003832. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho Waste Processing Facility, the Mixed and Low-Level Waste Treatment Facility, and the Mixed and Low-Level Waste Disposal Facility are new waste treatment, storage, and disposal facilities that have been proposed at the Idaho National Engineering Laboratory (INEL). A prime consideration in planning for such facilities is the selection of a site. Since spring of 1992, waste management personnel at the INEL have been involved in activities directed to this end. These activities have resulted in the (a) identification of generic siting criteria, considered applicable to either treatment or disposal facilities for the purpose of preliminary site evaluations and comparisons, (b) selection of six candidate locations for siting,and (c) site-specific characterization of candidate sites relative to selected siting criteria. This report describes the information gathered in the above three categories for the six candidate sites. However, a single, preferred site has not yet been identified. Such a determination requires an overall, composite ranking of the candidate sites, which accounts for the fact that the sites under consideration have different advantages and disadvantages, that no single site is superior to all the others in all the siting criteria, and that the criteria should be assigned different weighing factors depending on whether a site is to host a treatment or a disposal facility. Stakeholder input should now be solicited to help guide the final selection. This input will include (a) siting issues not already identified in the siting, work to date, and (b) relative importances of the individual siting criteria. Final site selection will not be completed until stakeholder input (from the State of Idaho, regulatory agencies, the public, etc.) in the above areas has been obtained and a strategy has been developed to make a composite ranking of all candidate sites that accounts for all the siting criteria.

849 (ES/WM–47) **Facility design, construction, and operation.** Oak Ridge National Lab., TN (United States); Numatec, Inc., Bethesda, MD (United States). Apr 1995. 218p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. 1AK-EGJ68V. (ORNL/M–4614). Order Number DE95017170. Source: OSTI; NTIS; INIS; GPO Dep.

Waste Management Program.

France has been disposing of low-level radioactive waste (LLW) at the Centre de Stockage de la Manche (CSM) since 1969 and now at the Centre de Stockage de l'Aube (CSA) since 1992. In France, several agencies and companies are involved in the development and implementation of LLW technology. The Commissariat a l'Energie Atomic (CEA), is responsible for research and development of new technologies. The Agence National pour la Gestion des Dechets Radioactifs is the agency responsible for the construction and operation of disposal facilities and for wastes acceptance for these facilities. Compagnie Generale des Matieres Nucleaires provides fuel services, including uranium enrichment, fuel fabrication, and fuel reprocessing, and is thus one generator of LLW. Societe pour les Techniques Nouvelles is an engineering company responsible for commercializing CEA waste management technology and for engineering and design support for the facilities. Numatec, Inc. is a US company representing these French companies and agencies in the US. In Task 1.1 of Numatec's contract with Martin Marietta Energy Systems, Numatec provides details on the design, construction and operation of the LLW disposal facilities at CSM and CSA. Lessons learned from operation of CSM and incorporated into the design, construction and operating procedures at CSA are identified and discussed. The process used by the French for identification, selection, and evaluation of disposal technologies is provided. Specifically, the decisionmaking process resulting in the change in disposal facility design for the CSA versus the CSM is discussed. This report provides' all of the basic information in these areas and reflects actual experience to date.

850 (ES/WM–80) **Life cycle benefit-cost analysis of alternatives for deployment of the transportable vitrification system.** Sexton, J.L.; Dole, L.R. Oak Ridge National Lab., TN (United States). Jul 1996. 149p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96011783. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy's (DOE) Oak Ridge Reservation (ORR) occupies almost 37,000 acres in and around the city of Oak Ridge, Tennessee. In the rapid effort to produce a working atomic bomb, three plants were constructed: Oak Ridge Gaseous Diffusion Plant (K-25), now the Oak Ridge K-25 Site and the Center for Environmental Technology and Waste Management; Clinton Laboratories (now the Oak Ridge National Laboratory [ORNL]); and the Oak Ridge Y-12 Plant. Following the end of the Cold War and the resulting reduction in nuclear weapons production, the DOE faced an unprecedented task of safely managing, storing, and treating legacy waste while, at the same time, cleaning up the contaminated areas within its sites in 33 states in a manner that uses the most cost-effective methods in conjunction with its responsibility to protect human health and the environment. The Transportable Vitrification system (TVS), an alternative waste treatment technology, has been developed by the DOE Office of Technology Development (EM-50). EM-50, or OTD, is the DOE program concerned with developing, demonstrating, and deploying new methods for environmental restoration and waste management and, as such, has provided the majority of the funding for the development of the TVS. This study reports the results of life cycle benefit-cost-risk analyses of the TVS for a series of use-scenarios proposed for treating mixed low-level waste (MLLW) streams on the ORR in accordance with the Office of Management and Budget (OMB) guidelines contained in OMB Circular 94. The system is designed to produce about 300 lb of glass per hour at its maximum capacity and is capable of processing wet, dry, or slurried waste. When formed into glass by the TVS, MLLW streams meet the Resource Conservation and Recovery Act (RCRA) land disposal requirements (LDR) and can potentially be disposed of as low-level wastes (LLW).

851 (FEMP–2388) **Radium bearing waste disposal.** Tope, W.G. (Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States)); Nixon, D.A.; Smith, M.L.; Stone, T.J.; Vogel, R.A.; Schofield, W.D. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950401–11: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE95013793. Source: OSTI; NTIS; INIS; GPO Dep.

Fernald radium bearing ore residue waste, stored within Silos 1 and 2 (K-65) and Silo 3, will be vitrified for disposal at the Nevada Test Site (NTS). A comprehensive, parametric evaluation of waste form, packaging, and transportation alternatives was completed to identify the most cost-effective approach. The impacts of waste loading, waste form, regulatory requirements, NTS waste acceptance criteria, as-low-as-reasonably-achievable principles, and material handling costs were factored into the recommended approach.

852 (FEMP–2445) **Chemical treatment of mixed waste can be done.....Today!.** Honigford, L. (Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States)); Dilday, D.; Cook, D.; Sattler, J. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-960212–13: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96007278. Source: OSTI; NTIS; INIS; GPO Dep.

The Chemical Treatment Project is one in a series of projects implemented by the FEMP to treat mixed waste. The projects were initiated to address concerns regarding treatment capacity for mixed waste and to comply with requirements established by the Federal Facility Compliance Act. The Chemical Treatment Project is designed to utilize commercially available mobile technologies to perform treatment at the FEMP site. The waste in the Project consists of a variety of waste types with a wide range of hazards and physical characteristics. The treatment processes to be established for the waste types will be developed by a systematic approach including waste streams evaluation, projectization of the waste streams, and categorization of the stream. This information is utilized to determine the proper train of treatment which will be required to lead the waste to its final destination (i.e., disposal). This approach allows flexibility to manage a wide variety of waste in a cheaper, faster manner than designing a single treatment technology diverse enough to manage all the waste streams.

853 (FEMP/SUB–102) **Natural phenomena hazards evaluation of concrete silos 1, 2, 3 and 4 at Fernald, Ohio.** Char, C.V. (PARSONS Environmental Remedial Action Project, Fairfield, OH (United States)); Shiner, T.J. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. Aug 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-9511128–1: 5. Department of Energy (DOE) natural phenomena hazards mitigation symposium, Denver, CO (United States), 13-17 Nov 1995). Order Number DE96000320. Source: OSTI; NTIS; INIS; GPO Dep.

Fernald Environmental Management Project (FEMP) is a United States Department of Energy (DOE) site located near Cincinnati, Ohio. FEMP was formerly established as the Feed Materials Production Center (FMPC) in 1951 under the Atomic Energy Commission. FEMP is currently undergoing site wide environmental remediation. This paper addresses four concrete silos built during the 1950s and located in Operable Unit 4 (OU-4). Silos 1 and 2 known as K-65 Silos contain residues from Uranium Ore processing. Silo 3 contains metal oxides in powder form. Silo 4 is empty. The Silos are categorized as low hazard facilities and the Natural Phenomena Hazards (NPH) performance category is PC-2, based on a recently completed safety analysis report. This paper describes the structural evaluation of concrete Silos 1, 2, 3 and 4 for NPH. Non Destructive Tests (NDT) were conducted to establish the current conditions of the silos. Analytical and computer methods were used to evaluate the stresses and displacements for different silo configurations and different loading combinations. Finite element models were developed to uniquely represent each silo, and analyzed using SAP90 computer program. The SAPLOT post processor was used for rapid determination of critical areas of concern for critical loading combinations and for varying silo configurations.

854 (INEL–94/00063) **Macroencapsulation of lead and steel SWARF.** Zirker, L.; Thiesen, T.; Tyson, D.; Beitel, G. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950877–24: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE96003507. Source: OSTI; NTIS; INIS; GPO Dep.

The treatability study to macroencapsulate radioactively contaminated lead and steel swarf (cuttings and/or chips)and chunks, a low level mixed waste, from the dismantlement of excess surplus uranium fuel handling and transfer casks was successful. Macroencapsulation is the land disposal restriction treatment standard for this waste form per 40 CFR 268.42 Table 3. An epoxy-based thermoset system was employed due to cracking failures of other types of thermoset systems. Bench scale tests were performed with a two-part epoxy (resin and hardener) using cast iron chips as a surrogate waste media. A two stage encapsulation process was employed in treating the swarf. Two liters of epoxy were added to a 2.8ℓ (3 qt) container of swarf under 51K Pa vacuum (-15-inch of Hg) during the first stage of the process. In this stage each individual particle or chip was wetted by epoxy and allowed to harden into an initial monolith. The second stage encapsulated the initial monolith with a secondary layer of epoxy forming a larger final monolith. By evacuating the air from the swarf and epoxy during the initial monolith encapsulation, a higher density (higher swarf to epoxy ratio) was achieved. Tensile and compressive strength tests were performed on samples and without any media (cast iron chips). The coupons were prepared from a series of monoliths featuring various mixtures ratios and vacuum levels. The tensile strength of epoxy without chips averaged 41M Pa (6000 psi) and 1.4M Pa (2000 psi) with cast iron chips. Compression strengths averaged 140M Pa (20,000 psi) without chips and 66.2M Pa (9600 psi) with cast iron chips.

855 (INEL–94/0095) **Modeling of thermal plasma arc technology FY 1994 report.** Hawkes, G.L.; Nguyen, H.D.; Paik, S.; McKellar, M.G. Idaho National Engineering Lab., Idaho Falls, ID (United States). Mar 1995. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001325. Source: OSTI; NTIS; INIS; GPO Dep.

The thermal plasma arc process is under consideration to thermally treat hazardous and radioactive waste. A computer model for the thermal plasma arc technology was designed as a tool to aid in the development and use of the plasma arc-Joule beating process. The value of this computer model is to: (a) aid in understanding the plasma arc-Joule beating process as applied to buried waste or exhumed buried waste, (b) help design melter geometry and electrode configuration, (c) calculate the process capability of vitrifying waste (i.e., tons/hour), (d) develop efficient plasma and melter operating conditions to optimize the process and/or reduce safety hazards, (e) calculate chemical reactions during treatment of waste to track chemical composition of off-gas products, and composition of final vitrified waste form and (f) help compare the designs of different plasma-arc facilities. A steady-state model of a two-dimensional axisymmetric transferred plasma arc has been developed and validated. A parametric analysis was performed that studied the effects of arc length, plasma gas composition, and input power on the temperatures and velocity profiles of the slag and plasma gas. A two-dimensional transient thermo-fluid model of the US Bureau of Mines plasma arc melter has been developed. This model includes the growth of a slag pool. The thermo-fluid model is used to predict the temperature and pressure fields within a plasma arc furnace. An analysis was performed to determine the effects of a molten metal pool on the temperature, velocity, and voltage fields within the slag. A robust and accurate model for the chemical equilibrium calculations has been selected to determine chemical composition of final waste form and off-gas based on the temperatures and pressures within the plasma-arc furnace. A chemical database has been selected. The database is based on the materials to be processed in the plasma arc furnaces.

856 (INEL–94/0211-Rev.2) **Waste Management facilities cost information: System Cost Model Software Quality Assurance Plan. Revision 2.** Peterson, B.L.; Lundeen, A.S. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Feb 1996. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96009906. Source: OSTI; NTIS; INIS; GPO Dep.

In May of 1994, Lockheed Idaho Technologies Company (LITCO) in Idaho Falls, Idaho and subcontractors developed the System Cost Model (SCM) application. The SCM estimates life-cycle costs of the entire US Department of Energy (DOE) complex for designing; constructing; operating; and decommissioning treatment, storage, and disposal (TSD) facilities for mixed low-level, low-level, transuranic, and mixed transuranic waste. The SCM uses parametric cost functions to estimate life-cycle costs for various treatment, storage, and disposal modules which reflect planned and existing facilities at DOE installations. In addition, SCM can model new facilities based on capacity needs over the program life cycle. The SCM also provides transportation costs for truck and rail, which include transport of contact-handled, remote-handled, and alpha (transuranic) wastes. The user can provide input data (default data is included in the SCM) including the volume and nature of waste to be managed, the time period over which the waste is to be managed, and the configuration of the waste management complex (i.e., where each installation's generated waste will be treated, stored, and disposed). Then the SCM uses parametric cost equations to estimate the costs of pre-operations (designing), construction costs, operation management, and decommissioning these waste management facilities. For the product to be effective and useful the SCM users must have a high level of confidence in the data generated by the software model. The SCM Software Quality Assurance Plan is part of the overall SCM project management effort to ensure that the SCM is maintained as a quality product and can be relied on to produce viable planning data. This document defines tasks and deliverables to ensure continued product integrity, provide increased confidence in the accuracy of the data generated, and meet the LITCO's quality standards during the software maintenance phase. 8 refs., 1 tab.

857 (INEL–94/0237) **Clean Lead Facility Inventory System user's manual.** Garcia, J.F. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Dec 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); INIS.

The purpose of this user's manual is to provide instruction and guidance needed to enter and maintain inventory information for the Clean Lead Facility (CLF), PER-612. Individuals responsible for maintaining and using the system should study and understand the information provided. The user's manual describes how to properly use and maintain the CLF Inventory System. Annual, quarterly, monthly, and current inventory reports may be printed from the Inventory System for reporting purposes. Profile reports of each shipment of lead may also be printed for verification and documentation of lead transactions. The CLF Inventory System was designed on Microsoft Access version 2.0. Similar inventory systems are in use at the Idaho National Engineering Laboratory (INEL) to facilitate site-wide compilations of mixed waste data. The CLF Inventory System was designed for inventorying the clean or non-radioactive contaminated lead stored at the CLF. This data, along with the mixed waste data, will be compiled into the Idaho Mixed Waste Information (IMWI) system for reporting to the Department of Energy Idaho Office, Department of Energy Headquarters, and/or the State of Idaho.

858 (INEL–94/0252-Rev.1) **Characterization of void volume VOC concentration in vented TRU waste drums. Final report.** Liekhus, K.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Aug 1995. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001190. Source: OSTI; NTIS; INIS; GPO Dep.

A test program has been conducted at the Idaho National Engineering Laboratory to demonstrate that the concentration of volatile organic compounds within the innermost layer of confinement in a vented waste drum can be estimated using a model incorporating diffusion and permeation transport principles and limited waste drum sampling data. This final report summarizes the experimental measurements and model predictions for transuranic waste drums containing solidified sludges and solid waste.

859 (INEL–95/0013) **Waste Management Facilities cost information for low-level waste.** Shropshire, D.; Sherick, M.; Biadgi, C. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001353. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains preconceptual designs and planning level life-cycle cost estimates for managing low-level waste. The report's information on treatment, storage, and disposal modules can be integrated to develop total life-cycle costs for various waste management options. A procedure to guide the US Department of Energy and its contractor personnel in the use of cost estimation data is also summarized in this report.

860 (INEL–95/0014-Rev.1) **Waste Management Facilities cost information for mixed low-level waste. Revision 1.** Shropshire, D.; Sherick, M.; Biadgi, C. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1995. 350p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001352. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains preconceptual designs and planning level life-cycle cost estimates for managing mixed low-level waste. The report's information on treatment, storage, and disposal modules can be integrated to develop total life-cycle costs for various waste management options. A procedure to guide the US Department of Energy and its contractor personnel in the use of cost estimation data is also summarized in this report.

861 (INEL–95/0016-Rev.1) **Waste management facilities cost information for hazardous waste. Revision 1.** Shropshire, D.; Sherick, M.; Biagi, C. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001351. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains preconceptual designs and planning level life-cycle cost estimates for managing hazardous waste. The report's information on treatment, storage, and disposal modules can be integrated to develop total life-cycle costs for various waste management options. A procedure to guide the US Department of Energy and its contractor personnel in the use of cost estimation data is also summarized in this report.

862 (INEL–95/0020-Rev.1) **Review of private sector treatment, storage, and disposal capacity for radioactive waste. Revision 1.** Smith, M.; Harris, J.G.; Moore-Mayne, S.; Mayes, R.; Naretto, C. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 14 Apr 1995. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001555. Source: OSTI; NTIS; INIS; GPO Dep.

This report is an update of a report that summarized the current and near-term commercial and disposal of radioactive and mixed waste. This report was capacity for the treatment, storage, dating and written for the Idaho National Engineering Laboratory (INEL) with the objective of updating and expanding the report entitled "Review of Private Sector Treatment, Storage, and Disposal Capacity for Radioactive Waste", (INEL-95/0020, January 1995). The capacity to process radioactively-contaminated protective clothing and/or respirators was added to the list of private sector capabilities to be assessed. Of the 20 companies surveyed in the previous report, 14 responded to the request for additional information, five did not respond, and one asked to be deleted from the survey. One additional company was identified as being capable of performing LLMW treatability studies and six were identified as providers of laundering services for radioactively-contaminated protective clothing and/or respirators.

863 (INEL–95/0054) **Advanced Mixed Waste Treatment Project melter system preliminary design technical review meeting.** Eddy, T.L.; Raivo, B.D.; Soelberg, N.R.; Wiersholm, O. Fermi National Accelerator Lab., Batavia, IL (United States). Feb 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001189. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory Advanced Mixed Waste Treatment Project sponsored a plasma are melter technical design review meeting to evaluate high-temperature melter system configurations for processing heterogeneous alpha-contaminated low-level radioactive waste (ALLW). Thermal processing experts representing Department of Energy contractors, the Environmental Protection Agency, and private sector companies participated in the review. The participants discussed issues and evaluated alternative configurations for three areas of the melter system design: plasma torch melters and graphite arc melters, offgas treatment options, and overall system configuration considerations. The Technical Advisory Committee for the review concluded that graphite arc melters are preferred over plasma torch melters for processing ALLW. Initiating involvement of stakeholders was considered essential at this stage of the design. For the offgas treatment system, the advisory committee raised the question whether to a use wet-dry or a dry-wet system. The committee recommended that the waste stream characterization, feed preparation, and the control system are essential design tasks for the high-temperature melter treatment system. The participants strongly recommended that a complete melter treatment system be assembled to conduct tests with nonradioactive surrogate waste material. A nonradioactive test bed would allow for inexpensive design and operational changes prior to assembling a system for radioactive waste treatment operations.

864 (INEL–95/0055) **Calculations of protective action distance for toxic chemical spills using nomographs.** Lee, L.G.; Vail, J.A.; Gibeault, G.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). Apr 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001140. Source: OSTI; NTIS; INIS; GPO Dep.

This document was produced for emergency use following a spill of liquid gas or finely divided solid (<100 micron) toxic chemicals. The information on the next few pages was kept deliberately terse and is limited to data and graphic aids needed for calculation of plume distance (protective action distance). All supporting material is provided as Appendices.

865 (INEL–95/00095) **Comparison of the radiological and chemical toxicity of lead.** Beitel, G.A.; Mott, S. EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9504207–1: Hazardous waste and materials conference, Pocatello, ID (United States), 17-19 Apr 1995). Order Number DE96001623. Source: OSTI; NTIS; INIS; GPO Dep.

This report estimates the worst-case radiological dose to an individual from ingested lead containing picocurie levels of radionuclides and then compares the calculated radiological health effects to the chemical toxic effects from that same lead. This comparison provides an estimate of the consequences of inadvertently recycling, in the commercial market, lead containing nominally undetectable concentrations of radionuclides. Quantitative expressions for the radiological and chemical toxicities of lead are based on concentrations of lead in the blood stream. The result shows that the chemical toxicity of lead is a greater health hazard, by orders of magnitude, than any probable companion radiation dose.

866 (INEL–95/0095-Rev.1) **Preliminary parametric performance assessment of potential final waste forms for alpha low-level waste at the Idaho National Engineering Laboratory. Revision 1.** Smith, T.H. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Sussman, M.E.; Myers, J.; Djordjevic, S.M.; DeBiase, T.A.; Goodrich, M.T.; DeWitt, D. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Aug 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002303. Source: OSTI; NTIS; INIS; GPO Dep.

Formerly EGG-WM-11415.

This report presents a preliminary parametric performance assessment (PA) of potential waste disposal systems for alpha-contaminated, mixed, low-level waste (ALLW) currently stored at the Transuranic Storage Area of INEL. The ALLW, which contains from 10 to 100 nCi/g of transuranic (TRU) radionuclides, is awaiting treatment and disposal. The purpose of this study was to examine the effects of several parameters on the radiological-confinement performance of potential disposal systems for the ALLW. The principal emphasis was on the performance of final waste forms (FWFs). Three categories of FWF (cement, glass, and ceramic) were addressed by evaluating the performance of two limiting FWFs for each category. Performance at five conceptual disposal sites was evaluated to illustrate the effects of site characteristics on the performance of the total disposal system. Other parameters investigated for effects on receptor dose included inventory assumptions, TRU radionuclide concentration, FWF fracture, disposal depth, water infiltration rates, subsurface-transport modeling assumptions, receptor well location, intrusion scenario assumptions, and the absence of waste immobilization. These and other factors were varied singly and in some combinations. The results indicate that compliance of the treated and disposed ALLW with the performance objectives depends on the assumptions made, as well as on the FWF and the disposal site. Some combinations result in compliance, while others do not. The implications of these results for decision making relative to treatment and disposal of the INEL ALLW are discussed. The report compares the degree of conservatism in this preliminary parametric PA against that in four other PAs and one risk assessment. All of the assessments addressed the same disposal site, but different wastes. The report also presents a qualitative evaluation of the uncertainties in the PA and makes recommendations for further study.

867 (INEL–95/0098) **Dissolution of two NWCF calcines: Extent of dissolution and characterization of undissolved solids.** Brewer, K.N. (and others); Herbst, R.S.; Tranter, T.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96004069. Source: OSTI; NTIS; INIS; GPO Dep.

A study was undertaken to determine the dissolution characteristics of two NWCF calcine types. A two-way blended calcine made from 4 parts nonradioactive aluminum nitrate and one part WM-102 was studied to determine the extent of dissolution for aluminum-type calcines. A two-way blend of 3.5 parts fluorinel waste from WM-187 and 1 part sodium waste from WM-185 was used to determine the extent of dissolution for zirconium-type calcines. This study was necessary to develop suitable aqueous separation flowsheets for the partitioning of actinides and fission products from ICPP calcines and to determine the disposition of the resulting undissolved solids (UDS). The dissolution flowsheet developed by Herbst was used to dissolve these two NWCF calcine types. Results show that greater than 95 wt% of aluminum and zirconium calcine types were dissolved after a single batch contact with 5 M HNO_3. A characterization of the UDS indicates that the weight percent of TRU elements in the UDS resulting from both calcine type dissolutions increases by approximately an order of magnitude from their concentrations prior to dissolution. Substantial activities of cesium and strontium are also present in the UDS resulting from the dissolution of both calcine types. Multiple TRU, Cs, and Sr analyses of both UDS types show that these solids are relatively homogeneous. From this study, it is estimated that between 63.5 and 635 cubic meters of UDS will be generated from the dissolution of 3800 M_3 of calcine. The significant actinide and fission product activities in these UDS will preclude their disposal as low-level waste. If the actinide and fission activity resulting from the UDS is the only considered source in the dissolved calcine solutions, an estimated 99.9 to 99.99 percent of the solids must be removed from this solution for it to meet non-TRU Class A low-level waste.

868 (INEL–95/0109-Rev.1) **Position for determining gas phase volatile organic compound concentrations in transuranic waste containers. Revision 1.** Connolly, M.J. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Liekhus, K.J.; Djordjevic, S.M.; Loehr, C.A.; Spangler, L.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States); Benchmark Environmental Corp., Albuquerque, NM (United States). Aug 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001196. Source: OSTI; NTIS; INIS; GPO Dep.

In the conditional no-migration determination (NMD) for the test phase of the Waste Isolation Pilot Plant (WIPP), the US Environmental Protection Agency (EPA) imposed certain conditions on the US Department of Energy (DOE) regarding gas phase volatile organic compound (VOC) concentrations in the void space of transuranic (TRU) waste containers. Specifically, the EPA required the DOE to ensure that each waste container has no layer of confinement that contains flammable mixtures of gases or mixtures of gases that could become flammable when mixed with air. The EPA also required that sampling of the headspace of waste containers outside inner layers of confinement be representative of the entire void space of the container. The EPA stated that all layers of confinement in a container would have to be sampled until DOE can demonstrate to the EPA that sampling of all layers is either unnecessary or can be safely reduced. A test program was conducted at the Idaho National Engineering Laboratory (INEL) to demonstrate that the gas phase VOC concentration in the void space of each layer of confinement in vented drums can be estimated from measured drum headspace using a theoretical transport model and that sampling of each layer of confinement is unnecessary. This report summarizes the studies performed in the INEL test program and extends them for the purpose of developing a methodology for determining gas phase VOC concentrations in both vented and unvented TRU waste containers. The methodology specifies conditions under which waste drum headspace gases can be said to be representative of drum gases as a whole and describes a method for predicting drum concentrations in situations where the headspace concentration is not representative. The methodology addresses the approach for determining the drum VOC gas content for two purposes: operational period drum handling and operational period no-migration calculations.

869 (INEL–95/0112) **Lessons learned from the EG&G consolidated hazardous waste subcontract and ESH&Q liability assessment process.** Fix, N.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1995. 350p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001178. Source: OSTI; NTIS; INIS; GPO Dep.

Hazardous waste transportation, treatment, recycling, and disposal contracts were first consolidated at the Idaho National Engineering Laboratory in 1992 by EG&G Idaho, Inc. At that time, disposition of Resource, Conservation and Recovery Act hazardous waste, Toxic Substance Control Act waste, Comprehensive Environmental Response, Compensation, and Liability Act hazardous substances and contaminated media, and recyclable hazardous materials was consolidated under five subcontracts. The wastes were generated by five different INEL M&O contractors, under the direction of three different Department of Energy field offices. The consolidated contract reduced the number of facilities handling INEL waste from 27 to 8 qualified treatment, storage, and disposal facilities, with brokers specifically prohibited. This reduced associated transportation costs, amount and cost of contractual paperwork, and environmental liability exposure. EG&G reviewed this approach and proposed a consolidated hazardous waste subcontract be formed for the major EG&G managed DOE sites: INEL, Mound, Rocky Flats, Nevada Test Site, and 10 satellite facilities. After obtaining concurrence from DOE Headquarters, this effort began in March 1992 and was completed with the award of two master task subcontracts in October and November 1993. In addition, the effort included a team to evaluate the apparent awardee's facilities for environment, safety, health, and quality (ESH&Q) and financial liability status. This report documents the evaluation of the process used to prepare, bid, and award the EG&G consolidated hazardous waste transportation, treatment, recycling, and/or disposal subcontracts and associated ESH&Q and financial liability assessments; document the strengths and weaknesses of the process; and propose improvements that would expedite and enhance the process for other DOE installations that used the process and for the re-bid of the consolidated subcontract, scheduled for 1997.

870 (INEL–95/0114) **Catalog of documents produced by the Greater-Than-Class C Low-Level Waste Management Program.** Winberg, M.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Mar 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001356. Source: OSTI; NTIS; INIS; GPO Dep.

This catalog provides a ready reference for documents prepared by the Greater-Than-Class C Low-Level Waste (GTCC LLW) Management Program. The GTCC LLW Management Program is part of the National Low-Level Waste Management Program (NLLWMP). The NLLWMP is sponsored by the US Department of Energy (DOE) and is responsible for assisting the DOE in meeting its obligations under Public Law 99-240, The Low-Level Radioactive Waste Policy Amendments Act of 1985. This law assigns DOE the responsibility of ensuring the safe disposal of GTCC LLW in a facility licensed by the Nuclear Regulatory Commission (NRC). The NLLWMP is managed at the Idaho National Engineering Laboratory (INEL).

871 (INEL–95/0129) **Integrated thermal treatment system sudy: Phase 2, Results.** Feizollahi, F.; Quapp, W.J. Idaho National Engineering Lab., Idaho Falls, ID (United States). Aug 1995. 405p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96000981. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the second phase of a study on thermal treatment technologies. The study consists of a systematic assessment of nineteen thermal treatment alternatives for the contact-handled mixed low-level waste (MLLW) currently stored in the US Department of Energy complex. The treatment alternatives consist of widely varying technologies for safely destroying the hazardous organic components, reducing the volume, and preparing for final disposal of the MLLW. The alternatives considered in Phase 2 were innovative thermal treatments with nine types of primary processing units. Other variations in the study examined the effect of combustion gas, air pollution control system design, and stabilization technology for the treatment residues. The Phase 1 study, the results of which have been published as an interim report, examined ten initial thermal treatment alternatives. The Phase 2 systems were evaluated in essentially the same manner as the Phase 2 systems. The assumptions and methods were the same as for the Phase 1 study. The quantities, and physical and chemical compositions, of the input waste used in he Phase 2 systems differ from those in the Phase 1 systems, which were based on a preliminary waste input database developed at the onset of the Integrated Thermal Treatment System study. The inventory database used in the Phase 2 study incorporates the latest US Department of Energy information. All systems, both primary treatment systems and subsystem inputs, have now been evaluated using the same waste input (2,927 lb/hr).

872 (INEL–95/0129-Rev.1) **Integrated thermal treatment system study – Phase 2 results. Revision 1.** Feizollahi, F.; Quapp, W.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Feb 1996. 410p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96008968. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the second phase of a study on thermal treatment technologies. The study consists of a systematic assessment of nineteen thermal treatment alternatives for the contact-handled mixed low-level waste (MLLW) currently stored in the US Department of Energy complex. The treatment alternatives consist of widely varying technologies for safely destroying the hazardous organic components, reducing the volume, and preparing for final disposal of the MLLW. The alternatives considered in Phase 2 were innovative thermal treatments with nine types of primary processing units. Other variations in the study examined the effect of combustion gas, air pollution control system design, and stabilization technology for the treatment residues. The Phase 1 study examined ten initial thermal treatment alternatives. The Phase 2 systems were evaluated in essentially the same manner as the Phase 1 systems. The alternatives evaluated were: rotary kiln, slagging kiln, plasma furnace, plasma gasification, molten salt oxidation, molten metal waste destruction, steam gasification, Joule-heated vitrification, thermal desorption and mediated electrochemical oxidation, and thermal desorption and supercritical water oxidation. The quantities, and physical and chemical compositions, of the input waste used in the Phase 2 systems differ from those in the Phase 1 systems, which were based on a preliminary waste input database developed at the onset of the Integrated Thermal Treatment System study. The inventory database used in the Phase 2 study incorporates the latest US Department of Energy information. All systems, both primary treatment systems and subsystem inputs, have now been evaluated using the same waste input (2,927 lb/hr). 28 refs., 88 figs., 41 tabs.

873 (INEL–95/0135-Vol.1) **A comprehensive inventory of radiological and nonradiological contaminants in waste buried or projected to be buried in the subsurface disposal area of the INEL RWMC during the years 1984-2003, Volume 1.** EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1995. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001162. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a comprehensive inventory of the radiological and nonradiological contaminants in waste buried or projected to be buried from 1984 through 2003 in the Subsurface Disposal Area (SDA) at the Radioactive Waste Management Complex (RWMC) of the Idaho National Engineering Laboratory. The project to compile the inventory is referred to as the recent and projected data task. The inventory was compiled primarily for use in a baseline risk assessment under the Comprehensive Environmental Response, Compensation, and Liability Act. The compiled information may also be useful for environmental remediation activities that might be necessary at the RWMC. The information that was compiled has been entered into a database termed CIDRA-the Contaminant Inventory Database for Risk Assessment. The inventory information was organized according to waste generator and divided into waste streams for each generator. The inventory is based on waste information that was available in facility operating records, technical and programmatic reports, shipping records, and waste generator forecasts. Additional information was obtained by reviewing the plant operations that originally generated the waste, by interviewing personnel formerly employed as operators, and by performing nuclear physics and engineering calculations. In addition to contaminant inventories, information was compiled on the physical and chemical characteristics and the packaging of the 99 waste streams. The inventory information for waste projected to be buried at the SDA in the future was obtained from waste generator forecasts. The completeness of the contaminant inventories was confirmed by comparing them against inventories in previous reports and in other databases, and against the list of contaminants detected in environmental monitoring performed at the RWMC.

874 (INEL–95/0135-Vol.2) **A comprehensive inventory of radiological and nonradiological contaminants in waste buried or projected to be buried in the subsurface disposal area of the INEL RWMC during the years 1984-2003, Volume 2.** EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001163. Source: OSTI; NTIS; INIS; GPO Dep.

This is the second volume of this comprehensive report of the inventory of radiological and nonradiological contaminants in waste buried or projected to be buried in the subsurface disposal area of the Idaho National Engineering Laboratory. Appendix B contains a complete printout of contaminant inventory and other information from the CIDRA Database and is presented in volumes 2 and 3 of the report.

875 (INEL–95/0135-Vol.3) **A comprehensive inventory of radiological and nonradiological contaminants in waste buried or projected to be buried in the subsurface disposal area of the INEL RWMC during the years 1984-2003, Volume 3.** EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001164. Source: OSTI; NTIS; INIS; GPO Dep.

This is the third volume of this comprehensive report of the inventory of radiological and nonradiological contaminants in waste buried or projected to be buried in the subsurface disposal area of the Idaho National Engineering Laboratory. Appendix B contains a complete printout of contaminant inventory and other information from the CIDRA Database and is presented in volumes 2 and 3 of the report.

876 (INEL–95/00137) **Life cycle cost estimation and systems analysis of Waste Management Facilities.** Shropshire, D. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Feizollahi, F. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950917–14: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE96001615. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents general conclusions from application of a system cost analysis method developed by the United States Department of Energy (DOE), Waste Management Division (WM), Waste Management Facilities Costs Information (WMFCI) program. The WMFCI method has been used to assess the DOE complex-wide management of radioactive, hazardous, and mixed wastes. The Idaho Engineering Laboratory, along with its subcontractor Morrison Knudsen Corporation, has been responsible for developing and applying the WMFCI cost analysis method. The cost analyses are based on system planning level life-cycle costs. The costs for life-cycle waste management activities estimated by WMFCI range from bench-scale testing and developmental work needed to design and construct a facility, facility permitting and startup, operation and maintenance, to the final decontamination, decommissioning, and closure of the facility. For DOE complex-wide assessments, cost estimates have been developed at the treatment, storage, and disposal module level and rolled up for each DOE installation. Discussions include conclusions reached by studies covering complex-wide consolidation of treatment, storage, and disposal facilities, system cost modeling, system costs sensitivity, system cost optimization, and the integration of WM waste with the environmental restoration and decontamination and decommissioning secondary wastes.

877 (INEL–95/0146) **Separation of non-hazardous, non-radioactive components from ICPP calcine via chlorination.** Nelson, L.O. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). May 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001554. Source: OSTI; NTIS; INIS; GPO Dep.

A pyrochemical treatment method for separating non-radioactive from radioactive components in solid granular waste accumulated at the Idaho Chemical Processing Plant was investigated. The goal of this study was to obtain kinetic and chemical separation data on the reaction products of the chlorination of the solid waste, known as calcine. Thermodynamic equilibrium calculations were completed to verify that a separation of radioactive and non-radioactive calcine components was possible. Bench-scale chlorination experiments were completed subsequently in a variety of reactor configurations including: a fixed-bed reactor (reactive gases flowed around and not through the particle bed), a packed/fluidized-bed reactor, and a packed-bed reactor (reactive gases flowed through the particle bed). Chemical analysis of the reaction products generated during the chlorination experiments verified the predictions made by the equilibrium calculations. An empirical first-order kinetic rate expression was developed for each of the reactor configurations. 20 refs., 16 figs., 21 tabs.

878 (INEL–95/0164) **Measurement of VOC permeability of polymer bags and VOC solubility in polyethylene drum liner.** Liekhus, K.J.; Peterson, E.S. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001180. Source: OSTI; NTIS; INIS; GPO Dep.

A test program conducted at the Idaho National Engineering Laboratory (INEL) investigated the use of a transport model to estimate the volatile organic compound (VOC) concentration in the void volume of a waste drum. Unsteady-state VOC transport model equations account for VOC permeation of polymer bags, VOC diffusion across openings in layers of confinement, and VOC solubility in a polyethylene drum liner. In support of this program, the VOC permeability of polymer bags and VOC equilibrium concentration in a polyethylene drum liner were measured for nine VOCs. The VOCs used in experiments were dichloromethane, carbon tetrachloride, cyclohexane, toluene, 1,1,1-trichloroethane, methanol, 1,1,2-trichloro-1,2,2-trifluoroethane (Freon-113), trichloroethylene, and p-xylene. The experimental results of these measurements as well as a method of estimating both parameters in the absence of experimental data are described in this report.

879 (INEL–95/0182) **HEPA filter leaching concept validation trials at the Idaho Chemical Processing Plant.** Chakravartty, A.C. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Apr 1995. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95017629. Source: OSTI; NTIS; INIS; GPO Dep.

The enclosed report documents six New Waste Calcining Facility (NWCF) HEPA filter leaching trials conducted at the Idaho Chemical Processing Plant using a filter leaching system to validate the filter leaching treatment concept. The test results show that a modified filter leaching system will be able to successfully remove both hazardous and radiological constituents to RCRA disposal levels. Based on the success of the filter leach trials, the existing leaching system will be modified to provide a safe, simple, effective, and operationally flexible filter leaching system.

880 (INEL–95/00184) **Compliance agreements at the INEL: A success story.** McBath, W.H. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950863–23: 4. IEEE international symposium on high performance distributed computing, Pentagon City, VA (United States), 1-4 Aug 1995). Order Number DE96001926. Source: OSTI; NTIS; INIS; GPO Dep.

The Radioactive Waste Management Complex (RWMC), located at the Idaho National Engineering Laboratory (INEL), is the storage facility for approximately 135,000 containers of radioactive mixed waste that must be stored in accordance with Resource Conservation and Recovery Act (RCRA) requirements. Collectively, the compliance and safety basis documents governing the operation of the storage facility contain approximately 2,500 specific, identifiable requirements. Critical to the compliance with these 2,500 requirements was the development of a process which converted these requirements to a form and format that allowed implementation at the operator level. Additionally, to ensure continued compliance, a method of identifying and controlling implementing documents is imperative. This paper discusses the methods employed to identify, implement, and control these requirements.

881 (INEL–95/00202) **Radiologically contaminated lead shot reuse at the Idaho National Engineering Laboratory (INEL).** Heileson, W.M.; Grant, R.P. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9505111–5: 11. pollution prevention conference: shaping the future through pollution prevention involvement - commitment - progress, Knoxville, TN (United States), 16-18 May 1995). Order Number DE96001710. Source: OSTI; NTIS; INIS; GPO Dep.

This project involved the utilization of radioactively contaminated lead shot located at the Radioactive Waste Management Complex (RWMC) for radiation shielding on a radioactive liquid process tank located at Argonne National Laboratory-West (ANL-W). The use of previously contaminated shot precludes the radioactive contamination of clean shot. With limited treatment and disposal options for contaminated lead shot, the reuse of lead for shielding is significant due to the inherent characteristic of becoming a mixed waste when radiologically contaminated. The INEL conducted a lead cleanup campaign in 1990. This was designed to ensure control of potential Resource Conservation and Recovery Act (RCRA) regulated waste. Contaminated lead from throughout the INEL, was containerized per the lead Waste Acceptance Criteria at the generator sites. Limited areas at the INEL are designated for mixed waste storage. As a result, some of the lead was stored at the RWMC in the air support weather shield (ASWS). This lead was contaminated with small amounts of fission product contamination. The lead was in the form of shot, brick, sheet, casks, and other various sized pieces. In 1993, ANL-W identified a need for lead shot to be used as shielding in a radioactive liquid waste storage and processing tank at the Fuel Cycle Facility (FCF). The contaminated lead used on this project had been in storage as mixed waste at the RWMC. This paper will focus on the processes and problems encountered to utilize the contaminated lead shot.

882 (INEL–95/00233) **Management of Pit 9 - highlights of accomplishments and lessons learned to date.** Schwartz, F.G. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950868–24: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE96001931. Source: OSTI; NTIS; INIS; GPO Dep.

The Pit 9 project is a U.S. Department of Energy prototype full scale demonstration to retrieve and treat buried mixed transuranic waste. The project is being managed by the DOE-Idaho Environmental Restoration Program, in conjunction with the Environmental Protection Agency Region 10 and the state of Idaho, under the Idaho National Engineering Laboratory Federal Facility Agreement and Consent Order. Pit 9 is located in the northeast corner of the Subsurface Disposal Area (SDA) of the Radioactive Waste Management Complex (RWMC) at the Idaho National Engineering Laboratory (INEL). The Pit 9 project was conceived out of the need to determine capabilities to cost effectively retrieve and treat buried radioactive and radioactive mixed waste, and obtain characterization and contaminant migration data for buried waste at the INEL. Waste was disposed in Pit 9 from November 1967 to June 1969. Pit 9, at about 380 feet by 125 feet, represents approximately one acre of surface area of the 88 acre SDA. The pit contains approximately 350,000 ft^3 of soil beneath and between the buried waste and about 250,000 ft^3 of overburden soil. The average depth of the pit from soil surface to bedrock is approximately 17.5 feet. Approximately 110,000 ft^3 of transuranic (TRU) contaminated mixed wastes from Rocky Flats and approximately 40,000 ft^3 of low level and mixed wastes from the INEL were buried in Pit 9 during this period. Pit 9 is estimated to contain over 30,000 gallons of organics (over 30% of the total organic inventory in the SDA) and approximately 66 pounds of TRU radionuclides (between 3% and 4% of the total TRU inventory in the SDA). Pit 9 was selected as a demonstration site because it was one of the last disposal pits at the INEL to receive Rocky Flats waste, disposal records are better for Pit 9 than for disposal pits and trenches from earlier points in time, and the wastes in Pit 9 are representative of the wastes disposed in the SDA.

883 (INEL–95/00256) **Use of a sensitivity study to identify risk assessment modeling data gaps at the Idaho National Engineering Laboratory's subsurface disposal area.** Burns, D.E. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950868–28: ER '95: environmental remediation conference: committed to results, Denver, CO

(United States), 13-18 Aug 1995). Order Number DE96004004. Source: OSTI; NTIS; INIS; GPO Dep.

A common question in the CERCLA remedial investigation (RI) process is, "What are the data gaps that must be filled in order to perform a risk assessment for a given site?" Often a method that can be used to identify and rank data gaps is needed to help allocate scarce remedial investigation funds, and to help prepare for a CERCLA site's baseline risk assessment (BRA). A CERCLA Remedial Investigation/Feasibility Study (RI/FS) is underway at the Idaho National Engineering Laboratory's (INEL) Subsurface Disposal Area (SDA). The SDA is a radioactive waste disposal site where transuranic (TRU) waste, mixed waste (MW), and low-level waste (LLW) has been buried in pits, trenches, and soil vaults since 1952. The procedures described in this paper have been developed for the identification of risk assessment data gaps at the SDA. In preparation for the SDA RI/FS, three major investigations have been performed over the past two years. The first of these investigations identified all of the waste streams that were buried in the SDA from 1952 through 1983. The second investigation identified all of the SDA waste streams that were buried from 1984 through the present, and made predictions of the waste volumes that will be buried through the year 2003. The third investigation was the Preliminary Scoping Risk Assessment (PSRA) for the SDA. The PSRA was an initial evaluation of the human health risk associated with the SDA's buried waste, and it was developed with the intent of identifying risk assessment data gaps for the SDA. The following paragraphs give a brief description of the PSRA, and of the sensitivity study within the PSRA that was used to idenitfy data gaps.

884 (INEL–95/0258) **Cyclone reduction of taconite. Final report.** Taylor, P.R. (College of Mines and Earth Resources, University of Idaho, Idaho Falls, ID (United States)); Bartlett, R.W.; Abdel-latif, M.A.; Hou, X.; Kumar, P. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). May 1995. 203p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003556. Source: OSTI; NTIS; INIS; GPO Dep.

A cyclone reactor system for the partial reduction and melting of taconite concentrate fines has been engineered, designed and operated. A non-transferred arc plasma torch was employed as a heat source. Taconite fines, carbon monoxide, and carbon dioxide were fed axially into the reactor, while the plasma gas was introduced tangentially into the cyclone. The average reactor temperature was maintained at above 1400°C, and reduction experiments were performed under various conditions. The influence of the following parameters on the reduction of taconite was investigated experimentally; carbon monoxide to carbon dioxide inlet feed ratio, carbon monoxide inlet partial pressure, and average reactor temperature. The interactions of the graphite lining with carbon dioxide and taconite were also studied. An attempt was made to characterize the flow behavior of the molten product within the cyclone. The results suggest that the system may approach a plug flow reactor, with little back mixing. Finally, a fundamental mathematical model was developed. The model describes the flow dynamics of gases and solid particles in a cyclone reactor, energy exchange, mass transfer, and the chemical kinetics associated with cyclone smelting of taconite concentrate fines. The influence of the various parameters on the reduction and melting of taconite particles was evaluated theoretically.

885 (INEL–95/0272) **Lead use and recycling at the INEL.** Losinski, S.J.; Thurmond, S.M. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Aug 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001336. Source: OSTI; NTIS; INIS; GPO Dep.

As part of DOE's efforts to develop a Department-wide management strategy for the use, reuse, and recycle of lead, DOE has requested that each site provide site-specific management and use practices for lead, specifically management and use information that responds to four specific questions of interest. This report provides the Idaho National Engineering Laboratory's response to those areas of interest.

886 (INEL–95/0315) **Development of DU-AGG (Depleted Uranium Aggregate).** Lessing, P.A. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Sep 1995. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96009937. Source: OSTI; NTIS; INIS; GPO Dep.

Depleted uranium oxide (UO_2 or $U0_3$) powder was mixed with fine mineral additives, pressed, and heated to about 1,250°C. The additives were chemically constituted to result in an iron-enriched basalt (IEB). Melting and wetting of the IEB phase caused the urania powder compact to densify (sinter) via a liquid phase sintering mechanism. An inorganic lubricant was found to aid in green-forming of the body. Sintering was successful in oxidizing (air), inert (argon), or reducing (dry hydrogen containing) atmospheres. The use of ground $U0_3$ powders (93 vol %) followed by sintering in a dry hydrogen-containing atmosphere significantly increased the density of samples (bulk density of 8.40 g/cm^3 and apparent density of 9.48 g/cm^3, open porosity of 11.43%). An improvement in the microstructure (reduction in open porosity) was achieved when the vol % of $U0_3$ was decreased to 80%. The bulk density increased to 8.59 g/cm^3, the apparent density decreased slightly to 8.82 g/cm^3 (due to increase of low density IEB content), while the open porosity decreased to an excellent number of 2.78%. A representative sample derived from 80 vol % $U0_3$ showed that most pores were closed pores and that, overall, the sample achieved the excellent relative density value of 94.1% of the estimated theoretical density (composite of $U0_2$ and IEB). It is expected that ground powders of $U0_3$ could be successfully used to mass produce lowcost aggregate using the green-forming technique of briquetting.

887 (INEL–95/00320) **Commercial low-level radioactive waste disposal in the US.** Smith, P. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950787–86: 36. annual meeting of the Institute for Nuclear Materials Management, Palm Desert, CA (United States), 9-12 Jul 1995). Order Number DE96001612. Source: OSTI; NTIS; INIS; GPO Dep.

Why are 11 states attempting to develop new low-level radioactive waste disposal facilities? Why is only on disposal facility accepting waste nationally? What is the future of waste disposal? These questions are representative of those being asked throughout the country. This paper attempts to answer these questions in terms of where we are, how we got there, and where we might be going.

888 (INEL–95/00321) **Plasma Hearth Process vitrification of DOE low-level mixed waste.** Gillins, R.L.

(Science Applications International Corp., Idaho Falls, ID (United States)); Geimer, R.M. Science Applications International Corp., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13266. (CONF-950718-2: Electric Power Research Institute low-level waste conference, Orlando, FL (United States), 10-12 Jul 1995). Order Number DE96002044. Source: OSTI; NTIS; INIS; GPO Dep.

The Plasma Hearth Process (PHP) demonstration project is one of the key technology projects in the Department of Energy (DOE) Office of Technology Development Mixed Waste Focus Area. The PHP is recognized as one of the more promising solutions to DOE's mixed waste treatment needs, with potential application in the treatment of a wide variety of DOE mixed wastes. The PHP is a high temperature vitrification process using a plasma arc torch in a stationary, refractory lined chamber that destroys organics and stabilizes the residuals in a nonleaching, vitrified waste form. This technology will be equally applicable to low-level mixed wastes generated by nuclear utilities. The final waste form will be volume reduced to the maximum extent practical, because all organics will have been destroyed and the inorganics will be in a high-density, low void-space form and little or no volume-increasing glass makers will have been added. Low volume and high integrity waste forms result in low disposal costs. This project is structured to ensure that the plasma technology can be successfully employed in radioactive service. The PHP technology will be developed into a production system through a sequence of tests on several test units, both non-radioactive and radioactive. As the final step, a prototype PHP system will be constructed for full-scale radioactive waste treatment demonstration.

889 (INEL-95/0381) **Radiological, physical, and chemical characterization of additional alpha contaminated and mixed low-level waste for treatment at the advanced mixed waste treatment project.** Hutchinson, D.P. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jul 1995. 950p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001177. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides physical, chemical, and radiological descriptive information for a portion of mixed waste that is potentially available for private sector treatment. The format and contents are designed to provide treatment vendors with preliminary information on the characteristics and properties for additional candidate portions of the Idaho National Engineering Laboratory (INEL) and offsite mixed wastes not covered in the two previous characterization reports for the INEL-stored low-level alpha-contaminated and transuranic wastes. This report defines the waste, provides background information, briefly reviews the requirements of the Federal Facility Compliance Act (P.L. 102-386), and relates the Site Treatment Plans developed under the Federal Facility Compliance Act to the waste streams described herein. Each waste is summarized in a Waste Profile Sheet with text, charts, and tables of waste descriptive information for a particular waste stream. A discussion of the availability and uncertainty of data for these waste streams precedes the characterization descriptions.

890 (INEL-95/00393) **Arc melter vitrification of organic and chloride containing materials.** Soelberg, N.R. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Chambers, A.G.; Anderson, G.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1995. 20p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9510125-2: International symposium on environmental technologies: plasma systems and applications, Atlanta, GA (United States), 8-11 Oct 1995). Order Number DE96001551. Source: OSTI; NTIS; INIS; GPO Dep.

Demonstration tests for vitrifying mixed wastes and contaminated soils have been conducted using a small (800 kVA), industrial-scale, three-phase AC, graphite electrode furnace located at the Albany Research Center of the United States Bureau of Mines (USBM). The feed mixtures were non-radioactive surrogates of mixed (radioactive and hazardous), transuranic (TRU)-contaminated wastes stored and buried at the Idaho National Engineering Laboratory (INEL). The different feed mixtures included up to (a) 80 weight % combustibles, (b) 60% chlorinated and nonchlorinated hydrocarbons, (c) 27% metals, (d) 2% nitrates, and (e) 3 % metal hydroxides. Cerium was added as a nonradioactive surrogate for plutonium, a TRU element. Over 9,200 kg (20,200 lb) of the feed mixtures were vitrified at feedrates of up to 500 kg/hr (1,100 lb/hr). The furnace products including the glass, metal, offgas, and offgas solids have been analyzed to determine the fate and partitioning of metals, organics, and the TRU surrogate. Offgas emissions were efficiently controlled using an air pollution control system that included a thermal oxidizer, water-spray and air dilution cooling, cyclone and baghouse particulate removal, packed bed acid gas scrubbing, charcoal absorption, and High Efficiency Particulate-Air (HEPA) filtration.

891 (INEL-95/0460) **Commercial disposal options for Idaho National Engineering Laboratory low-level radioactive waste.** Porter, C.L.; Widmayer, D.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002190. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory (INEL) is a Department of Energy (DOE)-owned, contractor-operated site. Significant quantities of low-level radioactive waste (LLW) have been generated and disposed of onsite at the Radioactive Waste Management Complex (RWMC). The INEL expects to continue generating LLW while performing its mission and as aging facilities are decommissioned. An on-going Performance Assessment process for the RWMC underscores the potential for reduced or limited LLW disposal capacity at the existing onsite facility. In order to properly manage the anticipated amount of LLW, the INEL is investigating various disposal options. These options include building a new facility, disposing the LLW at other DOE sites, using commercial disposal facilities, or seeking a combination of options. This evaluation reports on the feasibility of using commercial disposal facilities.

892 (INEL-95/0502) **Graphite electrode arc melter demonstration Phase 2 test results.** Soelberg, N.R.; Chambers, A.G.; Anderson, G.L.; O'Connor, W.K.; Oden, L.L.; Turner, P.C. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jun 1996. 283p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96014153. Source: OSTI; NTIS; INIS; GPO Dep.

Several U.S. Department of Energy organizations and the U.S. Bureau of Mines have been collaboratively conducting mixed waste treatment process demonstration testing on the near full-scale graphite electrode submerged arc melter system at the Bureau's Albany (Oregon) Research Center. An initial test series successfully demonstrated arc melter capability for treating surrogate incinerator ash of buried mixed wastes with soil. The conceptual treatment process for that test series assumed that buried waste would be retrieved and incinerated, and that the incinerator ash would be vitrified in an arc melter. This report presents results from a recently completed second series of tests, undertaken to determine the ability of the arc melter system to stably process a wide range of "as-received" heterogeneous solid mixed wastes containing high levels of organics, representative of the wastes buried and stored at the Idaho National Engineering Laboratory (INEL). The Phase 2 demonstration test results indicate that an arc melter system is capable of directly processing these wastes and could enable elimination of an up-front incineration step in the conceptual treatment process.

893 (INEL–95/00502) **Alternative disposal options for alpha-mixed low-level waste.** Loomis, G.G.; Sherick, M.J. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951209–1: 17. low-level radioactive waste management conference, Phoenix, AZ (United States), 12-14 Dec 1995). Order Number DE96002775. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents several disposal options for the Department of Energy alpha-mixed low-level waste. The mixed nature of the waste favors thermally treating the waste to either an iron-enriched basalt or glass waste form, at which point a multitude of reasonable disposal options, including in-state disposal, are a possibility. Most notably, these waste forms will meet the land-ban restrictions. However, the thermal treatment of this waste involves considerable waste handling and complicated/expensive offgas systems with secondary waste management problems. In the United States, public perception of offgas systems in the radioactive incinerator area is unfavorable. The alternatives presented here are nonthermal in nature and involve homogenizing the waste with cryogenic techniques followed by complete encapsulation with a variety of chemical/grouting agents into retrievable waste forms. Once encapsulated, the waste forms are suitable for transport out of the state or for actual in-state disposal. This paper investigates variances that would have to be obtained and contrasts the alternative encapsulation idea with the thermal treatment option.

894 (INEL–95/0517) **Alternatives to reduce corrosion of carbon steel storage drums.** Zirker, L.R.; Beitel, G.A. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Nov 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96004070. Source: OSTI; NTIS; INIS; GPO Dep.

The major tasks of this research were (a) pollution prevention opportunity assessments on the overpacking operations for failed or corroded drums, (b) research on existing container corrosion data, (c) investigation of the storage environment of the new Resource Conservation and Recovery Act Type II storage modules, (d) identification of waste streams that demonstrate deleterious corrosion affects on drum storage life, and (e) corrosion test cell program development. Twenty-one waste streams from five US Department of Energy (DOE) sites within the DOE Complex were identified to demonstrate a deleterious effect to steel storage drums. The major components of these waste streams include acids, salts, and solvent liquids, sludges, and still bottoms. The solvent-based waste streams typically had the shortest time to failure: 0.5 to 2 years. The results of this research support the position that pollution prevention evaluations at the front end of a project or process will reduce pollution on the back end.

895 (INEL–95/0519) **Geologic processes in the RWMC area, Idaho National Engineering Laboratory: Implications for long term stability and soil erosion at the radioactive waste management complex.** Hackett, W.R. (and others); Tullis, J.A.; Smith, R.P. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002205. Source: OSTI; NTIS; INIS; GPO Dep.

The Radioactive Waste Management Complex (RWMC) is the disposal and storage facility for low-level radioactive waste at the Idaho National Engineering Laboratory (INEL). Transuranic waste and mixed wastes were also disposed at the RWMC until 1970. It is located in the southwestern part of the INEL about 80 km west of Idaho Falls, Idaho. The INEL occupies a portion of the Eastern Snake River Plain (ESRP), a low-relief, basalt, and sediment-floored basin within the northern Rocky Mountains and northeastern Basin and Range Province. It is a cool and semiarid, sagebrush steppe desert characterized by irregular, rolling terrain. The RWMC began disposal of INEL-generated wastes in 1952, and since 1954, wastes have been accepted from other Federal facilities. Much of the waste is buried in shallow trenches, pits, and soil vaults. Until about 1970, trenches and pits were excavated to the basalt surface, leaving no sediments between the waste and the top of the basalt. Since 1970, a layer of sediment (about 1 m) has been left between the waste and the basalt. The United States Department of Energy (DOE) has developed regulations specific to radioactive-waste disposal, including environmental standards and performance objectives. The regulation applicable to all DOE facilities is DOE Order 5820.2A (Radioactive Waste Management). An important consideration for the performance assessment of the RWMC is the long-term geomorphic stability of the site. Several investigators have identified geologic processes and events that could disrupt a radioactive waste disposal facility. Examples of these "geomorphic hazards" include changes in stream discharge, sediment load, and base level, which may result from climate change, tectonic processes, or magmatic processes. In the performance assessment, these hazards are incorporated into scenarios that may affect the future performance of the RWMC.

896 (INEL–95/0537) **Routine organic air emissions at the Radioactive Waste Management Complex Waste Storage Facilities fiscal year 1995 report.** Galloway, K.J.; Jolley, J.G. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Dec 1995. 153p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003834. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the data and results of the routine organic air emissions monitoring performed in the Radioactive Waste Management Complex Waste Storage Facility, WMF-628, from January 4, 1995 to September 3, 1995. The task objectives were to systematically identify and measure volatile organic compound (VOC) concentrations within WMF-628 that could be emitted into the environment. These routine measurements implemented a dual method approach using Open-Path Fourier Transform Infrared Spectroscopy (OP-FTIR) monitoring and the Environmental Protection Agency (EPA) analytical method TO-14, Summa® Canister sampling. The data collected from the routine monitoring of WNF-628 will assist in estimating the total VOC emissions from WMF-628.

897 (INEL–95/00549) **Facility status and progress of the INEL's WERF MLLW and LLW incinerator.** Conley, D.; Corrigan, S. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1996]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-960804–27: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96010442. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory's (INEL) Waste Experimental Reduction Facility (WERF) incinerator began processing beta/gamma- emitting low-level waste (LLW) in September 1984. A Resource Conservation and Recovery Act (RCRA) trial burn for the WERF incinerator was conducted in 1986, and in 1989 WERF began processing (hazardous and low-level radioactive) waste known as mixed low-level waste (MLLW). On February 14, 1991 WERF operations were suspended to improve operating procedures and configuration management. On July 12, 1995, WERF initiated incineration of LLW; and on September 20, 1995 WERF resumed its primary mission of incinerating MLLW. MLLW incineration is proceeding under RCRA interim status. State of Idaho issuance of the Part B permit is one of the State's highest permitting priorities. The State of Idaho's Division of Environmental Quality is reviewing the permit application along with a revised trial burn plan that was also submitted with the application. The trial burn has been proposed to be performed in 1996 to demonstrate compliance with the current incinerator guidance. This paper describes the experiences and problems associated with WERF's operations, incineration of MLLW, and the RCRA Part B Permit Application. Some of the challenges that have been overcome include waste characterization, waste repackaging, repackaged waste storage, and implementation of RCRA interim status requirements. A number of challenges remain. They include revision of the RCRA Part B Permit Application and the Trial Burn Plan in response to comments from the state permit application reviewers as well as facility and equipment upgrades required to meet RCRA Permitted Status.

898 (INEL–95/0555) **Mixed Waste Focus Area: Department of Energy complex needs report.** Roach, J.A. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 16 Nov 1995. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003831. Source: OSTI; NTIS; INIS; GPO Dep.

The Assistant Secretary for the Office of Environmental Management (EM) at the US Department of Energy (DOE) initiated a new approach in August of 1993 to environmental research and technology development. A key feature of this new approach included establishment of the Mixed Waste Characterization, Treatment, and Disposal Focus Area (MWFA). The mission of the MWFA is to identify, develop, and implement needed technologies such that the major environmental management problems related to meeting DOE's commitments for treatment of mixed wastes under the Federal Facility Compliance Act (FFCA), and in accordance with the Land Disposal Restrictions (LDR) of the Resource Conservation and Recovery Act (RCRA), can be addressed, while cost-effectively expending the funding resources. To define the deficiencies or needs of the EM customers, the MWFA analyzed Proposed Site Treatment Plans (PSTPs), as well as other applicable documents, and conducted site visits throughout the summer of 1995. Representatives from the Office of Waste Management (EM-30), the Office of Environmental Restoration (EM-40), and the Office of Facility Transition and Management (EM-60) at each site visited were requested to consult with the Focus Area to collaboratively define their technology needs. This report documents the needs, deficiencies, technology gaps, and opportunities for expedited treatment activities that were identified during the site visit process. The defined deficiencies and needs are categorized by waste type, namely Wastewaters, Combustible Organics, Sludges/Soils, Debris/Solids, and Unique Wastes, and will be prioritized based on the relative affect the deficiency has on the DOE Complex.

899 (INEL–95/00616) **Mixed waste focus area Department of Energy technology development needs identification and prioritization.** Roach, J.A. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Nov 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960246–1: Waste management '96 symposium and spectrum '96, Seattle, WA (United States), 25-29 Feb 1996). Order Number DE96004553. Source: OSTI; NTIS; INIS; GPO Dep.

The Assistant Secretary for the Office of Environmental Management (EM) at the US DOE initiated a new approach in August, 1993 to environmental research and technology development. The key features of this new approach included establishment of five focus areas and three crosscutting technology programs, which overlap the boundaries of the focus areas. The five focus areas include the Contaminant Plumes Containment and Remediation; Mixed Waste Characterization, Treatment, and Disposal; High-Level Waste Tank Remediation, Landfill Stabilization, and Decontamination and Decommissioning Focus Areas. The three crosscutting technologies programs include Characterization, Monitoring, and Sensor Technology; Efficient Separations and Processing; and Robotics. The DOE created the Mixed Waste Characterization, Treatment, and Disposal Focus Area (MWFA) to develop and facilitate implementation of technologies required to meet its commitments for treatment of mixed wastes. To accomplish this goal, the technology deficiencies must be identified and categorized, the deficiencies and needs must be prioritized, and a technical baseline must be established that integrates the requirements associated with these needs into the planned and ongoing environmental research and technology development activities supported by the MWFA. These steps are described.

900 (INEL–95/0647) **National Low-Level Waste Management Program final summary report of key activities and accomplishments for fiscal year 1995.** Forman, S. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Dec 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96007529. Source: OSTI; NTIS; INIS; GPO Dep.

To assist the Department of Energy (DOE) in fulfilling its responsibilities under the Low-Level Radioactive Waste Policy Amendments Act of 1985, the National Low-Level Waste Management Program (NLLWMP) outlines the key activities that the NLLWMP will accomplish in the following fiscal year. Additional activities are added during the fiscal year as necessary to accomplish programmatic goals. This report summarizes the activities and accomplishments of the NLLWMP during fiscal year 1995.

901 (INEL–96/00041) **A comparison of the costs of treating wastes from a radio analytical laboratory.** Moore, R. (Dept. of Energy, Idaho Falls, ID (United States). Idaho Field Office); Pole, S.B. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1996]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9604123–1: Conference on hazardous wastes and materials, Idaho Falls, ID (United States), 3-4 Apr 1996). Order Number DE96009117. Source: OSTI; NTIS; INIS; GPO Dep.

The Radiological and Environmental Sciences Laboratory (RESL) is a government-owned, government-operated facility at the Idaho National Engineering Laboratory (INEL). RESL's traditional strengths are in precise radionuclide analysis and dosimetry measurements. RESL generates small quantities of various types of waste. This study identified potential waste management options for a solvent extraction process waste stream and the cost differences resulting from either process changes, improved technology usage, or material substitutions or changes at RESL. Where possible, this report identifies changes that have resulted or may result in waste reduction and cost savings. DOE P2 directs the lab to review processes, evaluate waste practices, and estimate potential reductions in waste volumes and waste management costs. This study focused on selected processes, but the processes are illustrative of potential waste volume reductions and cost minimizations that may be achieved elsewhere at the INEL and throughout the DOE complex. In analyzing a waste disposal process, the authors allocated component costs to functional categories. These categories included the following: (1) operational costs, included waste generation and collection into a storage area; (2) administrative costs, including worker training, routine inspections, and reporting; and (3) disposal costs, including preparing the waste for shipment and disposing of it.

902 (INEL–96/00047) **Survey of commercial firms with mixed-waste treatability study capability.** McFee, J. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); McNeel, K.; Eaton, D.; Kimmel, R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960212–78: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96009016. Source: OSTI; NTIS; INIS; GPO Dep.

According to the data developed for the Proposed Site Treatment Plans, the US Department of Energy (DOE) mixed low-level and mixed transuranic waste inventory was estimated at 230,000 m^3 and embodied in approximately 2,000 waste streams. Many of these streams are unique and may require new technologies to facilitate compliance with Resource Conservation and Recovery Act disposal requirements. Because most waste streams are unique, a demonstration of the selected technologies is justified. Evaluation of commercially available or innovative technologies in a treatability study is a cost-effective method of providing a demonstration of the technology and supporting decisions on technology selection. This paper summarizes a document being prepared by the Mixed Waste Focus Area of the DOE Office of Science and Technology (EM-50). The document will provide DOE waste managers with a list of commercial firms (and universities) that have mixed-waste treatability study capabilities and with the specifics regarding the technologies available at those facilities. In addition, the document will provide a short summary of key points of the relevant regulations affecting treatability studies and will compile recommendations for successfully conducting an off-site treatability study. Interim results of the supplier survey are tabulated in this paper. The tabulation demonstrates that treatment technologies in 17 of the US Environmental Protection Agency's technology categories are available at commercial facilities. These technologies include straightforward application of standard technologies, such as pyrolysis, as well as proprietary technologies developed specifically for mixed waste. The paper also discusses the key points of the management of commercial mixed-waste treatability studies.

903 (INEL–96/00055) **Life cycle cost and risk estimation of environmental management options.** Shropshire, D.; Sherick, M. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960212–77: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96009014. Source: OSTI; NTIS; INIS; GPO Dep.

The evaluation process is demonstrated in this paper through comparative analysis of two alternative scenarios identified for the management of the alpha-contaminated fixed low-level waste currently stored at INEL. These two scenarios, the Base Case and the Delay Case, are realistic and based on actual data, but are not intended to exactly match actual plans currently being developed at INEL. Life cycle cost estimates were developed for both scenarios using the System Cost Model; resulting costs are presented and compared. Life cycle costs are shown as a function of time and also aggregated by pretreatment, treatment, storage, and disposal activities. Although there are some short-term cost savings for the Delay Case, cumulative life cycle costs eventually become much higher than costs for the Base Case over the same period of time, due mainly to the storage and repackaging necessary to accommodate the longer Delay Case schedule. Life cycle risk estimates were prepared using a new risk analysis method adapted to the System Cost Model architecture for automated, systematic cost/risk applications. Relative risk summaries are presented for both scenarios as a function of time and also aggregated by pretreatment, treatment, storage, and disposal activities. Relative risk of the Delay Case is shown to be higher than that of the Base Case. Finally, risk and cost results are combined to show how the collective information can be used to help identify opportunities for risk or cost reduction and highlight areas where risk reduction can be achieved most economically.

904 (INEL–96/00056) **The System Cost Model: A tool for life cycle cost and risk analysis.** Hsu, K.; Lundeen, A.; Shropshire, D.; Sherick, M. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1996]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960212–75: Waste management '96: HLW, LLW, mixed wastes and

environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96009013. Source: OSTI; NTIS; INIS; GPO Dep.

In May of 1994, Lockheed Idaho Technologies Company (LITCO) in Idaho Falls, Idaho and subcontractors began development of the System Cost Model (SCM) application. The SCM estimates life cycle costs of the entire US Department of Energy (DOE) complex for designing; constructing; operating; and decommissioning treatment, storage, and disposal (TSD) facilities for mixed low-level, low-level, and transuranic waste. The SCM uses parametric cost functions to estimate life cycle costs for various treatment, storage, and disposal modules which reflect planned and existing waste management facilities at DOE installations. In addition, SCM can model new TSD facilities based on capacity needs over the program life cycle. The user can provide input data (default data is included in the SCM) including the volume and nature of waste to be managed, the time period over which the waste is to be managed, and the configuration of the waste management complex (i.e., where each installation's generated waste will be treated, stored, and disposed). Then the SCM uses parametric cost equations to estimate the costs of pre-operations (designing), construction, operations and maintenance, and decommissioning these waste management facilities. The SCM also provides transportation costs for DOE wastes. Transportation costs are provided for truck and rail and include transport of contact-handled, remote-handled, and alpha (transuranic) wastes. A complement to the SCM is the System Cost Model-Risk (SCM-R) model, which provides relative Environmental, Safety, and Health (ES and H) risk information. A relative ES and H risk basis has been developed and applied by LITCO at the INEL. The risk basis is now being automated in the SCM-R to facilitate rapid risk analysis of system alternatives. The added risk functionality will allow combined cost and risk evaluation of EM alternatives.

905 (INEL–96/0060) **Tribal and public involvement in the U.S. Department of Energy Mixed Waste Focus Area – First quarter status report for the period ending December 31, 1995.** Owens, K.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Feb 1996. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96013292. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy (DOE) Mixed Waste Focus Area (MWFA) began operations in February 1995 to provide technologies for the design, construction, and operation of implementable mixed waste treatment systems as identified in DOE Site Treatment Plans of the Federal Facilities Compliance Act. Implementable mixed waste treatment systems means that they meet the MWFA success criteria and that potential barriers to implementing those treatment systems have been identified and eliminated through effective communications and meaningful involvement with regulators, stakeholders, and tribal governments. The Regulatory and External Liaison Product Area of the MWFA is responsible for ensuring that possible teaming arrangements are considered and integrated into the MWFA technology development and decision-making processes. The Tribal and Public Involvement Team of the MWFA Regulatory and External Liaison Product Area has initiated a variety of activities to facilitate tribal and stakeholder involvement within the MWFA. This document discusses the status of those activities as of the end of the first quarter of the 1996 fiscal year and describes applicable lessons learned and process improvements.

906 (INEL–96/0073) **Review of private sector and Department of Energy treatment, storage, and disposal capabilities for low-level and mixed low-level waste.** Willson, R.A.; Ball, L.W.; Mousseau, J.D.; Piper, R.B. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Mar 1996. 170p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96010319. Source: OSTI; NTIS; INIS; GPO Dep.

Private sector capacity for treatment, storage, and disposal (TSD) of various categories of radioactive waste has been researched and reviewed for the Idaho National Engineering Laboratory (INEL) by Lockheed Idaho Technologies Company, the primary contractor for the INEL. The purpose of this document is to provide assistance to the INEL and other US Department of Energy (DOE) sites in determining if private sector capabilities exist for those waste streams that currently cannot be handled either on site or within the DOE complex. The survey of private sector vendors was limited to vendors currently capable of, or expected within the next five years to be able to perform one or more of the following services: low-level waste (LLW) volume reduction, storage, or disposal; mixed LLW treatment, storage, or disposal; alpha-contaminated mixed LLW treatment; LLW decontamination for recycling, reclamation, or reuse; laundering of radioactively-contaminated laundry and/or respirators; mixed LLW treatability studies; mixed LLW treatment technology development. Section 2.0 of this report will identify the approach used to modify vendor information from previous revisions of this report. It will also illustrate the methodology used to identify any additional companies. Section 3.0 will identify, by service, specific vendor capabilities and capacities. Because this document will be used to identify private sector vendors that may be able to handle DOE LLW and mixed LLW streams, it was decided that current DOE capabilities should also be identified. This would encourage cooperation between DOE sites and the various states and, in some instances, may result in a more cost-effective alternative to privatization. The DOE complex has approximately 35 sites that generate the majority of both LLW and mixed LLW. Section 4.0 will identify these sites by Operations Office, and their associated LLW and mixed LLW TSD units.

907 (INEL–96/00151) **Technology transfer: A cooperative agreement and success story.** Reno, H.W. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); McNeel, K.; Armstrong, A.T.; Vance, J.K. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960804–52: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96014121. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the cooperative agreement between the U.S. Department of Energy and Envirocare of Utah, Inc., wherein the former transferred macroencapsulative technology to the latter for purposes of demonstrating commercialization of treatment and disposal of 225, 000 Kg of radioactive lead stored at departmental installations.

908 (INEL–96/0155) **Mixed waste focus area integrated master schedule (current as of May 6, 1996).** Idaho National Engineering Lab., Idaho Falls, ID (United States). 1996. 84p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract AC07-94ID13223. Order Number DE96010270. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Mixed Waste Characterization, Treatment, and Disposal Focus Area (MWFA) is to provide acceptable treatment systems, developed in partnership with users and with the participation of stakeholders, tribal governments, and regulators, that are capable of treating the Department of Energy's (DOE's) mixed wastes. In support of this mission, the MWTA produced the Mixed Waste Focus Area Integrated Technical Baseline Report, Phase I Volume 1, January 16, 1996, which identified a prioritized list of 30 national mixed waste technology deficiencies. The MWFA is targeting funding toward technology development projects that address the current list of deficiencies. A clear connection between the technology development projects and the EM-30 and EM-40 treatment systems that they support is essential for optimizing the MWFA efforts. The purpose of the Integrated Master Schedule (IMS) is to establish and document these connections and to ensure that all technology development activities performed by the MWFA are developed for timely use in those treatment systems. The IMS is a list of treatment systems from the Site Treatment Plans (STPs)/Consent Orders that have been assigned technology development needs with associated time-driven schedules, Technology deficiencies and associated technology development (TD) needs have been identified for each treatment system based on the physical, chemical, and radiological characteristics of the waste targeted for the treatment system. The schedule, the technology development activities, and the treatment system have been verified through the operations contact from the EM-30 organization at the site.

909 (INEL–96/00188) **Packaged low-level waste verification system.** Tuite, K.T. (Waste Management Group, Peekskill, NY (United States)); Winberg, M.; Flores, A.Y.; Killian, E.W.; McIsaac, C.V. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960804–54: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96014106. Source: OSTI; NTIS; INIS; GPO Dep.

Currently, states and low-level radioactive waste (LLW) disposal site operators have no method of independently verifying the radionuclide content of packaged LLW that arrive at disposal sites for disposal. At this time, disposal sites rely on LLW generator shipping manifests and accompanying records to insure that LLW received meets the waste acceptance criteria. An independent verification system would provide a method of checking generator LLW characterization methods and help ensure that LLW disposed of at disposal facilities meets requirements. The Mobile Low-Level Waste Verification System (MLLWVS) provides the equipment, software, and methods to enable the independent verification of LLW shipping records to insure that disposal site waste acceptance criteria are being met. The MLLWVS system was developed under a cost share subcontract between WMG, Inc., and Lockheed Martin Idaho Technologies through the Department of Energy's National Low-Level Waste Management Program at the Idaho National Engineering Laboratory (INEL).

910 (INEL–96/0249) **Commercial treatability study capabilities for application to the US Department of Energy's anticipated mixed waste streams.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Jul 1996. 169p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96014151. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) has established the Mixed Waste Focus Area (MWFA), which represents a national effort to develop and coordinate treatment solutions for mixed waste among all DOE facilities. The hazardous waste component of mixed waste is regulated under the Resource Conservation and Recovery Act (RCRA), while the radioactive component is regulated under the Atomic Energy Act, as implemented by the DOE, making mixed waste one of the most complex types of waste for the DOE to manage. The MWFA has the mission to support technologies that meet the needs of the DOE's waste management efforts to characterize, treat, and dispose of mixed waste being generated and stored throughout the DOE complex. The technologies to be supported must meet all regulatory requirements, provide cost and risk improvements over available technologies, and be acceptable to the public. The most notable features of the DOE's mixed-waste streams are the wide diversity of waste matrices, volumes, radioactivity levels, and RCRA-regulated hazardous contaminants. Table 1-1 is constructed from data from the proposed site treatment plans developed by each DOE site and submitted to DOE Headquarters. The table shows the number of mixed-waste streams and their corresponding volumes. This table illustrates that the DOE has a relatively small number of large-volume mixed-waste streams and a large number of small-volume mixed-waste streams. There are 1,033 mixed-waste streams with volumes less than 1 cubic meter; 1,112 mixed-waste streams with volumes between 1 and 1,000 cubic meters; and only 61 mixed-waste streams with volumes exceeding 1,000 cubic meters.

Oak Ridge K-25 Site, TN (United States); Clark Atlanta Univ., GA (United States). May 1996. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96011091. Source: OSTI; NTIS; INIS; GPO Dep.

A sludge that simulates Water Softening Sludge number 5 (WSS number 5 filtercake) at Oak Ridge National Laboratory was prepared and evaluated for its thermal behavior, volume reduction, stabilization, surface area and compressive strength properties. Compaction of the surrogate waste and the calcium oxide (produced by calcination) in the presence of paraffin resulted in cylindrical molds with various degrees of stability. This work has demonstrated that surrogate WSS number 5 at ORNL can be successfully stabilized by blending it with about 35 percent paraffin and compacting the mixture at 8000 psi. This compressive strength of the waste form is sufficient for temporary storage of the waste while long-term storage waste forms are developed. Considering the remarkable similarity between the surrogate and the actual filtercake, the findings of this project should be useful for treating the sludge generated by the waste treatment facility at ORNL.

912 (LA–12967-MS) **Ecological surveys of the proposed high explosives wastewater treatment facility region.** Haarmann, T. Los Alamos National Lab., NM (United States). Jul 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015053. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos National Laboratory (LANL) proposes to improve its treatment of wastewater from high explosives (HE) research and development activities. The proposed project would focus on a concerted waste minimization effort to greatly reduce the amount of wastewater needing treatment. The result would be a 99% decrease in the HE wastewater volume, from the current level of 6,760,000 L/mo (1,786,000 gal./mo) to 41,200 L/mo (11,000 gal./mo). This reduction would entail closure of HE wastewater outfalls, affecting some wetland areas that depend on HE wastewater effluents. The outfalls also provide drinking water for many wildlife species. Terminating the flow of effluents at outfalls would represent an improvement in water quality in the LANL region but locally could have a negative effect on some wetlands and wildlife species. None of the affected species are protected by any state or federal endangered species laws. The purpose of this report is to briefly discuss the different biological studies that have been done in the region of the project area. This report is written to give biological information and baseline data and the biota of the project area.

913 (LA–13041-MS) **Mixed waste treatment model: Basis and analysis.** Palmer, B.A. Los Alamos National Lab., NM (United States). Sep 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96000887. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy's Programmatic Environmental Impact Statement (PEIS) required treatment system capacities for risk and cost calculation. Los Alamos was tasked with providing these capacities to the PEIS team. This involved understanding the Department of Energy (DOE) Complex waste, making the necessary changes to correct for problems, categorizing the waste for treatment, and determining the treatment system requirements. The treatment system requirements depended on the incoming waste, which varied for each PEIS case. The treatment system requirements also depended on the type of treatment that was desired. Because different groups contributing to the PEIS needed specific types of results, we provided the treatment system requirements in a variety of forms. In total, some 40 data files were created for the TRU cases, and for the MLLW case, there were 105 separate data files. Each data file represents one treatment case consisting of the selected waste from various sites, a selected treatment system, and the reporting requirements for such a case. The treatment system requirements in their most basic form are the treatment process rates for unit operations in the desired treatment system, based on a 10-year working life and 20-year accumulation of the waste. These results were reported in cubic meters and for the MLLW case, in kilograms as well. The treatment system model consisted of unit operations that are linked together. Each unit operation's function depended on the input waste streams, waste matrix, and contaminants. Each unit operation outputs one or more waste streams whose matrix, contaminants, and volume/mass may have changed as a result of the treatment. These output streams are then routed to the appropriate unit operation for additional treatment until the output waste stream meets the treatment requirements for disposal. The total waste for each unit operation was calculated as well as the waste for each matrix treated by the unit.

914 (LA–13042-MS) **Gas-solid alkali destruction of volatile chlorocarbons.** Foropoulos, J. Jr. Los Alamos National Lab., NM (United States). Dec 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96003988. Source: OSTI; NTIS; INIS; GPO Dep.

Many chlorocarbons are environmental dangers and health hazards. The simplest perchlorinated hydrocarbon, carbon tetrachloride, is near the top of the list of hazardous compounds. Carbon tetrachloride was used as a cleaning fluid, solvent, and fire-extinguishing agent. The nuclear and defense complexes also employed great quantities of carbon tetrachloride and other chlorocarbons as cleaning and degreasing agents. Many sites nationwide have underground chlorocarbon contamination plumes. Bulk chlorocarbon inventories at many locations await treatment and disposal. Often the problem is compounded by the chlorocarbon being radioactively contaminated. Waste inventory and groundwater contamination problems exist for many other chlorocarbons, especially methylene chloride, chloroform, and tri- and tetrachloroethylene. In this work solid soda lime (a fused mixture of approximately 95% CaO and 5% NaOH in a coarse, granulated form) at 350 C to 400 C acts as the hydrolyzing degradation, and off-gas scrubbing medium. Within soda lime CO_2 and HCl from hydrolysis and degradation convert immediately to calcium and sodium chlorides and carbonates, with water vapor as a volatile byproduct.

915 (LA–13089-MS) **Geological site characterization for the proposed Mixed Waste Disposal Facility, Los Alamos National Laboratory.** Reneau, S.L.; Raymond, R. Jr. (eds.). Los Alamos National Lab., NM (United States). Dec 1995. 136p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96012968. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of geological site characterization studies conducted from 1992 to 1994 on Pajarito Mesa for a proposed Los Alamos National Laboratory Mixed Waste Disposal Facility (MWDF). The MWDF is being designed to receive mixed waste (waste containing both hazardous and radioactive components) generated during Environmental Restoration Project cleanup activities at Los Alamos. As of 1995, there is no Resource Conservation and Recovery Act (RCRA) permitted disposal site for mixed waste at the Laboratory, and construction of the MWDF would provide an alternative to transport of this material to an off-site location. A 2.5 km long part of Pajarito Mesa was originally considered for the MWDF, extending from an elevation of about 2150 to 2225 m (7060 to 7300 ft) in Technical Areas (TAs) 15, 36, and 67 in the central part of the Laboratory, and planning was later concentrated on the western area in TA-67. The mesa top lies about 60 to 75 m (200 to 250 ft) above the floor of Pajarito Canyon on the north, and about 30 m (100 ft) above the floor of Threemile Canyon on the south. The main aquifer used as a water supply for the Laboratory and for Los Alamos County lies at an estimated depth of about 335 m (1100 ft) below the mesa. The chapters of this report focus on surface and near-surface geological studies that provide a basic framework for siting of the MWDF and for conducting future performance assessments, including fulfillment of specific regulatory requirements. This work includes detailed studies of the stratigraphy, mineralogy, and chemistry of the bedrock at Pajarito Mesa by Broxton and others, studies of the geological structure and of mesa-top soils and surficial deposits by Reneau and others, geologic mapping and studies of fracture characteristics by Vaniman and Chipera, and studies of potential landsliding and rockfall along the mesa-edge by Reneau.

916 (LA–13114-MS) **Deflagration in stainless steel storage containers containing plutonium dioxide.** Kleinschmidt, P.D. Los Alamos National Lab., NM (United States). Feb 1996. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96007457. Source: OSTI; NTIS; INIS; GPO Dep.

Detonation of hydrogen and oxygen in stainless steel storage containers produces maximum pressures of 68.5 psia and 426.7 psia. The cylinders contain 3,000 g of PuO_2 with 0.05 wt% and 0.5 wt% water respectively. The hydrogen and oxygen are produced by the alpha decomposition of the water. Work was performed for the Savannah River Site.

917 (LA–13175) **Application of cryogenic grinding to achieve homogenization of transuranic wastes.** Atkins, W.H. (and others); Hill, D.D.; Lucero, M.E.; Jaramillo, L.; Martinez, H.E. Los Alamos National Lab., NM (United States). Aug 1996. 96p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96013912. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes work done at Los Alamos National Laboratory (LANL) in collaboration with the Department of Energy Rocky Flats Field Office (DOE/RFFO) and with the National Institute of Standards and Technology (NIST), Boulder, Colorado. Researchers on this project have developed a method for cryogenic grinding of mixed wastes to homogenize and, thereby, to acquire a representative sample of the materials. There are approximately 220,000 waste drums owned by the Rocky Flats Environmental Technology Site (RFETS)-50,000 at RFETS and 170,000 at the Idaho National Engineering Laboratory. The cost of sampling the heterogeneous distribution of waste in each drum is prohibitive. In an attempt to produce a homogeneous mixture of waste that would reduce greatly the cost of sampling, researchers at NIST and RFETS are developing a cryogenic grinder. The Los Alamos work herein described addresses the implementation issues of the task. The first issue was to ascertain whether samples of the "small particle" mixtures of materials present in the waste drums at RFETS were representative of actual drum contents. Second, it was necessary to determine at what temperature the grinding operation must be performed in order to minimize or to eliminate the release of volatile organic compounds present in the waste. Last, it was essential to evaluate any effect the liquid cryogen might have on the structural integrity and ventilation capacity of the glovebox system. Results of this study showed that representative samples could be and had been obtained, that some release of organics occurred below freezing because of sublimation, and that operation of the cryogenic grinding equipment inside the glovebox was feasible.

918 (LA-SUB–95-166) **Project Management Support and Services for the Environmental Restoration and Waste Management. Final report.** Los Alamos National Lab., NM (United States); Project Time and Cost, Washington, DC (United States). 10 Apr 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96003108. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory (LANL) Environmental Restoration Technical Support Office (ERTSO) contracted Project Time & Cost, Inc. (PT&C) on 16 November 1992 to provide support services to the US Department of Energy (DOE). ERTSO had traditionally supported the DOE Albuquerque office in the Environmental Restoration and Waste Management Programs and had also supported the Office of Waste Management (EM-30) at DOE Headquarters in Germantown, Maryland. PT&C was requested to provide project management and support services for the DOE as well as liaison and coordination of responses and efforts between various agencies. The primary objective of this work was to continue LANL's technical support role to EM-30 and assist in the development of the COE Cost and Schedule Estimating (CASE) Guide for EM-30. PT&C's objectives, as specified in Section B of the contract, were well met during the duration of the project through the review and comment of various draft documents, trips to DOE sites providing program management support and participating in the training for the EM-30 Cost and Schedule Estimating Guide, drafting memos and scheduling future projects, attending numerous meetings with LANL, DOE and other subcontractors, and providing written observations and recommendations.he results obtained were determined to be satisfactory by both the LANL ERTSO and DOE EM-30 organizations. The objective to further the support from LANL and their associated subcontractor (PT&C) was met. The contract concluded with no outstanding issues.

919 (LA-SUB–95-196-Vol.1) **[Inspection of gas cylinders in storage at TA-54, Area L]. Volume 1, Final report.** Los Alamos National Lab., NM (United States); Earth Resources Corp., Ocoee, FL (United States). 23 Jun 1994. 350p. Sponsored by USDOE, Washington, DC (United States). ERC sampled, analyzed, and recontainerized when necessary 179 gas cylinders containing various chemicals in storage at LANL TA-54 Area L. This report summarizes the operation. This is Volume 5 of five volumes.

924 (LA-SUB-95-208) **Bioreduction amenability testing of actinide contaminated soils. The systems: Am^{241}-Pu^{238}, Am^{241}-$Pu^{239/40}$, U.** Korich, D.G. (MBX Systems, Inc., Tucson, AZ (United States)); Sharp, J.E. Los Alamos National Lab., NM (United States); MBX Systems, Inc., Tucson, AZ (United States). Jan 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96006790. Source: OSTI; NTIS; INIS; GPO Dep.

Bioreductive processing of actinide contaminated soils can achieve extraction levels in excess of 97% for both plutonium and uranium contaminants. Reasonable reaction rates of 4 to 6 day resident times for Pu-Am have been demonstrated on 4 gram sample charges. Longer reaction times of 17 days required for uranium extraction can be improved by soil sample preconditioning and/or an increase in process reagent concentrations. The environmentally benign treatment process operates at pH 6–7, preserves the original soil matrix, and utilizes standard processing equipment. The process reagent component (inoculum SD-1 and biological growth medium PX100™) are available for utilization in an integrated system. Process techniques developed by MBX, involving graduated volume bioreactors have been proven to alleviate biological toxicity problems in treatment leachates. Bioreduction processing of actinide contaminated soils, preconditioning of soil charges, and recycling or vegetation of unacceptable tailings can be combined to provide an effective and environmentally attractive method of remediation. The soil test program was designed to determine the applicability of the MBX bioreductive technology to solubilize Pu and Am from RFP, Mound and LANL soils and uranium from Hanford and Fernald soils.

925 (LA-SUB-95-223) **Waste management and technologies analytical database project for Los Alamos National Laboratory/Department of Energy. Final report, June 7, 1993–June 15, 1994.** Los Alamos National Lab., NM (United States); Summitec Corp., Oak Ridge, TN (United States). 17 Apr 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96006842. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Management and Technologies Analytical Database System (WMTADS) supported by the Department of Energy's (DOE) Office of Environmental Management (EM), Office of Technology Development (EM-50), was developed and based at the Los Alamos National Laboratory (LANL), Los Alamos, New Mexico, to collect, identify, organize, track, update, and maintain information related to existing/available/developing and planned technologies to characterize, treat, and handle mixed, hazardous and radioactive waste for storage and disposal in support of EM strategies and goals and to focus area projects. WMTADS was developed as a centralized source of on-line information regarding technologies for environmental management processes that can be accessed by a computer, modem, phone line, and communications software through a Local Area Network (LAN), and server connectivity on the Internet, the world's largest computer network, and with file transfer protocol (FTP) can also be used to globally transfer files from the server to the user's computer through Internet and World Wide Web (WWW) using Mosaic.

926 (LA-SUB-96-99-Pt.1) **Ambient monitoring of volatile organic compounds at Los Alamos National Laboratory in technical area 54, areas G and L. Final report.** Mischler, S. (Radian Corp., Austin, TX (United States)); Anderson, E.; Vold, E.L. Radian Corp., Austin, TX (United States); Los Alamos National Lab., NM (United States). 15 Mar 1994. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96013264. Source: OSTI; NTIS; INIS; GPO Dep.

Ambient air monitoring for volatile organic compounds (VOCs) was conducted at TA-54 to characterize non-radioactive air emissions to determine if the Laboratory's waste operations are releasing significant amounts of VOCs to the ambient environment. Samples were collected at four locations along the northern fenceline (dominant downwind side) of Areas G & L and at a background site located in Bandelier National Monument. Eight-hour integrated samples were collected in evacuated canisters during daylight hours on each of eight days during the summer of 1994, for a total of 40 samples. The samples were analyzed by gas chromatography following EPA Method TO-14 for a target list of 68 analytes. In general, about two dozen volatile organic compounds (VOCs) were identified in each sample, including those collected at the background site, but the concentration levels were very low (e.g.; < 1 to 10 ppbv). The average total non-methane hydrocarbon (TNMHC) concentration ranged from 4.3 to 22.8 ppbv at the Area G and L sites as compared with an average of 4.2 ppbv at the background site. The measured concentrations were compared with action levels developed by the New Mexico Environment Department and were well below the action levels in all cases. Methanol and benzene were the only compounds that ever exceeded 1 % of the action level. The measured VOC concentrations were collected during the warmest months of the year and therefore should represent worst-case air impacts. Based on the results of this study, VOC emissions from Areas G and L have an insignificant impact on local air quality and pose no health risk to workers or nearby populations.

927 (LA-SUB-96-99-Pt.3) **Measurement of emission fluxes from Technical Area 54, Area G and L. Final report.** Eklund, B. (Radian Corp., Austin, TX (United States)). Los Alamos National Lab., NM (United States). 15 Mar 1995. 265p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96013367. Source: OSTI; NTIS; INIS; GPO Dep.

The emission flux (mass/time-area) of tritiated water from TA-54 was measured to support the characterization of radioactive air emissions from waste sites for the Radioactive

Air Emissions Management (RAEM) program and for the Area G Performance Assessment. Measurements were made at over 180 locations during the summers of 1993 and 1994, including randomly selected locations across Area G, three suspected areas of contamination at Area G, and the property surrounding TA-54. The emission fluxes of radon were measured at six locations and volatile organic compounds (VOCs) at 30 locations. Monitoring was performed at each location over a several-hour period using the U.S. EPA flux chamber approach. Separate samples for tritiated water, radon, and VOCs were collected and analyzed in off-site laboratories. The measured tritiated water emission fluxes varied over several orders of magnitude, from background levels of about 3 pCi/m^2-min to 9.69 x 10^6 pCi/m^2-min near a disposal shaft. Low levels of tritiated water were found to have migrated into Pajarito Canyon, directly south of Area G. The tritium flux data were used to generate an estimated annual emission rate of 14 Curies/yr for all of Area G, with the majority of this activity being emitted from relatively small areas adjacent to several disposal shafts. The estimated total annual release is less than 1% of the total tritium release from all LANL in 1992 and results in a negligible off-site dose. Based on the limited data available, the average emission flux of radon from Area G is estimated to be 8.1 pCi/m^2-min. The measured emission fluxes of VOCs were < 100 μg/m^2-min, which is small compared with fluxes typically measured at hazardous waste landfills. The air quality impacts of these releases were evaluated in a separate report.

928 (LA-UR–95-252) **A process for treating uranium chips and turnings.** Dziewinska, K. (Los Alamos National Lab., NM (United States)); Lussiez, G.; Munger, D. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950917–5: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006270. Source: OSTI; NTIS; INIS; GPO Dep.

Depleted uranium (DU) chips and turnings are generated during machining of uranium metal. Because high surface area uranium is pyrophoric, the turnings are subject to spontaneous ignition in air. The oxidation of uranium to UO_2 and U_3O_8 is highly exothermic and therefore the reaction may be self-sustaining. A uranium fire or even rapid oxidation and thermal convection currents will cause emission of radioactive uranium oxides. In the presence of water as liquid or vapor, uranium may also oxidize into UO_2 and U_3O_8-with generation of hydrogen, a flammable and explosive gas. The heat generated the water reaction may ignite the uranium or hydrogen producing a fire, explosion, or convection current resulting in some uranium oxide becoming airborne. Because the high surface area uranium has the hazardous characteristic of reactivity, it is stored immersed in diesel oil preventing contact with water or air. Los Alamos National Laboratory (LANL) has developed and constructed a process to remove the reactivity characteristic by oxidizing uranium metal to an inert product. This inert form can then be landfilled as a low-level waste. The treatment process consists of draining the packing oils, treating with sodium hypochlorite to wet-oxidize the DU to uranyl hydroxide ($UO_2(OH)_2$), using sodium thiosulfate to reduce the (UO_2(OH)2) to UO_2, neutralizing with sodium hydroxide, and stabilizing the settled slurry in a cement matrix. The neutralized waste water is consumed at a radioactive waste water treatment facility. Studies done at LANL describe a manageable oxidation rate well within safe bounds.

929 (LA-UR–95-254) **A process for treating radioactive water-reactive wastes.** Dziewinski, J. (Los Alamos National Lab., NM (United States)); Lussiez, G.; Munger, D. Los Alamos National Lab., NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950917–4: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006269. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos National Laboratory and other locations in the complex of experimental and production facilities operated by the United States Department of Energy (DOE) have generated an appreciable quantity of hazardous and radioactive wastes. The Resource Conservation and Recovery Act (RCRA) enacted by the United States Congress in 1976 and subsequently amended in 1984, 1986, and 1988 requires that every hazardous waste must be rendered nonhazardous before disposal. Many of the wastes generated by the DOE complex are both hazardous and radioactive. These wastes, called mixed wastes, require applying appropriate regulations for radioactive waste disposal and the regulations under RCRA. Mixed wastes must be treated to remove the hazardous waste component before they are disposed as radioactive waste. This paper discusses the development of a treatment process for mixed wastes that exhibit the reactive hazardous characteristic. Specifically, these wastes react readily and violently with water. Wastes such as lithium hydride (LiH), sodium metal, and potassium metal are the primary wastes in this category.

930 (LA-UR–95-255) **A process for treatment of mixed waste containing chemical plating wastes.** Anast, K.R.; Dziewinski, J.; Lussiez, G. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950917–3: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006267. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Treatment and Minimization Group at Los Alamos National Laboratory has designed and will be constructing a transportable treatment system to treat low-level radioactive mixed waste generated during plating operations. The chemical and plating waste treatment system is composed of two modules with six submodules, which can be trucked to user sites to treat a wide variety of aqueous waste solutions. The process is designed to remove the hazardous components from the waste stream, generating chemically benign, disposable liquids and solids with low level radioactivity. The chemical and plating waste treatment system is designed as a multifunctional process capable of treating several different types of wastes. At this time, the unit has been the designated treatment process for these wastes: Destruction of free cyanide and metal-cyanide complexes from spent plating solutions; destruction of ammonia in solution from spent plating solutions; reduction of Cr^{VI} to Cr^{III} from spent plating solutions, precipitation, solids separation, and immobilization; heavy metal precipitation from spent plating solutions, solids separation, and immobilization, and acid or base neutralization from unspecified solutions.

931 (LA-UR–95-256) **Electrochemical treatment of mixed (hazardous and radioactive) wastes.** Dziewinski,

J.; Zawodzinski, C.; Smith, W.H. Los Alamos National Lab., NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950917–2: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006268. Source: OSTI; NTIS; INIS; GPO Dep.

Electrochemical treatment technologies for mixed hazardous waste are currently under development at Los Alamos National Laboratory. For a mixed waste containing toxic components such as heavy metals and cyanides in addition to a radioactive component, the toxic components can be removed or destroyed by electrochemical technologies allowing for recovery of the radioactive component prior to disposal of the solution. Mixed wastes with an organic component can be treated by oxidizing the organic compound to carbon dioxide and then recovering the radioactive component. The oxidation can be done directly at the anode or indirectly using an electron transfer mediator. This work describes the destruction of isopropanol, acetone and acetic acid at greater than 90% current efficiency using cobalt +3 or silver +2 as the electron transfer mediator. Also described is the destruction of cellulose based cheesecloth rags with electrochemically generated cobalt +3, at an overall efficiency of approximately 20%.

932 (LA-UR–95-586) **Considerations relating to mixed waste treatment technologies.** Reader, G.E. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950877–1: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95007887. Source: OSTI; NTIS; INIS; GPO Dep.

In order to select the most appropriate mixed waste treatment technology, many factors need to be evaluated. Depending upon individual circumstances, different factors will carry greater weight. Some of these factors must be addressed early on in the selection process. Various factors may also be used as screening criteria thus streamlining the selection process. New and innovative technologies should also be addressing key, critical factors during the conceptual development phase in order to guide efforts through the construction of production units. This will aid in the development of technologies which are attractive for technology transfer. This paper discusses considerations relating to the selection of mixed waste treatment technologies. Covered by this paper are applicability, cost, availability/maturity, capacity, safety/reliability, secondary waste generation, liability, regulatory considerations, treatment requirements, and public interactions. Basing selection processes on these factors will help assure that all technologies are evaluated fairly and that the appropriate waste treatment technology is selected for a given situation. Suggestions for selection processes are also covered as well as other important information required for selecting a mixed waste treatment technology.

933 (LA-UR–95-1136) **Air modelling as an alternative to sampling for low-level radioactive airborne releases.** Morgenstern, M.Y. (ERM Program Management Co., Los Alamos, NM (United States)); Hueske, K. Los Alamos National Lab., NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505206–1: 50. Purdue industrial waste conference, W. Lafayette, IN (United States), 8-10 May 1995). Order Number DE95010884. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes our efforts to assess the effect of airborne releases at one DOE laboratory using air modelling based on historical data. Among the facilities affected by these developments is Los Alamos National Laboratory (LANL) in New Mexico. RCRA, as amended by the Hazardous and Solid Waste Amendments (HSWA) in 1984, requires all facilities which involve the treatment, storage, and disposal of hazardous waste obtain a RCRA/HSWA waste facility permit. LANL complied with CEARP by initiating a process of identifying potential release sites associated with LANL operations prior to filing a RCRA/HSWA permit application. In the process of preparing the RCRA/HSWA waste facility permit application to the U.S. Environmental Protection Agency (EPA), a total of 603 Solid Waste Management Units (SWMUs) were identified as part of the requirements of the HSWA Module VIH permit requirements. The HSWA Module VIII permit requires LANL to determine whether there have been any releases of hazardous waste or hazardous constituents from SWMUs at the facility dating from the 1940's by performing a RCRA Facility Investigation to address known or suspected releases from specified SWMUs to affected media (i.e. soil, groundwater, surface water, and air). Among the most troublesome of the potential releases sites are those associated with airborne radioactive releases. In order to assess health risks associated with radioactive contaminants in a manner consistent with exposure standards currently in place, the DOE and LANL have established Screening Action Levels (SALs) for radioactive soil contamination. The SALs for each radionuclide in soil are derived from calculations based on a residential scenario in which individuals are exposed to contaminated soil via inhalation and ingestion as well as external exposure to gamma emitters in the soil. The applicable SALs are shown.

934 (LA-UR–95-1838) **Mixed waste focus area alternative technologies workshop.** Borduin, L.C. (Los Alamos National Lab., NM (United States). Technology Analysis Group); Palmer, B.A.; Pendergrass, J.A. Los Alamos National Lab., NM (United States). 24 May 1995. 158p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9501100–Summ: Mixed waste focus area alternative technologies workshop, Salt Lake City, UT (United States), 24-27 Jan 1995). Order Number DE95015256. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the Mixed Waste Focus Area (MWFA)-sponsored Alternative Technology Workshop held in Salt Lake City, Utah, from January 24–27, 1995. The primary workshop goal was identifying potential applications for emerging technologies within the Options Analysis Team (OAT) "wise" configuration. Consistent with the scope of the OAT analysis, the review was limited to the Mixed Low-Level Waste (MLLW) fraction of DOE's mixed waste inventory. The Los Alamos team prepared workshop materials (databases and compilations) to be used as bases for participant review and recommendations. These materials derived from the Mixed Waste Inventory Report (MWIR) data base (May 1994), the Draft Site Treatment Plan (DSTP) data base, and the OAT treatment facility configuration of December 7, 1994. In reviewing workshop results, the reader should note several caveats regarding data limitations. Link-up of the MWIR and DSTP data bases, while representing the most comprehensive array of mixed waste information available at the time of the workshop, requires additional data to completely characterize all waste streams.

A number of changes in waste identification (new and redefined streams) occurred during the interval from compilation of the data base to compilation of the DSTP data base with the end result that precise identification of radiological and contaminant characteristics was not possible for these streams. To a degree, these shortcomings compromise the workshop results; however, the preponderance of waste data was linked adequately, and therefore, these analyses should provide useful insight into potential applications of alternative technologies to DOE MLLW treatment facilities.

935 (LA-UR–95-2343) **A high temperature pulsed corona plasma reactor.** Korzekwa, R.A.; Rosocha, L.A. Los Alamos National Lab., NM (United States). 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950750–17: 10. Institute of Electrical and Electronics Engineers (IEEE) pulsed power conference, Albuquerque, NM (United States), 10-13 Jul 1995). Order Number DE95016780. Source: OSTI; NTIS; GPO Dep.

Non-thermal plasma reactors have recently been used for the treatment of gaseous pollutants. High energy electrons (several eV) are produced in the plasma while the gas remains near ambient temperatures. Pollutant molecules are decomposed by highly reactive chemical radicals created through electron collisions. The focus of this work is the treatment of pollutants from the exhaust of electric arc incinerators. A pulsed corona reactor capable of operation at exhaust temperatures of hundreds of degrees C has been constructed. This design can be used as a conventional pulsed corona reactor (wire-metal tube geometry) and has the potential for use as a hybrid reactor which incorporates a wire-tube geometry with a ceramic dielectric barrier on the inside surface of the metal tube. Pulse widths of a few 10's of ns and risetimes of less than 10 ns have been obtained. Specifically, the reactor performance as a function of temperature is investigated. The preliminary results of the destruction of gaseous pollutants from this prototype are presented along with electrical and chemical efficiencies of the device.

936 (LA-UR–95-3004) **Preliminary results from the Los Alamos TA54 complex terrain Atmospheric Transport Study (ATS).** Vold, E.; Chan, M.; Sanders, L. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960127–2: 9. joint American Meteorological Society/Air and Waste Management Association conference on applications of air pollution meteorology, Atlanta, GA (United States), 28 Jan - 2 Feb 1996). Order Number DE96000027. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory (LANL) Low-Level Radioactive Waste (LLRW) disposal site at TA54, Area G la located on a mesa top amidst a complex terrain of finger like mesas typically 30 motors or more In height above canyons of widths varying from 100 to 300 motors. Atmospheric dispersion from this site is of concern for routine operations and for potential Incidents during waste retrieval operations. Indian lands are located In the dominant downwind direction within 500 m from the site and provide further incentive to understand the potential and actual impacts of waste disposal operations. The permanent network of meteorological towers at LANL have been located primarily at mesa-top locations to coincide with most laboratory facilities and as such do not resolve the effects of channeling in the canyons and the influence this has on potential surface releases. An Atmospheric Transport Study (ATS) was initiated to better understand the wind flow fields and dispersion from the LANL Waste Storage and Disposal facilities at TA-54, Area G. As part of this effort, a series of six portable meteorological towers were sited in the vicinity of Area G, two at mesa top locations, one just east of the site where the mesas have dissipated to mild ridges, and three in the canyons adjacent to the disposal site mesa as indicated on the topographic representation of the local terrain. Since 1994, the towers have collected horizontal wind velocities, pressure, temperature, relative humidity and a radiation gamma reading every fifteen minutes. The data bass is being analyzed for trends and to provide a basis for comparison to computational modeling efforts to predict the flow fields.

937 (LA-UR–95-3523) **Integration of computational modeling for the Los Alamos National Laboratory low level radioactive waste disposal performance assessment.** Vold, E.L. (Lawrence Livermore National Lab., CA (United States)); Birdsell, K.H.; Springer, E.P.; Hollis, D.K.; Shuman, R. Lawrence Livermore National Lab., CA (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-951209–3: 17. low-level radioactive waste management conference, Phoenix, AZ (United States), 12-14 Dec 1995). Order Number DE96002597. Source: OSTI; NTIS; INIS; GPO Dep.

The preliminary Performance Assessment for the Los Alamos National Laboratory Low Level Radioactive Waste Disposal Facility at Area G is drawing to completion. The disposal site is located on the top of a finger mesa in the complex terrain of a semi-arid region which leads to considerable complications in the atmospheric and subsurface transport and in the requisite modeling. Infiltration and run-off are evaluated for the proposed disposal unit closure configuration. A new analytic source release model characterizes the disposal unit performance utilizing detailed source term characterization from the inventory data base. This analysis provides input to the subsurface modeling done by the sophisticated finite element transport code, FEHM, using realistic 2-D cross-sections of the geologic units stratigraphies and the disposal units. Subsurface transport via lateral flow to intermittent alluvial waters in adjacent canyons is evaluated in addition to the usual deep aquifer. Vapor phase flow has been treated separately and calibrated to field data for tritium migration. Atmospheric transport is based on Gaussian dispersion with a correction for complex canyon terrain evaluated from on-going 3-D atmospheric transport studies. Indications to date are that the Performance Assessment objectives are met for all migration pathways.

938 (LA-UR–95-3690) **A source release model with application to the LANL LLRW disposal site performance assessment.** Vold, E.L. Los Alamos National Lab., NM (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-951155–4: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96002586. Source: OSTI; NTIS; INIS; GPO Dep.

A source release model was developed to quantify time dependent liquid phase releases of radioactive material to the vadose zone from a disposal site. The model has been implemented to evaluate the source terms in the Performance Assessment for the Los Alamos National Laboratory (LANL) Low Level Radioactive Waste (LLRW) Disposal Facility at Area G, an analysis of the long term post-closure impact of disposal operations required by the USDOE orders. Analytic solutions describe transport through the model compartments: the solid phase waste package, the liquid phase within each waste package and the liquid phase within the disposal unit. The model accounts for elemental solubility limits and retardation coefficients (Rf) separately in the waste package and in the disposal unit. Several parameters define the site specific aspects of the disposal unit. In our case for example, the disposal unit is waste buried with crushed volcanic tuff, and a small net infiltration rate is determined from independent numerical studies. The analytic solution allows efficient explorations of the sensitivity to the input parameters. Numerical solutions extend the model to account for decay product ingrowth which may have different transport properties than the parent nuclides. Results show source release rates verses package or disposal unit Kd, and effects of solubility limits. At the LANL LLRW disposal site, only thorium, uranium and some low-level nuclides are solubility limited. Otherwise, a 'rapid rinse' waste package category dominates the peak disposal unit efflux which occurs for the LANL disposal site at about 100 years for nuclides with Kd=0 (Rf=1) and for proportionately longer times as Kd or Rf increases. Additional simple analytic models or detailed numerical codes can be coupled to these results to predict groundwater concentrations.

939 (LA-UR–95-3691) **Low-impact sampling under an active solid low-level radioactive waste disposal unit using horizontal drilling technology.** Puglisi, C.V.; Vold, E.L. Los Alamos National Lab., NM (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-951155–5: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96002585. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this project was to determine the performance of the solid low-level radioactive waste (LLRW) disposal units located on a mesa top at TA-54, Area G, Los Alamos National Laboratory (LANL), Los Alamos, NM, and to provide in-situ (vadose zone) site characterization information to Area G's Performance Assessment. The vadose zone beneath an active disposal unit (DU 37), was accessed by utilizing low-impact, air-rotary horizontal drilling technology. Core samples were pulled, via wire-line core method, in 3 horizontal holes fanning out below DU 37 at approximately 5 foot intervals depending on recovery percentage. Samples were surveyed and prepared in-field following Environmental Restoration (ER) guidelines. Samples were transferred from the field to the CST-9 Radvan for initial radiological screening. Following screening, samples were delivered to CST-3 analytical lab for analyses including moisture content, 23 inorganics, 60 volatile organic compounds (VOC's), 68 semivolatile organic compounds (SVOC's), tritium, lead 210, radium 226 & 228, cesium 137, isotopic plutonium, americium 241, strontium 90, isotopic uranium, and isotopic thorium. Other analyses included matric potential, alpha spectroscopy, gamma spectroscopy, and gross alpha/beta. The overall results of the analysis identified only tritium as having migrated from the DU. Am-241, Eu-152, and Pu-238 were possibly identified above background but the results are not definitive. Of all organics analysed for, only ethyl acetate was tentatively identified slightly above background. All inorganics were found to be well below regulatory limits. Based on the results of the above mentioned analyses, it was determined that Area G's disposal units are performing well and no significant liquid phase migration of contaminants has occurred.

940 (LA-UR–95-3707) **Los Alamos National Laboratory's mobile PAN (Passive/Active Neutron) system for assay of TRU waste in 55 gallon drums.** Taggart, D.P. (and others); Betts, S.E.; Martinez, E.F. Los Alamos National Lab., NM (United States). 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-951091–6: 4. nondestructive assay and nondestructive examination waste characterization conference, Salt Lake City, UT (United States), 24-26 Oct 1995). Order Number DE96002583. Source: OSTI; NTIS; INIS; GPO Dep.

We describe the refurbishment, reactivation and rough calibration of a mobile second generation Passive/Active Neutron (PAN) assay system previously owned by the Carlsbad Area Office (CAO) and stored at the Idaho National Engineering Laboratory - Lockheed Idaho Technology Center (INEL-LITC). This system was transferred to LANL a little over one year ago. After substantial refurbishment for operations, including installation of operating software developed at INEL-LITC, we have completed a rough calibration of the system in preparation for the Performance Demonstration Program (PDP) expected to begin in the near future. We discuss compensation for the waste matrix neutron moderating and absorbing characteristics and present some data acquired during the calibration process which points out the possible waste matrix effects on the results of an assay. Future plans are also discussed.

941 (LA-UR–95-4244) **Solid low-level radioactive waste volume projections at Los Alamos National Laboratory.** Art, K. (Benchmark Environmental Corp., White Rock, NM (United States)); Minton-Hughes, J.; Peper, C. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960212–9: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96005607. Source: OSTI; NTIS; INIS; GPO Dep.

In response to regulatory requirements, the current economic environment, and diminishing on-site low-level radioactive waste (LLW) disposal capacity, LANL needed to develop a system to collect data on future LLW generation that would comply with DOE Order 5820. 2A and be an effective facility planning tool. The LANL Volume Projections Project (VPP) was created to meet these needs. This paper describes objectives, scope, and components of the VPP that will provide information essential to future facility planning and development.

942 (LA-UR–95-4245) **Characterization of mixed waste for shipment to TSD Facilities Program.** Chandler, K. (Benchmark Environmental Corp., Albuquerque, NM (United States)); Goyal, K. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960212–8: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96005606. Source: OSTI; NTIS; INIS; GPO Dep.

In compliance with the Federal Facilities Compliance Agreement, Los Alamos National Laboratory (LANL) is striving to ship its low-level mixed waste (LLMW) off-site for treatment and disposal. In order to ship LLMW off site to a commercial facility, LANL must request exemption from the DOE Order 5820.2A requirement that LLMW be shipped only to Department of Energy facilities. Because the process of obtaining the required information and approvals for a mixed waste shipment campaign can be very expensive, time consuming, and frustrating, a well-planned program is necessary to ensure that the elements for the exemption request package are completed successfully the first time. LANL has developed such a program, which is cost- effective, quality-driven, and compliance-based. This program encompasses selecting a qualified analytical laboratory, developing a quality project-specific sampling plan, properly sampling liquid and solid wastes, validating analytical data, documenting the waste characterization and decision processes, and maintaining quality records. The products of the program are containers of waste that meet the off-site facility's waste acceptance criteria, a quality exemption request package, documentation supporting waste characterization, and overall quality assurance for the process. The primary goal of the program is to provide an avenue for documenting decisions, procedures, and data pertinent to characterizing waste and preparing it for off-site treatment or disposal.

943 (LA-UR–96-368) **The role of a detailed aqueous phase source release model in the LANL Area G performance assessment.** Vold, E.L. (Los Alamos National Lab., NM (United States)); Hollis, D.; Longmire, P.; Springer, E.; Birdsell, K.; Shuman, R. Los Alamos National Lab., NM (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960212–69: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96008122. Source: OSTI; NTIS; INIS; GPO Dep.

The Performance Assessment for the LANL Low-Level Radioactive Waste (LLRW) Disposal Facility, Area G, is ongoing. A detailed review of the inventory data base records and the existing models for source release led to the development of a new modeling capability to describe the liquid phase aqueous transport from the waste package volumes. Inventory is sorted into four release form categories and screened in a comparison of leachate concentrations to the drinking water limit. Percolation through the disposal unit is prescribed in an independent surface water balance model incorporating site rainfall statistics. Waste package types and the disposal unit matrix have independently specified solubility limits and solid-liquid phase partition coefficients, or Kd values. Analytic solutions for inventory limited release of each nuclide in each of the four different waste package release forms are computed. Isotopic contributions are summed over elements to limit the waste package liquid phase concentrations to the elemental solubility limits. Time dependent releases from the waste packages for each nuclide which may be inventory or solubility limited are specified as model output which is provided as the source term to the unsaturated transport model. The waste package efflux is distributed over the 2-D unsaturated zone model grid points corresponding to the cross-sections for 5 representative disposal units within the mesa top. Results show the Area G release is dominated by the inventory in the rapid release waste form (Kd = 0), which percolates from the waste packages over 5–100 years and from the disposal unit over 50–1,000 years. Nuclides in waste package categories with larger Kd values are released proportionately slower. U and Th are the main nuclides of concern released as solubility limited nuclides from the historical inventory at Area G.

944 (LA-UR–96-0595) **Non-Thermal Plasma (NTP) session overview: Second International Symposium on Environmental Applications of Advanced Oxidation Technologies (AOTs).** Rosocha, L.A. Los Alamos National Lab., NM (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960252–1: 2. international symposium on environmental applications of advanced oxidation technologies, San Francisco, CA (United States), 28 Feb - 1 Mar 1996). Order Number DE96006969. Source: OSTI; NTIS; INIS; GPO Dep.

Advanced Oxidation Technologies (used in pollution control and treating hazardous wastes) has expanded from using hydroxyl radicals to treat organic compounds in water, to using reductive free radicals as well, and to application to pollutants in both gases and aqueous media. Non-Thermal Plasma (NTP) is created in a gas by an electrical discharge or energetic electron injection. Highly reactive species (O atoms, OH, N radicals, plasma electrons) react with entrained hazardous organic chemicals in the gas, converting them to CO2, H2O, etc. NTP can be used to simultaneously remove different kinds of pollutants (eg, VOCs, SOx, NOx in flue gases). This paper presents an overview of NTP technology for pollution control and hazardous waste treatment; it is intended as an introduction to the NTP session of the symposium.

945 (LA-UR–96-1102) **Ready, set,...quit! A review of the controlled-air incinerator.** Reader, G.E. California Univ., Irvine, CA (United States). 1996. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960535–1: 15. international conference on incineration and thermal treatment technologies, Savannah, GA (United States), 6-10 May 1996). Order Number DE96009034. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory (LANL) Controlled-Air Incinerator (CAI) has had a long and productive past as a research and development tool. It now appears that use of the CAI to treat LANL legacy and other wastes under the Federal Facilities Compliance Act is no longer viable due to numerous programmatic problems. This paper will review the history of the CAI. Various aspects associated with the CAI and how those aspects resulted in the loss of this Department of Energy asset as a viable waste treatment option will also be discussed. Included are past missions and tests-CAI capabilities, emissions, and permits; Federal Facility Compliance Act and associated Agreement; National Environmental Policy Act coverage; cost; budget impacts; public perception; the U.S. Environmental Protection Agency Combustion Strategy; Independent Technical Review "Red" Team review; waste treatment alternative technologies; the New Mexico Environment Department; and future options and issues.

946 (LA-UR–96-1103) **Evaluation of pressure response in the Los Alamos controlled air incinerator during three incident scenarios.** Vavruska, J.S. (Equinox, Ltd., Santa Fe, NM (United States)); Elsberry, K.; Thompson, T.K.; Pendergrass, J.A. Los Alamos National Lab., NM (United States). 1996. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960535–3: 15. international conference on incineration and thermal treatment technologies, Savannah, GA (United States), 6-10 May 1996). Order Number DE96009035. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos Controlled Air Incinerator (CAI) is a system designed to accept radioactive mixed waste containing alpha-emitting radionuclides. A mathematical model was developed to predict the pressure response throughout the offgas treatment system of the CAI during three hypothetical incident scenarios. The scenarios examined included: (1) loss of burner flame and failure of the flame safeguard system with subsequent reignition of fuel gas in the primary chamber, (2) pyrolytic gas buildup from a waste package due to loss of induced draft and subsequent restoration of induced draft, and (3) accidental charging of propellant spray cans in a solid waste package to the primary chamber during a normal feed cycle. For each of the three scenarios, the finite element computer model was able to determine the transient pressure surge and decay response throughout the system. Of particular interest were the maximum absolute pressures attainable at critical points in the system as well as maximum differential pressures across the high efficiency particulate air (HEPA) filters. Modeling results indicated that all three of the scenarios resulted in maximum HEPA filter differential pressures well below the maximum allowable levels.

947 (LA-UR-96-1287) **Experiences with treatment of mixed waste.** Dziewinski, J. (Los Alamos National Lab., NM (United States)); Marczak, S.; Smith, W.H.; Nuttall, E. Los Alamos National Lab., NM (United States). 10 Apr 1996. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-960804–17: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96009230. Source: OSTI; NTIS; INIS; GPO Dep.

During its many years of research activities involving toxic chemicals and radioactive materials, Los Alamos National Laboratory (Los Alamos) has generated considerable amounts of waste. Much of this waste includes chemically hazardous components and radioisotopes. Los Alamos chose to use an electrochemical process for the treatment of many mixed waste components. The electro-chemical process, which the authors are developing, can treat a great variety of waste using one type of equipment built at a moderate expense. Such a process can extract heavy metals, destroy cyanides, dissolve contamination from surfaces, oxidize toxic organic compounds, separate salts into acids and bases, and reduce the nitrates. All this can be accomplished using the equipment and one crew of trained operating personnel. Results of a treatability study of chosen mixed wastes from Los Alamos Mixed Waste Inventory are presented. Using electrochemical methods cyanide and heavy metals bearing wastes were treated to below disposal limits.

948 (LA-UR–962050) **Los Alamos Waste Management FY96 and FY97 Tactical Plan, March 1, 1996.** Los Alamos National Lab., NM (United States). 1 Mar 1996. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE96012850. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos National Laboratory (LANL) Waste Management Program (WMP) began a transition to become a "best of class" waste management program during fiscal year 1995 (FY95). A best of class waste management program means that LANL will provide cost-effective and compliant management of the minimum amount of waste. In FY94, the WMP could be characterized as a level of effort program requiring several new facilities and new LANL-developed technologies to carry out its waste management responsibilities. By the end of FY95, significant progress had been made in the transition to best of class. The FY96 WMP is realigned and reorganized. Its budget and scope of work are built upon discrete work packages. It is committed to achieving improved cost-effectiveness, providing significant tangible technical results, and to having its performance measured. During FY95, over $11,000,000 in facility and operational costs were avoided. The need for three new major facilities was reexamined and lower cost solutions, not requiring the development of new facilities, were agreed to. Technology development activities were terminated and replaced with the use of commercial facilities to achieve aggressive reductions in the Low-Level Mixed Waste legacy inventory. In addition, over $14,000,000 in improved cost-effectiveness has been included in the FY96 Baseline. An overall WMP vision, specific milestones, performance measures, and commitments are in place for FY96 to ensure that LANL continues the transition to a best of class waste management program. The following table identifies the overall vision and success indicators for FY96.

949 (NBL–332) **Evaluation on the use of cerium in the NBL Titrimetric Method.** Zebrowski, J.P.; Orlowicz, G.J.; Johnson, K.D.; Smith, M.M.; Soriano, M.D. USDOE New Brunswick Lab., Argonne, IL (United States). Mar 1995. 50p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95011952. Source: OSTI; NTIS; INIS; GPO Dep.

An alternative to potassium dichromate as titrant in the New Brunswick Laboratory Titrimetric Method for uranium analysis was sought since chromium in the waste makes disposal difficult. Substitution of a ceric-based titrant was statistically evaluated. Analysis of the data indicated statistically equivalent precisions for the two methods, but a significant overall bias of +0.035% for the ceric titrant procedure. The cause of the bias was investigated, alterations to the procedure were made, and a second statistical study was performed. This second study revealed no statistically significant bias, nor any analyst-to-analyst variation in the ceric titration procedure. A statistically significant day-to-day variation was detected, but this was physically small (0.01 5%) and was only detected because of the within-day precision of the method. The added mean and standard deviation of the %RD for a single measurement was found to be 0.031%. A comparison with quality control blind dichromate titration data again indicated similar overall precision. Effects of ten elements on the ceric titration's performance was determined. Co, Ti, Cu, Ni, Na, Mg, Gd, Zn, Cd, and Cr in previous work at NBL these impurities did not interfere with the potassium dichromate titrant. This study indicated similar results for the ceric titrant, with the exception of Ti. All the elements (excluding Ti and Cr), caused no statistically significant bias in uranium measurements at levels of 10 mg impurity per 20-40 mg uranium. The presence of Ti was found to cause a bias of −0.05%; this is attributed to the presence of sulfate ions, resulting in precipitation of titanium sulfate and occlusion of uranium. A negative bias of 0.012% was also statistically observed in the samples containing chromium impurities.

950 (NCRP–95-22246) **Radioactive and mixed waste - risk as a basis for waste classification. Symposium proceedings No. 2.** Oak Ridge National Lab., TN (United States). 21 Jun 1995. 201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-941192–: Symposium on radioactive and mixed waste: risk as a basis for waste classification, Las Vegas, NV (United States), 9 Nov 1994). Order Number

DE95016101. Source: OSTI; NTIS; INIS; NCRP Publications, 7910 Woodmont Avenue, Suite 800, Bethesda, MD 20814-3095; GPO Dep.

The management of risks from radioactive and chemical materials has been a major environmental concern in the United states for the past two or three decades. Risk management of these materials encompasses the remediation of past disposal practices as well as development of appropriate strategies and controls for current and future operations. This symposium is concerned primarily with low-level radioactive wastes and mixed wastes. Individual reports were processed separately for the Department of Energy databases.

951 (ORNL/ER–297) **Inactive Tanks Remediation Program strategy and plans for Oak Ridge National Laboratory, Oak Ridge, Tennessee. Environmental Restoration Program.** H and R Technical Associates, Inc., Oak Ridge, TN (United States); Oak Ridge National Lab., TN (United States). Jun 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017059. Source: OSTI; NTIS; INIS; GPO Dep.

The overall objective of the Inactive Tank Remediation Program is to remediate all LLLW tanks that have been removed fimn service to the extent practicable in accordance with the FFA and CERCLA requirements. Applicable or relevant and appropriate requirements (ARARs) will be addressed in choosing a remediation alternative. Preference will be given to remedies that are highly reliable and provide long-term protection. Efforts will be directed toward permanently and significantly reducing the volume, toxicity, or mobility of hazardous substances, pollutants, and contaminants associated with the tank systems. Where indicated by operational or other restraints, interim measures short of full and complete remediation may be taken to maintain human health and ecological risks at acceptable levels until full remediation can be accomplished.

952 (ORNL/ER–298) **Waste Area Grouping 4 Site Investigation Data Management Plan, Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); CDM Federal Programs Corp., Oak Ridge, TN (United States). Environmental Restoration Program.

The purpose of this Data and Records Management Plan (DRMP) is to ensure that the ER environmental measurements data management process, from planning through measurement, recording, evaluation, analysis, use, reporting, and archival of data, is controlled in an efficient, comprehensive, and standardized manner. Proper organization will ensure that data and documentation are adequate to describe the procedures, events,and results of the Waste Area Grouping (WAG) 4 project. The data management process manages the life cycle of environmental measurements data from the planning of data for characterization and remediation decisions through the collection, review, and actual usage of the data for decision-making purposes to the long-term storage of the data. The nature of the decision-making process for an Environmental Restoration (ER) project is inherently repetitive. Existing data are gathered and evaluated to establish what is known about a site. Decisions regarding the nature of the contamination and potential remedial actions are formulated. Based upon the potential risk to human health and the environment, an acceptable level of uncertainty is defined for each remediation decision. WAG 4 is a shallow-waste burial site consisting of three separate areas: (1) Solid Waste Storage Area (SWSA) 4, a shallow-land burial ground containing radioactive and potentially hazardous wastes; (2) an experimental Pilot Pit Area, including a pilot-scale testing pit; and (3) sections of two abandoned underground pipelines formerly used for transporting liquid, low-level radioactive waste.

953 (ORNL/ER–304) **Waste management plan for inactive LLLW tanks 3001-B, 3004-B, 3013, and T-30 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Environmental Restoration Program.** H and R Technical Associates, Inc., Oak Ridge, TN (United States); Oak Ridge National Lab., TN (United States). Jul 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016172. Source: OSTI; NTIS; INIS; GPO Dep.

This Project Waste Management Plan identifies the waste that is expected to be generated in connection with the removal and disposition of inactive liquid low-level radioactive waste tanks 3001-B, 3004-B, and T-30, and grouting of tank 3013 at the Oak Ridge National Laboratory and the isolation of these tanks' associated piping systems. The plan also identifies the organization, responsibilities, and administrative controls that will be followed to ensure proper handling of the waste.

954 (ORNL/ER–306) **Inactive Tanks Remediation Program Batch I, Series I tanks 3001-B, 3004-B, 3013, and T-30 technical memorandum. Environmental Restoration Program.** H and R Technical Associates, Inc., Oak Ridge, TN (United States); Oak Ridge National Lab., TN (United States). May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017049. Source: OSTI; NTIS; INIS; GPO Dep.

This technical memorandum provides information that can be used to make decisions concerning the disposition of four inactive tank systems that have been designated Batch 1, Series 1, by the Inactive Tanks Remediation Program team. The Batch I, Series 1, tanks are 3001-B, 3004-B, 3013, and T-30. The report offers viable alternatives for tank system disposition. The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) requires a Federal Facility Agreement (FFA) for federal facilities placed on the National Priorities List. The Oak Ridge Reservation was placed on that list on December 21, 1989, and the agreement was signed in November 1991 by DOE's Oak Ridge Operations Office, the US Environmental Protection Agency-Region IV, and the Tennessee Department of Environment and Conservation. The effective date of the FFA is January 1, 1992. One objective of the FFA is to ensure that inactive liquid low-level radioactive waste tank systems are evaluated and, if appropriate, remediated through the CERCLA process. The Inactive Tanks Remediation Program and the Gunite and Associated Tanks Project (GAAT) are the two efforts that will meet this FFA objective. This memorandum addresses tank systems within the Inactive Tanks Remediation Program. Separate CERCLA documentation addresses the tank systems within the GAAT Project.

955 (ORNL/ER–312) **Project management plan for inactive tanks 3001-B, 3004-B, 3013, and T-30 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Environmental Restoration Program.** Oak Ridge National Lab.,

TN (United States). Jul 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016167. Source: OSTI; NTIS; INIS; GPO Dep.

*This document identifies the roles and responsibilities of the project team members and identifies the project scope, schedule, and cost reporting activities for a maintenance activity to remove and dispose of three inactive liquid low-level radioactive waste (LLLW) system tanks and to isolate and fill one LLLW tank with grout. Tanks 3001-B, 3004-B, and T-30 are located in concrete vaults and tank 3013 is buried directly in the soil. The maintenance project consists of cutting the existing pipes attached to the tanks; capping the piping to be left in place; removing the tanks and filling the vaults with grout for tanks 3001-B, 3004-B, and T-30; and filling tank 3013 with grout. Because the LLLW line serving tank 3001-B will be needed for discharging the 3001 canal demineralizer back flush and regeneration waste to tank WC-19, tank 3001-B will be replaced with a section of piping.

956 (ORNL/ER–318) **Maintenance Action Readiness Assessment Plan for Waste Area Grouping 1 inactive Tanks 3001-B, 3004-B, T-30, and 3013 at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); CDM Federal Programs Corp., Oak Ridge, TN (United States). Jul 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016169. Source: OSTI; NTIS; INIS; GPO Dep.

This Readiness Assessment Plan has been prepared to document operational readiness for the maintenance action consisting of remediation of four inactive liquid low-level radioactive tanks in Waste Area Grouping 1 at Oak Ridge National Laboratory. The four tanks to be remediated are Tanks 3001-B, 3004-B, T-30, and 3013. Tanks 3001-B, 3004-B, and T-30 will be removed from the ground. Because of logistical issues associated with excavation and site access, Tank 3013 will be grouted in place and permanently closed. This project is being performed as a maintenance action rather than an action under the Comprehensive Environmental Response, Compensation, and Liability Act, because the risk to human health and environment is well below the US Environmental Protection Agency's level of concern. The decision to proceed as a maintenance action was documented by an interim action proposed plan, which is included in the administrative record. A Readiness Assessment Team has been assembled to review the criteria deemed necessary to conduct the remediation tasks. These criteria include approval of all plans, acquisition of needed equipment, completion of personnel training, and coordination with plant health and safety personnel. Once the criteria have been met and documented, the task will begin. The readiness assessment is expected to be completed by late July 1995, and the task will begin thereafter.

957 (ORNL/ER–319) **Maintenance Action Work Plan for Waste Area Grouping 1 inactive tanks 3001-B, 3004-B, T-30, and 3013 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Environmental Restoration Program.** Oak Ridge National Lab., TN (United States); CDM Federal Programs Corp., Oak Ridge, TN (United States). Jul 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016170. Source: OSTI; NTIS; INIS; GPO Dep.

This Maintenance Action Work Plan has been prepared to document the activities and procedures for the remediation of four inactive, low-level radioactive tanks at Waste Area Grouping 1, from the Category D list of tanks in the Federal Facility Agreement for the Oak Ridge Reservation (EPA et al. 1994). The four tanks to remediated are tanks 3001-B, 3004-B, T-30, and 3013. Three of the tanks (3001-B, 3004-B, and T-30) will be physically removed from the ground. Because of logistical issues associted with excavation and site access, the fourth tank (3013) will be grouted in place and permanently closed.

958 (ORNL/ER–349) **Preliminary evaluation of liquid integrity monitoring methods for gunite and associated tanks at the Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); Vista Research, Inc., Oak Ridge, TN (United States). Feb 1996. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006685. Source: OSTI; NTIS; INIS; GPO Dep.

The Gunite and Associated Tanks (GAAT) are inactive, liquid low-level waste (LLLW) tanks located in and around the North and South Tank Farms (NTF and STF) at Oak Ridge National Laboratory (ORNL). These tanks, which contain a supernatant over a layer of radioactive sludge, are the subject of an ongoing treatability study that will determine the best way to remove the sludge and remediate the tanks. As part of this study, a preliminary assessment of liquid integrity (or "tightness") monitoring methods for the Gunite tanks has been conducted. Both an external and an internal liquid integrity monitoring method were evaluated, and a preliminary assessment of the liquid integrity of eight Gunite tanks was made with the internal method. The work presented in this report shows that six of the eight GAAT considered here are liquid tight and that, in the case of the other two, data quality was too poor to allow a conclusive decision. The analysis indicates that when the release detection approach described in this report is used during the upcoming treatability study, it will function as a sensitive and robust integrity monitoring system. Integrity assessments based on both the internal and external methods can be used as a means of documenting the integrity of the tanks before the initiation of in-tank operations. Assessments based on the external method can be used during these operations as a means of providing a nearly immediate indication of a release, should one occur. The external method of release detection measures the electrical conductivity of the water found in the dry wells associated with each of the tanks. This method is based on the fact that the conductivity of the liquid in the GAAT is very high, while the conductivity of the groundwater in the dry wells and the underdrain system for the GAAT is very low.

959 (ORNL/ER–359) **Root cause analysis for waste area grouping 1, Batch I, Series 1 Tank T-30 project at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Aug 1996. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96013408. Source: OSTI; NTIS; INIS; GPO Dep.

Four inactive liquid low-level waste (LLLW) tanks were scheduled for remedial actions as the Batch L Series I Tank Project during fiscal year (FY) 1995. These tanks are 3001-B, 3004-B, T-30, and 3013. The initial tank remediation project was conducted as a maintenance action. One project objective was to gain experience in remediation efforts (under maintenance actions) to assist in conducting remedial action projects for the 33 remaining inactive LLLW tanks. Batch I, Series 1 project activities resulted in the successful remediation of tanks 3001-B, 3004-B, and 3013.

Tank T-30 remedial actions were halted as a result of information obtained during waste characterization activities. The conditions discovered on tank T-30 would not allow completion of tank removal and smelting as originally planned. A decision was made to conduct a root cause analysis of Tank T-30 events to identify and, where possible, correct weaknesses that, if uncorrected, could result in similar delays for completion of future inactive tank remediation projects. The objective of the analysis was to determine why a portion of expected project end results for Tank T-30 were not fully achieved. The root cause analysis evaluates project events and recommends beneficial improvements for application to future projects. This report presents the results of the Batch I, Series root cause analysis results and makes recommendations based on that analysis.

960 (ORNL/ER–372) **Preliminary engineering report waste area grouping 5, Old Hydrofracture Facility Tanks content removal project, Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Jun 1996. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96014280. Source: OSTI; NTIS; INIS; GPO Dep.

The Superfund Amendments and Reauthorization Act of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) requires a Federal Facilities Agreement (FFA) for federal facilities placed on the National Priorities List. The Oak Ridge Reservation was placed on that list on December 21, 1989, and the agreement was signed in November 1991 by the U.S. Department of Energy (DOE) Oak Ridge Operations Office, the U.S. Environmental Protection Agency (EPA) Region IV, and the Tennessee Department of Environment and Conservation (TDEC). The effective date of the FFA is January 1, 1992. One objective of the FFA is to ensure that liquid low-level waste (LLLW) tanks that are removed from service are evaluated and remediated through the CERCLA process. Five inactive LLLW tanks, designated T-1, T-2, T-3, T-4, and T-9, located at the Old Hydrofracture (OHF) Facility in the Melton Valley area of Oak Ridge National Laboratory (ORNL) have been evaluated and are now entering the remediation phase. As a precursor to final remediation, this project will remove the current liquid and sludge contents of each of the five tanks (System Requirements Document, Appendix A). It was concluded in the Engineering Evaluation/Cost Analysis [EE/CA] for the Old Hydrofracture Facility Tanks (DOE 1996) that sluicing and pumping the contaminated liquid and sludge from the five OHF tanks was the preferred removal action. Evaluation indicated that this alternative meets the removal action objective and can be effective, implementable, and cost-effective. Sluicing and removing the tank contents was selected because this action uses (1) applicable experience, (2) the latest information about technologies and techniques for removing the wastes from the tanks, and (3) activities that are currently acceptable for storage of transuranic (TRU) mixed waste.

961 (ORNL/ER–375) **Project management plan for Waste Area Grouping 5 Old Hydrofracture Facility tanks content removal at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); CDM Federal Programs Corp., Oak Ridge, TN (United States). Jul 1996. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96012158. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Old Hydrofracture Facility (OHF) tanks content removal project is to transfer inventory from the five OHF tanks located in Waste Area Grouping (WAG) 5 at Oak Ridge National Laboratory (ORNL) to the Melton Valley Storage Tanks (MVST) liquid low-level (radioactive) waste (LLLW) storage facility, and remediate the remaining OHF tank shells. The major activities involved are identified in this document along with the organizations that will perform the required actions and their roles and responsibilities for managing the project.

962 (ORNL/GWPO–0024) **Variable-density flow and transport modeling to evaluate anomalous nitrate concentrations and pressures in GW-134.** Jones, T.L.; Toran, L.E.; Watson, D.B. Oak Ridge National Lab., TN (United States). Jun 1996. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96013673. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy operates the Oak Ridge Reservation near Oak Ridge, Tennessee. Four waste disposal ponds, referred to as the S-3 ponds, were located within this reservation near the western edge of the Y-12 Plant. The S-3 ponds were constructed in 1951 and received liquid waste until 1983. The main component of the waste received by the ponds was nitric acid. In 1988, the ponds were structurally stabilized and capped and the area above the ponds was converted into an asphalt parking lot. Coreholes were drilled in 1985 to characterize the geology of the region. These coreholes have since been equipped with monitoring equipment capable of performing pressure measurements and collecting fluid samples. A modeling study was also conducted to evaluate scenarios potentially capable of producing anomalous pressure and concentration data observed in GW-134. Results are described.

963 (ORNL/TM–12105) **Update of the management strategy for Oak Ridge National Laboratory Liquid Low-Level Waste.** Robinson, S.M.; Abraham, T.J.; DePaoli, S.M.; Walker, A.B. Oak Ridge National Lab., TN (United States). Apr 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011626. Source: OSTI; NTIS; INIS; GPO Dep.

The strategy for management of the Oak Ridge National Laboratory's (ORNL) radioactively contaminated liquid waste was reviewed in 1991. The latest information available through the end of 1990 on waste characterization, regulations, US Department of Energy (DOE) budget guidance, and research and development programs was evaluated to determine how the strategy should be revised. Few changes are needed to update the strategy to reflect new waste characterization, research, and regulatory information. However, recent budget guidance from DOE indicates that minimum funding will not be sufficient to accomplish original objectives to upgrade the liquid low-level waste (LLLW) system to comply with the Federal Facilities Agreement, provide long-term LLLW treatment capability, and minimize environmental, safety, and health risks. Options are presented that might allow the ORNL LLLW system to continue operations temporarily, but they would significantly reduce its capabilities to handle emergency situations, provide treatment for new waste streams, and accommodate waste from the Environmental Restoration Program and from decontamination and decommissioning of surplus facilities. These options are also likely to increase worker radiation exposure, risk of environmental insult, and generation of solid waste for on-site and off-site disposal/storage beyond existing facility capacities. The strategy will be fully developed after receipt of additional guidance. The proposed budget limitations are too severe to allow ORNL to meet regulatory requirements or continue operations long term.

964 (ORNL/TM-12299) **Status of the ORNL liquid low-level waste management upgrades.** Robinson, S.M.; Kent, T.E.; DePaoli, S.M. Oak Ridge National Lab., TN (United States). Aug 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96000849. Source: OSTI; NTIS; INIS; GPO Dep.

The strategy for management of the Oak Ridge National Laboratory's (ORNL's) radioactively contaminated liquid waste was reviewed. The latest information on waste characterization, regulations, US Department of Energy (DOE) budget guidance, and research and development programs was evaluated to determine how the strategy should be revised. Few changes are needed to update the strategy to reflect new waste characterization, research, and regulatory information. However, recent budget guidance from DOE indicates that minimum funding will not be sufficient to accomplish original objectives to upgrade the liquid low-level waste (LLLW) system to be in compliance with the Federal Facilities Agreement compliance, provide long-term LLLW treatment capability, and minimize Environmental Safety & Health risks. Options are presented that might allow the ORNL LLLW system to continue operations temporarily but significantly reduce its capabilities to handle emergency situations, provide treatment for new waste streams, and accommodate waste from the Environmental Restoration Program and from decontamination and decommissioning of surplus facilities. These options are also likely to increase worker radiation exposure, risk of environmental insult, and generation of solid waste for on-site and off-site disposal/storage beyond existing facility capacities. The strategy will be fully developed after receiving additional guidance. The proposed budget limitations are too severe to allow ORNL to meet regulatory requirements or continue operations long term.

965 (ORNL/TM-12887) **The removal of mercury from solid mixed waste using chemical leaching processes.** Gates, D.D.; Chao, K.K.; Cameron, P.A. Oak Ridge National Lab., TN (United States). Jul 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95017139. Source: OSTI; NTIS; INIS; GPO Dep.

The focus of this research was to evaluate chemical leaching as a technique to treat soils, sediments, and glass contaminated with either elemental mercury or a combination of several mercury species. Potassium iodide/iodine solutions were investigated as chemical leaching agents for contaminated soils and sediments. Clean, synthetic soil material and surrogate storm sewer sediments contaminated with mercury were treated with KI/I_2 solutions. It was observed that these leaching solutions could reduce the mercury concentration in soil and sediments by 99.8%. Evaluation of selected posttreatment sediment samples revealed that leachable mercury levels in the treated solids exceeded RCRA requirements. The results of these studies suggest that KI/I_2 leaching is a treatment process that can be used to remove large quantities of mercury from contaminated soils and sediments and may be the only treatment required if treatment goals are established on Hg residual concentrations in solid matrices. Fluorescent bulbs were used to simulate mercury contaminated glass mixed waste. To achieve mercury contamination levels similar to those found in larger bulbs such as those used in DOE facilities a small amount of Hg was added to the crushed bulbs. The most effective agents for leaching mercury from the crushed fluorescent bulbs were KI/I_2, NaOCl, and NaBr + acid. Radionuclide surrogates were added to both the EPA synthetic soil material and the crushed fluorescent bulbs to determine the fate of radionuclides following chemical leaching with the leaching agents determined to be the most promising. These experiments revealed that although over 98% of the dosed mercury solubilized and was found in the leaching solution, no Cerium was measured in the posttreatment leaching solution. This finding suggest that Uranium, for which Ce was used as a surrogate, would not solubilize during leaching of mercury contaminated soil or glass.

966 (ORNL/TM-12913) **Liquid and Gaseous Waste Operations Department annual operating report CY 1994.** Maddox, J.J.; Scott, C.B. Oak Ridge National Lab., TN (United States). Mar 1995. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014460. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents details about the operation of the liquid and gaseous waste department of Oak Ridge National Laboratory for the calendar year 1994. Topics discussed include; process waste system, upgrade activities, low-level liquid radioactive waste solidification project, maintenance activities, and other activities such as training, audits, and tours.

967 (ORNL/TM-12939) **Design alternatives report for the cesium removal demonstration.** Walker, J.F. Jr.; Youngblood, E.L. Oak Ridge National Lab., TN (United States). Sep 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96002293. Source: OSTI; NTIS; INIS; GPO Dep.

The Cesium Removal Demonstration (CRD) project will use liquid low-level waste (LLLW) stored in the Oak Ridge National Laboratory Melton Valley Storage Tanks to demonstrate cesium removal from sodium nitrate-based supernates. This report presents the results of a conceptual design study to scope the alternatives for conducting the demonstration at ORNL. Factors considered included (1) sorbent alternatives, (2) facility alternatives, (3) process alternatives, (4) process disposal alternatives, and (5) relative cost comparisons. Recommendations included (1) that design of the CRD system move forward based on information obtained to date from tests with Savannah River Resin, (2) that the CRD system be designed so it could use crystalline silicotitanates (CST) if an engineered form of CST becomes available prior to the CRD, (3) that the system be designed without the capability for resin regeneration, (4) that the LLLW solidification facility be used for the demonstration (5) that vitrification of the loaded resins from the CRD be demonstrated at the Savannah River Site, and (6) that permanent disposal of the loaded and/or vitrified resin at the Nevada Test Site be pursued.

968 (ORNL/TM-12974) **Investigation of the liquid low-level waste evaporator steam coil failure and supporting laboratory studies.** Pawel, S.J.; Keiser, J.R.; Longmire, H.F. Oak Ridge National Lab., TN (United States). May 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95015662. Source: OSTI; NTIS; INIS; GPO Dep.

Using a remote video camera, the internals of a low-level waste evaporator tank (termed 2A2, type 304L stainless steel construction, known to have failed steam coils) were inspected. This inspection revealed at least three rather substantial holes as opposed to crack- or pit-like leak sites near the nominal solution level position on one particular steam coil. This section was removed from the evaporator vessel, and subsequent hot cell examination revealed extensive general corrosion on the process side of the coil with little or no attack on the steam side. Hot cell metallography confirmed intense general corrosion on the process side and, in addition, revealed shallow intergranular attack at the leading edge of corrosion. No pits or cracks were detected in this section of the steam coil. Laboratory corrosion tests with coupons of 304L (and other high-alloy materials) isothermally exposed in a range of solutions similar to those expected in the evaporator reveal only very low corrosion rates below 40% sodium hydroxide and the solution boiling point. However, "dried film" experiments revealed that much more dilute solutions became aggressive to stainless steel due to concentrating effects (evaporation and periodic wetting) at the air/solution interface. The high general corrosion rates observed on the failed coil section occurred at or near the air/solution interface and were attributed to such "splash zone" activity.

969 (ORNL/TM–13012) **Prediction of external corrosion for UF_6 cylinders: Results of an empirical method.** Lyon, B.F. Oak Ridge National Lab., TN (United States). Jun 1995. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014488. Source: OSTI; NTIS; INIS; GPO Dep.

Wall thickness data for depleted LTF, (DU) cylinders in above-ground storage at three Department of Energy (DOE) sites (Oak Ridge, TN; Paducah, KY; Portsmouth, OH) were analyzed in order to address the following questions: How many cylinders may have breaches now? and, What will the conditions be like in 2020? This report summarizes preliminary results of the analyses conducted. These results are to be used as input into models for estimating risks and hazards associated with the cylinders in the various conditions. These models will then be used as a basis for implementing engineering fixes where possible and for management decisions on corrective actions. This is part of the overall assessment of the risks and hazards within the DU management program.

970 (ORNL/TM–13028) **Evaluation of interim and final waste forms for the newly generated liquid low-level waste flowsheet.** Abotsi, G.M.K. (Clark Atlanta Univ., GA (United States)); Bostick, D.T.; Beck, D.E. Oak Ridge National Lab., TN (United States). May 1996. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96011591. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this review is to evaluate the final forms that have been proposed for radioactive-containing solid wastes and to determine their application to the solid wastes that will result from the treatment of newly generated liquid low-level waste (NGLLLW) and Melton Valley Storage Tank (MVST) supernate at the Oak Ridge National Laboratory (ORNL). Since cesium and strontium are the predominant radionuclides in NGLLLW and MVST supernate, this review is focused on the stabilization and solidification of solid wastes containing these radionuclides in cement, glass, and polymeric materials-the principal waste forms that have been tested with these types of wastes. Several studies have shown that both cesium and strontium are leached by distilled water from solidified cement, although the leachabilities of cesium are generally higher than those of strontium under similar conditions. The situation is exacerbated by the presence of sulfates in the solution, as manifested by cracking of the grout. Additives such as bentonite, blast-furnace slag, fly ash, montmorillonite, pottery clay, silica, and zeolites generally decrease the cesium and strontium release rates. Longer cement curing times (>28 d) and high ionic strengths of the leachates, such as those that occur in seawater, also decrease the leach rates of these radionuclides. Lower cesium leach rates are observed from vitrified wastes than from grout waste forms. However, significant quantities of cesium are volatilized due to the elevated temperatures required to vitrify the waste. Hence, vitrification will generally require the use of cleanup systems for the off-gases to prevent their release into the atmosphere.

971 (ORNL/TM–13036) **Sludge mobilization with submerged nozzles in horizontal cylindrical tanks.** Hylton, T.D.; Cummins, R.L.; Youngblood, E.L.; Perona, J.J. Oak Ridge National Lab., TN (United States). Oct 1995. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96003185. Source: OSTI; NTIS; INIS; GPO Dep.

The Melton Valley Storage Tanks (MVSTs) and the evaporator service tanks at the Oak Ridge National Laboratory (ORNL) are used for the collection and storage of liquid low-level waste (LLLW). Wastes collected in these tanks are typically acidic when generated and are neutralized with sodium hydroxide to protect the tanks from corrosion; however, the high pH of the solution causes the formation of insoluble compounds that precipitate. These precipitates formed a sludge layer approximately 0.6 to 1.2 m (2 to 4 ft) deep in the bottom of the tanks. The sludge in the MVSTs and the evaporator service tanks will eventually need to be removed from the tanks and treated for final disposal or transferred to another storage facility. The primary options for removing the sludge include single-point sluicing, use of a floating pump, robotic sluicing, and submerged-nozzle sluicing. The objectives of this study were to (1) evaluate the feasibility of submerged-nozzle sluicing in horizontal cylindrical tanks and (2) obtain experimental data to validate the TEMPEST (time-dependent, energy, momentun, pressure, equation solution in three dimensions) computer code.

972 (ORNL/TM–13078) **PCB extraction from ORNL tank WC-14 using a unique solvent.** Bloom, G.A.; Lucero, A.J.; Koran, L.J.; Turner, E.N. Oak Ridge National Lab., TN (United States). Sep 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96000834. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the development work of the Engineering Development Section of the Chemical Technology Division at Oak Ridge National Laboratory (ORNL) for an organic extraction method for removing polychlorinated biphenyls (PCBs) from tank WC-14. Tank WC-14 is part of the ORNL liquid low-level radioactive tank waste system and does not meet new secondary containment and leak detection regulations. These regulations require the tank to be taken out of service, and remediated before tank removal. To remediate the tank, the PCBs must be removed; the tank contents can then be transferred to the Melton Valley Storage Tanks before final disposal. The solvent being used for the PCB extraction experiments is triethylamine, an aliphatic amine that is soluble in water below 60°F but insoluble in water above 90°F. This property will allow the extraction to be carried out under fully miscible conditions within the tank; then, after tank conditions have been changed, the solvent will not be miscible with water and phase separation will occur. Phase separation between sludge, water, and solvent will allow solvent (loaded with PCBs) to be removed from the tank for disposal. After removing the PCBs from the sludge and removing the sludge from the tank, administrative control of the tank can be transferred to ORNL's Environmental Restoration Program, where priorities will be set for tank removal. Experiments with WC-14 sludge show that greater than 90% extraction efficiencies can be achieved with one extraction stage and that PCB concentration in the sludge can be reduced to below 2 ppm in three extractions. It is anticipated that three extractions will be necessary to reduce the PCB concentration to below 2 ppm during field applications. The experiments conducted with tank WC-14 sludge transferred less than 0.03% of the original alpha contamination and less than 0.002% of the original beta contamination.

973 (ORNL/TM-13101) **FY 1995 separation studies for liquid low-level waste treatment at Oak Ridge National Laboratory.** Bostick, D.T. (and others); Arnold, W.D.; Burgess, M.W. Oak Ridge National Lab., TN (United States). Jan 1995. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96006025. Source: OSTI; NTIS; INIS; GPO Dep.

During FY 1995, studies were continued to develop improved methods for centralized treatment of liquid low-level waste (LLLW) at Oak Ridge National Laboratory (ORNL). Focus in this reporting period was on (1) identifying the parameters that affect the selective removal of ^{90}Sr and ^{137}Cs, two of the principal radioactive contaminants expected in the waste; (2) validating the effectiveness of the treatment methods by testing an ac Melton Valley Storage Tank (MVST) supernate; (3) evaluating the optimum solid/liquid separation techniques for the waste; (4) identifying potential treatment methods for removal of technetium from LLLW; and (5) identifying potential methods for stabilizing the high-activity secondary solid wastes generated by the treatment.

974 (ORNL/TM-13131) **Current and projected liquid low-level waste generation at ORNL.** DePaoli, S.M.; West, G.D. Oak Ridge National Lab., TN (United States). Apr 1996. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96010623. Source: OSTI; NTIS; INIS; GPO Dep.

Liquid low-level waste (LLLW) is generated by various programs and projects throughout Oak Ridge National Laboratory (ORNL). This waste is collected in bottles, by trucks, or in underground collection tanks; it is then neutralized with sodium hydroxide and reduced in volume at the ORNL LLLW evaporator. This report presents historical and projected data concerning the volume and the characterization of LLLW, both prior to and after evaporation. Storage space for projected waste generation is also discussed.

975 (ORNL/TM-13164) **Liquid and Gaseous Waste Operations Department annual operating report, CY 1995.** Maddox, J.J.; Scott, C.B. Oak Ridge National Lab., TN (United States). Mar 1996. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96009374. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the operating activities, upgrade activities, maintenance, and other activities regarding liquid and gaseous low level radioactive waste management at the Oak Ridge National Laboratory. Miscellaneous activities include training, audits, tours, and environmental restoration support.

976 (ORNL/TM-13189) **Oak Ridge National Laboratory program plan for certification of nonradioactive hazardous waste.** Oak Ridge National Lab., TN (United States). May 1996. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96012271. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes Oak Ridge National Laboratory's (ORNL) Program for Certification of Nonradioactive Hazardous Waste (Program). The Program establishes the criteria that will be used by all ORNL divisions, offices, and programs for unrestricted release of hazardous waste to off-site commercial facilities. The certification process meets the requirements given in the Performance Objective for Certification of Non-Radioactive Hazardous Waste. The Program Plan has two main elements: (A) Establishing Radioactive Materials Management Areas (RMMAs). At ORNL, RMMAs are (1) Contamination Areas, High Contamination Areas, and Airborne Radioactivity Areas, (2) Radiological Buffer Areas established for contamination control, and (3) areas posted to prevent loss of control of activated items. (B) Certifying that hazardous waste originating in an RMMA is suitable for commercial treatment, storage, or disposal by process knowledge, surface contamination surveys, sampling and analysis, or a combination of these techniques. If process knowledge is insufficient, the hazardous waste must undergo sampling and analysis in addition to surface contamination surveys. This Program will reduce the impact to current ORNL operations by using current radiological area boundaries and existing plans and procedures to the greatest extent possible. New or revised procedures will be developed as necessary to implement this Program.

977 (ORNL/TM-13192) **Prediction of external corrosion for steel cylinders at the Paducah Gaseous Diffusion Plant: Application of an empirical method.** Lyon, B.F. Oak Ridge National Lab., TN (United States). Feb 1996. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE96008763. Source: OSTI; NTIS; INIS; GPO Dep.

During the summer of 1995, ultrasonic wall thickness data were collected for 100 steel cylinders containing depleted uranium (DU) hexafluoride located at Paducah Gaseous Diffusion Plant (PGDP) in Paducah, Kentucky. The cylinders were selected for measurement to assess the condition of the more vulnerable portion of the cylinder inventory at PGDP. The purpose of this report is to apply the method used in Lyon to estimate the effects of corrosion for larger unsampled populations as a function of time. The scope of this report is limited and is not intended to represent the final analyses of available data. Future efforts will include continuing analyses of available data to investigate defensible deviations from the conservative assumptions made to date. For each cylinder population considered, two basic types of analyses were conducted: (1) estimates were made of the number of cylinders as a function of time that will have a minimum wall thickness of either 0 mils (1 mil = 0.00 1 in.) or 250 mils and (2) the current minimum wall thickness distributions across cylinders were estimated for each cylinder population considered. Additional analyses were also performed investigating comparisons of the results for F and G yards with the results presented in Lyon (1995).

978 (ORNL/TM–13236) **Comparison of SW-846 method 3051 and SW-846 method 7471A for the preparation of solid waste samples for mercury determination.** Giaquinto, J.M.; Essling, A.M.; Keller, J.M. Oak Ridge National Lab., TN (United States). [1996]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. Order Number DE96014278. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes experimental studies to evaluate the use of EPA SW-846 method 3051 for preparation and dissolution of solid samples for Hg analysis. The study showed that the method is effective in dissolution of four sample types without significant loss of Hg. Based on results of this study, method 3051 was used for analysis of high radioactive waste samples to obtain results for a number of RCRA regulated metals without the need to utilize a separate sample preparation method (EPA SW-846 method 7471A) specific only for Hg.

979 (PNL–10068) **300 Area dangerous waste tank management system: Compliance plan approach. Final report.** Pacific Northwest National Lab., Richland, WA (United States); Ebasco Environmental, Richland, WA (United States); Hart Crowser, Inc., Richland, WA (United States). Mar 1996. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008343. Source: OSTI; NTIS; INIS; GPO Dep.

In its Dec. 5, 1989 letter to DOE-Richland (DOE-RL) Operations, the Washington State Dept. of Ecology requested that DOE-RL prepare "a plant evaluating alternatives for storage and/or treatment of hazardous waste in the 300 Area...". This document, prepared in response to that letter, presents the proposed approach to compliance of the 300 Area with the federal Resource Conservation and Recovery Act and Washington State's Chapter 173-303 WAC, Dangerous Waste Regulations. It also contains 10 appendices which were developed as bases for preparing the compliance plan approach. It refers to the Radioactive Liquid Waste System facilities and to the radioactive mixed waste.

980 (PNL–10524) **Arid sites stakeholder participation in evaluating innovative technologies: VOC-Arid Site Integrated Demonstration.** Peterson, T.S. (and others); McCabe, G.H.; Brockbank, B.R. Pacific Northwest Lab., Richland, WA (United States). May 1995. 192p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012395. Source: OSTI; NTIS; GPO Dep.

Developing and deploying innovative environmental cleanup technologies is an important goal for the U.S. Department of Energy (DOE), which faces challenging remediation problems at contaminated sites throughout the United States. Achieving meaningful, constructive stakeholder involvement in cleanup programs, with the aim of ultimate acceptance of remediation decisions, is critical to meeting those challenges. DOE's Office of Technology Development sponsors research and demonstration of new technologies, including, in the past, the Volatile Organic Compounds Arid Site Integrated Demonstration (VOC-Arid ID), hosted at the Hanford Site in Washington State. The purpose of the VOC-Arid ID has been to develop and demonstrate new technologies for remediating carbon tetrachloride and other VOC contamination in soils and ground water. In October 1994 the VOC-Arid ID became a part of the Contaminant Plume Containment and Remediation Focus Area (Plume Focus Area). The VOC Arid ID's purpose of involving stakeholders in evaluating innovative technologies will now be carried on in the Plume Focus Area in cooperation with Site Technology Coordination Groups and Site Specific Advisory Boards. DOE's goal is to demonstrate promising technologies once and deploy those that are successful across the DOE complex. Achieving that goal requires that the technologies be acceptable to the groups and individuals with a stake in DOE facility cleanup. Such stakeholders include groups and individuals with an interest in cleanup, including regulatory agencies, Native American tribes, environmental and civic interest groups, public officials, environmental technology users, and private citizens. This report documents the results of the stakeholder involvement program, which is an integral part of the VOC-Arid ID.

981 (PNL–10623) **324 Building Compliance Project: Selection and evaluation of alternatives for the removal of solid remote-handled mixed wastes from the 324 Building.** Ross, W.A. (and others); Bierschbach, M.C.; Dukelow, J.S. Jr. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95016115. Source: OSTI; NTIS; INIS; GPO Dep.

Six alternatives for the interim storage of remote-handled mixed wastes from the 324 Building on the Hanford Site have been identified and evaluated. The alternatives focus on the interim storage facility and include use of existing facilities in the 200 Area, the construction of new facilities, and the vitrification of the wastes within the 324 Building to remove the majority of the wastes from under RCRA regulations. The six alternatives are summarized in Table S.1, which identifies the primary facilities to be utilized, the anticipated schedule for removal of the wastes, the costs of the transfer from 324 Building to the interim storage facility (including any capital costs), and an initial risk comparison of the alternatives. A recently negotiated Tri-Party Agreement (TPA) change requires the last of the mixed wastes to be removed by May 1999. The ability to use an existing facility reduces the costs since it eliminates the need for new capital construction. The basic regulatory approvals for the storage of mixed wastes are in place for the PUREX facility, but the Form HI permit will need some minor modifications since the 324 Building wastes have some additional characteristic waste codes and the current permit limits storage of wastes to those from the facility itself. Regulatory reviews have indicated that it will be best to use the tunnels to store the wastes. The PUREX alternatives will only provide storage for about 65% of the wastes. This results from the current schedule of the B-Cell Clean Out Project, which projects that dispersible debris will continue to be collected in small quantities until the year 2000. The remaining fraction of the wastes will then be stored in another facility. Central Waste Complex (CWC) is currently proposed for that residual waste storage; however, other options may also be available.

982 (PNL–10666) **Literature review of arc/plasma, combustion, and joule-heated melter vitrification systems.** Freeman, C.J.; Abrigo, G.P.; Shafer, P.J.; Merrill, R.A. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95017598. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides reviews of papers and reports for three basic categories of melters: arc/plasma-heated melters, combustion-heated melters, and joule-heated melters. The literature reviewed here represents those publications which may lend insight to phase I testing of low-level waste vitrification being performed at the Hanford Site in FY 1995. For each melter category, information from those papers and reports containing enough information to determine steady-state mass balance data is tabulated at the end of each section. The tables show the composition of the feed processed, the off-gas measured via decontamination factors, gross energy consumptions, and processing rates, among other data.

983 (PNL–10743) **1995 Baseline solid waste management system description.** Anderson, G.S.; Konynenbelt, H.S. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000203. Source: OSTI; NTIS; INIS; GPO Dep.

This provides a detailed solid waste system description that documents the treatment, storage, and disposal (TSD) strategy for managing Hanford's solid low-level waste, low-level mixed waste, transuranic and transuranic mixed waste, and greater-than-Class III waste. This system description is intended for use by managers of the solid waste program, facility and system planners, as well as system modelers. The system description identifies the TSD facilities that constitute the solid waste system and defines these facilities' interfaces, schedules, and capacities. It also provides the strategy for treating each of the waste streams generated or received by the Hanford Site from generation or receipt through final destination.

984 (PNL–10746) **Evaluation of the single-pass flow-through test to support a low-activity waste specification.** McGrail, B.P. (Pacific Northwest Lab., Richland, WA (United States)); Peeler, D.K. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000197. Source: OSTI; NTIS; INIS; GPO Dep.

A series of single-pass flow-through (SPFT) tests was performed on five reference low-activity waste glasses and a reference glass from the National Institute of Standards and Technology to support a product specification for low-activity waste (LAW) forms. The results showed that the SPFT test provides a means to quantitatively distinguish among LAW glass forms in terms of their forward reaction rate at a given temperature and solution pH. Two of the test glasses were also subjected to SPFT testing at Argonne National Laboratory (ANL). Forward reaction rate constants calculated from the ANL test data were 100 to over 1,000 times larger than the values obtained from the SPFT tests conducted at PNL. An analysis of the ANL results showed that they were inconsistent with independent measurements done on glasses of similar composition, the known pH-dependence of the forward rate, and with the results from low surface-area-to-volume, short duration product consistency tests. Because the data set obtained from the SPFT tests done at PNL was consistent with each of these same factors, a detailed examination of the test procedures used at both laboratories was performed to determine the cause(s) of the discrepancy. The omission of background subtraction in the data analysis procedure and the short-duration (on the order of hours) of the ANL tests are factors that may have significantly affected the calculated rates.

985 (PNL–10779) **Alternative comparison, analysis, and evaluation of solid waste and materials system alternatives.** Brothers, A.J. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003602. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a comprehensive analysis of the impact of solid waste technical options on values and objectives that are important to the public. It is written in support of the Solid Waste and Materials Systems Alternatives Study (WHC, 1995). Described are the values that were identified, the major programmatic risks, how the impacts were measured, the performance of alternatives, the methodology used for the analysis, and the implications of the results. Decision analysis was used to guide the collection and analysis of data and the logic of the evaluation. Decision analysis is a structured process for the analysis and evaluation of alternatives. It is theoretically grounded in a set of axioms that capture the basic principles of decision making (von Neuman and Morgenstern 1947). Decision analysis objectively specifies what factors are to be considered, how they are to be measured and evaluated, and heir relative importance. The result is an analysis in which the underlying rationale or logic upon which the decision is based is made explicit. This makes possible open discussion of the decision basis in which facts and values are clearly distinguished, resulting in a well- documented decision that can be clearly explained and justified. The strategy of decision analysis is to analyze the various components relevant to the decision separately and then integrate the individual judgments to arrive at an overall decision. This assures that all the relevant factors are identified and their relative importance is considered. The procedure for obtaining the individual judgments, and the decision rules, for combining them and evaluating alternatives, have both theoretical and empirical foundation in mathematics, economics, and psychology.

986 (PNL–10788) **The role of plants and animals in isolation barriers at Hanford, Washington.** Link, S.O.; Cadwell, L.L.; Petersen, K.L.; Sackschewsky, M.R.; Landeen, D.S. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96000814. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site Surface Barrier Development Program was organized in 1985 to test the effectiveness of various barrier designs in minimizing the effects of water infiltration; plant, animal, and human intrusion; and wind and water erosion on buried wastes, and in minimizing the emanation of noxious gases. Plants will serve to minimize drainage and erosion, but present,the potential for growing roots into wastes. Animals burrow holes into the soil, and the burrow holes could allow water to preferentially drain into the waste. They also bring soil to the surface which, if wastes are incorporated, could present a risk for the dispersion of wastes into the environment. This report reviews work done to assess the role of plants and animals in isolation barriers at Hanford. It also reviews work done to understand the potential effects from climate change on the plants and animals that may inhabit barriers in the future.

987 (PNL–10830) **Selection of a computer code for Hanford low-level waste engineered-system performance assessment.** McGrail, B.P.; Mahoney, L.A. Pacific Northwest Lab., Richland, WA (United States). Oct 1995. 30p. Sponsored by USDOE, Washington,. DC (United

States). DOE Contract AC06-76RL01830. Order Number DE96001363. Source: OSTI; NTIS; INIS; GPO Dep.

Planned performance assessments for the proposed disposal of low-level waste (LLW) glass produced from remediation of wastes stored in underground tanks at Hanford, Washington will require calculations of radionuclide release rates from the subsurface disposal facility. These calculations will be done with the aid of computer codes. Currently available computer codes were ranked in terms of the feature sets implemented in the code that match a set of physical, chemical, numerical, and functional capabilities needed to assess release rates from the engineered system. The needed capabilities were identified from an analysis of the important physical and chemical process expected to affect LLW glass corrosion and the mobility of radionuclides. The highest ranked computer code was found to be the ARES-CT code developed at PNL for the US Department of Energy for evaluation of and land disposal sites.

988 (PNL–10872) **Hanford prototype-barrier status report: FY 1995.** Gee, G.W.; Ward, A.L.; Gilmore, B.G.; Ligotke, M.W.; Link, S.O. Pacific Northwest Lab., Richland, WA (United States). Nov 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96003908. Source: OSTI; NTIS; INIS; GPO Dep.

Surface barriers (or covers) have been proposed for use at the Hanford Site as a means to isolate certain waste sites that, for reasons of cost or worker safety or both, may not be exhumed. Surface barriers are intende to isolated the wastes from the accessible environment and to provide long-term protection to future populations that might use the Hanford Site. Currently, no "proven" long-term barrier system is available. For this reason, the Hanford Site Permanent Isolation Surface-Barrier Development Program (BDP) was organized to develop the technology needed to provide long-term surface barrier capability for the Hanford Site for the US Department of Energy (DOE). Designs have been proposed to meet the most stringent needs for long-term waste disposal. The objective of the current barrier design is to use natural materials to develop a protective barrier system that isolates wastes for at least 1000 years by limiting water, plant, animal, and human intrusion; and minimizing erosion. The design criteria for water drainage has been set at 0.5 mm/yr. While other design criteria are more qualitative, it is clear that waste isolation for an extended time is the prime objective of the design. Constructibility and performance. are issues that can be tested and dealt with by evaluating prototype designs prior to extensive construction and deployment of covers for waste sites at Hanford.

989 (PNL-SA–24939) **Applying waste logistics modeling to regional planning.** Holter, G.M.; Khawaja, A.; Shaver, S.R.; Peterson, K.L. Pacific Northwest Lab., Richland, WA (United States). May 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505208–3: Pacific basin conference on hazardous waste, Alberta (Canada), 7-12 May 1995). Order Number DE95014179. Source: OSTI; NTIS; GPO Dep.

Waste logistics modeling is a powerful analytical technique that can be used for effective planning of future solid waste storage, treatment, and disposal activities. Proper waste management is essential for preventing unacceptable environmental degradation from ongoing operations, and is also a critical part of any environmental remediation activity. Logistics modeling allows for analysis of alternate scenarios for future waste flowrates and routings, facility schedules, and processing or handling capacities. Such analyses provide an increased understanding of the critical needs for waste storage, treatment, transport, and disposal while there is still adequate lead time to plan accordingly. They also provide a basis for determining the sensitivity of these critical needs to the various system parameters. This paper discusses the application of waste logistics modeling concepts to regional planning. In addition to ongoing efforts to aid in planning for a large industrial complex, the Pacific Northwest Laboratory (PNL) is currently involved in implementing waste logistics modeling as part of the planning process for material recovery and recycling within a multi-city region in the western US.

990 (PNL-SA–25207) **The comparison of element partitioning in two types of thermal treatment facilities and the effects on potential radiation dose.** Aaberg, R.L. (Pacific Northwest Lab., Richland, WA (United States)); Burger, L.L.; Baker, D.A.; Wallo, A. III; Vazquez, G.A.; Beck, W.L. Pacific Northwest Lab., Richland, WA (United States). May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950542–4: 14. international symposium on thermal treatment technologies: incineration conference, Seattle, WA (United States), 8-12 May 1995). Order Number DE95014175. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is performing a technical analysis to support the potential development of risk-based, numerical radiological control criteria (RCC) for mixed waste from DOE operations. As part of the technical analysis, potential future radiation doses are being calculated for workers at thermal treatment facilities and members of the public residing near such facilities. This study compared two types of thermal treatment systems: a conventional combustion chamber with excess air, represented by a rotary kiln with afterburner, and an oxygen-deficient pyrolysis unit, represented by a plasma arc furnace. The purpose of the first part of this study is to estimate the partitioning for significant radionuclides and elements in the two types of thermal treatment systems. Excess-air systems are generally found to produce heavy-metal chlorides, oxides, and sulfates; plasma-arc systems tend to produce more volatile free metals. This difference causes a change in source term dominance from halide volatility to free metal volatility. Chemical thermodynamic methodology is used to estimate partitioning in the two treatment systems. The second part of the study examines how the potential radiation dose to workers handling residue materials is affected by partitioning of radionuclides at the different types of facilities.

991 (PNL-SA–25640) **Effect of temperature on perchloroethylene dechlorination by a methanogenic consortium.** Gao, J.; Skeen, R.S.; Hooker, B.S. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950483–3: 3. international in situ and on-site bioreclamation symposium, San Diego, CA (United States), 24-27 Apr 1995). Order Number DE95014168. Source: OSTI; NTIS; GPO Dep.

The effect of temperature on the kinetics of growth, substrate metabolism, and perchloroethylene (PCE) dechlorination by a methanogenic consortium is reported. In all cases, a simple kinetic model accurately reflected experimental data. Values for the substrate and methane yield coefficients, and the maximum specific growth rate are fairly consistent at each temperature. Also, the substrate and methane yield coefficients show little temperature sensitivity. In contrast, both the maximum specific growth rate and the PCE dechlorination yield coefficient (Y_{PCE}) are temperature dependent.

992 (PNL-SA-25753) **A PC-based software package for modeling DOE mixed-waste management options.** Abashian, M.S. (IT Corp., Albuquerque, NM (United States)); Carney, C.; Schum, K. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216-153: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95014171. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) Headquarters and associated contractors have developed an IBM PC-based software package that estimates costs, schedules, and public and occupational health risks for a range of mixed-waste management options. A key application of the software package is the comparison of various waste-treatment options documented in the draft Site Treatment Plans prepared in accordance with the requirements of the Federal Facility Compliance Act of 1992. This automated Systems Analysis Methodology consists of a user interface for configuring complexwide or site-specific waste-management options; calculational algorithms for cost, schedule and risk; and user-selected graphical or tabular output of results. The mixed-waste management activities modeled in the automated Systems Analysis Methodology include waste storage, characterization, handling, transportation, treatment, and disposal. Analyses of treatment options identified in the draft Site Treatment Plans suggest potential cost and schedule savings from consolidation of proposed treatment facilities. This paper presents an overview of the automated Systems Analysis Methodology.

993 (PNL-SA-25764) **Vitrification development for mixed wastes.** Merrill, R.; Whittington, K.; Peters, R. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216-154: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95014190. Source: OSTI; NTIS; INIS; GPO Dep.

Vitrification is a promising approach to waste-form immobilization. It destroys hazardous organic compounds and produces a durable and highly stable glass. Vitrification tests were performed on three surrogate wastes during fiscal year 1994; 183-H Solar Evaporation Basin waste from Hanford, bottom ash from the Oak Ridge TSCA incinerator, and saltcrete from Rocky Flats. Preliminary glass development involved melting trials followed by visual homogeneity examination, short-duration leach tests on glass specimens, and long-term leach tests on selected glasses. Viscosity and electrical conductivity measurements were taken for the most durable glass formulations. Results for the saltcrete are presented in this paper and demonstrate the applicability of vitrification technology to this mixed waste.

994 (PNL-SA-25844) **Nonthermal plasma technology for organic destruction.** Heath, W.O.; Birmingham, J.G. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950601-17: Annual meeting of the American Nuclear Society (ANS), Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95014188. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory (PNL) is investigating the use of nonthermal, electrically driven plasmas for destroying organic contaminants near ambient temperatures and pressures. Three different plasma systems have been developed to treat organics in air, water, and soil. These systems are the Gas-Phase Corona Reactor (GPCR)III for treating air, the Liquid-Phase Corona Reactor for treating water, and In Situ Corona for treating soils. This presentation focuses on recent technical developments, commercial status, and project costs of OPCR as a cost-effective alternative to other air-purification technologies that are now in use to treat off-gases from site-remediation efforts as well as industrial emissions.

995 (PNL-SA-26015) **Vitrification of NAC process residue.** Merrill, R.A.; Whittington, K.F.; Peters, R.D. Pacific Northwest Lab., Richland, WA (United States). Sep 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950917-16: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE96002717. Source: OSTI; NTIS; INIS; GPO Dep.

Vitrification tests have been performed with simulated waste compositions formulated to represent the residue which would be obtained from the treatment of low-level, nitrate wastes from Hanford and Oak Ridge by the nitrate to ammonia and ceramic (NAC) process. The tests were designed to demonstrate the feasibility of vitrifying NAC residue and to quantify the impact of the NAC process on the volume of vitrified waste. The residue from NAC treatment of low-level nitrate wastes consists primarily of oxides of aluminum and sodium. High alumina glasses were formulated to maximize the waste loading of the NAC product. Transparent glasses with up to 35 wt% alumina, and even higher contents in opaque glasses, were obtained at melting temperatures of 1200°C to 1400°C. A modified TCLP leach test showed the high alumina glasses to have good chemical durability, leaching significantly less than either the ARM-1 or the DWPF-EA high-level waste reference glasses. A significant increase in the final waste volume would be a major result of the NAC process on LLW vitrification. For Hanford wastes, NAC-treatment of nitrate wastes followed by vitrification of the residue will increase the final volume of vitrified waste by 50% to 90%; for Melton Valley waste from Oak Ridge, the increase in final glass volume will be 260% to 280%. The increase in volume is relative to direct vitrification of the waste in a 20 wt% Na_2O glass formulation. The increase in waste volume directly affects not only disposal costs, but also operating and/or capital costs. Larger plant size, longer operating time, and additional energy and additive costs are direct results of increases in waste volume. Such increases may be balanced by beneficial impacts on the vitrification process; however, those effects are outside the scope of this report.

996 (PNL-SA-26066) **Demonstrating and implementing innovative technologies: Case studies from the USDOE Office of Technology Development.** Brouns, T.M. (Pacific Northwest Lab., Richland, WA (United States)); Koegler, K.J.; Mamiya, L.S. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216-136: Waste management '95,

Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95011492. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes elements of success for demonstration, evaluation, and transfer for deployment of innovative technologies for environmental restoration. They have been compiled from lessons learned through the US Department of Energy (DOE) Office of Technology Development's Volatile Organic Compounds in Arid Soil Integrated Demonstration (VOC-Arid ID). The success of the VOC-Arid ID program was determined by the rapid development demonstration, and transfer for deployment of technologies to operational sites that improve on safety, cost, and/or schedule of performance over baseline technologies. The VOC-Arid ID successfully fielded more than 25 innovative technology field demonstrations; several of the technologies demonstrated have been successfully transferred for deployment Field demonstration is a critical element in the successful transfer of innovative technologies into environmental restoration operations. The measures of success for technology demonstrations include conducting the demonstration in a safe and controlled environment and generating the appropriate information by which to evaluate the technology. However, field demonstrations alone do not guarantee successful transfer for deployment There are many key elements throughout the development and demonstration process that have a significant impact on the success of a technology. This paper presents key elements for a successful technology demonstration and transfer for deployment identified through the experiences of the VOC-Arid ID. Also, several case studies are provided as examples.

997 (PNL-SA-26147) **Application of macro material flow modeling to the decision making process for integrated waste management systems.** Vigil, S.A. (California Polytechnic State Univ., San Luis Obispo, CA (United States)); Holter, G.M. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9504119-1: Air & Waste Management Association international speciality conference on thermal treatment and waste-to-energy technologies for solid waste management, Washington, DC (United States), 18-21 Apr 1995). Order Number DE95014635. Source: OSTI; NTIS; INIS; GPO Dep.

Computer models have been used for almost a decade to model and analyze various aspects of solid waste management Commercially available models exist for estimating the capital and operating costs of landfills, waste-to-energy facilities and compost systems and for optimizing system performance along a single dimension (e.g. cost or transportation distance). An alternative to the use of currently available models is the more flexible macro material flow modeling approach in which a macro scale or regional level approach is taken. Waste materials are tracked through the complete integrated waste management cycle from generation through recycling and reuse, and finally to ultimate disposal. Such an approach has been applied by the authors to two different applications. The STELLA simulation language (for Macintosh computers) was used to model the solid waste management system of Puerto Rico. The model incorporated population projections for all 78 municipalities in Puerto Rico from 1990 to 2010, solid waste generation factors, remaining life for the existing landfills, and projected startup time for new facilities. The Pacific Northwest Laboratory has used the SimScript simulation language (for Windows computers) to model the management of solid and hazardous wastes produced during cleanup and remediation activities at the Hanford Nuclear Site.

998 (PNL-SA-26246) **Liquid Effluent Monitoring Program at the Pacific Northwest Laboratory.** Ballinger, M.Y. Pacific Northwest Lab., Richland, WA (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505101-9: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE95015826. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory (PNL) is conducting a program to monitor the waste water from PNL-operated research and development facilities on the Hanford Site. The purpose of the program is to collect data to assess administrative controls and to determine whether discharges to the process sewer meet sewer criteria. Samples have been collected on a regular basis from the major PNL facilities on the Hanford Site since March 1994. A broad range of analyses has been performed to determine the primary constituents in the liquid effluent. The sampling program is briefly summarized in the paper. Continuous monitoring of pH, conductivity, and flow also provides data on the liquid effluent streams. In addition to sampling and monitoring, the program is evaluating the dynamics of the waste stream with dye studies and is evaluating the use of newer technologies for potential deployment in future sampling/monitoring efforts. Information collected to date has been valuable in determining sources of constituents that may be higher than the Waste Acceptance Criteria (WAC) for the Treated Effluent Disposal Facility (TEDF). This facility treats the waste streams before discharge to the Columbia River.

999 (PNL-SA-26455) **Large-scale multimedia modeling applications.** Droppo, J.G. Jr.; Buck, J.W.; Whelan, G.; Strenge, D.L.; Castleton, K.J.; Gelston, G.M. Pacific Northwest Lab., Richland, WA (United States). Aug 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9507119-7: Summer national meeting of the American Institute of Chemical Engineers, Boston, MA (United States), 30 Jul - 2 Aug 1995). Order Number DE96002615. Source: OSTI; NTIS; INIS; GPO Dep.

Over the past decade, the US Department of Energy (DOE) and other agencies have faced increasing scrutiny for a wide range of environmental issues related to past and current practices. A number of large-scale applications have been undertaken that required analysis of large numbers of potential environmental issues over a wide range of environmental conditions and contaminants. Several of these applications, referred to here as large-scale applications, have addressed long-term public health risks using a holistic approach for assessing impacts from potential waterborne and airborne transport pathways. Multimedia models such as the Multimedia Environmental Pollutant Assessment System (MEPAS) were designed for use in such applications. MEPAS integrates radioactive and hazardous contaminants impact computations for major exposure routes via air, surface water, ground water, and overland flow transport. A number of large-scale applications of MEPAS have been conducted to assess various endpoints for environmental and human health impacts. These applications are described in terms of lessons learned in the development of an effective approach for large-scale applications.

1000 (PNNL–10913) **Stakeholder acceptance analysis: Tunable hybrid plasma.** Peterson, T. Battelle Seattle Research Center, WA (United States). Dec 1995. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (BSRC–800/95/020). Order Number DE96005842. Source: OSTI; NTIS; INIS; GPO Dep.

This report resents evaluations, recommendations, and requirements concerning Tunable Hybrid Plasma (THP) derived from a three-year program of stake holder involvement. THP destroys volatile organic compounds by directing a moderate energy electron beam into a flow of air containing organic contaminants. This report is for technology developers and for those responsible for making decisions about the use of technology to remediate contamination by volatile organic compounds. Stakeholders' perspectives help those responsible for technology deployment make good decisions concerning the acceptability and applicability of THP to the remediation problems the face. In addition, this report presents data requirements for the technology's field demonstration defined by stakeholders associated with the Hanford site in Washington State, as well as detailed comments on THP from stakeholders from four other sites throughout the western United States.

1001 (PNNL–10947) **Sulfur polymer cement as a low-level waste glass matrix encapsulant.** Sliva, P. (and others); Peng, Y.B.; Peeler, D.K. Pacific Northwest Lab., Richland, WA (United States). Jan 1996. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96006587. Source: OSTI; NTIS; INIS; GPO Dep.

Sulfur polymer cement (SPC) is being considered as a matrix encapsulant for the Hanford low-level (activity) waste glass. SPC is an elemental sulfur polymer-stabilized thermoplastic that is fluid at 120 °C to 140°C. The candidate process would encapsulate the waste glass by mixing the glass cullet with the SPC and casting it into the container. As the primary barrier to groundwater and a key factor in controlling the local environment of the disposal system after it has been compromised, SPC plays a key role in the waste form's long-term performance assessment. Work in fiscal year 1995 targeted several technical areas of matrix encapsulation involving SPC. A literature review was performed to evaluate potential matrix-encapsulant materials. The dissolution and corrosion behavior of SPC under static conditions was determined as a function of temperature, pH, and sample surface area/solution volume. Preliminary dynamic flow-through testing was performed. SPC formulation and properties were investigated, including controlled crystallization, phase formation, modifying polymer effects on crystallization, and SPC processibility. The interface between SPC and simulated LLW glass was examined. Interfacial chemistry and stability, the effect of water on the glass/SPC interface, and the effect of molten sulfur on the glass surface chemistry were established. Preliminary scoping experiments, involving SPC's Tc gettering capabilities were performed. Compressive strengths of SPC and SPC/glass composites, both before and after lifetime radiation dose exposure, were determined.

1002 (PNNL–11052) **Volatility literature of chlorine, iodine, cesium, strontium, technetium, and rhenium; technetium and rhenium volatility testing.** Langowski, M.H.; Darab, J.G.; Smith, P.A. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C95-02-03G). Order Number DE96008860. Source: OSTI; NTIS; INIS; GPO Dep.

A literature review pertaining to the volatilization of Sr, Cs, Tc (and its surrogate Re), Cl, I and other related species during the vitrification of Hanford Low Level Waste (LLW) streams has been performed and the relevant information summarized. For many of these species, the chemistry which occurs in solution prior to the waste stream entering the melter is important in dictating their loss at higher temperatures. In addition, the interactive effects between the species being lost was found to be important. A review of the chemistries of Tc and Re was also performed. It was suggested that Re would indeed act as an excellent surrogate for Tc in non-radioactive materials testing. Experimental results on Tc and Re loss from sodium aluminoborosilicate melts of temperatures ranging from 900–1350°C performed at PNL are reported and confirm that Re behaves in a nearly identical manner to that of technetium.

1003 (PNNL–11053) **Letter report: Minor component study for low-level radioactive waste glasses.** Li, H. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 115p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C95-02-01B). Order Number DE96008814. Source: OSTI; NTIS; INIS; GPO Dep.

During the waste vitrification process, troublesome minor components in low-level radioactive waste streams could adversely affect either waste vitrification rate or melter life-time. Knowing the solubility limits for these minor components is important to determine pretreatment options for waste streams and glass formulation to prevent or to minimize these problems during the waste vitrification. A joint study between Pacific Northwest Laboratory and Rensselaer Polytechnic Institute has been conducted to determine minor component impacts in low-level nuclear waste glass.

1004 (PNNL–11055) **Low-level waste vitrification pilot-scale system need report.** Morrissey, M.F.; Whitney, L.D. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–C94-22-02D). Order Number DE96008429. Source: OSTI; NTIS; INIS; GPO Dep.

This report examines the need for pilot-scale testing in support of the low-level vitrification facility at Hanford. In addition, the report examines the availability of on-site facilities to contain a pilot-plant. It is recommended that a non-radioactive pilot-plant be operated for extended periods. In addition, it is recommended that two small-scale systems, one processing radioactive waste feed and one processing a simulated waste feed be used for validation of waste simulants. The actual scale of the pilot-plant will be determined from the technologies included in conceptual design of the plant. However, for the purposes of this review, a plant of 5 to 10 metric ton/day of glass production was assumed. It is recommended that a detailed data needs package and integrated flowsheet be developed in FY95 to clearly identify data requirements and identify relationships with other TWRS elements. A pilot-plant will contribute to the reduction of uncertainty in the design and initial operation of the vitrification facility to an acceptable level. Prior to pilot-scale testing, the components will not have been operated as an integrated system and will not have been tested for extended operating periods. Testing for extended periods at pilot-scale will allow verification of the flowsheet including the effects of recycle streams. In addition, extended testing will allow evaluation of wear, corrosion and mechanical reality of individual components, potential accumulations within the components, and the sensitivity of the process to operating conditions. Also, the pilot facility will provide evidence that the facility will meet radioactive and nonradioactive environmental release limits, and increase the confidence in scale-up. The pilot-scale testing data and resulting improvements in the vitrification facility design will reduce the time required for cold chemical testing in the vitrification facility.

1005 (PNNL–11056) **Process system evaluation-consolidated letters. Volume 1. Alternatives for the off-gas treatment system for the low-level waste vitrification process.** Peurrung, L.M.; Deforest, T.J; Richards, J.R. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96008184. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides an evaluation of alternatives for treating off-gas from the low-level waste (LLW) melter. The study used expertise obtained from the commercial nonradioactive off-gas treatment industry. It was assumed that contact maintenance is possible, although the subsequent risk to maintenance personnel was qualitatively considered in selecting equipment. Some adaptations to the alternatives described may be required, depending on the extent of contact maintenance that can be achieved. This evaluation identified key issues for the off-gas system design. To provide background information, technology reviews were assembled for various classifications of off-gas treatment equipment, including off-gas cooling, particulate control, acid gas control, mist elimination, NO_x reduction, and SO_2 removal. An order-of-magnitude cost estimate for one of the off-gas systems considered is provided using both the off-gas characteristics associated with the Joule-heated and combustion-fired melters. The key issues identified and a description of the preferred off-gas system options are provided below. Five candidate treatment systems were evaluated. All of the systems are appropriate for the different melting/feed preparations currently being considered. The lowest technical risk is achieved using option 1, which is similar to designs for high-level waste (HLW) vitrification in the Hanford Waste Vitrification Project (HWVP) and the West Valley. Demonstration Project. Option 1 uses a film cooler, submerged bed scrubber (SBS), and high-efficiency mist eliminator (HEME) prior to NO_x reduction and high-efficiency particulate air (HEPA) filtration. However, several advantages were identified for option 2, which uses high-temperature filtration. Based on the evaluation, option 2 was identified as the preferred alternative. The characteristics of this option are described below.

1006 (PNNL–11057) **Letter report: Pre-conceptual design study for a pilot-scale Non-Radioactive Low-Level Waste Vitrification Facility.** Thompson, R.A.; Morrissey, M.F. Pacific Northwest Lab., Richland, WA (United States). Mar 1996. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PVTD–T3B-95-212). Order Number DE96008338. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a pre-conceptual design study for a Non-Radioactive Low-Level Waste, Pilot-Scale Vitrification System. This pilot plant would support the development of a full-scale LLW Vitrification Facility and would ensure that the full-scale facility can meet its programmatic objectives. Use of the pilot facility will allow verification of process flowsheets, provide data for ensuring product quality, assist in scaling to full scale, and support full-scale start-up. The facility will vitrify simulated non-radioactive LLW in a manner functionally prototypic to the full-scale facility. This pre-conceptual design study does not fully define the LLW Pilot-Scale Vitrification System; rather, it estimates the funding required to build such a facility. This study includes identifying all equipment necessary. to prepare feed, deliver it into the melter, convert the feed to glass, prepare emissions for atmospheric release, and discharge and handle the glass. The conceived pilot facility includes support services and a structure to contain process equipment.

1007 (PNNL–11116) **Low-level tank waste simulant data base.** Lokken, R.O. Pacific Northwest National Lab., Richland, WA (United States). Apr 1996. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE96011464. Source: OSTI; NTIS; INIS; GPO Dep.

The majority of defense wastes generated from reprocessing spent N- Reactor fuel at Hanford are stored in underground Double-shell Tanks (DST) and in older Single-Shell Tanks (SST) in the form of liquids, slurries, sludges, and salt cakes. The tank waste remediation System (TWRS) Program has the responsibility of safely managing and immobilizing these tank wastes for disposal. This report discusses three principle topics: the need for and basis for selecting target or reference LLW simulants, tanks waste analyses and simulants that have been defined, developed, and used for the GDP and activities in support of preparing and characterizing simulants for the current LLW vitrification project. The procedures and the data that were generated to characterized the LLW vitrification simulants were reported and are presented in this report. The final section of this report addresses the applicability of the data to the current program and presents recommendations for additional data needs including characterization and simulant compositional variability studies.

1008 (SAND–94-1639) **TOUGH2 simulations of the TEVES Project including the behavior of a single-component NAPL.** Webb, S.W. (Sandia National Labs., Albuquerque, NM (United States). Geohydrology Dept.). Sandia National Labs., Albuquerque, NM (United States). May 1996. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96013676. Source: OSTI; NTIS; INIS; GPO Dep.

The TEVES (Thermal Enhanced Vapor Extraction System) Project is a demonstration of a process designed to extract solvents and chemicals contained in the Chemical Waste Landfill at Sandia National Laboratories. In this process, the ground is electrically heated, and borehole(s) within the heated zone are maintained at a vacuum to draw air and evaporated contaminants into the borehole and a subsequent treatment facility. TOUGH2 simulations have been performed to evaluate the fluid flow and heat transfer behavior of the system. The TOUGH2 version used in this study includes air, water, and a single-component non-aqueous phase liquid (NAPL). In the present simulations, an initial o-xylene inventory is assumed in the heated zone for illustration purposes. Variation in borehole (vapor extraction) vacuum, borehole location, and soil permeability were investigated. Simulations indicate that the temperatures in the soil are relatively insensitive to the magnitude of the borehole vacuum or the borehole locations. In contrast, however, the NAPL and liquid water saturation distributions are sensitive to these borehole parameters. As the borehole vacuum and air flow rate through the soil decrease, the possibility of contaminant (NAPL) migration from the heated zone into the surrounding unheated soil increases. The borehole location can also affect the likelihood of contaminant movement into the unheated soil.

1009 (SAND–94-2340) **Off site demonstrations for MWLID technologies.** Williams, C. (Sandia National Labs., Albuquerque, NM (United States)); Gruebel, R. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011835. Source: OSTI; NTIS; INIS; GPO Dep.

Open demonstrations of technologies developed by the Office of Technology Development's (QTD's) Mixed Waste Landfill Integrated Demonstration (MWLID) should facilitate regulatory acceptance and speed the transfer and commercialization of these technologies. The purpose of the present project is to identify the environmental restoration needs of hazardous waste and/or mixed waste landfill owners within a 25-mile radius of Sandia National Laboratories (SNL). Most municipal landfills that operated prior to the mid-1980s accepted household/commercial hazardous waste and medical waste that included low-level radioactive waste. The locations of hazardous and/or mixed waste landfills within the State of New Mexico were. identified using federal, state, municipal and Native American tribal environmental records. The records reviewed included the US Environmental Protection Agency (EPA) Superfund Program CERCLIS Event/Site listing (which includes tribal records), the New Mexico Environment Department (NMED), Solid Waste Bureau mixed waste landfill database, and the City of Albuquerque Environmental Health Department landfill database. Tribal envirorunental records are controlled by each tribal government, so each tribal environmental officer and governor was contacted to obtain release of specific site data beyond what is available in the CERCLIS listings.

1010 (SAND–94-2643C) **Characterization of indoor and outdoor pool fires with active calorimetry.** Koski, J.A. (Sandia National Labs., Albuquerque, NM (United States)); Gill, W.; Gritzo, L.A.; Kent, L.A.; Wix, S.D. Sandia National Labs., Albuquerque, NM (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950828–3: 1995 National heat transfer conference, Portland, OR (United States), 5-9 Aug 1995). Order Number DE95006315. Source: OSTI; NTIS; INIS; GPO Dep.

A water cooled, 1 m × 1 m, vertical calorimeter panel has been used in conjunction with other fire diagnostics to characterize a 6 m × 6 m outdoor and three 3 m × 3 m indoor JP-4 pool fires. Measurements reported include calorimeter surface heat flux and surface temperatures, flame temperatures, and gas flow velocities in the fire. From the data, effective radiative absorption coefficients for various zones in the fires have been estimated. The outdoor test was conducted at Sandia's Coyote Canyon test facility, while indoor tests were conducted at the indoor SMokE Reduction Facility (SMERF) at the same location. The measurements provide data useful in calibrating simple analytic fire models intended for the analysis of packages containing hazardous materials.

1011 (SAND–94-2728) **Framework for DOE mixed low-level waste disposal: Site fact sheets.** Gruebel, M.M.; Waters, R.D.; Hospelhorn, M.B.; Chu, M.S.Y. (eds.). Sandia National Labs., Albuquerque, NM (United States). Nov 1994. 315p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95008800. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) is required to prepare and submit Site Treatment Plans (STPS) pursuant to the Federal Facility Compliance Act (FFCAct). Although the FFCAct does not require that disposal be addressed in the STPS, the DOE and the States recognize that treatment of mixed low-level waste will result in residues that will require disposal in either low-level waste or mixed low-level waste disposal facilities. As a result, the DOE is working with the States to define and develop a process for evaluating disposal-site suitability in concert with the FFCAct and development of the STPS. Forty-nine potential disposal sites were screened; preliminary screening criteria reduced the number of sites for consideration to twenty-six. The DOE then prepared fact sheets for the remaining sites. These fact sheets provided additional site-specific information for understanding the strengths and weaknesses of the twenty-six sites as potential disposal sites. The information also provided the basis for discussion among affected States and the DOE in recommending sites for more detailed evaluation.

1012 (SAND–94-3188C) **Successful remediation of four uranium calibration pits at Technical Area II, Sandia National Laboratories, Albuquerque, New Mexico, USA.** Conway, R. (Sandia National Labs., Albuquerque, NM (United States)); Wade, M.; Tharp, T.; Copland, J. Sandia National Labs., Albuquerque, NM (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950917–1: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95006308. Source: OSTI; NTIS; INIS; GPO Dep.

The first remediation of an Environmental Restoration (ER) Project site at Sandia National Laboratories (SNL) was successfully conducted in May and June 1994 at Technical Area II. The removal action involved four Uranium Calibration Pits (UCPs) filled with radioactive or hazardous materials. The concrete culvert pits were used to test and calibrate borehole radiometric logging tools for uranium exploration. The removal action consisted of excavating and containerizing the pit contents and contaminated soil beneath the culverts, removing the four culverts, and backfilling the excavation. Each UCP removal had unique complexities. Sixty 208-L drums of solid radioactive waste and eight 208-L drums of liquid hazardous waste were generated during the VCM. Two of the concrete culverts will be disposed as radioactive waste and two as solid waste. Uranium-238 was detected in UCP-2 ore material at 746 pci/g, and at 59 pci/g in UCP-1 silica sand. UCP-4 was empty; sludge from UCP-3 contained 122 mg/L (ppm) chromium.

1013 (SAND–95-0188C) **Mixed waste chemical compatibility: A testing program for plastic packaging components.** Nigrey, P.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–6: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003097. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of hazardous and radioactive materials packaging is to enable these materials to be transported without posing a threat to the health or property of the general public. To achieve this aim, regulations in the United States have been written establishing general design requirements for such packagings. While no regulations have been written specifically for mixed waste packaging, regulations for the constituents of mixed wastes, i.e., hazardous and radioactive substances, have been codified by the US Department of Transportation (DOT, 49 CFR 173) and the US Nuclear Regulatory Commission (NRC, 10 CFR 71). The design requirements for both hazardous [49 CFR 173.24 (e)(1)] and radioactive [49 CFR 173.412 (g)] materials packaging specify packaging compatibility, i.e., that the materials of the packaging @d any contents be chemically compatible with each other. Furthermore, Type A [49 CFR 173.412 (g)] and Type B (10 CFR 71.43) packaging design requirements stipulate that there be no significant chemical, galvanic, or other reaction between the materials and contents of the package. Based on these requirements, a Chemical Compatibility Testing Program was developed in the Transportation Systems Department at Sandia National Laboratories (SNL). The program attempts to assure any regulatory body that the issue of packaging material compatibility towards hazardous and radioactive materials has been addressed. This program has been described in considerable detail in an internal SNL document, the Chemical Compatibility Test Plan & Procedure Report (Nigrey 1993).

1014 (SAND–95-0208C) **Corrosion resistance of candidate transportation container materials.** Maestas, L.M.; Sorensen, N.R.; McAllaster, M.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951203–24: PATRAM '95: 11. international conference on packaging and transportation of radioactive materials, Las Vegas, NV (United States), 3-8 Dec 1995). Order Number DE96003658. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy is currently remediating several sites that have been contaminated over the years with hazardous, mixed waste and radioactive materials. Regulatory guidelines require strict compliance demonstrating public safety during remediation and the transport of these hazardous, mixed waste and radioactive materials. The compatibility of the metallic transportation containers with the contents they are designed to transport is an ultimate concern that must be satisfied to ensure public safety. The transportation issue is inherently complicated due to the complex, varied, and unknown composition of the hazardous, mixed and radioactive waste that is being, considered for transport by the DOE facilities. Never before have the interactions between the waste being transported and the materials that comprise the transportation packages been more important. Therefore, evaluation of material performance when subjected to a simulated waste will ensure that all regulatory issues and requirements for transportation of hazardous, mixed, and radioactive wastes are satisfied. The tasks encompassed by this study include defining criteria for candidate material selection, defining a test matrix that will provide pertinent information on the material compatibility with the waste stimulant, and evaluation of material performance when subjected to a stimulant waste. Our goal is to provide package design engineers with a choice of materials which exhibit enhanced performance upon exposure to hazardous, mixed, and radioactive waste that is similar in composition to the waste stimulant used in this study. Due to the fact that there are many other possible waste compositions, additional work needs to be done to broaden our materials compatibility/waste stream data base.

1015 (SAND–95-0789C) **DOE's Innovative Treatment Remediation Demonstration Program accelerating the implementation of innovative technologies.** Hightower, M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950868–5: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE95015853. Source: OSTI; NTIS; INIS; GPO Dep.

A program to help accelerate the adoption and implementation of new and innovative remediation technologies has been initiated by the Department of Energy's (DOE) Environmental Restoration Program Office (EM40). Developed as a Public-Private Partnership program in cooperation with the US Environmental Protection Agency's (EPA) Technology Innovation Office (TIO) and coordinated by Sandia National Laboratories, the Innovative Treatment Remediation Demonstration (ITRD) Program attempts to reduce many of the classic barriers to the use of new technologies by involving government, industry, and regulatory agencies in the assessment, implementation, and validation of innovative technologies. In this program, DOE facilities work cooperatively with EPA, industry, national laboratories, and state and federal regulatory agencies to establish remediation demonstrations using applicable innovative technologies at their sites. Selected innovative technologies are used to remediate small, one to two acre, sites to generate the full-scale and real-world operating, treatment performance, and cost data needed to validate these technologies and gain acceptance by industry and regulatory agencies, thus accelerating their use nationwide. Each ITRD project developed at a DOE site is designed to address a typical soil or groundwater contamination issue facing both DOE and industry. This includes sites with volatile organic compound (VOC), semi-VOC, heavy metal, explosive residue, and complex or multiple constituent contamination. Projects are presently underway at three DOE facilities, while additional projects are under consideration for initiation in FY96 at several additional DOE sites. A brief overview of the ITRD Program, program plans, and the status and progress of existing ITRD projects are reviewed in this paper.

1016 (SAND–95-1084C) **Modeling of capillary barriers and comparison to data.** Webb, S.W.; Stormont, J.C. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503116–11: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95013027. Source: OSTI; NTIS; GPO Dep.

Measurements of capillary barrier performance have been conducted in above-grade wooden structures (boxes) configured to measure the water balance. The capillary-barrier portion of the boxes is 6.0 m long, 2.0 m wide, and 1.2 m high with a slope of 5%. A coarse-grained material was placed in the bottom 25-cm of the box with a 90-cm deep fine-grained material (local soil) on top. A region for laterally diverted water to accumulate and drain was created in the last 1.0 m of the box. The soil at the top is terraced into five, 1.4 m long, level intervals to prevent runoff when adding water. Water is added uniformly to the entire top of the box at a rate of about 66 l/day, or an infiltration rate of 1.7 m/year.

The top of the box is covered with fiber-reinforced plastic to minimize evaporation of water, discourage plant growth, and prevent rainfall from contacting the soil. Five drains are spaced along the bottom of the coarse layer. These drains discretize the coarse layer into five collection regions to provide a means of identifying the breakthrough location into the coarse layer. A drain is also located in the downdip collection region of the box. Soil moisture changes were measured in the fine-grained material with a frequency-domain reflectometry (FDR) probe, which was calibrated using soil from the field site at a known moisture content and density.

1017 (SAND-95-1356) **Passive and active soil gas sampling at the Mixed Waste Landfill, Technical Area III, Sandia National Laboratories/New Mexico.** McVey, M.D. (GRAM, Inc., Albuquerque, NM (United States)); Goering, T.J.; Peace, J.L. Sandia National Labs., Albuquerque, NM (United States). Feb 1996. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96008036. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Restoration Project at Sandia National Laboratories, New Mexico is tasked with assessing and remediating the Mixed Waste Landfill in Technical Area III. The Mixed Waste Landfill is a 2.6 acre, inactive radioactive and mixed waste disposal site. In 1993 and 1994, an extensive passive and active soil gas sampling program was undertaken to identify and quantify volatile organic compounds in the subsurface at the landfill. Passive soil gas surveys identified levels of PCE, TCE, 1,1, 1-TCA, toluene, 1,1,2-trichlorotrifluoroethane, dichloroethyne, and acetone above background. Verification by active soil gas sampling confirmed concentrations of PCE, TCE, 1,1,1-TCA, and 1,1,2-trichloro-1,2,2-trifluoroethane at depths of 10 and 30 feet below ground surface. In addition, dichlorodifluoroethane and trichlorofluoromethane were detected during active soil gas sampling. All of the volatile organic compounds detected during the active soil gas survey were present in the low ppb range.

1018 (SAND-95-1609) **Application of non-intrusive geophysical techniques at the Mixed Waste Landfill, Technical Area 3, Sandia National Laboratories, New Mexico.** Peace, J.L. (Sandia National Labs., Albuquerque, NM (United States). Environmental Restoration Project); Hyndman, D.A.; Goering, T.J. Sandia National Labs., Albuquerque, NM (United States). Mar 1996. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010900. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Restoration Project at Sandia National Laboratories, New Mexico is tasked with assessment and remediation of the Mixed Waste Landfill in Technical Area 3. The Mixed Waste Landfill is an inactive radioactive and mixed waste disposal site. The landfill contains disposal pits and trenches of questionable location and dimension. Non-intrusive geophysical techniques were utilized to provide an effective means of determining the location and dimension of suspected waste disposal trenches before Resource Conservation and Recovery Act intrusive assessment activities were initiated. Geophysical instruments selected for this investigation included a Geonics EM-31 ground conductivity meter, the new Geonics EM-61 high precision, time-domain metal detector, and a Geometrics 856 total field magnetometer. The results of these non-intrusive geophysical techniques were evaluated to enhance the efficiency and cost-effectiveness of future waste-site investigations at Environmental Restoration Project sites.

1019 (SAND-95-1611) **Tritium in surface soils at the Mixed Waste Landfill, Technical Area 3, Sandia National Laboratories, New Mexico.** Peace, J.L. (Sandia National Labs., Albuquerque, NM (United States). Environmental Restoration Project); Goering, T.J.; McVey, M.D. Sandia National Labs., Albuquerque, NM (United States). Mar 1996. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96009071. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Restoration Project at Sandia National Laboratories, New Mexico is tasked with assessment and remediation of the Mixed Waste Landfill in Technical Area 3. The Mixed Waste Landfill is an inactive, low-level radioactive and mixed waste disposal site. The Mixed Waste Landfill was subject to an extensive surface soil sampling program for tritium in July 1993. Results indicate that surface soils at the landfill contain significant levels of tritium. The classified area of the landfill contains the highest levels of tritium. Results also indicate that tritium has migrated beyond the fenced boundary of the classified area of the landfill.

1020 (SAND-95-1637) **Analysis of instantaneous profile test data from soils near the Mixed Waste Landfill, Technical Area 3, Sandia National Laboratories/New Mexico.** Goering, T.J. (GRAM, Inc., Albuquerque, NM (United States)); McVey, M.D.; Strong, W.R.; Peace, J.L. Sandia National Labs., Albuquerque, NM (United States). Feb 1996. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96008037. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the results of an instantaneous profile test conducted near the Mixed Waste Landfill at Sandia National Laboratories/New Mexico. The purpose of the test was to measure the unsaturated hydraulic properties of soils near the Mixed Waste Landfill, including the relations between hydraulic conductivity, moisture content, and soil water tension. A 4.7 meter by 4.7 meter plot was saturated with water to a depth of 2 meters, and the wetting and drying responses of the vertical profile were observed. These data were analyzed to obtain in situ measurements of the unsaturated hydraulic properties.

1021 (SAND-95-2060) **SEAMIST™ in-situ instrumentation and vapor sampling system applications in the Sandia Mixed Waste Landfill Integrated Demonstration program: Final report.** Williams, C. (Sandia National Labs., Albuquerque, NM (United States). Environmental Restoration Technologies); Lowry, W.; Cremer, D.; Dunn, S.D. Sandia National Labs., Albuquerque, NM (United States). Sep 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96001760. Source: OSTI; NTIS; INIS; GPO Dep.

The Mixed Waste Landfill Integrated Demonstration was tasked with demonstrating innovative technologies for the cleanup of chemical and mixed waste landfills that are representive of sites occurring throughout the DOE complex and the nation. The SEAMIST™ inverting membrane deployment system has been used successfully at the Mixed Waste Landfill Integrated Demonstration (MWLID) for multipoint vapor sampling, pressure measurement, permeability measurement, sensor integration demonstrations, and borehole lining. Several instruments were deployed inside the SEAMIST™-lined boreholes to detect metals, radionuclides, moisture, and geologic variations. The liner protected the instruments from contamination, maintained support of the uncased borehole wall, and sealed the total borehole from air circulation. Recent activities included the installation of three multipoint vapor sampling systems and sensor integration systems in 100-foot-deep vertical boreholes. A long term pressure monitoring program has recorded barometric pressure effects at depth with relatively high spatial resolution. The SEAMIST™ system has been integrated with a variety of hydrologic and chemical sensors for in-situ measurements, demonstrating its versatility as an instrument deployment system that allows easy emplacement and removal. Standard SEAMIST™ vapor sampling systems were also integrated with state-of-the-art volatile organic compound analysis technologies. The results and status of these demonstration tests are presented.

1022 (SAND–95-2216C) **A proposed alternative approach for protection of inadvertent human intruders from buried Department of Energy low level radioactive wastes.** Cochran, J.R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212–45: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006398. Source: OSTI; NTIS; INIS; GPO Dep.

The burial of radioactive wastes creates a legacy. To limit the impact of this legacy on future generations, we establish and comply with performance objectives. This paper reviews performance objectives for the long-term isolation of buried radioactive wastes; identifies regulatorly-defined performance objectives for protecting the inadvertent human intruder (IHI) from buried low-level radioactive waste (LLW); (3) discusses a shortcoming of the current approach; and (4) offers an alternative approach for protecting the IHI. This alternative approach is written specifically for the burial of US Department of Energy (DOE) wastes at the Nevada Test Site (NTS), although the approach might be applied at other DOE burial sites.

1023 (SAND–95-2583C) **Scoping evaluation of the technical capabilities of DOE sites for disposal of mixed low-level waste. Examples: Sandia National Laboratories and Los Alamos National Laboratory.** Gruebel, M.R. (Tech Reps, Inc., Albuquerque, NM (United States)); Parsons, A.M.; Waters, R.D. Sandia National Labs., Albuquerque, NM (United States). 1996. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9603129–1: 1996 New Mexico conference on the environment, Albuquerque, NM (United States), 12-14 Mar 1996). Order Number DE96007059. Source: OSTI; NTIS; INIS; GPO Dep.

The disposal of mixed low-level waste has become an issue for the U.S. Department of Energy and the States since the inception of the Federal Facilities Compliance Act in 1992. Fifteen sites, including Sandia National Laboratories (SNL) and Los Alamos National Laboratory (LANL), have been evaluated to estimate their technical capabilities for disposal of this type of waste after it has been subjected to treatment processes. The analyses were designed to quantify the maximum permissible concentrations of radioactive and hazardous constituents in mixed low-level waste that could potentially be disposed of in a facility at one of the fifteen sites and meet regulatory requirements. The evaluations provided several major insights about the disposal of mixed low-level waste. All of the fifteen sites have the technical capability for disposal of some waste. Maximum permissible concentrations for the radioactive component of the waste at and sites such as SNL and LANL are almost exclusively determined by pathways other than through groundwater. In general, for the hazardous component of the waste, travel times through groundwater to a point 100 meters from the disposal facility are on the order of thousands of years. The results of the evaluations will be compared to actual treated waste that may be disposed of in a facility at one of these fifteen evaluated sites. These comparisons will indicate which waste streams may exceed the disposal limitations of a site and which component of the waste limits the technical acceptability for disposal. The technical analyses provide only partial input to the decision-making process for determining the disposal sites for mixed low-level waste. Other, less quantitative factors such as social and political issues will also be considered.

1024 (SAND–95-2934C) **Update on the Federal Facilities Compliance Act disposal workgroup disposal site evaluation - what has worked and what has not.** Case, J.T.; Waters, R.D. Sandia National Labs., Albuquerque, NM (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951209–8: 17. low-level radioactive waste management conference, Phoenix, AZ (United States), 12-14 Dec 1995). Order Number DE96004302. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) has been developing a planning process for mixed low-level waste (MLLW) disposal in conjunction with the affected states for over two years and has screened the potential disposal sites from 49 to 15. A radiological performance evaluation was conducted on these fifteen sites to further identify their strengths and weaknesses for disposal of MLLW. Technical analyses are on-going. The disposal evaluation process has sufficiently satisfied the affected states' concerns to the point that disposal has not been a major issue in the consent order process for site treatment plans. Additionally, a large amount of technical and institutional information on several DOE sites has been summarized. The relative technical capabilities of the remaining fifteen sites have been demonstrated, and the benefits of waste form and disposal facility performance have been quantified. However, the final disposal configuration has not yet been determined. Additionally, the MLLW disposal planning efforts will need to integrate more closely with the low-level waste disposal activities before a final MLLW disposal configuration can be determined. Recent Environmental Protection Agency efforts related to the definition of hazardous wastes may also affect the process.

1025 (SAND–96-0113) **Report on the treatability study for inerting small quantities of radioactive explosives and explosive components.** Loyola, V.M.; Reber, S.D. Sandia National Labs., Albuquerque, NM (United States). Feb 1996. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96006197. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of Sandia's radiation hardening testing on a variety of its explosive components, radioactive waste streams were generated and have to be disposed of as radioactive waste. Due to the combined hazards of explosives and radioactivity, Sandia's Radioactive and Mixed Waste Management organization did not have a mechanism for disposal of these waste streams. This report documents the study done to provide a method for the removal of the explosive hazard from those waste streams. The report includes the design of the equipment used, procedures followed, results from waste stream analog tests and the results from the actual explosive inerting tests on radioactive samples. As a result of the inerting treatment, the waste streams were rendered non-explosive and, thus, manageable through normal radioactive waste disposal channels.

1026 (SAND–96-0294C) **On-site vs off-site management of environmental restoration waste: A cost effectiveness analysis.** Morse, M.A. (Terradigm, Inc., Albuquerque, NM (United States)); Aamodt, P.L.; Cox, W.B. Sandia National Labs., Albuquerque, NM (United States). [1996]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212–57: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96007341. Source: OSTI; NTIS; INIS; GPO Dep.

The Sandia National Laboratories Environmental Restoration Project is expected to generate relatively large volumes of hazardous waste as a result of cleanup operations. These volumes will exceed the Laboratories existing waste management capacity. This paper presents four options for managing remediation wastes, including three alternatives for on-site waste management utilizing a corrective action management unit (CAMU). Costs are estimated for each of the four options based on current volumetric estimates of hazardous waste. Cost equations are derived for each of the options with the variables being waste volumes, the major unknowns in the analysis. These equations provide a means to update cost estimates as volume estimates change. This approach may be helpful to others facing similar waste management decisions.

1027 (SAND–96-0297C) **Stabilization of liquid low-level and mixed wastes: a treatability study.** Carson, S.; Cheng, Yu-Cheng; Yellowhorse, L.; Peterson, P. Sandia National Labs., Livermore, CA (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212–11: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96007428. Source: OSTI; NTIS; INIS; GPO Dep.

A treatability study has been conducted on liquid low-level and mixed wastes using the stabilization agents Aquaset, Aquaset II, Aquaset II-H, Petroset, Petroset-H, and Petroset and Petroset II. A total of 40 different waste types with activities ranging from 10^{-14} to 10^{-4} curies/ml have been stabilized. Reported data for each waste include its chemical and radiological composition and the optimum composition or range of compositions (weight of agent/volume of waste) for each stabilization agent used. All wastes were successfully stabilized with one or more of the stabilization agents and all final waste forms passed the Paint Filter Liquids Test (EPA Method 9095).

1028 (SAND–96-0377C) **Scoping analysis of toxic metal performance in DOE low-level waste disposal facilities.** Waters, R.D; Bougai, D.A.; Pohl, P.I. Sandia National Labs., Albuquerque, NM (United States). [1996]. 13p. Sponsored by USDOE, Washington, DC (United States);National Academy of Sciences, Washington, DC (United States);National Research Council, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212–46: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006479. Source: OSTI; NTIS; INIS; GPO Dep.

This study provides a scoping safety assessment for disposal of toxic metals contained in Department of Energy (DOE) mixed low-level waste (MLLW) at six DOE sites that currently have low-level waste (LLW) disposal facilities–Savannah River Site, Oak Ridge Reservation, Los Alamos National Laboratory, Hanford Reservation, Nevada Test Site, and Idaho National Engineering Laboratory. The study has focused on the groundwater contaminant pathway, which is considered to be the dominant human exposure pathway from shallow land MLLW disposal. A simple and conservative transport analysis has been performed using site hydrological data to calculate site-specific "permissible" concentrations of toxic metals in grout-immobilized waste. These concentrations are calculated such that, when toxic metals are leached from the disposal facility by infiltrating water and attenuated in local ground-water system the toxic metal concentrations in groundwater below the disposal facility do not exceed the Maximum Contaminant Levels as stated in the National Primary Drinking Water Regulation. The analysis shows that and sites allow about l00 times higher toxic metal concentrations in stabilized waste leachate than humid sites. From the limited available data on toxic metal concentrations in DOE MLLW, a margin of protection appears to exist in most cases when stabilized wastes containing toxic metals are disposed of at the DOE sites under analysis. Possible exceptions to this conclusion are arsenic, chromium selenium, and mercury when disposed of at some humid sites such as the Oak Ridge Reservation. This analysis also demonstrates that the US Environmental Protection Agency's prescriptive regulatory approach that defines rigid waste treatment standards does not inherently account for the variety of disposal environments encountered nationwide and may result in either underprotection of groundwater resources (at humid sites) or an excessive margin of protection (at and sites).

1029 (SAND–96-0378C) **Disposal of mixed waste: Technical, institutional, and policy factors.** Waters, R.D. (Sandia National Labs., Albuquerque, NM (United States)); Gruebel, M.M.; Letourneau, M.J.; Case, J.T. Sandia National Labs., Albuquerque, NM (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960212–47: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006474. Source: OSTI; NTIS; INIS; GPO Dep.

In conjunction with the affected States as part of their interactions required by the Federal Facilities Compliance Act, the Department of Energy has been developing a process for a disposal configuration for its mixed low-level waste (MLLW). This effort, spanning more than two years, has reduced the potential disposal sites from 49 to 15. The remaining 15 sites have been subjected to a performance evaluation to determine their strengths and weaknesses for disposal of MLLW. The process has included institutional and policy factors as well as strictly technical analyses, and technical analyses must be supported by technical analyses, and technical analyses must be performed within a framework which includes some institutional considerations, with the institutional considerations selected for inclusion largely a matter of policy. While the disposal configuration process is yet to be completed, the experience to date offers a viable approach for solving some of these issues. Additionally, several factors remain to be addressed before an MLLW disposal configuration can be developed.

1030 (SAND–96-0692C) **A general method for the efficient selection of sampling locations for problems in environmental restoration.** Rutherford, B.M. Sandia National Labs., Albuquerque, NM (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9605103–1: 2. international symposium on spatial accuracy assessment in natural resources and environmental sciences, St. Collins, CO (United States), 21-23 May 1996). Order Number DE96006981. Source: OSTI; NTIS; INIS; GPO Dep.

Problems in environmental restoration that involve detecting or monitoring contamination or site characterization often benefit from procedures that help select sampling or drilling locations for obtaining meaningful data that support the analysis. One example of this type of procedure is a spatial sampling program that will "automatically" (based on the implementation of a computer algorithm) guide an iterative investigation through the process of site characterization at a minimal cost to determine appropriate remediation activities. In order to be effective, such a procedure should translate site and modeling uncertainties into terms that facilitate comparison with regulations and should also provide a methodology that will lead to an efficient sampling plan over the course of the analysis. In this paper, a general framework is given that can accomplish these objectives and can be applied to a wide range of environmental restoration applications. The methodology is illustrated using an example where soil samples support the characterization of a chemical waste landfill area.

1031 (SAND–96-0749C) **Probabilistic risk assessment for the Sandia National Laboratories Technical Area V Liquid Waste Disposal System surface impoundments.** Dawson, L.A. (Sandia National Labs., Albuquerque, NM (United States)); Eidson, A.F. Sandia National Labs., Albuquerque, NM (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960804–4: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96008252. Source: OSTI; NTIS; INIS; GPO Dep.

A probabilistic risk assessment was completed for a former radioactive waste disposal site. The site, two unlined surface impoundment, was designed as part of the Liquid Waste Disposal System (LWDS) to receive radioactive effluent from nuclear reactors in Technical Area-V (TA-V) at Sandia National Laboratories/New Mexico (SNL/NM). First, a statistical comparison of site sampling results to natural background, using EPA methods, and a spatial distribution analysis were performed. Risk assessment was conducted with SNL/NM's Probabilistic Risk Evaluation and Characterization Investigation System model. The risk assessment indicated that contamination from several constituents might have been high enough to require remediation. However, further analysis based on expected site closure activities and recent EPA guidance indicated that No Further Action was acceptable.

1032 (SAND–96-0813) **Preliminary data from an instantaneous profile test conducted near the Mixed Waste Landfill, Technical Area 3, Sandia National Laboratories/New Mexico.** Bayliss, S.C. (DanShar, Inc., Bosque Farms, NM (United States)); Goering, T.J.; McVey, M.D.; Strong, W.R.; Peace, J.L. Sandia National Labs., Albuquerque, NM (United States). Apr 1996. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010914. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents data from an instantaneous profile test conducted near the Sandia National Laboratories/New Mexico Mixed Waste Landfill in Technical Area 3. The test was performed from December 1993 through 1995 as part of the environmental Restoration Project's Phase 2 RCRA Facility Investigation of the Mixed Waste Landfill. The purpose of the test was to measure the unsaturated hydraulic properties of soils near the Mixed Waste Landfill. The instantaneous profile test and instrumentation are described, and the pressure and moisture content data from the test are presented. These data may be useful for understanding the unsaturated hydraulic properties of soils in Technical Area 3 and for model validation, verification, and calibration.

1033 (SAND–96-0815C) **Compatibility of packaging components with simulant mixed waste.** Nigrey, P.J.; Dickens, T.G. Sandia National Labs., Albuquerque, NM (United States). [1996]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9604104–7: 20. compatibility, aging and stockpile stewardship conference, Kansas City, KS (United States), 30 Apr - 2 May 1996). Order Number DE96008165. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of hazardous and radioactive materials packaging is to enable these materials to be transported without posing a threat to the health or property of the general public. To achieve this aim, regulations in the US have been written establishing general design requirements for such packagings. While no regulations have been written specifically for mixed waste packaging, regulations for the constituents of mixed wastes, i.e., hazardous and radioactive substances, have been codified by the US Department of Transportation (US DOT, 49 CFR 173) and the US Nuclear Regulatory Commission (NRC, 10 CFR 71). Based on these national requirements, a Chemical Compatibility Testing Program was developed in the Transportation Systems Department at Sandia National Laboratories (SNL). The program provides a basis to assure any regulatory body that the issue of packaging material compatibility towards hazardous and radioactive materials has been addressed. In this paper, the authors present the results of the second phase of this testing program. The first phase screened five liner materials and six seal materials towards four simulant mixed wastes. This phase involved the comprehensive testing of five candidate liner materials to an aqueous Hanford Tank simulant mixed waste. The comprehensive testing protocol involved exposing the respective materials a matrix of four gamma radiation doses ($\sim$ 1, 3, 6, and 40 kGy), three temperatures (18, 50, and 60 C), and four exposure times (7, 14, 28, and 180 days). Following their exposure to these combinations of conditions, the materials were evaluated by measuring five material properties. These properties were specific gravity, dimensional changes, hardness, stress cracking, and mechanical properties.

1034 (SAND–96-0899C) **Application of a NAPL partitioning interwell tracer test (PITT) to support DNAPL remediation at the Sandia National Laboratories/New Mexico chemical waste landfill.** Studer, J.E. (INTERA Inc., Albuquerque, NM (United States)); Mariner, P.; Jin, M. Sandia National Labs., Albuquerque, NM (United States). 1996. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9605148–1: Superfund Hazwaste West, Las Vegas, NV (United States), 21 May - 5 Jun 1996). Order Number DE96008862. Source: OSTI; NTIS; INIS; GPO Dep.

Chlorinated solvents as dense non-aqueous phase liquid (DNAPL) are present at a large number of hazardous waste sites across the U.S. and world. DNAPL is difficult to detect in the subsurface, much less characterize to any degree of accuracy. Without proper site characterization, remedial decisions are often difficult to make and technically effective, cost-efficient remediations are even more difficult to obtain. A new non-aqueous phase liquid (NAPL) characterization technology that is superior to conventional technologies has been developed and applied at full-scale. This technology, referred to as the Partitioning Interwell Tracer Test (PITT), has been adopted from oil-field practices and tailored to environmental application in the vadose and saturated zones. A PITT has been applied for the first time at full-scale to characterize DNAPL in the vadose zone. The PITT was applied in December 1995 beneath two side-by-side organic disposal pits at Sandia National Laboratories/New Mexico (SNL/NM) RCRA Interim Status Chemical Waste Landfill (CWL), located in Albuquerque, New Mexico. DNAPL, consisting of a mixture of chlorinated solvents, aromatic hydrocarbons, and PCE oils, is known to exist in at least one of the two buried pits. The vadose zone PITT was conducted by injecting a slug of non-partitioning and NAPL-partitioning tracers into and through a zone of interest under a controlled forced gradient. The forced gradient was created by a balanced extraction of soil gas at a location 55 feet from the injector. The extracted gas stream was sampled over time to define tracer break-through curves. Soil gas sampling ports from multilevel monitoring installations were sampled to define break-through curves at specific locations and depths. Analytical instrumentation such as gas chromatographs and a photoacoustical analyzers operated autonomously, were used for tracer detection.

1035 (SAND–96-0972) **Identifying industrial best practices for the waste minimization of low-level radioactive materials.** Levin, V. Sandia National Labs., Albuquerque, NM (United States); Sandia National Labs., Livermore, CA (United States). Apr 1996. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96010381. Source: OSTI; NTIS; INIS; GPO Dep.

In US DOE, changing circumstances are affecting the management and disposal of solid, low-level radioactive waste (LLW). From 1977 to 1991, the nuclear power industry achieved major reductions in solid waste disposal, and DOE is interested in applying those practices to reduce solid waste at DOE facilities. Project focus was to identify and document commercial nuclear industry best practices for radiological control programs supporting routine operations, outages, and decontamination and decommissioning activities. The project team (DOE facility and nuclear power industry representatives) defined a Work Control Process Model, collected nuclear power industry Best Practices, and made recommendations to minimize LLW at DOE facilities.

1036 (SAND–96-1088) **Phase 2 report on the evaluation of polyacrylonitrile (PAN) as a binding polymer for absorbers used to treat liquid radioactive wastes.** Sebesta, F. (Czech Technical Univ., Prague (Czech Republic). Dept. of Nuclear Chemistry); John, J.; Motl, A. Sandia National Labs., Albuquerque, NM (United States). May 1996. 40p. Sponsored by USDOE, Washington, DC (United States);Florida State Univ., Tallahassee, FL (United States). DOE Contract AC04-94AL85000. Contract AE-4761; Agreement FSU/CTU-1. Order Number DE96010906. Source: OSTI; NTIS; INIS; GPO Dep.

The performance of PAN-based composite absorbers was evaluated in dynamic experiments at flow rates ranging from 25–100 bed volumes (BV) per hour. Composite absorbers with active components of ammonium molybdophosphate (AMP) PAN and K-Co ferrocyanide (KCoFC) PAN were used for separating Cs from a 1 M HNO_3 + 1 M $NaNO_3$ + 2×10^{-5} M CsCl acidic simulant solution. KCoFC-PAN and two other FC-based composite absorbers were tested for separating Cs from alkaline simulant solutions containing 0.01 M to 1 M NaOH and 1 M $NaNO_3$ + $x \times 10^{-4}$ M CsCl. The efficiency of the Cs sorption on the AMP-PAN absorber from acidic simulant solutions was negatively influenced by the dissolution of the AMP active component. At flow rates of 50 BV/hr, the decontamination factor of about 10^3 could be maintained for treatment of 380 BV of the feed. With the KCoFC-PAN absorber, the decontamination factor of about 10^3 could be maintained for a feed volume as great as 1,800 BV. In alkaline simulant solutions, significant decomposition of the active components was observed, and the best performance was exhibited by the KCoFC-PAN absorber. Introductory experiments confirmed that Cs may be washed out of the composite absorbers. Regeneration of both absorbers for repetitive use was also found to be possible. The main result of the study is that PAN was proven to be a versatile polymer capable of forming porous composite absorbers with a large number of primary absorbers. The composite absorbers proved to be capable of withstanding the harsh acidic and alkaline conditions and significant radiation doses that may be expected in the treatment of US DOE wastes. A field demonstration is proposed as a follow-on activity.

1037 (SAND–96-1651C) **Comparison of passive soil vapor survey techniques at a Tijeras Arroyo site, Sandia National Laboratories, Albuquerque, New Mexico.** Eberle, C.S.; Wade, W.M.; Tharp, T.; Brinkman, J. Sandia National Labs., Albuquerque, NM (United States). [1996]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960804–47: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96012953. Source: OSTI; NTIS; INIS; GPO Dep.

Soil vapor surveys were performed to characterize the approximate location of soil contaminants at a hazardous waste site. The samplers were from two separate companies and a comparison was made between the results of the two techniques. These results will be used to design further investigations at the site.

1038 (SAND–96-1652C) **Use of thermal desorption/ gas chromatography as a performance-based screening method for petroleum hydrocarbons.** Slavin, P.J. (GRAM, Inc., Albuquerque, NM (United States)); Crandall, K.; Dawson, L.; Kottenstette, R.; Wade, M. Sandia National Labs., Albuquerque, NM (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-960804–51: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96012951. Source: OSTI; NTIS; GPO Dep.

Thermal desorption/gas chromatography (TD/GC) was used to screen soil samples on site for total petroleum hydrocarbon (TPH) content during a RCRA Facility Investigation (RFI). It proved to be a rapid, cost- effective tool for detecting non-aromatic mineral oil in soil. The on- site TD/GC results correlated well with those generated at an off-site laboratory for samples analyzed in accordance with EPA Method 418.1.

1039 (SAND–96-2090) **Unsaturated hydrologic flow parameters based on laboratory and field data for soils near the mixed waste landfill, technical area III, Sandia National Laboratories/New Mexico.** Roepke, C.S. (INTERA, Inc., Albuquerque, NM (United States)); Strong, W.R.; Nguyen, H.A. Sandia National Labs., Albuquerque, NM (United States). Aug 1996. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE96014311. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of laboratory tests conducted on soil core samples obtained prior to an instantaneous profile test conducted west of the Mixed Waste Landfill in Technical Area III. The instantaneous profile test was conducted to measure in situ hydrologic parameters controlling unsaturated flow and contaminant transport in the near - surface vadose zone. Soil core samples from the instantaneous profile test plot were tested in the Sandia National Laboratory's Environmental Restoration Project Hydrology Laboratory to measure saturated hydraulic conductivity and the relationships between moisture content and soil water tension. Data from laboratory tests and the instantaneous profile field test were then modeled using the computer code RETC to quantify moisture content, soil water tension, and unsaturated hydraulic conductivity relationships. Results content, soil verified that a combination of laboratory and field data yielded a more complete definition of hydrologic properties than either laboratory or field data alone. Results also indicated that at native moisture contents, the potential for significant unsaturated aqueous flow is limited, while at saturated or near - saturated conditions, preferential flow may occur.

1040 (UCRL-JC–118024) **Laboratory treatability studies preparatory to field testing a resting-cell in situ microbial filter bioremediation strategy.** Taylor, R.T.; Hanna, M.L. Lawrence Livermore National Lab., CA (United States). Apr 1995. 14p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950483–7: 3. international in situ and on-site bioreclamation symposium, San Diego, CA (United States), 24-27 Apr 1995). Order Number DE96000360. Source: OSTI; NTIS; INIS; GPO Dep.

Prior to a down-hole-column treatability test of a Methylosinus trichosporium OB3b attached-resting-cell in situ biofilter strategy, a set of three sequential laboratory experiments were carried out to define several key operational parameters and to evaluate the likely degree of success at a NASA Kennedy Space Center site. They involved the cell attachment to site-specific sediments, the intrinsic resting-cell biotransformation capacities for the contaminants of interest plus their time-dependent extents of biodegradative removal at the concentrations of concern, and a scaled in situ mini-flow-through-column system that closely mimics the subsurface conditions during a field-treatability or pilot test of an emplaced resting-cell filter. These experiments established the conditions required for the complete metabolic removal of a vinyl chloride (VC), cis-dichlororthylene (cis-DCE) and trichloroethylene (TCE) mixture. However, the gas chromatographic (GC) procedures that we utilized and the mini-flow-through column data demonstrated that, at most, only about 50–70% of the site-water VC, cis-DCE, and TCE would be biodegraded. This occurred because of a limiting level of dissolved oxygen, which was exacerbated by the simultaneous presence of several additional previously unrecognized groundwater components, especially methane, that are also competing substrates for the whole-cell soluble methane monooxygenase (sMMO) enzyme complex. Irrespective, collectively the simplicity of the methods that we have developed and the results obtainable with them appear to provide relevant laboratory-based test-criteria before taking our microbial filter strategy to an in situ field treatability or pilot demonstration stage at other sites in the future.

1041 (UCRL-JC–120442) **Development of advanced waste treatment technologies for demonstration in the Mixed Waste Management Facility.** Adamson, M.G.; Chiba, Z.; von Holtz, E.H.; Streit, R.D. Lawrence Livermore National Lab., CA (United States). Mar 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950877–5: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95009875. Source: OSTI; NTIS; INIS; GPO Dep.

The Mixed Waste Management Facility (MWMF) is a national demonstration test bed that will be used to evaluate, at pilot scale, emerging alternative-to-incineration technologies for the effective treatment of low-level radioactive, organic mixed wastes. Two primary treatment technologies have been selected from candidates of advanced processes that have been sufficiently demonstrated in laboratory and bench-scale tests, and most closely meet suitable criteria for demonstration. The two processes are Molten Salt Oxidation (MSO) and Mediated Electrochemical Oxidation (MEO). MSO destroys the organic constituent of wastes as a result of both the elevated temperature (700–950°C) and the catalytic action of molten carbonate salt. The MEO process destroys organic compounds under near-ambient conditions by employing an acid solution in conjunction with oxidizable metallic ions such as silver in an electrochemical cell. In this paper, we describe selection and current technology development for these two primary treatment technologies, as well as the conceptual designs for the technologies in the MWMF integrated process flowsheet. For MSO, we have performed a detailed study of the effect of salt composition (chloride level) on carbon monoxide emissions in the off gas. For MEO, we have developed efficient recovery processes for precipitated silver and for nitrous acid produced at the cathode.

1042 (UCRL-JC–120690) **Remote waste handling and feed preparation for Mixed Waste Management.** Couture, S.A. (Lawrence Livermore National Lab., CA (United States)); Merrill, R.D.; Densley, P.J. Lawrence Livermore National Lab., CA (United States). May 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950836–2: American Institute of Aeronautics and Astronautics guidance, navigation and control conference, Baltimore, MD (United

States), 7-10 Aug 1995). Order Number DE95012484. Source: OSTI; NTIS; INIS; GPO Dep.

The Mixed Waste Management Facility (MWMF) at the Lawrence Livermore National Laboratory (LLNL) will serve as a national testbed to demonstrate mature mixed waste handling and treatment technologies in a complete front-end to back-end –facility (1). Remote operations, modular processing units and telerobotics for initial waste characterization, sorting and feed preparation have been demonstrated at the bench scale and have been selected for demonstration in MWMF. The goal of the Feed Preparation design team was to design and deploy a robust system that meets the initial waste preparation flexibility and productivity needs while providing a smooth upgrade path to incorporate technology advances as they occur. The selection of telerobotics for remote handling in MWMF was made based on a number of factors – personnel protection, waste generation, maturity, cost, flexibility and extendibility. Modular processing units were selected to enable processing flexibility and facilitate reconfiguration as new treatment processes or waste streams are brought on line for demonstration. Modularity will be achieved through standard interfaces for mechanical attachment as well as process utilities, feeds and effluents. This will facilitate reconfiguration of contaminated systems without drilling, cutting or welding of contaminated materials and with a minimum of operator contact. Modular interfaces also provide a standard connection and disconnection method that can be engineered to allow convenient remote operation.

1043 (WHC-EP–0645) **Performance assessment for the disposal of low-level waste in the 200 West Area Burial Grounds.** Wood, M.I. (Westinghouse Hanford Co., Richland, WA (United States)); Khaleel, R.; Rittmann, P.D.; Lu, A.H.; Finfrock, S.H.; DeLorenzo, T.H.; Serne, R.J.; Cantrell, K.J. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 483p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95017141. Source: OSTI; NTIS; INIS; GPO Dep.

This document reports the findings of a performance assessment (PA) analysis for the disposal of solid low-level radioactive waste (LLW) in the 200 West Area Low-Level Waste Burial Grounds (LLBG) in the northwest corner of the 200 West Area of the Hanford Site. This PA analysis is required by US Department of Energy (DOE) Order 5820.2A (DOE 1988a) to demonstrate that a given disposal practice is in compliance with a set of performance objectives quantified in the order. These performance objectives are applicable to the disposal of DOE-generated LLW at any DOE-operated site after the finalization of the order in September 1988. At the Hanford Site, DOE, Richland Operations Office (RL) has issued a site-specific supplement to DOE Order 5820.2A, DOE-RL 5820.2A (DOE 1993), which provides additiona l ce objectives that must be satisfied.

1044 (WHC-EP–0826-Rev.1) **Performance objectives of the tank waste remediation system low-level waste disposal program.** Westinghouse Hanford Co., Richland, WA (United States). 25 Aug 1994. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016325. Source: OSTI; NTIS; INIS; GPO Dep.

Before low-level waste may be disposed of, a performance assessment must be written and then approved by the U.S. Department of Energy. The performance assessment is to determine whether "reasonable assurance" exists that the performance objectives of the disposal facility will be met. The DOE requirements for waste disposal require: the protection of public health and safety; and the protection of the environment. Although quantitative limits are sometimes stated (for example, the all exposure pathways exposure limit is 25 mrem/year), usually the requirements are stated in a general nature. Quantitative limits were established by: investigating all potentially applicable regulations as well as interpretations of the Peer Review Panel which DOE has established to review performance assessments, interacting with program management to establish their needs, and interacting with the public (i.e., the Hanford Advisory Board members; as well as affected Indian tribes) to understand the values of residents in the Pacific Northwest.

1045 (WHC-EP–0827-Rev.1) **Overview of the performance objectives and scenarios of TWRS Low-Level Waste Disposal Program. Revision 1.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010576. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of past Department of Energy (DOE) weapons material production operations, Hanford now stores nuclear waste from processing facilities in underground tanks on the 200 area plateau. An agreement between the DOE, the Environmental Protection Agency (EPA), and the Washington state Department of Ecology (the Tri-Party Agreement, or TPA) establishes an enforceable schedule and a technical framework for recovering, processing, solidifying, and disposing of the Hanford tank wastes. The present plan includes retrieving the tank waste, pre-treating the waste to separate into low level and high level streams, and converting both streams to a glass waste form. The low level glass will represent by far the largest volume and lowest quantity of radioactivity (i.e., large volume of waste chemicals) of waste requiring disposal. The low level glass waste will be retrievably stored in sub-surface disposal vaults for several decades. Assuming the low level disposal system proves to be acceptable, the disposal site will be closed with the low level waste in place. If the disposal system is not acceptable, then the waste will be subject to possible retrieval followed by some other disposal solution. Westinghouse Hanford Company is also planning to emplace the waste so that it is retrievable for up to 50 years after completion of the tank waste processing.

1046 (WHC-EP–0828) **Scenarios of the TWRS low-level waste disposal program.** Westinghouse Hanford Co., Richland, WA (United States). Oct 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012840. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of past Department of Energy (DOE) weapons material production operations, Hanford now stores nuclear waste from processing facilities in underground tanks on the 200 Area plateau. An agreement between the DOE, the Environmental Protection Agency (EPA), and the Washington state Department of Ecology (the Tri-Party Agreement, or TPA) establishes an enforceable schedule and a technical framework for recovering, processing, solidifying, and disposing of the Hanford tank wastes. The present plan includes retrieving the tank waste, pretreating the waste to separate into low level and high level streams, and converting both streams to a glass waste form. The low level glass will represent by far the largest volume and lowest quantity of radioactivity (i.e., large volume of waste chemicals) of waste requiring disposal. The low level glass waste will be retrievably stored in sub-surface disposal vaults for several decades. If the low level disposal system proves to be acceptable, the disposal site will be closed with the low level waste in place. If, however, at some time the disposal system is found to be unacceptable, then the waste can be retrieved and dealt with in some other manner. WHC is planning to emplace the waste so that it is retrievable for up to 50 years after completion of the tank waste processing. Acceptability of disposal of the TWRS low level waste at Hanford depends on technical, cultural, and political considerations. The Performance Assessment is a major part of determining whether the proposed disposal action is technically defensible. A Performance Assessment estimates the possible future impact to humans and the environment for thousands of years into the future. In accordance with the TPA technical strategy, WHC plans to design a near-surface facility suitable for disposal of the glass waste.

1047 (WHC-EP–0828-Rev.1) **Scenarios of the TWRS low-level waste disposal program. Revision 1.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012791. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of past Department of Energy (DOE) weapons material production operations, Hanford now stores nuclear waste from processing facilities in underground tanks on the 200 area plateau. Acceptability of disposal of the TWRS low level waste at Hanford depends on technical, cultural, and political considerations. The Performance Assessment is a major part of determining whether the proposed disposal action is technically defensible. A Performance Assessment estimates the possible future impact to humans and the environment for thousands of years into the future. In accordance with the TPA technical strategy, WHC plans to design a near-surface facility suitable for disposal of the glass waste.

1048 (WHC-EP–0846) **Waste specification system.** Kirkpatrick, K.L.; Oswald, B.L. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010938. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the acceptance process. r treatment, storage, or disposal of low-level waste (LLW), mixed waste (MW), and transuranic waste (TRU) at Hanford Site facilities. Section 3.0 describes the Waste Specification System (WSS) which facilitates proper characterization, acceptability, and management of waste streams. Section 4.0 explains the roles and responsibilities of the parties involved in the waste acceptance process. This document is intended to be used with the current revision of the "Hanford Site Solid Waste Acceptance Criteria," (WHC-EP-0063) to provide the necessary acceptance information for treatment, storage, or disposal of radioactive waste at the Hanford Site.

1049 (WHC-EP–0859) **Measurements of the corrosion of low-carbon steel drums under environmental conditions at Hanford: One-year test results.** Duncan, D.R. (Westinghouse Hanford Co., Richland, WA (United States)); Bunnell, L.R. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015548. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the methods used to expose low-carbon steel drums to atmospheric and soil corrosion and describes the methods used to examine specimens retrieved from both types of tests. These drums are being tested to meet requirements of radioactive waste storage for both low-level radioactive wastes and transuranic wastes.

1050 (WHC-EP–0863) **Centralized consolidation/recycling center.** St. Georges, L.T. (Westinghouse Hanford Co., Richland, WA (United States)); Poor, A.D. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013580. Source: OSTI; NTIS; INIS; GPO Dep.

There are approximately 175 separate locations on the Hanford Site where dangerous waste is accumulated in hundreds of containers according to compatibility. Materials that are designated as waste could be kept from entering the waste stream by establishing collection points for these materials and wastes and then transporting them to a centralized consolidation/recycling center (hereinafter referred to as the consolidation center). Once there the materials would be prepared for offsite recycling. This document discusses the removal of batteries, partially full aerosol cans, and DOP light ballasts from the traditional waste management approach, which eliminates 89 satellite accumulation areas from the Hanford Site (43 for batteries, 33 for aerosols, and 13 for DOP ballasts). Eliminating these 89 satellite accumulation areas would reduce by hundreds the total number of containers shipped offsite as hazardous waste (due to the increase in containers when the wastes that are accumulated are segregated according to compatibility for final shipment). This new approach is in line with the U.S. Environmental Protection Agency's (EPA) draft Universal Waste Rules for these "nuisance" and common waste streams. Additionally, future reviews of other types of wastes that can be handled in this less restrictive and more cost-effective manner will occur as part of daily operations at the consolidation center. The Hanford Site has been identified as a laboratory for reinventing government by the Secretary of the U.S. Department of Energy (DOE), Hazel O'Leary, and as a demonstration zone where "innovative ideas, processes and technologies can be created, tested and demonstrated." Additionally, DOE, EPA, and the Washington State Department of Ecology (Ecology) have agreed to cut Hanford cleanup costs by $1 billion over a 5-year period.

1051 (WHC-EP–0865) **1995 Solid Waste 30-year volume summary.** Valero, O.J. (Westinghouse Hanford Co., Richland, WA (United States)); DeForest, T.J.; Templeton, K.J. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015657. Source: OSTI; NTIS; INIS; GPO Dep.

This document, prepared by Pacific Northwest Laboratory (PNL) under the direction of Westinghouse Hanford Company (WHC), provides a description of the annual low-level mixed waste (LLMW) and transuranic/transuranic mixed solid waste (TRU-TRUM) volumes expected to be managed by Hanford's Solid Waste Central Waste Complex (CWC) over the next 30 years. The waste generation sources and waste categories are also described. This document is intended to be used as a reference for short- and long-term planning of the Hanford treatment, storage, and disposal (TSD) activities over the next several decades. By estimating the waste volumes that will be generated in the future, facility planners can determine the timing of key waste management activities, evaluate alternative treatment strategies, and plan storage and disposal capacities. In addition, this document can be used by other waste sites and the general public to gain a better understanding of the types and volumes of waste that will be managed at Hanford.

1052 (WHC-EP–0871) **1995 solid waste 30-year container volume summary.** Templeton, K.J. (Pacific Northwest Lab., Richland, WA (United States)); DeForest, T.J.; Patridge, M.D. Westinghouse Hanford Co., Richland, WA (United States). Jul 1995. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95017153. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes a 30-year forecast of the solid waste volumes by container category. The volumes described are low-level mixed waste (LLMW) and transuranic/transuranic mixed (TRU-TRUM) waste. These volumes and their associated container categories will be generated or received at the US Department of Energy Hanford Site for storage, treatment, and disposal at Westinghouse Hanford Company's Solid Waste Operations Complex (SWOC) during a 30-year period from FY 1995 through FY 2024. The data presented in this report establish a baseline for solid waste management both in the present and future. With knowledge of the volumes by container type, decisions on the facility handling and storage requirements can be adequately made. It is recognized that the forecast estimates will vary as facility planning and missions continue to change and become better defined; however, the data presented in this report still provide useful insight into Hanford's future solid waste management requirements.

1053 (WHC-EP–0872) **Practical Modeling of aluminum species in high-pH waste.** Reynolds, D.A. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001605. Source: OSTI; NTIS; INIS; GPO Dep.

One of the main components of the nuclear waste stored at the Hanford Site is aluminum. As efforts are made to dispose of the waste, the need to predict the various phases of the aluminum becomes important for modeling of the disposal processes. Current databases of the aluminum species are not adequate as they stand. This study is not an attempt to present a rigorous discussion of aluminum chemistry, but to approach aluminum solubility as a practical application. The approach considers two different forms of aluminate; $Al(OH)_4^-$ and AlO_2^-. By taking both of these forms of aluminate into consideration, a workable system of aluminium chemistry is formed that can be used to model the various waste disposal processes.

1054 (WHC-EP–0885) **Facility effluent monitoring plan for the Waste Receiving and Processing Facility Module 1.** Lewis, C.J. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003337. Source: OSTI; NTIS; INIS; GPO Dep.

A facility effluent monitoring plan is required by the US Department of Energy in Order 5400.1 for any operations that involve hazardous materials and radioactive substances that could impact employee or public safety or the environment. This document is prepared using the specific guidelines identified in A Guide for Preparing Hanford Site Facility Effluent Monitoring Plans, WHC-EP-0438. This facility effluent monitoring plan assesses effluent monitoring systems and evaluates whether they are adequate to ensure the public health and safety as specified in applicable federal state, and local requirements. This facility effluent monitoring plan shall ensure lonq-range integrity of the effluent monitoring systems by requiring an update whenever a new process or operation introduces new hazardous materials or significant radioactive materials. This document must be reviewed annually even if there are no operational changes, and it must be updated as a minimum every three years.

1055 (WHC-EP–0888) **1995 solid waste 30-year characteristics volume summary.** Templeton, K.J. (Pacific Northwest Lab., Richland, WA (United States)); DeForest, T.J.; Rice, G.I.; Valero, O.J. Westinghouse Hanford Co., Richland, WA (United States). Oct 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96004827. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site has been designated by the US Department of Energy (DOE) to store, treat, and dispose of solid waste received from both onsite and offsite generators. This waste is currently or planned to be generated from ongoing operations, maintenance and deactivation activities, decontamination and decommissioning (D&D) of facilities, and environmental restoration (ER) activities. This document, prepared by Pacific Northwest Laboratory (PNL) under the direction of Westinghouse Hanford Company (WHC), describes the characteristics of the waste to be shipped to Hanford's SWOC. The physical waste forms and hazardous constituents are described for the low-level mixed waste (LLMW) and the transuranic - transuranic mixed waste (TW_TRUM).

1056 (WHC-EP–0891) **Corrosion of low-carbon steel under environmental conditions at Hanford: Two-year soil corrosion test results.** Anantatmula, R.P. (Westinghouse Hanford Co., Richland, WA (United States)); Divine, J.R. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96004832. Source: OSTI; NTIS; INIS; GPO Dep.

At the Hanford Site, located in southeastern Washington state, nuclear production reactors were operated from 1944 to 1970. The handling and processing of radioactive nuclear fuels produced a large volume of low-level nuclear wastes, chemical wastes, and a combination of the two (mixed wastes). These materials have historically been packaged in US Department of Transportation (DOT) approved drums made from low-carbon steel, then handled in one of three ways: (A) Before 1970, the drums were buried in the dry desert soil. It was assumed that chemical and radionuclide mobility would be low and that the isolated, government-owned site would provide sufficient protection for employees and the public. (B) After 1970, the drums containing long-lived transuranic radionuclides were protected from premature failure by stacking them in an ordered array on an asphalt concrete pad in the bottom of a burial trench. The array was then covered with a large, 0.28-mm- (011-in.-) thick polyethylene tarp and the trench was backfilled with 1.3 m (4 ft) of soil cover. This burial method is referred to as soil-shielded burial . Other configurations were also employed but the soil-shielded burial method contains most of the transuranic drums. (C) Since 1987, US Department of Energy sites have complied with the Resource Conservation and Recovery Act of 1976 (RCRA) regulations. These regulations require mixed waste drums to be stored in RCRA compliant large metal sheds with provisions for monitoring. These sheds are provided with forced ventilation but are not heated or cooled.

1057 (WHC-EP–0892) **Hanford/Rocky Flats collaboration on development of supercritical carbon dioxide extraction to treat mixed waste.** Hendrickson, D.W. (Westinghouse Hanford Co., Richland, WA (United States)); Biyani, R.K.; Brown, C.M.; Teter, W.L. Westinghouse Hanford Co., Richland, WA (United States). Nov 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96003256. Source: OSTI; NTIS; INIS; GPO Dep.

Proposals for demonstration work under the Department of Energy's Mixed Waste Focus Area, during the 1996 through 1997 fiscal years included two applications of supercritical carbon dioxide to mixed waste pretreatment. These proposals included task RF15MW58 of Rocky Flats and task RL46MW59 of Hanford. Analysis of compatibilities in wastes and work scopes yielded an expectation of substantial collaboration between sites whereby Hanford waste streams may undergo demonstration testing at Rocky Flats, thereby eliminating the need for test facilities at Hanford. This form of collaboration is premised the continued deployment at Rocky Flats and the capability for Hanford samples to be treated at Rocky Flats. The recent creation of a thermal treatment contract for a facility near Hanford may alleviate the need to conduct organic extraction upon Rocky Flats wastes by providing a cost effective thermal treatment alternative, however, some waste streams at Hanford will continue to require organic extraction. Final site waste stream treatment locations are not within the scope of this document.

1058 (WHC-MR–0507) **Glass science tutorial: Lecture No. 8, introduction cementitious systems for Low-Level Waste immobilization.** Young, J.F.; Kirkpatrick, R.J.; Mason, T.O.; Brough, A. Westinghouse Hanford Co., Richland, WA (United States). Jul 1995. 186p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016484. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents details about cementitious systems for low-level waste immobilization. Topics discussed include: composition and properties of portland cement; hydration properties; microstructure of concrete; pozzolans; slags; zeolites; transport properties; and geological aspects of long-term durability of concrete.

1059 (WHC-SA–2611) **Coal ash usage in environmental restoration at the Hanford site.** Scanlon, P.L.; Sonnichsen, J.C.; Phillips, S.J. Westinghouse Hanford Co., Richland, WA (United States). Aug 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950414–4: 57. annual American power conference, Chicago, IL (United States), 18-20 Apr 1995). Order Number DE95013575. Source: OSTI; NTIS; GPO Dep.

The ash stockpiled next to the 284E steam plant is mixed fly ash, bottom ash, and slag. The ash consists of (1) baghouse residue and (2) a mixture of bottom ash and slag which is washed out of the bottom of the boilers daily. In 1991, a Toxicity Characteristic Leaching Procedure (TCLP) was performed on several samples of this ash (Hazen Research 1991). This procedure is designed to determine the mobility of organic and inorganic anatytes present in liquid, solid, or multiphasic wastes (EPA 1994). The ash tested came from surge bins, conveyor samples, and bottom ash and fly ash from the boilers at 284E. Antimony, cadmium, germanium, molybdenum, silver, thallium, tungsten, and vanadium were tested for, but on all samples were below detection Limits for the testing method. Analytes present in relatively high concentrations (but less than one part per thousand) included barium, boron, chromium, fluorine, and zinc. The size of ash particles passing through a Taylor sieve series was very evenly distributed from 1 to 200m.

1060 (WHC-SA–2857) **Melter technology evaluation for vitrification of Hanford Site low-level waste.** Wilson, C.N. (Westinghouse Hanford Co., Richland, WA (United States)); Burgard, K.C.; Weber, E.T.; Brown, N.R. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950401–23: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE95013720. Source: OSTI; INIS; NTIS; GPO Dep.

The current plan at the Hanford Site, in accordance with the Tri-Party Agreement among Washington State, the US Environmental Protection Agency, and the US Department of Energy, is to convert the low-level tank waste fraction into a silicate glass. The low-level waste will be composed primarily of sodium nitrate and nitrite salts concentrated in a highly alkaline aqueous solution. The capability to process up to 200 metric tons/day off glass will be established to produce an estimated 210,000 m^3 for onsite disposal. A program to test and evaluate high-capacity melter technologies is in progress. Testing performed by seven different industrial sources using Joule heating, combustion, plasma, and carbon arc melters is described.

1061 (WHC-SA–2865) **Early containment of high-alkaline solution simulating low-level radioactive waste stream in clay-bearing blended cement.** Kruger, A.A. (Westinghouse Hanford Co., Richland, WA (United States)); Olson, R.A.; Tennis, P.D. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013576. Source: OSTI; NTIS; INIS; GPO Dep.

Portland cement blended with fly ash and attapulgite clay was mixed with high-alkaline solution simulating low-level radioactive waste stream at a one-to-one weight ratio. Mixtures were adiabatically and isothermally cured at various temperatures and analyzed for phase composition, total alkalinity, pore solution chemistry, and transport properties as measured by impedance spectroscopy. Total alkalinity is characterized by two main drops. The early one corresponds to a rapid removal of phosphorous, aluminum, sodium, and to a lesser extent potassium solution. The second drop from about 10 h to 3 days is mainly associated with the removal of aluminum, silicon, and sodium. Thereafter, the total alkalinity continues descending, but at a lower rate. All pastes display a rapid flow loss that is attributed to an early precipitation of hydrated products. Hemicarbonate appears as early as one hour after mixing and is probably followed by apatite precipitation. However, the former is unstable and decomposes at a rate that is inversely related to the curing temperature. At high temperatures, zeolite appears at about 10 h after mixing. At 30 days, the stabilized crystalline composition Includes zeolite, apatite and other minor amounts of $CaCO_3$, quartz, and monosulfate Impedance spectra conform with the chemical and mineralogical data. The normalized conductivity of the pastes shows an early drop, which is followed by a main decrease from about 12 h to three days. At three days, the permeability of the cement-based waste as calculated by Katz-Thompson equation is over three orders of magnitude lower than that of ordinary portland cement paste. However, a further decrease in the calculated permeability is questionable. Chemical stabilization is favorable through incorporation of waste species into apatite and zeolite.

1062 (WHC-SA–2887) **In situ monitoring of grouted electrolytes.** Kahanda, G.L.M.K.S. (Brooklyn Coll., NY (United States). Dept. of Physics); Gu, Jingyan; Tomkiewicz, M.; Kruger, A.A. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016340. Source: OSTI; NTIS; INIS; GPO Dep.

We describe conductivity measurements of grouts flooded with water and in contact with a sink that consists of pure water. The conductivity measurements were designed and carried out in parallel with present quality verification methods and standard leach test of the nuclear waste management industry. For the first time, we show that the method of replacing intrusive chemical analysis with conductivity measurements of the leaching samples yield equivalent results.

1063 (WHC-SA–2905) **Pore solution chemistry of simulated low-level liquid waste incorporated in cement grouts.** Kruger, A.A. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951155–82: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96005229. Source: OSTI; NTIS; INIS; GPO Dep.

Expressed pore solutions from simulated low level liquid waste cement grouts cured at room temperature, 50°C and 90°C for various duration were analyzed by standard chemical methods and ion chromatography. The solid portions of the grouts were formulated with portland cement, fly ash, slag, and attapulgite clay in the ratios of 3:3:3:1. Two different solutions simulating off-gas condensates expected from vitrification of Hanford low level tank wastes were made. One is highly alkaline and contains the species Na^+, PO_4^{3-}, NO_2^-, NO_3^- and OH^-. The other is carbonated and contains the species, Na^+, PO_4^{3-}, NO_2^-, NO_3^-, and CO_3^{2-}. In both cases phosphate rapidly disappeared from the pore solution, leaving behind sodium in the form of hydroxide. The carbonates were also removed from the pore solution to form calcium carbonate and possibly calcium monocarboaluminate. These reactions resulted in the increase of hydroxide ion concentration in the early period. Subsequently there was a significant reduction OH^- and Na^+ ion concentrations. In contrast high concentration of NO_2^- and NO_3^- were retained in the pore solution indefinitely.

1064 (WHC-SA–2906) **Immobilization index of liquid low-level waste in cementitious grouts.** Kruger, A.A. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951155–31: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96005199. Source: OSTI; NTIS; INIS; GPO Dep.

The ability of grouts formulated from mixtures of cementitious materials and attapulgite clay to immobilize various chemical species in the projected off-gas waste stream from vitrification of Hanford low level tank wastes was studied. Three different solid blends were evaluated, with cement:fly ash: slag:clay weight ratios of 3:3:3:1, 3:0:6:1, and 0:0:9:1. The blended solids were mixed with a simulated low level liquid waste solution containing Na^+, NO_2^-, NO_3^-, PO_4^{3-} and OH^- ions, in the proportion of 1 liter of solution to 1 kg of solid blend, and were cured either at 22 C (room temperature), 50 C or 90 C. Pore solutions were expressed at various ages and were analyzed to determine the reductions in concentrations of the individual ionic species. The results were expressed in the form of immobilization index (I) calculated for each species. The immobilization indices for Na^+ (I Na^+) and for OH^- (I OH^-) were similar in each case, and were found to be highest when only slag and clay was present (blend 0:0:9:1). The immobilization index for phosphate, I PO_4^{3-}, was 1 in all cases, i.e. phosphate was completely removed from solution. On the other hand removal of NO_2^- and NO_3^- ions was generally ineffective.

1065 (WHC-SA–2908-FP) **Application of solvlent change techniques to blended cements used to immobilize low-level radioactive liquid waste.** Kruger, A.A. Westinghouse Hanford Co., Richland, WA (United States). Jul 1996. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9606155–1: 2. international conference on improvements geosystems, Tokyo (Japan), 1 Jun 1996). Order Number DE96009887. Source: OSTI; NTIS; INIS; GPO Dep.

The microstructures of hardened portland and blended cement pastes, including those being considered for use in immobilizing hazardous wastes, have a complex pore structure that changes with time. In solvent exchange, the pore structure is examined by immersing a saturated sample in a large volume of solvent that is miscible with the pore fluid. This paper reports the results of solvent replacement measurements on several blended cements mixed at a solution:solids ratio of 1.0 with alkaline solutions from the simulation of the off- gas treatment system in a vitrification facility treating low-level radioactive liquid wastes. The results show that these samples have a lower permeability than ordinary portland cement samples mixed at a water:solids ratio of 0.70, despite having a higher volume of porosity. The microstructure is changed by these alkaline solutions, and these changes have important consequences with regard to durability.

1066 (WHC-SA–2914) **Vitrification of low-level radioactive waste in a slagging combustor.** Holmes, M.J. (and others); Downs, W.; Higley, B.A. Westinghouse Hanford Co., Richland, WA (United States). Jul 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950868–11: ER '95: environmental remediation conference: committed to results, Denver, CO (United States), 13-18 Aug 1995). Order Number DE95017150. Source: OSTI; NTIS; INIS; GPO Dep.

The suitability of a Babcock & Wilcox cyclone furnace to vitrify a low-level radioactive liquid waste was evaluated. The feed stream contained a mixture of simulated radioactive liquid waste and glass formers. The U.S. Department of Energy is testing technologies to vitrify over 60,000,000 gallons of this waste at the Hanford site. The tests reported here demonstrated the technical feasibility of Babcock & Wilcox's cyclone vitrification technology to produce a glass for near surface disposal. Glass was produced over a period of 24-hours at a rate of 100 to 150 lb/hr. Based on glass analyses performed by an independent laboratory, all of the glass samples had leachabilities at least as low as those of the laboratory glass that the recipe was based upon. This paper presents the results of this demonstration, and includes descriptions of feed preparation, glass properties, system operation, and flue gas composition. The paper also provides discussions on key technical issues required to match cyclone furnace vitrification technology to this U.S. Department of Energy Hanford site application.

1067 (WHC-SA–2960-FP) **Disposition of PUREX contaminated nitric acid the role of stakeholder involvement.** Jasen, W.G.; Duncan, R.A. Westinghouse Hanford Co., Richland, WA (United States). Jan 1996. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-960212–58: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006377. Source: OSTI; NTIS; INIS; GPO Dep.

What does the United States space shuttle and the Hanford PUREX facility's contaminated nitric acid have in common. Both are reusable. The PUREX Transition Project has achieved success and, minimized project expenses and waste generation by looking at excess chemicals not as waste but as reusable substitutes for commercially available raw materials. This philosophy has helped PUREX personnel to reuse or recycle more than 2.5 million pounds of excess chemicals, a portion of which is the slightly contaminated nitric acid. After extensive public review, the first shipment of contaminated acid was made in May 1995. Removal of the acid was completed on November 6, 1995 when the fiftieth shipment left the Hanford site. This activity, which avoided dispositioning the contaminated acid as a waste, generated significantly more public input and concern than was expected. One of the lessons learned from this process is to not underestimate public perceptions regarding the reuse of contaminated materials.

1068 (WHC-SA–3015) **Durability of cement stabilized low-level wastes.** Kkruger, A.A. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951155–112: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96009106. Source: OSTI; NTIS; INIS; GPO Dep.

Cementitious materials containing high proportions of slag and fly ash have been tested for suitability to immobilize simulated alkaline and carbonated off-gas waste solutions after vitrification of low- level tank wastes stored at Hanford. To assess their performance, long-term durability was assessed by measuring stability of compressive strength and weight during leaching and exposure to sulfate and carbonate solutions. The important parameter controlling the durability is pore structure, because it affects both compressive strength and susceptibility to different kinds of chemical attack. Impedance spectroscopy was utilized to assess the connectivity of the pore system at early ages. Mercury intrusion porosimetry (MIP) and SEM were utilized to assess development of porosity at later ages. Phase alterations in the matrix exposed to aging and leaching in different media were followed using XRD. Mixtures were resistant to deterioration during immersion in solutions containing high concentrations of sulfate or carbonate ions. Mixtures were also resistant to leaching. These results are consistent with microstructural observations, which showed development of a finer pore structure and reduction in diffusivity over days or months of hydration.

1069 (WHC-SA–3022) **Chemical evolution of cementitious materials with high proportion of fly ash and slag.** Kruger, A.A. (Westinghouse Hanford Co., Richland, WA (United States)); Bakharev, T.; Brough, A.R.; Kirkpatrick, R.J.; Struble, L.J.; Young, J.F. Westinghouse Hanford Co., Richland, WA (United States). Dec 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951155–113: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96009105. Source: OSTI; NTIS; INIS; GPO Dep.

Cement mixtures containing high proportions of slag and fly ash were tested to assess their suitability to immobilize simulated off-gas waste solutions after vitrification of low-level radioactive tank wastes stored at Hanford. Materials were mixed with carbonated or alkaline solutions and cured initially adiabatically, then at 70°C. Chemical changes were monitored for 7 months using X-ray diffraction, selective dissolution and SEM; NMR was utilized to follow the polymerization of silicate species. The process of hydration during the first months of curing was characterized by formation of quite crystalline Al-substituted C-S-H structurally related to 1.1 nm tobermorite and traces of zeolites in some materials. A low content of calcium hydroxide was found in all materials after I month of curing. The SEM examination demonstrated rapidly decreasing porosity, making the mixtures favorable for long-term durability.

1070 (WHC-SD-CP-TP–087) **Rocky Flats Ash test procedure (sludge stabilization).** Funston, G.A. Westinghouse Hanford Co., Richland, WA (United States). 14 Jun 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015583. Source: OSTI; NTIS; GPO Dep.

Rocky Flats Ash items have been identified as the next set of materials to be stabilized. This test is being run to determine charge sizes and soak times to completely stabilize the Rocky Flats Ash items. The information gathered will be used to generate the heating rampup cycle for stabilization. The test will provide information to determine charge sizes, soak times and mesh screen sizes (if available at time of test) for stabilization of Rocky Flats Ash items to be processed in the HC-21C Muffle Furnace Process. Once the charge size and soak times have been established, a program for the temperature controller of the HC-21C Muffle Furnace process will be generated for processing Rocky Flats Ash.

1071 (WHC-SD-CP-TP-087-REV1) **Rocky Flats ash test procedure (sludge stabilization).** Winstead, M.L. Westinghouse Hanford Co., Richland, WA (United States). 14 Sep 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050007. Source: OSTI; NTIS; INIS; GPO Dep.

Rocky Flats Ash items have been identified as the next set of materials to be stabilized. This test is being run to determine charge sizes and soak times to completely stabilize the Rocky Flats Ash items. The information gathered will be used to generate the heating rampup cycle for stabilization. This test will also gain information on the effects of the glovebox atmosphere (moisture) on the stabilized material. This document provides instructions for testing Rocky Flats Ash in the HC-21C muffle furnace process.

1072 (WHC-SD-CP-TRP-063) **HC-21C off-gas test report.** Cunningham, L.T. Westinghouse Hanford Co., Richland, WA (United States). 12 Sep 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050008. Source: OSTI; NTIS; INIS; GPO Dep.

Test procedure WHC-SD-CP-TC-032, HC-21C Off-Gas Test Procedure, was performed to determine the cause and establish a method of the elimination of liquid formation in the HC-21C Furnace off-gas system. This report discusses the findings of the test procedure and the changes implemented.

1073 (WHC-SD-FF-MP-01-Rev1) **Hanford site sodium management plan.** Guttenberg, S. Westinghouse Hanford Co., Richland, WA (United States). 25 Sep 1995. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050012. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site Sodium Management Plan, Revision 1, provides changes to the major elements and management strategy to ensure an integrated and coordinated approach for disposition of the more than 350,000 gallons of sodium and related sodium facilities located at the DOE's Hanford Site

1074 (WHC-SD-FF-QAPP-005-Rev.1) **Quality Assurance Program Plan for FFTF effluent controls. Revision 1.** Seamans, J.A. Westinghouse Hanford Co., Richland, WA (United States). 8 Jun 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014312. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Program Plan is specific to environmental related activities within the FFTF Property Protected Area. The activities include effluent monitoring and Low Level Waste Certification.

1075 (WHC-SD-GN-TI-20004) **A method for estimating ground areas contaminated by a postulated fire in a facility containing radioactive material.** Himes, D.A. Westinghouse Hanford Co., Richland, WA (United States). 31 Aug 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010677. Source: OSTI; NTIS; INIS; GPO Dep.

A simple method has been developed for estimating the extent of radiological ground contamination associated with postulated fires in nuclear facilities to be used as input to the estimation of replacement and cleanup cost. The basic model assumes that the radioactive material is released in the form of particles in a wide range of sizes (0 to about 300 μm) and is carried aloft in the thermal plume from the fire. The particles are then assumed to be released where the thermal plume reaches equilibrium height, and to fall to the ground at a continuous range of speeds associated with the various particle sizes. The thermal output of the fire and resulting equilibrium plume height are determined using standard models. The downward movement and dispersion of the particles is modelled using a tilted Gaussian plume. This approach produces a realistic distribution of particulate material on the ground with the larger particles fatting close to the fire and smaller particles being carried further out and dispersed over a Larger area. The model includes simple methods to determine maximum allowable inventory or fire size so as not to exceed a limiting cleanup area (or cost), thus permitting direct calculation of the maximum sizes of inventory modules to be separated by fire barriers.

1076 (WHC-SD-L045H-PLN-004-Rev.1) **300 area TEDF NPDES Permit Compliance Monitoring Plan.** Loll, C.M. Westinghouse Hanford Co., Richland, WA (United States). 5 Sep 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050017. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the 300 Area Treated Effluent Disposal Facility (TEDF) National Pollutant Discharge Elimination System (NPDES) Permit Compliance Monitoring Plan (MP). The MP describes how ongoing monitoring of the TEDF effluent stream for compliance with the NPDES permit will occur. The MP also includes Quality Assurance protocols to be followed.

1077 (WHC-SD-PRP-HA-007-Rev.1) **Liquid Effluent Retention Facility/Effluent Treatment Facility Hazards Assessment.** Broz, R.E. Westinghouse Hanford Co., Richland, WA (United States). 21 Sep 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050019. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes the technical basis in support of Emergency Planning activities for the LERF (Liquid Effluent Retention Facility)/ETF (Effluent Treatment Facility) on the Hanford Site. Through this document, the technical basis for the development of facility specific Emergency Action Levels and the Emergency Planning Zone is demonstrated.

1078 (WHC-SD-SNF-DTR-001) **Development test report for the high pressure water jet system nozzles.** Takasumi, D.S. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1995. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050021. Source: OSTI; NTIS; INIS; GPO Dep.

The high pressure water jet nozzle tests were conducted to identify optimum water pressure, water flow rate, nozzle orifice size and fixture configuration needed to effectively decontaminate empty fuel storage canisters in KE-Basin. This report gives the tests results and recommendations from the these tests.

1079 (WHC-SD-TP-SEP-035-Rev.1) **Safety Evaluation for Packaging for onsite Transfer of plutonium**

recycle test reactor ion exchange columns. Smith, R.J. Westinghouse Hanford Co., Richland, WA (United States). 11 Sep 1995. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050094. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this Safety Evaluation for Packaging (SEP) is to authorize the use of three U.S. Department of Transportation (DOT) 7A, Type A metal boxes (Capital Industries Part No. S 0600-0600-1080- 0104) to package 12 Plutonium Recycle Test Reactor (PRTR) ion exchange columns as low-level waste (LLW). The packages will be transferred from the 309 Building in the 300 Area to low level waste burial in the 200 West Area. Revision 1 of WHC-SD-TP-SEP-035 (per ECN No. 621467) documents that the boxes containing ion exchange columns and grout will maintain the payload under normal conditions of transport if transferred without the box lids

1080 (WHC-SD-TP-SEP–040) **FFTF railroad tank car Safety Evaluation for Packaging.** Carlstrom, R.F. Westinghouse Hanford Co., Richland, WA (United States). 21 Sep 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050095. Source: OSTI; NTIS; INIS; GPO Dep.

This Safety Evaluation for Packaging (SEP) provides evaluations considered necessary to approve transfer of the 8,000 gallon Liquid Waste Tank Car (LWTC) from Fast Flux Test Facility (FFTF) to the 200 Areas. This SEP will demonstrate that the transfer of the LWTC will provide an equivalent degree of safety as would be provided by packages meeting U.S. Department of Transportation (DOT) requirements. This fulfills onsite transportation requirements implemented in the Hazardous Material Packaging and Shipping, WHC-CM-2-14

1081 (WHC-SD-W026-PLN–007) **WRAP module 1 treatment plan.** Mayancsik, B.A. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012952. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the methodology to treat waste in the Waste Receiving and Processing Module 1 facility to meet the Resource Conservation and Recovery Act (RCRA) land disposal restrictions or the Waste Isolation and Pilot Plant waste acceptance criteria. This includes Low-Level Mixed Waste, Transuranic Waste, and Transuranic Mixed Waste.

1082 (WHC-SD-W105-SWD–1-Rev.1) **242-A/LERF programmable Logic Controller Ladder. Revision 1.** Teats, M.C. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013905. Source: OSTI; NTIS; GPO Dep.

This document defines and describes the user-generated application software written to transmit digital and analog signals from the Liquid Effluent Retention Facility (LERF) to the 242-A Evaporator Distributed Control System (DCS). PLCs and modems were installed in the 242-A Evaporator by Project W-105 (LERF) to transmit 6 analog liquid level signals, 6 range alarms based on the analog signals, and 6 leak detection and pump status signals to the 242-A Distributive Control System (DCS) from LERF. Communications between the two facilities are also monitored and alarm on the DCS. Following the Project W-105 completion, the communications and signal mix were modified by Project C-018H (ETF). The current PLC software (including ladder logic and data tables), PLC hardware settings, and modern option settings to transmit the signals and monitor communications are documented and described in this document.

1083 (WHC-SD-W105-TM–001-Rev.3) **Technology basis for the Liquid Effluent Retention Facility Operating Specifications. Revision 3.** Johnson, P.G. Westinghouse Hanford Co., Richland, WA (United States). 17 May 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013336. Source: OSTI; NTIS; INIS; GPO Dep.

The Liquid Effluent Retention Facility (LERF) consists of three retention basins, each with a nominal storage capacity of 6.5 million gallons. LERF serves as interim storage of 242-A Evaporator process condensate for treatment in the Effluent Treatment Facility. This document provides the technical basis for the LERF Operating Specifications, OSD-T-151-00029.

1084 (WHC-SD-W113-FDR–001-Vol.1) **Solid Waste Operations Complex W-113, Detail Design Report (Title II). Volume 1: Title II design report.** Westinghouse Hanford Co., Richland, WA (United States); Raytheon Engineers and Constructors, Inc., Philadelphia, PA (United States). Sep 1995. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Contract MJJ-SVV-364162. Source: OSTI.

The Solid Waste Retrieval Facility–Phase 1 (Project W113) will provide the infrastructure and the facility required to retrieve from Trench 04, Burial ground 4C, contact handled (CH) drums and boxes at a rate that supports all retrieved TRU waste batching, treatment, storage, and disposal plans. This includes (1) operations related equipment and facilities, viz., a weather enclosure for the trench, retrieval equipment, weighing, venting, obtaining gas samples, overpacking, NDE, NDA, shipment of waste and (2) operations support related facilities, viz., a general office building, a retrieval staff change facility, and infrastructure upgrades such as supply and routing of water, sewer, electrical power, fire protection, roads, and telecommunication. Title I design for the operations related equipment and facilities was performed by Raytheon/BNFL, and that for the operations support related facilities including infrastructure upgrade was performed by KEH. These two scopes were combined into an integrated W113 Title II scope that was performed by Raytheon/BNFL. Volume 1 provides a comprehensive narrative description of the proposed facility and systems, the basis for each of the systems design, and the engineering assessments that were performed to support the technical basis of the Title II design. The intent of the system description presented is to provide WHC an understanding of the facilities and equipment provided and the A/E's perspective on how these systems will operate.

1085 (WHC-SD-W113-FDR–001-Vol.3) **Solid Waste Operations Complex W-113, Detail Design Report (Title II). Volume 3: Specifications.** Westinghouse Hanford Co., Richland, WA (United States); Raytheon Engineers and Constructors, Inc., Philadelphia, PA (United States). Sep 1995. 680p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Contract MJJ-SVV-364162. Order Number DE96000772. Source: OSTI; NTIS; INIS; OSTI.

The Solid Waste Retrieval Facility–Phase 1 (Project W113) will provide the infrastructure and the facility required to retrieve from Trench 04, Burial ground 4C, contact handled (CH) drums and boxes at a rate that supports all retrieved TRU waste batching, treatment, storage, and disposal plans. This includes (1) operations related equipment and facilities, viz., a weather enclosure for the trench, retrieval equipment, weighing, venting, obtaining gas samples, overpacking, NDE, NDA, shipment of waste and (2) operations support related facilities, viz., a general office building, a retrieval staff change facility, and infrastructure upgrades such as supply and routing of water, sewer, electrical power, fire protection, roads, and telecommunication. Title I design for the operations related equipment and facilities was performed by Raytheon/BNFL, and that for the operations support related facilities including infrastructure upgrade was performed by KEH. These two scopes were combined into an integrated W113 Title II scope that was performed by Raytheon/BNFL. Volume 3 is a compilation of the construction specifications that will constitute the Title II materials and performance specifications. This volume contains CSI specifications for non-equipment related construction material type items, performance type items, and facility mechanical equipment items. Data sheets are provided, as necessary, which specify the equipment overall design parameters.

1086 (WHC-SD-W320-DA–007) **Structural analysis of the Heel Jet secondary catch mechanism.** Coverdell, B.L. Westinghouse Hanford Co., Richland, WA (United States). 17 Apr 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010573. Source: OSTI; NTIS; INIS; GPO Dep.

Studies of the Heel Jet Pump lifting bail weld indicate that the weld process and/or weld material used may be incompatible with the base metal. For this reason, a backup design for hoist of the Heel Jet Pump is necessary. By using a 0.0508 m (2 in.) and 0.0762 m (3 in.) jumper connector in conjunction with the existing lifting bail the Heel Jet Pump can be safely hoisted.

1087 (WHC-SD-W378-DRD–001) **Preliminary design requirements document for Project W-378, low-level waste vitrification plant.** Swanson, L.M. Westinghouse Hanford Co., Richland, WA (United States). 31 Mar 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010676. Source: OSTI; NTIS; INIS; GPO Dep.

The scope of this preliminary Design Requirements Document (DRD) is to identify and define the functions, with associated requirements, which must be performed to accomplish vitrification and disposal of the pretreated low-level waste (LLW) fraction of the Hanford Site tank waste. This document sets forth function requirements, performance requirements and design constraints necessary to begin conceptual design for the Low-Level Waste Vitrification Plant (LLWVP). System and physical interfaces between the LLWVP Project and the Tank Waste Remediation System (TWRS) are identified. The constraints, performance requirements, and transfer of information and data across a technical interface will be documented in an Interface Control Document. The design requirements provided in this document will be augmented by additional detailed design data to be documented by the project.

1088 (WHC-SD-WM-DA–194) **Analysis of the 241SY101 pump removal trailer and the 241SY101 strongback.** Coverdell, B.L. Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 171p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050106. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the calculations contained in the attached appendix is to determine the vibrational stability of the following combination (The Combination); shipping container, strongback and trailer. The vibrational stability of The Combination will be determined with the shipping container and strongback in the upright position. If the natural frequency of The Combination coincides with the input frequency and no damping is present, resonance will occur. The result of this is that the natural frequency of the Combination must be calculated as well as the input frequency. The input frequency in this case is caused by wind. Due to their geometrical complexity the upper and lower hydraulic clevises were analyzed for structural adequacy by using finite-element analysis (FEA). The FEA software COSMOS/M version 1.70 was used to model the upper and lower hydraulic clevis. All designs are in accordance with Standard Architectural-Civil Design Criteria, Design Loads for Facilities (DOE-RL 1989) and are safety class 3. The design and fabrication of each component is in accordance with American Institute of Steel Construction, Manual of Steel Construction, (AISC, 1989). The analyses contained in this document reflects the as-built condition of the 241SY101 hydraulic trailer.

1089 (WHC-SD-WM-DA–206) **Flexible receiver adapter and secondary bagger support frame analysis for 241AP102 mixer pump removal.** Axup, M.D.; Egger, J. Westinghouse Hanford Co., Richland, WA (United States). 29 Sep 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050108. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Grout Process startup, the 241AP102 Mixer Pump, failed in 1993, is scheduled to be removed. A structural analysis was performed on two components to be used in the bagging process for the failed pump. The loading criteria was based on a worst case accident of the entire pump weight (including a 50% impact load) being applied over a small localized area. The results show that the design of each structure is adequate to protect against failure, i.e., yield

1090 (WHC-SD-WM-ER–434) **Engineering report of plasma vitrification of Hanford tank wastes.** Hendrickson, D.W. Westinghouse Hanford Co., Richland, WA (United States). 12 May 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013324. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides an analysis of vendor-derived testing and technology applicability to full scale glass production from Hanford tank wastes using plasma vitrification. The subject vendor testing and concept was applied in support of the Hanford LLW Vitrification Program, Tank Waste Remediation System.

1091 (WHC-SD-WM-ER–502) **Documentation of a decision framework to support enhanced sludge washing.** Brothers, A.J. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050182. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes a proposed decision model that, if developed to its fullest, can provide a wide range of analysis options and insights to pretreatment/sludge washing alternatives. A recent decision has been made to terminate this work

1092 (WHC-SD-WM-EV–060-Rev.5) **242-A Evaporator Waste Analysis Plan. Revision 5.** Basra, T.S. Westinghouse Hanford Co., Richland, WA (United States). 13 Apr 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011503. Source: OSTI; NTIS; INIS; GPO Dep.

This Waste Analysis Plan (WAP) provides the plan for obtaining information needed for proper waste handling and processing in the 242-A Evaporator (Evaporator) located on the Hanford Site. In particular it addresses analysis necessary to manage the waste according to Washington Administrative Code (WAC) 173-303 and Parts 264 and 265 of the Code of Federal Regulations (CFR). Regulatory and safety issues are addressed by establishing boundary conditions for waste received and treated at the 242-A Evaporator. The boundary conditions are set by establishing limits for items such as potential exothermic reactions, waste compatibility, and control of vessel vent organic emissions. Boundary conditions are also set for operational considerations and to ensure waste acceptance at receiving facilities. The issues that are addressed in this plan include prevention of exotherms in the waste, waste compatibility, and vessel vent emissions. Samples from the other streams associated with the Evaporator are taken as required by Process Control Plans but are excluded from this plan because either the streams do not contain dangerous waste or the analyses are not required by WAC 173-303-300.

1093 (WHC-SD-WM-FHA–009) **Preliminary fire hazard analysis for the PUTDR and TRU trenches in the Solid Waste Burial Ground.** Gaschott, L.J. Hughes Associates, Inc., Columbia, MD (United States). 16 Jun 1995. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015789. Source: OSTI; NTIS; INIS; GPO Dep.

This document represents the Preliminary Fire Hazards Analysis for the Pilot Unvented TRU Drum Retrieval effort and for the Transuranic drum trenches in the low level burial grounds. The FHA was developed in accordance with DOE Order 5480.7A to address major hazards inherent in the facility.

1094 (WHC-SD-WM-FHA–010) **Fire hazard analysis of the radioactive mixed waste trenchs.** McDonald, K.M. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Columbia Energy and Environmental Services, Inc., Richland, WA (United States). 27 Apr 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011509. Source: OSTI; NTIS; INIS; GPO Dep.

This Fire Hazards Analysis (FHA) is intended to assess comprehensively the risk from fire associated with the disposal of low level radioactive mixed waste in trenches within the lined landfills, provided by Project W-025, designated Trench 31 and 34 of the Burial Ground 218-W-5. Elements within the FHA make recommendations for minimizing risk to workers, the public, and the environment from fire during the course of the operation's activity. Transient flammables and combustibles present that support the operation's activity are considered and included in the analysis. The graded FHA contains the following elements: description of construction, protection of essential safety class equipment, fire protection features, description of fire hazards, life safety considerations, critical process equipment, high value property, damage potential–maximum credible fire loss (MCFL) and maximum possible fire loss (MPFL), fire department/brigade response, recovery potential, potential for a toxic, biological and/or radiation incident due to a fire, emergency planning, security considerations related to fire protection, natural hazards (earthquake, flood, wind) impact on fire safety, and exposure fire potential, including the potential for fire spread between fire areas. Recommendations for limiting risk are made in the text of this report and printed in bold type. All recommendations are repeated in a list in Section 18.0.

1095 (WHC-SD-WM-FHA–015) **Fire hazards analysis for solid waste burial grounds.** McDonald, K.M. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1995. 165p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050210. Source: OSTI; NTIS; INIS; GPO Dep.

This document comprises the fire hazards analysis for the solid waste burial grounds, including TRU trenches, low-level burial grounds, radioactive mixed waste trenches, etc. It analyzes fire potential, and fire damage potential for these facilities. Fire scenarios may be utilized in future safety analysis work, or for increasing the understanding of where hazards may exist in the present operation.

1096 (WHC-SD-WM-ISB–007) **Central waste complex interim safety basis.** Cain, F.G. Westinghouse Hanford Co., Richland, WA (United States). 15 May 1995. 129p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013331. Source: OSTI; NTIS; INIS; GPO Dep.

This interim safety basis provides the necessary information to conclude that hazards at the Central Waste Complex are controlled and that current and planned activities at the CWC can be conducted safely. CWC is a multi-facility complex within the Solid Waste Management Complex that receives and stores most of the solid wastes generated and received at the Hanford Site. The solid wastes that will be handled at CWC include both currently stored and newly generated low-level waste, low-level mixed waste, contact-handled transuranic, and contact-handled TRU mixed waste.

1097 (WHC-SD-WM-LL–007) **Lessons Learned Report for the radioactive mixed waste land disposal facility (Trench 31, Project W-025).** Irons, L.G. Westinghouse Hanford Co., Richland, WA (United States). 20 Jun 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015793. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the lessons learned from a project that involved modification to the existing burial grounds at the Hanford Reservation. This project has been focused on the development and operation of a Resource Conservation and Recovery Act compliant landfill which will accept low-level radioactive wastes that have been placed in proper containers.

1098 (WHC-SD-WM-PAP–062) **Statements of work for FY 1995 to 2000.** Mann, F.M. Westinghouse Hanford Co., Richland, WA (United States). 26 Apr 1995. 209p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011508. Source: OSTI; NTIS; INIS; GPO Dep.

The activities and tasks needed to successfully prepare an interim, preliminary, and final performance assessment on the disposal of the low-level fraction of Hanford tank wastes are given. Included are analytic, experimental, computational, writing, and approval tasks. These statements of work will be revised annually.

1099 (WHC-SD-WM-PAP-062-Rev.1) **Statements of work for FY 1996 to 2001 for the Hanford Low-Level Tank Waste Performance Assessment Project.** Mann, F.M. Westinghouse Hanford Co., Richland, WA (United States). 7 Jun 1995. 292p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015748. Source: OSTI; NTIS; INIS; GPO Dep.

The statements of work for each activity and task of the Hanford Low-Level Tank Waste Performance Assessment project are given for the fiscal years 1996 through 2001. The end product of this program is approval of a final performance assessment by the Department of Energy in the year 2000.

1100 (WHC-SD-WM-PCP-010) **Process control plan for 242-A Evaporator Campaign 95-1.** Le, E.Q.; Guthrie, M.D. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 235p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013334. Source: OSTI; NTIS; INIS; GPO Dep.

The wastes from tanks 106-AP, 107-AP, and 106-AW have been selected to be candidate feed wastes for Evaporator Campaign 95-1. The wastes in tank 106-AP and 107-AP are primarily from B-Plant strontium processing and PUREX neutralized cladding removal, respectively. The waste in tank 106-AW originated primarily from the partially concentrated product from 242-A Evaporator Campaign 94-2. Approximately 8.67 million liters of waste from these tanks will be transferred to tank 102-AW during the campaign. Tank 102-AW is the dedicated waste feed tank for the evaporator and currently contains 647,000 liters of processable waste. The purpose of the 242-A Evaporator Campaign 95-1 Process Control Plan (hereafter referred to as PCP) is to certify that the wastes in tanks 106-AP, 107-AP, 102-AW, and 106-AW are acceptable for processing through evaporator and provide a general description of process strategies and activities which will take place during Campaign 95-1. The PCP also summarizes and presents a comprehensive characterization of the wastes in these tanks.

1101 (WHC-SD-WM-PLN-104) **Solid Waste Assurance Program Implementation Plan.** Irons, L.G. Westinghouse Hanford Co., Richland, WA (United States). 19 Jun 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015781. Source: OSTI; NTIS; INIS; GPO Dep.

On June 6, 1995, a waiver to Hanford Site Solid Waste Acceptance Criteria, was approved by the US Department of Energy Richland Operations Office (RL) to replace the low-level, mixed, and transuranic (TRU) generator assessment programs with the Solid Waste Assurance Program (SWAP). This is associated with a waiver that was approved on March 16, 1995 to replace the Storage/Disposal Approval Record (SDAR) requirements with the Waste Specification System (WSS). This implementation plan and the SWAP applies to Solid Waste Disposal (SWD) functions, facilities, and personnel who perform waste acceptance, verification, receipt, and management functions of dangerous, radioactive, and mixed waste from on- and off-site generators who ship to or within the Hanford Site for treatment, storage, and/or disposal (TSD) at SWD TSD facilities.

1102 (WHC-SD-WM-RPT-099-Rev.2) **Compliance matrix for the mixed waste disposal facilities, trenches 31 and 34, burial ground 218-W-5. Revision 2.** Johnson, K.D. Westinghouse Hanford Co., Richland, WA (United States). 3 May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012587. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a listing of applicable regulatory requirements to the Mixed Waste Disposal trenches. After the listing of regulations to be followed is a listing of documents that show how the regulations are being implemented and followed for the Mixed Waste trenches.

1103 (WHC-SD-WM-RPT-159) **Disposal facility data for the interim performance.** Eiholzer, C.R. Westinghouse Hanford Co., Richland, WA (United States). 15 May 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013360. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to identify and provide information on the waste package and disposal facility concepts to be used for the low-level waste tank interim performance assessment. Current concepts for the low-level waste form, canister, and the disposal facility will be used for the interim performance assessment. The concept for the waste form consists of vitrified glass cullet in a sulfur polymer cement matrix material. The waste form will be contained in a 2 × 2 × 8 meter carbon steel container. Two disposal facility concepts will be used for the interim performance assessment. These facility concepts are based on a preliminary disposal facility concept developed for estimating costs for a disposal options configuration study. These disposal concepts are based on vault type structures. None of the concepts given in this report have been approved by a Tank Waste Remediation Systems (TWRS) decision board. These concepts will only be used in th interim performance assessment. Future performance assessments will be based on approved designs.

1104 (WHC-SD-WM-TP-336) **Analysis and stabilization of Lawrence Berkeley Laboratory's multiphase mixed waste.** Crawford, B.A. Westinghouse Hanford Co., Richland, WA (United States). 19 May 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013326. Source: OSTI; NTIS; INIS; GPO Dep.

Five drums of mixed waste were accepted from LBL during FY 1994; they contain inorganic acids and compounds, as well as organic reagents and radioactive materials. This document defines the work plan for stabilization and characterization of the waste in three of these 5 drums.

1105 (WHC-SD-WM-TRP-243) **Physical property characterization of 183-H Basin sludge.** Biyani, R.K.; Delegard, C.H. Westinghouse Hanford Co., Richland, WA (United States). 20 Sep 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050213. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the characterization of 183-H Basin sludge physical properties, e.g. bulk density of sludge and absorbent, and determination of free liquids. Calcination of crucible-size samples of sludge was also done and the resulting 'loss-on-ignition' was compared to the theoretical weight loss based on sludge analysis obtained from Weston Labs.

1106 (WHC-SD-WM-TRP–245) **183-H Basin sludge treatability test report.** Biyani, R.K. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050191. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the results from the treatability testing of a 1-kg sample of 183-H Basin sludge. Compressive strength measurements, Toxic Characteristic Leach Procedure, and a modified ANSI 16.1 leach test were conducted

1107 (WHC-SD-WM-VI–020) **Test Plan: Phase 1, Hanford LLW melter tests, GTS Duratek, Inc.** Eaton, W.C. Westinghouse Hanford Co., Richland, WA (United States). 14 Jun 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016331. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a test plan for the conduct of vitrification testing by a vendor in support of the Hanford Tank Waste Remediation System (TWRS) Low-Level Waste (LLW) Vitrification Program. The vendor providing this test plan and conducting the work detailed within it [one of seven selected for glass melter testing under Purchase Order MMI-SVV-384215] is GTS Duratek, Inc., Columbia, Maryland. The GTS Duratek project manager for this work is J. Ruller. This test plan is for Phase I activities described in the above Purchase Order. Test conduct includes melting of glass with Hanford LLW Double-Shell Slurry Feed waste simulant in a DuraMelter™ vitrification system.

1108 (WHC-SD-WM-VI–021) **Test Plan: Phase 1 demonstration of 3-phase electric arc melting furnace technology for vitrifying high-sodium content low-level radioactive liquid wastes.** Eaton, W.C. (ed.). Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 55p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014303. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a test plan for the conduct of electric arc vitrification testing by a vendor in support of the Hanford Tank Waste Remediation System (TWRS) Low-Level Waste (LLW) Vitrification Program. The vendor providing this test plan and conducting the work detailed within it [one of seven selected for glass melter testing under Purchase Order MMI-SVV-384216] is the US Bureau of Mines, Department of the Interior, Albany Research Center, Albany, Oregon. This test plan is for Phase I activities described in the above Purchase Order. Test conduct includes feed preparation activities and melting of glass with Hanford LLW Double-Shell Slurry Feed waste simulant in a 3-phase electric arc (carbon electrode) furnace.

1109 (WHC-SD-WM-VI–024) **Glass melter system technologies for vitrification of high-sodium-content low-level, radioactive, liquid wastes: Phase 1, SBS demonstration with simulated low-level waste. Final test report.** Holmes, M.J. (Babcock & Wilcox, Alliance, OH (United States) Research Center); Scotto, M.V.; Shiao, S.Y. Westinghouse Hanford Co., Richland, WA (United States); Babcock and Wilcox Co., Alliance, OH (United States). Research Center. [1995]. 296p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96050196. Source: OSTI; NTIS; INIS; GPO Dep.

The attached vendor report was prepared for Westinghouse Hanford Company by Babcock & Wilcox as documentation of the Phase I Final Test Report, Cyclone Combustion Melter Demonstration.

1110 (WHC-SP–1114-Rev.1) **Solid Waste Program Fiscal Year 1996 Multi-Year Program Plan WBS 1.2.1, Revision 1.** Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 400p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001637. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the Fiscal Year 1996 Multi-Year Program Plan for the Solid Waste Program at the Hanford Reservation in Richland, Washington. The Solid Waste Program treats, stores, and disposes of a wide variety of solid wastes consisting of radioactive, nonradioactive and hazardous material types. Solid waste types are typically classified as transuranic waste, low-level radioactive waste, low-level mixed waste, and non-radioactive hazardous waste. This report describes the mission, goals and program strategies for the Solid Waste Program for fiscal year 1996 and beyond.

1111 (WHC-SP–1159) **HAMMER FY 1996 Multi-Year Program Plan: WBS #8.2.** Westinghouse Hanford Co., Richland, WA (United States). Sep 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001814. Source: OSTI; NTIS; INIS; GPO Dep.

The Hazardous Material Management and Emergency Response Training and Education Center – known simply as HAMMER – is being developed to assist the US Department of Energy (DOE) and others dedicated to improving worker health, safety and productivity. HAMMER is a training and education program for hazardous material, waste management, and emergency response workers. HAMMER is managed by the DOE Richland Operations Office under Work Breakdown Structure (8.2). The 1996 Multi-Year Program Plan (MYPP) includes the Execution Year data and provides the information for Programmatic Fiscal Year Site Management System Execution Baseline, as well as the detailed work plan for performance evaluation of the authorized work. The MYPP incorporates various planning methodologies to define the program and provides essential program integration, and a fully developed technical, cost, and schedule baseline. The MYPP will be utilized by WHC Program and Department Managers as the baseline management tool for status and progress monitoring, performance enhancement, impact analysis studies, and as the basis for detailed fiscal year and near-term planning.

1112 (WINCO–1196) **Modelling the unsteady growth state population balance for a nonlinear growth model in an MSMPR crystallizer.** Carver, C. (Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States)); Chipman, N.A.; Carleson, T.E. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Mar 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE96003548. Source: OSTI; NTIS; INIS; GPO Dep.

The precipitation of zirconium and other metal species as hydroxides (hydrous oxides) from simulated nuclear waste process solutions has been investigated as a potential method to reduce radioactive waste volumes. The reaction of ammonium hexaflourozirconate was used to simulate these waste streams. Studies were conducted to investigate the unsteady state response of crystallization in mixed suspension, mixed product removal (MSMPR) crystallizer. Size distributions below 40 μm from laboratory batch and MSMPR data indicate size-dependent growth may be occurring because they may fit the Abegg, Stevens and Larson (ASL) model. However, these distributions also may fit a transient growth model based on the Method of Lines numerical solution to the unsteady state population balance equation. The development of the Method of Lines solution as well as experimental agreement with both models were studied.

1113 (WINCO–1198) **Decontamination of metals by melt refining/slagging: First year progress report.** Mizia, R.E. (ed.); Worcester, S.A.; Twidwell, L.G.; Paolini, D.J.; Weldon, T.A. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). Mar 1994. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE96003532. Source: OSTI; NTIS; INIS; GPO Dep.

As the number of nuclear installations undergoing decontamination and decommissioning (D&D) increases, current radioactive waste storage space is consumed and establishment of new waste storage areas becomes increasingly difficult. The problem of handling and storing radioactive scrap metal (RSM) gains increasing importance in the DOE Environmental Restoration and Waste Management Program. To alleviate present and future waste storage problems, Westinghouse Idaho Nuclear Company (WINCO) is managing a program for the recycling of RSM for beneficial use within the DOE complex. As part of that effort, Montana Tech has been awarded a contract to help optimize melting and refining technologies for the recycling of stainless steel RSM. The scope of the Montana Tech program includes a literature survey, a decontaminating slag design study, small scale melting studies to determine optimum slag compositions for removal of radioactive contaminant surrogates, analysis of preferred melting techniques, and coordination of pilot scale melting demonstrations (100-500 lbs) to be conducted at selected commercial facilities. This program will identify methods that can be used to recycle stainless steel RSM which will be used to fabricate high and low level waste canisters for the Idaho Waste Immobilization Facility. This report summarizes the results of an extensive literature review and the first year's progress on slag design, small-scale melt refining of surrogate-containing stainless steel (presently only a three month effort), and pilot-scale preparation of surrogate master ingots.

1114 (WSRC-IM–91-53-Vol.X) **1993 RCRA Part B permit renewal application, Savannah River Site: Volume 10, Consolidated Incineration Facility, Section C, Revision 1.** Molen, G. Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1993. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95017473. Source: OSTI; NTIS; INIS; GPO Dep.

This section describes the chemical and physical nature of the RCRA regulated hazardous wastes to be handled, stored, and incinerated at the Consolidated Incineration Facility (CIF) at the Savannah River Site. It is in accordance with requirements of South Carolina Hazardous Waste Management Regulations R.61-79.264.13(a) and(b), and 270.14(b)(2). This application is for permit to store and teat these hazardous wastes as required for the operation of CIF. The permit is to cover the storage of hazardous waste in containers and of waste in six hazardous waste storage tanks. Treatment processes include incineration, solidification of ash, and neutralization of scrubber blowdown.

1115 (WSRC-MS–94-0640) **Microwave technology for waste management applications including disposition of electronic circuitry.** Wicks, G.G. (Westinghouse Savannah River Co., Aiken, SC (United States)); Clark, D.E.; Schulz, R.L.; Folz, D.C. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9505249–11: 97. American Ceramic Society (ACS) annual meeting and exposition, Cincinnati, OH (United States), 1-4 May 1995). Order Number DE95017491. Source: OSTI; NTIS; INIS; GPO Dep.

Microwave technology is being developed nationally and internationally for a variety of environmental remediation purposes. These efforts include treatment and destruction of a vast array of gaseous, liquid and solid hazardous wastes as well as subsequent immobilization of selected components. Microwave technology provides an important contribution to an arsenal of existing remediation methods that are designed to protect the public and environment from undesirable consequences of hazardous materials. Applications of microwave energy for environmental remediation will be discussed. Emphasized will be a newly developed microwave process designed to treat discarded electronic circuitry and reclaim the precious metals within for reuse.

1116 (WSRC-MS–95-0038) **The effect of chemical composition on the PCT durability of mixed waste glasses from wastewater treatment sludges.** Bickford, D.F. (Westinghouse Savannah River Co., Aiken, SC (United States)); Cicero, C.A.; Resce, J.L.; Ragsdale, R.G.; Overcamp, T.J. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–135: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95010967. Source: OSTI; NTIS; INIS; GPO Dep.

TTP/SR132004.

The Mixed Waste Integrated Program (NMIP) at the Department of Energy (DOE) has taken a serious look at vitrification for treatment of low-level mixed waste streams. This was prompted, in part, by the fact that the EPA has declared that vitrification is the Best Demonstrated Available Technology for the disposal of high-level radioactive waste. Among the low-level mixed waste streams within the DOE complex, which are under consideration for vitrification, are wastewater treatment sludges at the Savannah River Site (SRS), Oak Ridge Reservation (ORR), Rocky Flats Plant (RFP), and Los Alamos National Laboratory (LANL), These sludges typically contain low levels of radioactive and hazardous metals, water, and additives from the waste treatment process itself The treatment additives normally include precipitating and flocculating agents such as sodium, calcium, magnesium, and iron compounds or siliceous filter aids from the dewatering process. These treatment additives tend to be soluble in silicate glass and are thus amenable to vitrification.

1117 (WSRC-MS–95-0064) **Vitrification treatability studies of actual waste water treatment sludges.** Jantzen, C.M. (Westinghouse Savannah River Co., Aiken, SC (United States)); Hutson, N.D.; Gilliam, T.M.; Bleier, A.; Spence, R.D. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–134: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95010960. Source: OSTI; NTIS; INIS; GPO Dep.

Treatability studies have been conducted at the laboratory-scale to evaluate vitrification of waste water sludges at the Oak Ridge Reservation (ORR). These studies are being conducted jointly by Westinghouse Savannah River Technology Center (SRTC) and Oak Ridge National Laboratory (ORNL). These studies include testing with surrogate waste formulations at both the laboratory-scale and pilot-scale, and testing with actual waste at the laboratory-scale, pilot-scale, and field-scale. ORR was chosen as the host site for the field-scale demonstration. The Y-12 West End Treatment Facility (WETF) waste water treatment sludges, which are RCRA F-listed wastes, were chosen as the candidate waste stream for the first field-scale demonstration. The laboratory-scale "proof-of-principle" demonstrations reported in this study and the pilot-scale studies planned for FY95 on the WETF sludge will provide needed operating parameters for the planned field-scale demonstration. These laboratory-scale "proof-of-principle" and pilot-scale studies also provide needed data for the evaluation of the feasibility of vitrification as a stabilization option for a variety of wastes which do not currently meet RCRA/LDR (Resource Conservation and Recovery Act/Land Disposal Restrictions) requirements for storage/disposal and/or those for which treatment capacity does not presently exist.

1118 (WSRC-MS–95-0068) **Changes in chemical composition of tetraphenylboron slurry during pretreatment for vitrification.** Clamp, L.A. (Clemson Univ., SC (United States). Dept. of Chemical Engineering); Ferrara, D.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–133: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE95010966. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents results from a study of changes in the composition of a high-level waste (HLW) stream at two stages of its treatment. The waste stream that was studied was a tetraphenylborate precipitate slurry of a HLW supernate from a storage tank at the Savannah River Site. Changes to the slurry composition were studied prior to treatment (a hydrolysis process) and then again after hydrolysis of the slurry. In addition, the success of the hydrolysis is briefly discussed. This study showed that prior to hydrolysis, the solubility of cesium 137 and potassium increased significantly under the influence of the beta and gamma radiation from cesium-137 decay. This was due to radiolytic decomposition of the tetraphenylborate precipitate. The concentration of soluble boron was also expected to increase. Although the boron concentration did seem to increase, the change could not be considered statistically significant. Composition of the hydrolysis product also changed. Concentrations of soluble mercury, calcium, and magnesium all increased by more than 2X in a six month period following the hydrolysis. Concentrations of soluble copper, boron and zinc decreased by more than 2X. The concentrations of the most soluble species in the sample, sodium and potassium, did not change significantly. Comparisons of results from four hydrolysis demonstrations with radioactive precipitate slurry indicated that the elemental composition of the hydrolysis product did not vary greatly even when the process was scaled down. The one exception was the concentration of soluble copper. This concentration was significantly lower in two of the four studies.

1119 (WSRC-MS–95-0080) **Nitric-phosphoric acid oxidation of organic waste materials.** Pierce, R.A.; Smith, J.R. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950877–21: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE96001859. Source: OSTI; NTIS; INIS; GPO Dep.

A wet chemical oxidation technology has been developed to address issues facing defense-related facilities, private industry, and small-volume generators such as university and medical laboratories. Initially tested to destroy and decontaminate a heterogenous mixture of radioactive-contaminated solid waste, the technology can also remediate other hazardous waste forms. The process, unique to Savannah River, offers a valuable alternative to incineration and other high-temperature or high-pressure oxidation processes. The process uses nitric acid in phosphoric acid; phosphoric acid allows nitric acid to be retained in solution well above its normal boiling point. The reaction converts organics to carbon dioxide and water, and generates NO_x vapors which can be recycled using air and water. Oxidation is complete in one to three hours. In previous studies, many organic compounds were completely oxidized, within experimental error, at atmospheric pressure below 180°C; more stable compounds were decomposed at 200°C and 170 kPa. Recent studies have evaluated processing parameters and potential throughputs for three primary compounds: EDTA, polyethylene, and cellulose. The study of polyvinylchloride oxidation is incomplete at this time.

1120 (WSRC-MS–95-0087) **Initial Experience to Determine the Solubility of Salts in Low-Level Mix Waste Glasses.** Andrews, M.K.; Saur, C.C. Westinghouse Savannah River Co., Aiken, SC (United States). 17 Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950877–9: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95060113. Source: OSTI; NTIS; INIS; GPO Dep.

Glass may be used to immobilize low-level mixed waste (LLMW) at the Savannah River Site because of its ability to accept a wide variety of components into its network structure. However, many common salts (sulfates, chlorides, phosphates, and chromates) present in the LLMW streams have limited solubility in glass. Processing and product problems may arise if the solubility of these salts is exceeded. In an effort to determine the factors that most affect salt solubilities, a statistical screening experiment was performed. The screening experiment, a Plackett-Burman design, allowed efficient estimation of the effects of variables, such as the composition of the glass, the temperature of the melt, the duration of melting, and the cooling rate. Each of these factors, along with a combination of sulfate, chloride, phosphate and chromate concentrations, were examined to provide an estimate of the solubility of each salt. The results of the screening experiment were interpreted to determine which variables should be further examined. The composition of the glass, especially the concentrations of boron, calcium and the alkalis, was found to have the greatest effect on the solubilities of the salts. This paper will discuss the results of the screening experiment and describe a path forward.

1121 (WSRC-MS-95-0153) **High temperature vitrification of surrogate Savannah River Site (SRS) mixed waste materials.** Applewhite-Ramsey, A. (Westinghouse Savannah River Co., Aiken, SC (United States)); Schumacher, R.F.; Spatz, T.L.; Newsom, R.A.; Circeo, L.J.; Danjaji, M.B. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950401-29: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE96001849. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Technology Center (SRTC) has been funded through the DOE Office of Technology Development (DOE-OTD) to investigate high-temperature vitrification technologies for the treatment of diverse low-level and mixed wastes. High temperature vitrification is a likely candidate for processing heterogeneous solid wastes containing low levels of activity. Many SRS wastes fit into this category. Plasma torch technology is one high temperature vitrification method. A trial demonstration of plasma torch processing is being performed at the Georgia Institute of Technology on surrogate SRS wastes. This effort is in cooperation with the Engineering Research and Development Association of Georgia Universities (ERDA) program. The results of phase 1 of these plasma torch trials will be presented.

1122 (WSRC-MS-95-0184) **Defining the Glass Composition Limits for SRS Contaminated Soils.** Cicero, C.A. (Westinghouse Savannah River Company, Aiken, SC (United States)); Bickford, D.F.; Crews, W.O. Westinghouse Savannah River Co., Aiken, SC (United States). 12 May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950877-18: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE96060001. Source: OSTI; NTIS; INIS; GPO Dep.

Contaminated soil resulting from the excavation, repair, and decommissioning of facilities located at the Savannah River Site (SRS) is currently being disposed of by shallow land burial or is being stored when considered only hazardous. Vitrification of this waste is being investigated, since it will bind the hazardous and radioactive species in a stable and durable glass matrix, which will reduce the risk of ground water contamination. However, the composition limits for producing durable glass have to be determined before the technology can be applied. Glass compositions, consisting of SRS soil and glass forming additives, were tested on a crucible-scale in three ternary phase systems. Nine different glass compositions were produced, with waste loadings ranging from 43 to 58 weight percent. These were characterized using varoius chemical methods and tested for durability in both alkaline and acidic environments. All nine performed well in alkaline environments, but only three met the strictest criteria for the acidic environment tests. Although the glasses did not meet all of the limits for the acidic tests, the test was performed on very conservative size samples, so the results were also conservative. Therefore, enough evidence was found to provide proof that SRS soil can be vitrified in a durable glass matrix

1123 (WSRC-MS-95-0185) **Defining the glass composition limits for the CaO-Al2O3-SiO2 ternary system.** Cicero, C.A. (and others); Andrews, M.K.; Bickford, D.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States);South Carolina Univ., Columbia, SC (United States). DOE Contract AC09-89SR18035. (CONF-950877-20: 3. American Society for Mechanical Engineers (ASME) biennial mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE96001858. Source: OSTI; NTIS; INIS; GPO Dep.

Vitrification is being investigated as an alternative wasteform for Department of Energy low-level mixed wastes. Since these wastes often contain significant amounts of calcium, the $CaO-Al_2O_3-SiO_2$ ternary system may be used when trying to determine suitable glass compositions. The objective of this research was to determine a leach-resistant glass forming region in the $CaO-Al_2O_3-SiO_2$ system. Several glasses were fabricated and characterized for chemical composition and durability to ensure that the glass-forming region was completely covered. A total of twenty-nine compositions were studied, with eighteen producing glass. Eleven of the glasses passed all the durability tests performed and could be characterized as durable and leach resistant. Five additional glasses passed the Product Consistency Test (PCT), but did not meet the most restrictive limits for the Toxicity Characteristic Leaching Procedure (TCLP). However, these glasses were also classified as acceptable because of the conservative sample size used for the test. The other two glasses performed well on the PCT, but had excessive releases on the TCLP. When plotted on the $CaO-Al_2O_3-SiO_2$ ternary, these compositions provided a good sized glass forming region, which will be utilized for further low-level mixed waste studies.

1124 (WSRC-MS-95-0261) **Waste certification review program at the Savannah River Site.** Faulk, G.W. (Westinghouse Savannah River Co., Aiken, SC (United States)); Kinney, J.C.; Knapp, D.C.; Burdette, T.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960212-3: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96005347. Source: OSTI; NTIS; INIS; GPO Dep.

After approving the waste certification programs for 45 generators of low-level radioactive and mixed waste, Westinghouse Savannah River Company (WSRC) moved forward to implement a performance-based approach for assuring that approved waste generators maintain their waste certification programs. WSRC implemented the Waste Certification Review Program, which is comprised of two sitewide programs, waste generator self-assessments and Facility Evaluation Board reviews, integrated with the WSRC Solid Waste Management Department Waste Verification Program Evaluations. The waste generator self-assessments ensure compliance with waste certification requirements, and Facility Evaluation Board reviews provide independent oversight of generators' waste certification programs. Waste verification evaluations by the TSD facilities serve as the foundation of the program by confirming that waste contents and generator performance continue to meet waste acceptance criteria (WSRC 1994) prior to shipment to treatment, storage, and disposal facilities. Construction of the Savannah River Site (SRS) was started by the US Government in 1950. The site covers approximately 300 square miles located along the Savannah River near Aiken, South Carolina. It is operated by the US Department of Energy (DOE). Operations are conducted by managing and operating contractors, including the Westinghouse Savannah River Company (WSRC). Historically, the primary purpose of the

SRS was to produce special nuclear materials, primarily plutonium and tritium. In general, low-level radioactive and mixed waste is generated through activities in operations. Presently, 47 SRS facilities generate low-level radioactive and mixed waste. The policies, guidelines, and requirements for managing these wastes are determined by DOE and are reflected in DOE Order 5820.2A (US DOE 1988).

1125 (WSRC-MS--95-0328) **The effect of quench rate on the TCLP and PCT durability of environmental waste glass.** Resce, J.L. (Clemson Univ., Clemson, SC (United States). 1126 (WSRC-MS--95-0423) **Bench-scale vitrification studies with Savannah River Site mercury contaminated soil.** Cicero, C.A.; Bickford, D.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960212--88: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96009649. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Technology Center (SRTC) has been charted by the Department of Energy (DOE)--Office of Technology Development (OTD) to investigate vitrification technology for the treatment of Low Level Mixed Wastes (LLMW). In fiscal year 1995, mercury containing LLMW streams were targeted. In order to successfully apply vitrification technology to mercury containing LLMW, the types and quantities of glass forming additives necessary for producing homogeneous glasses from the wastes have to be determined and the treatment for the mercury portion must also be determined. Selected additives should ensure that a durable and leach resistant waste form is produced, while the mercury treatment should ensure that hazardous amounts of mercury are not released into the environment. The mercury containing LLMW selected for vitrification studies at the SRTC was mercury contaminated soil from the TNX pilot-plant facility at the Savannah River Site (SRS). Samples of this soil were obtained so bench-scale vitrification studies could be performed at the SRTC to determine the optimum waste loading obtainable in the glass product without sacrificing durability and leach resistance. Vitrifying this waste stream also required offgas treatment for the capture of the vaporized mercury.

1127 (WSRC-MS--96-0256) **Vitrification demonstration with surrogate Oak Ridge Reservation K-25 B and C pond sludge.** Cicero, C.A. (Westinghouse Savannah River Co., Aiken, SC (United States)); Overcamp, T.J.; Erich, D.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9605199--1: International symposium on the environmental issues and waste management technologies in ceramic and nuclear industry, Indianapolis, IN (United States), 31 May 1996). Order Number DE96060060. Source: OSTI; NTIS; INIS; GPO Dep.

Surrogate Oak Ridge Reservation (ORR) K-25 B&C Pond sludge was vitrified in a pilot-scale EnVit Co melter operated by Clemson University at the DOE/Industrial Center for Vitrification Research Center. This demonstration was performed for the Savannah River Technology Center (SRTC) in support of a Department of Energy (DOE) - Office of Technology Development (OTD) Technical Task Plan. The intent of the demonstration was to determine the feasibility of vitrifying actual K-25 B&C Pond sludge in an EnVitCo type melter. B&C Pond sludge is a mixed waste consisting primarily of various amounts of Ca, Fe, and Si, with Ni and U as the principal hazardous and radioactive components. The demonstration was successfully completed and homogeneous, durable glass was produced. Characterization of the glass product, as well as details of the demonstration, will be discussed.

1128 (WSRC-RP--94-927) **Final Report on Testing of Off-Gas Treatment Technologies for Abatement of Atmospheric Emissions of Chlorinated Volatile Organic Compounds.** Jarosch, T.R.; Haselow, J.S.; Rossabi, J.; Burdick, S.A.; Raymond, R.; Young, J.E.; Lombard, K.H. Westinghouse Savannah River Co., Aiken, SC (United States). 23 Jan 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060136. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to summarize the results of the program for off-gas treatment of atmospheric emissions of chlorinated volatile organic compounds (CVOCs), in particular trichloroethylene (TCE) and perchloroethylene (PCE). This program was funded through the Department of Energy Office of Technology Development's VOC's in Non-Arid Soils Integrated Demonstration (VNID). The off-gas treatment program was initiated after testing of in-situ air stripping with horizontal wells was completed (Looney et al., 1991). That successful test expectedly produced atmospheric emissions of CVOCs that were unabated. It was decided after that test that an off-gas treatment is an integral portion of remediation of CVOC contamination in groundwater and soil but also because several technologies were being developed across the United States to mitigate CVOC emissions. A single platform for testing off-gas treatment technologies would facilitate cost effective evaluation of the emerging technologies. Another motivation for the program is that many CVOCs will be regulated under the Clean Air Act Amendments of 1990 and are already regulated by many state regulatory programs. Additionally, compounds such as TCE and PCE are pervasive subsurface environmental contaminants, and, as a result, a small improvement in terms of abatement efficiency or cost will significantly reduce CVOC discharges to the environment as well as costs to United States government and industry.

1129 (WSRC-TR--94-0239) **A synopsis of environmental horizontal wells at the Savannah River Site.** Denham, M.E.; Lombard, K.H. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95014720. Source: OSTI; NTIS; INIS; GPO Dep.

Seven horizontal wells for environmental remediation were installed at the Savannah River Site as part of an Integrated Demonstration Project sponsored by the Department of Energy's Office of Technology Development. The wells were used to demonstrate innovative remediation systems for the clean up of chlorinated organic solvent contamination in groundwater and the vadose zone. The wells were installed in four demonstrations of different horizontal drilling technologies. A short-radius petroleum industry technology, a modified petroleum industry technology (using a downhole motor), a utility industry technology, and a river crossing technology were demonstrated. The goals of the demonstrations were to show the utility of horizontal wells in environmental remediation and further development of the technology required to install these wells. From the first demonstration in 1988 to the latest in 1991, there was significant evolution in horizontal drilling technology. The main technical challenges in the first demonstration were directional control during drilling and borehole instability. Through advancement of the technology these problems were overcome and did not affect the last demonstration. Those considering the use of horizontal wells for environmental remediation will benefit from the knowledge gained from these demonstrations.

1130 (WSRC-TR-94-0402) **Burst Test Qualification Analysis of DWPF Canister-Plug Weld.** Gupta, N.K.; Gong, Chung. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060133. Source: OSTI; NTIS; INIS; GPO Dep.

The DWPF canister closure system uses resistance welding for sealing the canister nozzle and plug to ensure leak tightness. The welding group at SRTC is using the burst test to qualify this seal weld in lieu of the shear test in ASME B&PV Code, Section IX, paragraph QW-196. The burst test is considered simpler and more appropriate than the shear test for this application. Although the geometry, loading and boundary conditions are quite different in the two tests, structural analyses show similarity in the failure mode of the shear test in paragraph QW-196 and the burst test on the DWPF canister nozzle Non-linear structural analyses are performed using finite element techniques to study the failure mode of the two tests. Actual test geometry and realistic stress strain data for the 304L stainless steel and the weld material are used in the analyses. The finite element models are loaded until failure strains are reached. The failure modes in both tests are shear at the failure points. Based on these observations, it is concluded that the use of a burst test in lieu of the shear test for qualifying the canister-plug weld is acceptable. The burst test analysis for the canister-plug also yields the burst pressures which compare favorably with the actual pressure found during burst tests. Thus, the analysis also provides an estimate of the safety margins in the design of these vessels.

1131 (WSRC-TR-94-0608-Rev.2) **Savannah River Site mixed waste Proposed Site Treatment Plan (PSTP). Volumes 1 and 2 and reference document: Revision 2.** Helmich, E.; Noller, D.K.; Wierzbicki, K.S.; Bailey, L.L. Westinghouse Savannah River Co., Aiken, SC (United States). 13 Jul 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96001688. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE is required by the Resource Conservation and Recovery Act to prepare site treatment plans describing the development of treatment capacities and technologies for treating mixed waste. This proposed plan contains Savannah River Site's preferred options and schedules for constructing new facilities, and otherwise obtaining treatment for mixed wastes. The proposed plan consists of 2 volumes. Volume 1, Compliance Plan, identifies the capacity to be developed and the schedules as required. Volume 2, Background, provides a detailed discussion of the preferred options with technical basis, plus a description of the specific waste streams. Chapters are: Introduction; Methodology; Mixed low level waste streams; Mixed transuranic waste; High level waste; Future generation of mixed waste streams; Storage; Process for evaluation of disposal issues in support of the site treatment plans discussions; Treatment facilities and treatment technologies; Offsite waste streams for which SRS treatment is the Preferred Option (Naval reactor wastes); Summary information; and Acronyms and glossary. This revision does not contain the complete revised report, but only those pages that have been revised.

1132 (WSRC-TR-94-0608-Rev.3) **Proposed site treatment plan (PSTP) Volumes I & II & reference document, Revision 3.** Helmich, E. (and others); Noller, D.K.; Wierzbicki, K.S. Westinghouse Savannah River Co., Aiken, SC (United States). 27 Sep 1995. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96002955. Source: OSTI; NTIS; INIS; GPO Dep.

The Federal Facility Compliance Act requires the Department of Energy to undertake a national effort to develop Site Treatment Plans for each of its sites generating or storing mixed waste. Mixed waste contains both a hazardous waste subject to the Resource Conservation and Recovery Act and radioactive material subject to the Atomic Energy Act of 1954. The Site Treatment Plan for the Savannah River Site proposes how SRS will treat mixed waste that is now stored on the site and mixed waste that Will be generated in the future. Also, the Site Treatment Plan identifies Savannah River Site mixed wastes that other Department of Energy facilities could treat and mixed waste from other facilities that the Savannah River Site could treat. The Site Treatment Plan has been approved by the State of South Carolina. The Department of Energy Will enter into a consent order with the State of South Carolina by October 6, 1995. The consent order will contain enforceable commitments to treat mixed waste.

1133 (WSRC-TR-94-0608-Rev.4) **Approved Site Treatment Plan, Volumes 1 and 2. Revision 4.** Helmich, E.H.; Molen, G.; Noller, D. Westinghouse Savannah River Co., Aiken, SC (United States). 22 Mar 1996. 370p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96012433. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy, Savannah River Operations Office (DOE-SR), has prepared the Site Treatment Plan (STP) for Savannah River Site (SRS) mixed wastes in accordance with RCRA Section 3021(b), and SCDHEC has approved the STP (except for certain offsite wastes) and issued an order enforcing the STP commitments in Volume 1. DOE-SR and SCDHEC agree that this STP fulfills the requirements contained in the FFCAct, RCRA Section 3021, and therefore, pursuant to Section 105(a) of the FFCAct (RCRA Section 3021(b)(5)), DOE's requirements are to implement the plan for the development of treatment capacities and technologies pursuant to RCRA Section 3021. Emerging and new technologies not yet considered may be identified to manage waste more safely, effectively, and at lower cost than technologies currently identified in the plan. DOE will continue to evaluate and develop technologies that offer potential advantages in public acceptance, privatization, consolidation, risk abatement, performance, and life-cycle cost. Should technologies that offer such advantages be identified, DOE may request a revision/modification of the STP in accordance with the provisions of Consent Order 95-22-HW. The Compliance Plan Volume (Volume 1) identifies project activity schedule milestones for achieving compliance with Land Disposal Restrictions (LDR). Information regarding the technical evaluation of treatment options for SRS mixed wastes is contained in the Background Volume (Volume 2) and is provided for information.

1134 (WSRC-TR-94-0608-Vol.1-2) **Proposed Site Treatment Plan (PSTP). Volumes 1 and 2 and Reference Document.** Helmich, E.; Noller, D.K.; Wierzbicki, K.S.; Bailey, L.L. Westinghouse Savannah River Co., Aiken, SC (United States). 22 Dec 1994. 368p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060111. Source: OSTI; NTIS; INIS; GPO Dep.

The Compliance Plan Volume provides overall schedules with target dates for achieving compliance with the land disposal restrictions (LDR) and contains procedures to establish milestones to be enforced under the Order. Information regarding the technical evaluation of treatment options for SRS mixed wastes is contained in the Background Volume and is provided for informational purposes only.

1135 (WSRC-TR-95-0016) **Consolidated Incineration Facility waste burn test. Final report.** Burns, D.B. Westinghouse Savannah River Co., Aiken, SC (United States). 11 Jan 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95017492. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Technology Center (SRTC) is Providing technical support for start-up and operation of the Consolidated Incineration Facility. This support program includes a series of pilot incineration tests performed at the Environmental Protection Agency's (EPA's) Incineration Research Facility (MF) using surrogate CIF mixed wastes. The objectives for this test program included measuring incinerator offgas particulate loading and size distributions as a function of several operating variables, characterizing kiln bottom ash and offgas particulates, determining heavy metal partition between the kiln bottom ash and incinerator stack gas, and measuring kiln organics emissions (particularly polychlorinated dioxins and furans). These tests were designed to investigate the effect of the following operating parameters: Incineration Temperature; Waste Feed Rate; Waste Density; Kiln Solids Residence Time; and Waste Composition. Tests were conducted at three kiln operating temperatures. Three solid waste simulants were burned, two waste mixtures (paper, plastic, latex, and PVC) with one containing spiked toxic organic and metal compounds, and one waste type containing only paper. Secondary Combustion Chamber (SCC) offgases were sampled for particulate loading and size distribution, organic compounds, polychlorinated dibenzo[p]dioxins and polychlorinated dibenzofurans (PCDD/PCDF), metals, and combustion products. Kiln bottom ash and offgas particulates were characterized to determine the principal elements and compounds comprising these secondary wastes.

1136 (WSRC-TR-95-0034) **Glass composition development for plasma processing of Hanford high sodium content low-level radioactive liquid waste.** Marra, J.C. Westinghouse Savannah River Co., Aiken, SC (United States). Feb 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95014719. Source: OSTI; NTIS; INIS; GPO Dep.

To assess the acceptability of prospective compositions, response criteria based on durability, homogeneity, viscosity and volatility were defined. Response variables were weighted: durability 35%, homogeneity 25%, viscosity 25%, volatility 15%. A Plackett-Burman experimental design was used to define the first twelve glass formulations. Glass former additives included Al2O3, B2O3, CaO, Li2O, ZrO2 and SiO2. Lithia was added to facilitate fritting of the additives. The additives were normalized to silica content to ease experimental matrix definition and glass formulation. Preset high and low values of these ratios were determined for the initial twelve melts. Based on rankings of initial compositions, new formulations for testing were developed based on a simplex algorithm. Rating and ranking of subsequent compositions continued until no apparent improvement in glass quality was achieved in newly developed formulations. An optimized composition was determined by averaging the additive component values of the final best performing compositions. The glass former contents to form the optimized glass were: 16.1 wt % Al2O3, 12.3 wt % B2O3, 5.5 wt % CaO, 1.7 wt % Li2O, 3.3 wt % ZrO2, 61.1 wt % SiO2. An optimized composition resulted after only 25 trials despite studying six glass additives. A vitrification campaign was completed using a small-scale Joule heated melter. 80 lbs of glass was produced over 96 hours of continuous operation. Several salt compounds formed and deposited on melter components during the run and likely caused the failure of several pour chamber heaters. In an attempt to minimize sodium volatility, several low or no boron glasses were formulated. One composition containing no boron produced a homogeneous glass worthy of additional testing.

1137 (WSRC-TR-95-0085) **Approximate cylindrical blast theory: Application to pressure loading.** Hutchens, G.J.; Gong, C. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95017502. Source: OSTI; NTIS; INIS; GPO Dep.

SRTC is currently investigating the use of plasma systems for immobilization of mixed low-level waste and transuranic waste. Much of this waste contains organic materials which are unstable in high temperature environments. For plasma technology to be viable for immobilization of these wastes, the breakdown of the organic materials must not pose a safety problem. To support start-up and operational planning for waste vitrification activities at SRS, an analysis has been performed to estimate the pressure load on a vessel wall due to an explosion. If, during routine operation of a waste vitrifier, a container with reactive material is injected, an explosion may result. With this in mind it is important to determine the pressure load on the container wall that results. The analysis performed below is a scoping calculation and is considered an R&D level 2 calculation based on the WSRC manual E-7. The objective of this analysis is to use near-field cylindrical blast theory to estimate the pressure load on a container wall due to an internal explosion. The blast theory result will then be compared to a structural calculation performed using ABAQUS. The ABAQUS calculations are to determine the pressure at which the container wall will fracture. Then, that pressure will be compared to the pressure given by blast theory for several explosive loadings.

1138 (WSRC-TR-95-0176) **Electronic Denitration Savannah River Site Radioactive Waste.** Hobbs, D.T. Westinghouse Savannah River Co., Aiken, SC (United States). 11 Apr 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060149. Source: OSTI; NTIS; INIS; GPO Dep.

Electrochemical destruction of nitrate in radioactive Savannah River Site Waste has been demonstrated in a bench-scale flow cell reactor. Greater than 99% of the nitrate can be destroyed in either an undivided or a divided cell reactor. The rate of destruction and the overall power consumption is dependent on the cell configuration and electrode materials. The fastest rate was observed using an undivided cell equipped with a nickel cathode and nickel anode. The use of platinized titanium anode increased the energy requirement and costs compared to a nickel anode in both the undivided and divided cell configurations.

1139 (WSRC-TR-95-0199) **The Savannah River Site Waste Inventory Management Program.** Griffith, J.M.; Holmes, B.R. Westinghouse Savannah River Co., Aiken, SC (United States). 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9505111-4: 11. pollution prevention conference: shaping the future through pollution prevention involvement - commitment - progress, Knoxville, TN (United States), 16-18 May 1995). Order Number DE95017490. Source: OSTI; NTIS; INIS; GPO Dep.

Each hazardous and radioactive waste generator that delivers waste to Savannah River Site (SRS) treatment, storage and disposal (TSD) facilities is required to implement a waste certification plan. The waste certification process ensures that waste has been properly identified, characterized, segregated, packaged, and shipped according to the receiving facilities waste acceptance criteria. In order to comply with the rigid acceptance criteria, the Reactor Division developed and implemented the Waste Inventory Management Program (WIMP) to track the generation and disposal of low level radioactive waste. The WIMP system is a relational database with integrated barcode technology designed to track the inventory radioactive waste. During the development of the WIMP several waste minimization tools were incorporated into the design of the program. The inclusion of waste minimization tools as part of the WIMP has resulted in a 40% increase in the amount of waste designated as compactible and an overall volume reduction of 5,000 cu-ft.

1140 (WSRC-TR-95-0303) **Waste minimization methods for treating analyticl instrumentation effluents at the source.** Policke, T.R. (Westinghouse Savannah River Co., Aiken, SC (United States)); Ritter, J.A.; Barnhart, C. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9509139-6: 7. ACS special symposium: emerging technologies in hazardous waste management, Atlanta, GA (United States), 17-20 Sep 1995). Order Number DE96002922. Source: OSTI; NTIS; INIS; GPO Dep.

Recently there has been increasing interest in minimizing analytical laboratory wastes. The driving forces behind this interest are the ever increasing costs and liabilities associated with waste disposal. Thus, many analytical laboratories, like the Defense Waste Processing Technology-Analytical Laboratory (DWPT-AL), located at the Savannah River Site (SRS), are looking into treating their own wastes. The DWPT-AL operates four laboratory modules that produce hazardous liquid effluents from the analytical instrumentation: Spectroscopy, Chromatography I, Chromatography II, and Wet Chemistry. The hazardous waste from these modules is being sent to SRS Waste Management at a cost of approximately $13,000 per drum, which corresponds to approximately $325,000 to $520,000 per year. If the hazardous characteristics of and the hazardous components in the analytical instrument effluents or example preparation wastes can be altered and/or reduced in such a way as to render the stream non-hazardous, the large volume of non-hazardous waste can be disposed of via process drains. Therefore, the primary goal of this project was to reduce the amount of hazardous waste being generated by the DWPT-AL, thereby substantially reducing the costs associated with its disposal. A secondary goal was to develop in-line methods using primarily adsorption/ion exchange columns that can be used to treat the liquid effluent as it emerges from the analytical instrument as a slow, dripping flow. The second goal allows the treatment method to become part of the operating procedure associated with the instrument; thus, the effluent would not be considered a waste until it emerges from the in-line column.

1141 (WSRC-TR-95-0304) **A bench scale study of a one-step dissolution process for treating contaminated fiberglass filters.** Policke, T.A.; Ritter, J.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9509139-8: 7. ACS special symposium: emerging technologies in hazardous waste management, Atlanta, GA (United States), 17-20 Sep 1995). Order Number DE96002923. Source: OSTI; NTIS; INIS; GPO Dep.

High efficiency mist eliminators (HEME) and high efficiency particulate air filters (HEPA) made of High fiberglass will be used at the Savannah River Site (SRS) to remove particulate matter from offgases generated during melter feed preparation and vitrification of high-level radioactive waste (HLW) at the Defense Waste Processing Facility (DWPF). These filters will be contaminated with high-level, radioactive species and also with various high-boiling organic compounds. For this reason, a process was developed at the Savannah River Technology Center (SRTC) that will dissolve the spent filters so that the residues may be recycled to the HLW tanks for eventual vitrification. This process involves boiling the filters sequentially in NaOH, $HN0_3$ and NaOH, while contained in a stainless steal wire mesh frame assembly. The objective of this communication is to present some of the original preliminary work done by Ritter on the simple one-step dissolution process. The results from six bench-scale experiments are reported for the dissolution of an organically-fouled sample of HEME obtained from the Integrated DWPF Melter (IDMS) offgas filtration system. The preliminary effects of filter packing density, air sparging versus rotating basket agitation, fouling, and adding Triton X-405 as a dispersing agent are reported.

1142 (WSRC-TR-95-0310) **Evaluation of packed-bed and fluidized-bed cell technology for the destruction and removal of contaminants in alkaline waste solutions. Final report.** Hobbs, D.T. (Westinghouse Savannah River Co., Aiken, SC (United States)); Bockris, J.O.M.; Kim, Jinseong. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96005799. Source: OSTI; NTIS; INIS; GPO Dep.

Disposing of the large quantity of nuclear waste that has been produced within the DOE complex is an area of active research and development. Electrochemical processes have been reported for the treatment of alkaline wastes including the destruction of nitrate and nitrite and the removal of metals such as Tc and Ru. Electrolytic recovery of metals from dilute solution has been reported using conventional porous electrodes such as felt electrode and reticulated electrode, but use of such electrodes is limited. The pores of such electrodes become blocked as a consequence of metal deposition. If an attempt is made to regenerate these electrodes by dissolution of the deposited metals, oxygen evolution on the matrix competes with dissolution of metals deposited within the pores. On the other hand, the use of three dimensional packed-bed and fluidized-bed electrodes having large surface area per unit volume would offer an improvement on felt or reticulated system because of the greater ease of regeneration.

1143 (WSRC-TR--95-0395) **Fiscal year 1995 final report for TTP SR-1320-04.** Cicero, C.A.; Bickford, D.F.; Marra, J.C. Westinghouse Savannah River Co., Aiken, SC (United States). 30 Sep 1995. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96010994. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this Technical Task Plan (TTP) in fiscal year 1995 was to develop vitrification technology for application to mercury and organic waste streams, which are considered problem streams for a large portion of the DOE complexes. In addition, efforts were continued for pilot-scale demonstrations on Rocky Flats Plant (RFP) Precipitate sludge, and Los Alamos National Laboratory (LANL) TA-50 sludge, which was a carry-over of fiscal year 1994 activities. Crucible-scale studies were performed on mercury and organic waste streams to determine the optimum glass compositions. The optimal compositions were then used to treat actual wastes on a bench-top scale. Reports were written to summarize the data and results from the mercury and organic studies. The pilot-scale studies with RFP and LANL simulated sludge used glass compositions determined in fiscal year 1994 studies. The pilot-scale studies were attempted in the EnVitCo cold-top melter and the Stir-Melter® stirred melter at the DOE/Industrial Center for Vitrification Research (Center).

1144 (WSRC-TR--95-0403) **Summary of pilot-scale activities with resorcinol ion exchange resin.** Cicero, C.A. (Westinghouse Savannah River Company, AIKEN, SC (United States)); Bickford, D.F.; Sargent, T.N.; Andrews, M.K.; Bibler, J.P.; Bibler, N.E.; Jantzen, C.M. Westinghouse Savannah River Co., Aiken, SC (United States). 2 Oct 1995. 116p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96060073. Source: OSTI; NTIS; INIS; GPO Dep.

The Mixed Waste Focus Area (MWFA) of the Department of Energy (DOE) is currently investigating vitrification technology for treatment of low level mixed wastes (LLMW). They have chartered the Savannah River Technology Center (SRTC) to study vitrification of the wastes through an Office of Technology Development (OTD) Technical Task Plan (TTP). SRTC's efforts have included crucible-scale studies and pilot scale testing on simulated LLMW sludges, resins, soils, and other solid wastes. Results from the crucible-scale studies have been used as the basis for the pilot-scale demonstrations. As part of the fiscal year (FY) 1995 activities, SRTC performed crucible-scale studies with organic resins. This waste stream was selected because of the large number of DOE sites, as well as commercial industries, that use resins for treatment of liquid wastes. Pilot-scale studies were to be completed in FY 1995, but could not be due to a reduction in funding. Instead, a compilation of pilot-scale tests with organic resins performed under the guidance of SRTC was provided in this report. The studies which will be discussed used a resorcinol-formaldehyde resin loaded with non-radioactive cesium, which was fed with simulated wastewater treatment sludge feed. The first study was performed at the SRTC in the mini-melter, 1/100th scale of the Defense Waste Processing Facility (DWPF) melter, and also involved limited crucible-scale studies to determine the resin loading obtainable. The other study was performed at the DOE/Industrial Center for Vitrification Research (Center) and involved both crucible and pilot-scale testing in the Stir-Melter stirred-melter. Both studies were successful in vitrifying the resin in simulated radioactive sludge and glass additive feeds.

1145 (WSRC-TR--95-0404) **Summary of Pilot-Scale Activities with Mercury Contaminated Sludges (U).** Cicero, C.A. (Westinghouse Savannah River Company, AIKEN, SC (United States)); Hutson, N.D.; Zamecnik, J.R.; Smith, M.E.; Miller, D. H.; Ritter, J.A.; Hardy, B.J.; Jantzen, C.M. Westinghouse Savannah River Co., Aiken, SC (United States). 2 Oct 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96060074. Source: OSTI; NTIS; INIS; GPO Dep.

Technologies for treatment of low level mixed wastes (LLMW) are currently being investigated by the Mixed Waste Focus Area (MWFA) of the Department of Energy (DOE). The Savannah River Technology Center (SRTC) has been chartered by the MWFA to study vitrification treatment of the wastes through an Office of Technology Development (OTD) Technical Task Plan (TTP). SRTC's efforts have included crucible-scale studies and pilot-scale testing on simulated LLMW sludges, resins, soils, and other solid wastes. Results from the crucible-scale studies have been used as the basis for the pilot-scale demonstrations. One of the streams to be investigated in fiscal year (FY) 1995 by SRTC was a mercury waste. In FY 1995, SRTC performed crucible-scale studies with mercury contaminated soil. This waste stream was selected because of the large number of DOE sites that have an inventory of contaminated or hazardous soil. More importantly, it was readily available for treatment. Pilot-scale studies were to be completed in FY 1995, but could not be completed due to a reduction in funding. Since the main driver for focusing on a mercury waste stream was to determine how the mercury could be treated, a compilation of pilot-scale tests with mercury sludges performed under the guidance of SRTC is provided in this report. The studies summarized in this report include several pilot-scale vitrification demonstrations with simulated radioactive sludges that contained mercury. The pilot-scale studies were performed at the SRTC in the Integrated Defense Waste Processing Facility (DWPF) Melter System (IDMS). The studies involved complete glass and offgas product characterization. Future pilot-scale studies with mercury streams will likely be performed with mercury contaminated soils, sediments, or sludges because of the need to dispose of this technically challenging waste stream. (Abstract Truncated)

1146 (WSRC-TR–95-0438) **Progress report on the evaluation of porous cathode for the electrochemical reduction of nitrates and nitrites in liquid wastes.** Hobbs, D.T. (Westinghouse Savannah River Co., Aiken, SC (United States)); Jha, K.; Weidner, J.W.; White, R.E. Westinghouse Savannah River Co., Aiken, SC (United States). 27 Dec 1995. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96010997. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the experimental and modeling work performed to evaluate porous cathodes for the electrochemical reduction of nitrites in liquid wastes. The experiments were done using the MP† cell with two different porous cathodes: nickel foam and TySAR™SB‡. The experimental results are compared with each other and to those obtained with a planar nickel cathode. The results show that the ammonia production reaction is the dominant cathodic reaction (~80% efficiency) for all three electrodes. The temperature range used in this study was 29-37 oC while the catholyte feed was either 0.6M $NaNO_2$ or 1.9M $NaNO_3$, both supported by a 1.33 M NaOH solution. All experiments used a constant current density of 0.25 A/cm^2. The experimental results suggest that the porous nickel electrode at lower temperatures (~31oC) is the most efficient of the three electrodes for the reduction of nitrates and nitrites. The porous nickel electrode exhibited the highest conversion of nitrates and nitrites, and the lowest overpotential for a given current density. The partial current fractions at known catholyte concentrations were used to extract the exchange-current densities for the five cathodic reactions. Using these kinetic parameters, dynamic simulations of the four hour experiments were performed. Agreement was found between the model and experimental results for changes in the moles of the nitrate and nitrite and the cell overpotential with time. Future work will determine the effects of temperature and current densities on the exchange-current densities and reaction product distributions. The performance of other porous cathode materials (TySAR™EP§, TySAR™IM) will also be evaluated.

1147 (WSRC-TR–95-0454) **Evaluation of processing alternatives for the in-tank precipitation facility using flowsheet modeling to reduce waste streams.** Taylor, G.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960212–84: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96009656. Source: OSTI; NTIS; INIS; GPO Dep.

Due to increasing cost and decreasing funding it is becoming more important than ever to reduce the waste streams generated by the Savannah River Site's High Level Waste Management division. One of the process that generates a waste stream is the In-Tank Precipitation Facility. This study seeks to reduce the waste stream of excess washwater from the ITP facility. At the ITP, high level liquid waste is processed at a high sodium content in order to remove radionuclides. After the radionuclides have been precipitated and concentrated the sodium molarity must be reduced. This is done by washing the concentrate with a washwater stream. The washwater is then sent to either the Saltstone Facility to be turned into grout for final disposal or set to the evaporator system for volume reduction. It is this washwater stream that this study seeks to reduce.

1148 (WSRC-TR–95-0471) **Facilities for stabilization and stabilization end states.** Moore, E.N.; Allender, J.S. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-951259–10: Plutonium stabilization and immobilization workshop, Washington, DC (United States), 12-14 Dec 1995). Order Number DE96009648. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) has embarked upon an aggressive program to stabilize and package nuclear materials for safe, interim storage. The scope and approach to accomplish this objective is documented in the DOE Implementation Plan prepared in response to Defense Nuclear Facilities Safety Board (DNFSB, or the Board) Recommendation 94-1. In support of this plan, DOE-Headquarters formed a Nuclear Material Stabilization Task Group (NMSTG) and each major site prepared a Site Integrated Stabilization Management Plan (SISMP) providing resource-loaded schedules to achieve the objectives. To assure intersite integration of the plans, DOE assembled an Integration Working Group (IWG), comprising contractor representatives from each site, with the primary initial purpose of preparing an Integrated Facilities Plan (IFP). This paper provides a brief summary of the IFP, with particular emphasis on the plutonium materials and facilities. In its Recommendation 94-1, the Board recommended that an integrated program plan be formulated, on a high priority basis, to integrate use of facilities and capabilities to deal with concerns about liquids and solids containing radioactive substances, located in spent fuel storage pools; reactor basins; reprocessing canyons; and various other facilities that were used for processing and weapons manufacture. Further, the DNFSB recommended that facilities that might be needed for future handling and treatment of these materials be maintained in a usable state.

1149 (WSRC-TR–96-0003) **Operation of a 1/10 scale mixed water incinerator air pollution control system.** Burns, D.B.; Wong, A.; Walker, W. Westinghouse Savannah River Co., Aiken, SC (United States). [1996]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-960212–96: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96012427. Source: OSTI; NTIS; INIS; GPO Dep.

The Consolidated Incineration Facility (CIF) at the Savannah River Site is designed to treat solid and liquid RCRA hazardous and mixed wastes generated by site operations and clean-up activities. The technologies selected for use in the CIF air pollution control system (APCS) were based on reviews of existing commercial and DOE incinerators, onsite air pollution control experience, and recommendations from contracted consultants. In order to study the CIF APCS prior to operation, a 1/10 scale pilot facility, known as the Offgas Components Test Facility (OCTF) was constructed and has been in operation since late 1994. Its current mission is to demonstrate the design integrity of the CIF APCS and optimize equipment/instrument performance of the full scale production facility. Due to the nature of the wastes to be incinerated at the CIF, High Efficiency Particulate Air (HEPA) filters are used to remove hazardous and radioactive particulates from the exhaust gas stream before being released into the atmosphere. The HEPA filter change-out frequency has been a potential issue and was the first technical issue to be studied at the OCTF. Tests were conducted to evaluate the performance of HEPA filters under different operating conditions. These tests included evaluating the impact on HEPA life of scrubber operating parameters and the type of HEPA prefilter used. This pilot-scale testing demonstrated satisfactory HEPA filter life when using cleanable metal prefilters and high flows of steam and water in the offgas scrubber.

1150 (Y/NA–1801) **Depeted uranium market study. Final report.** Kaplan, S.A. (Kapline Enterprises, Inc., Knoxville, TN (United States)). Oak Ridge National Lab., TN (United States). Aug 1995. 223p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE96000383. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The objective of this study is to identify potential markets for depleted uranium (DU) materials and products that may be developed by 2005. For each potential market, the study identifies the maximum amount of DU that might be used, the probability that the use will develop, and the time period or schedule for the product or market to reach maturity. The report also describes and attempts to quantify benefits from the development of the market and commercialization of a product, such as financial gains in a community due to increase in industrial base (i.e., jobs). A cost threshold for maximum development potential of each DU market or product is also established. This threshold is based on the cost of currently used products in each application. Such a threshold is necessary because the DU material considered is in the form of uranium hexafluoride (UF_6) and current conversion methods of depleted UF_6 are expensive and produces large quantities of waste products. In addition to cost, the study identifies other barriers such as public perception, environmental and health concerns, regulatory restrictions, and engineering constraints.

A program was established for DOE Environmental Restoration and Waste Management (EM) to evaluate factors that are anticipated to affect waste glass reaction during repository disposal, especially in an unsaturated environment typical of what may be expected for the proposed Yucca Mountain repository site. This report covers progress in FY 1994 on the following tasks: (1) Critical Reviews of important parameters that affect the reactivity of glass in an unsaturated environment are being prepared. (2) A series of tests is ongoing to evaluate the reactivity of fully radioactive glasses in a high-level waste repository environment and compare it to the reactivity of synthetic, nonradioactive glasses of similar composition. (3) The effect of radiation upon the durability of waste glasses at a high SA/V ratio and a high gas-to-liquid volume ratio has been assessed. (4) A series of tests is being performed to compare the extent of reaction of nuclear waste glasses at various SA/V ratios. Such differences in the SA/V ratio may significantly affect glass durability. At long-term periods and high SA/V ratios, acceleration in glass reaction has been observed. (5) Tests were initiated on West Valley Reference 6 (WV6) glass and on the Environmental Assessment (EA) glass. (6) Tests with the actinide-doped West Valley glass ATM-10 have been in progress for over seven years as a part of work for the Yucca Mountain Site Characterization Project (YMP). (7) Analytical electron microscopy (AEM) is being used to assess the glass/water reaction pathway by identifying intermediate phases that appear on the reacting glass. Also, colloids from the leach solutions are being studied using AEM.

1152 (ANL–95/23) **Advanced evaporator technology progress report FY 1992.** Chamberlain, D. (and others); Hutter, J.C.; Leonard, R.A. Argonne National Lab., IL (United States). Jan 1995. 125p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE96006112. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the work that was completed in FY 1992 on the program "Technology Development for Concentrating Process Streams." The purpose of this program is to evaluate and develop evaporator technology for concentrating radioactive waste and product streams such as those generated by the TRUEX process. Concentrating these streams and minimizing the volume of waste generated can significantly reduce disposal costs; however, equipment to concentrate the streams and recycle the decontaminated condensates must be installed. LICON, Inc., is developing an evaporator that shows a great deal of potential for this application. In this report, concepts that need to be incorporated into the design of an evaporator operated in a radioactive environment are discussed. These concepts include criticality safety, remote operation and maintenance, and materials of construction. Both solubility and vapor-liquid equilibrium data are needed to design an effective process for concentrating process streams. Therefore, literature surveys were completed and are summarized in this report. A model that is being developed to predict vapor phase compositions is described. A laboratory-scale evaporator was purchased and installed to study the evaporation process and to collect additional data. This unit is described in detail. Two new LICON evaporators are being designed for installation at Argonne-East in FY 1993 to process low-level radioactive waste generated throughout the laboratory. They will also provide operating data from a full-sized evaporator processing radioactive solutions. Details on these evaporators are included in this report.

1153 (ANL–96/11) **ANL technical support program for DOE Office of Environmental Management. Annual report, October 1994–September 1995.** Bates, J.K. (and others); Buck, E.C.; Dietz, N.L.; DiSanto, T.; Ebert, W.L. Argonne National Lab., IL (United States). Jul 1996. 153p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract W-31109-ENG-38. Order Number DE96014264. Source: OSTI; NTIS; INIS; GPO Dep.

A program was established for the DOE Office of Environmental Management (EM) to evaluate factors that are anticipated to affect waste glass reaction during repository disposal, especially in an unsaturated environment typical of what may be expected for the proposed Yucca Mountain repository site. This report covers progress in FY 1995 on the following tasks: (1) Tests are ongoing to evaluate and compare the reactivity of fully radioactive glasses with that of glasses having the same compositions except for the absence of radionuclides under conditions representative of a high-level waste repository environment. Data from these tests will be used to evaluate the effect of radionuclides on the glass corrosion behavior and to determine the disposition of the radionuclides as the glass corrodes. Static dissolution tests and unsaturated tests are being conducted with several Defense Waste Processing Facility (DWPF) and West Valley Demonstration Project (WVDP) glasses. (2) A series of static dissolution tests is being performed to compare the corrosion behavior of nuclear waste glasses made with SRL 131 and SRL 202 frits at different S/V ratios. The S/V ratio affects the extent to which dissolved glass species are diluted; the solution chemistry then affects continued glass dissolution. The solutions generated in tests at high S/V ratios are conducive to the formation of alteration phases that may be deleterious to the glass. After long time periods, the glass dissolution rates of both glasses increase coincidentally with the formation of analcime and other alteration phases. However, the release of radionuclides from the glasses into solution is controlled by their individual solubilities.

1154 (ANL/CHM/CP-84143) **A combined cesium-strontium extraction/recovery process.** Horwitz, E.P.; Dietz, M.L.; Jensen, M.P. Argonne National Lab., IL (United States). 1996. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960314-4: International solvent extraction conference, Melbourne (Australia), 17-21 Mar 1996). Order Number DE96007067. Source: OSTI; NTIS; INIS; GPO Dep.

A new solvent extraction process for the simultaneous extraction of cesium and strontium from acidic nitrate media is described. This process uses a solvent formulation comprised of 0.05 M di-t-butylcyclohexano-18-crown-6 (DtBuCH18C6), 0.1 M Crown 100′ (a proprietary, cesium-selective derivative of dibenzo-18-crown-6), 1.2 M tributyl phosphate (TBP), and 5% (v/v) lauryl nitrile in an isoparaffinic hydrocarbon diluent. Distribution ratios for cesium and strontium from 4 M nitric acid are 4.13 and 3.46, respectively. A benchtop batch countercurrent extraction experiment indicates that >98% of the cesium and strontium initially present in the feed solution can be removed in only four extraction stages. Through proper choice of extraction and strip conditions, extracted cesium and strontium can be recovered either together or individually.

1155 (ANL/CMT/CP-84524) **Laboratory testing of West Valley reference 6 glass.** Ebert, W.L. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950401-13: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE95014235. Source: OSTI; NTIS; INIS; GPO Dep.

A series of laboratory tests is being conducted to characterize the corrosion of West Valley reference 6 glass (WV6) and to provide parametric values for modeling its long-term durability. Models require measurement of the corrosion rate in the absence of corrosion products and in fluids that are "saturated" with corrosion products, and the identification of alteration phases. Corrosion rates in dilute and saturated conditions were measured using MCC-1 and PCT tests, respectively. Vapor hydration tests were performed to generate secondary phases. The PCT tests show the WV6 glass to be more durable than SRL EA, SRL 202, and HW-39-1 glasses. Vapor hydration tests show weeksite (a uranyl silicate), a potassium-bearing zeolite, analcime, potassium feldspar, a calcium silicate phase, and lithium phosphate to form as WV6 glass corrodes. Test results are presented and their relevance to long-term performance discussed.

1156 (ANL/CMT/CP-84525) **Performance testing of West Valley Reference 6 glass.** Ebert, W.L. (Argonne National Lab., IL (United States). Chemical Technology Div.); Bates, J.K. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950570-26: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95013442. Source: OSTI; NTIS; INIS; GPO Dep.

The chemical durability of West Valley Reference 6 glass is being evaluated by using a suite of laboratory tests which highlight the early, interim, and long-term stages of corrosion. The test results are being used to describe the glass corrosion path and its long-term durability. The long-term durability of the SRL Environmental Assessment glass is being evaluated for comparison. Test results also provide parameter values for an analytical corrosion model that can be used in performance assessments of specific disposal sites.

1157 (ANL/CMT/CP-84527) **Validation of the generic TRUEX model using data from TRUEX demonstrations with actual high-level waste.** Vandegrift, G.F.; Regalbuto, M.C. Argonne National Lab., IL (United States). 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950917-20: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE96005207. Source: OSTI; NTIS; INIS; GPO Dep.

The main objective of the Generic TRUEX Model (GTM) is to calculate TRUEX solvent extraction flowsheets based on input of a specific feed and a specific set of process goals and constraints. The output will be (1) the compositions of all effluent streams, (2) the compositions of both phases (organic and aqueous) in each stage of the contacting equipment at steady state, and (3) estimates of the space and cost requirements for installing the flowsheet in a plant situation. Other options are available to calculate aqueous-phase speciation and thermodynamic activities, distribution ratios of extractable species, and solvent radiolytic and hydrolytic degradation. Calculation of these options is based on initial aqueous- and organic-phase compositions and other important variables supplied by the user. Three demonstrations of the TRUEX process have been run by Power Reactor and Nuclear Fuel Development Corp. (PNC) researchers at the Tokai Works using actual PUREX raffinates. A 19-stage mixer settler was used for the extraction and scrub sections, and a 16-to-19-stage unit for stripping. Stagewise data were collected on the behavior of nitric acid and several fission-product and actinide radioisotopes during these runs; Run 2 was the best documented and the one with which most comparisons were made. These data are important tools for validating predictions made by the GTM and understanding the intricacies of the TRUEX process. In this paper, results of the GTM calculations will be compared to the actual data published by PNC researchers. Differences between model predictions and experimental data were analyzed in terms of the process chemistry and demonstration conditions.

1158 (ANL/CMT/CP–84591) **Long-term test results from a West Valley actinide-doped reference glass.** Fortner, J.A.; Gerding, T.J.; Bates, J.K. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950401–20: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE95013693. Source: OSTI; NTIS; INIS; GPO Dep.

Results from drip tests designed to simulate unsaturated conditions in the proposed Yucca Mountain Repository are reported for an actinide-doped glass (reference glass ATM-10) used as a model waste form. These tests have been ongoing for nearly 7 years, with data collected on solution composition (including transuranics), colloid formation and disposition, glass corrosion layers, and solid secondary phases. This test is unique because of its long elapsed time, high content of thorium and transuranics, use of actual groundwater from the proposed site area, use of contact between the glass and sensitized stainless steel in the test, and the variety of analytical procedures applied to the components. Some tests have been terminated, and scanning electron microscopy (SEM) and analytical transmission electron microscopy (AEM) were used to directly measure glass corrosion and identify secondary phases. Other tests remain ongoing, with periodic sampling of the water that had contacted the glass. The importance of integrated testing has been demonstrated, as complex interactions between the glass, the groundwater, and the sensitized stainless steel have been observed. Secondary phases include smectite clay, iron silicates, and brockite. Actinides, except neptunium, concentrate into stable secondary phases. The release of actinides is then controlled by the behavior of these phases.

1159 (ANL/CMT/CP–84717) **Microscopic characterization of crystalline phases in waste forms.** Buck, E.C. (Argonne National Lab., IL (United States)); Dietz, N.L.; Wronkiewicz, D.J.; Bates, J.K.; Millar, A. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950401–10: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE95013890. Source: OSTI; NTIS; INIS; GPO Dep.

Transmission electron microscopy (TEM) has been used to determine the microstructure of crystalline phases present in zirconium- and titanium-bearing glass crystalline composite (GCC) waste forms. The GCC materials were found to contain spinels (maghemite), zirconolites, perovskites ($CaTiO_3$) and plagiociase feldspar (anorthite) mineral phases. The structure of the uranium and cerium-bearing monoclinic zirconolite was characterized by medium resolution TEM imaging and electron and X-ray diffraction (XRD). The phase was found to contain high levels of iron in comparison to Synroc-type zirconolites. Excess zirconium in zirconolite has resulted in martensitic baddeleyite (ZrO_2) formation. Anorthite ($CaAl_2Si_2O_8$) was present as elongated crystallites within a calcium-rich aluminosilicate glass. Lead and iron-bearing anorthite lying along distinct precipitates were occasionally observed within the an crystallographic planes.

1160 (ANL/CMT/CP–84718) **Evaluation of models of waste glass durability.** Ellison, A. Argonne National Lab., IL (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950402–15: 209. American Chemical Society (ACS) national meeting, Anaheim, CA (United States), 2-6 Apr 1995). Order Number DE95015833. Source: OSTI; NTIS; INIS; GPO Dep.

The main variable under the control of the waste glass producer is the composition of the glass; thus a need exists to establish functional relationships between the composition of a waste glass and measures of processability, product consistency, and durability. Many years of research show that the structure and properties of a glass depend on its composition, so it seems reasonable to assume that there also is relationship between the composition of a waste glass and its resistance to attack by an aqueous solution. Several models have been developed to describe this dependence, and an evaluation their predictive capabilities is the subject of this paper. The objective is to determine whether any of these models describe the "correct" functional relationship between composition and corrosion rate. A more thorough treatment of the relationships between glass composition and durability has been presented elsewhere, and the reader is encouraged to consult it for a more detailed discussion. The models examined in this study are the free energy of hydration model, developed at the Savannah River Laboratory, the structural bond strength model, developed at the Vitreous State Laboratory at the Catholic University of America, and the Composition Variation Study, developed at Pacific Northwest Laboratory.

1161 (ANL/CMT/CP–84719) **The corrosion behavior of DWPF glasses.** Ebert, W.L. (Argonne National Lab., IL (United States). Chemical Technology Div.); Bates, J.K. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950401–6: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 May 1995). Order Number DE95013466. Source: OSTI; NTIS; INIS; GPO Dep.

The authors analyzed the corroded surfaces of reference glasses developed for the Defense Waste Processing Facility (DWPF) to characterize their corrosion behavior. The corrosion mechanism of nuclear waste glasses must be known in order to provide source terms describing radionuclide release for performance assessment calculations. Different DWPF reference glasses were corroded under conditions that highlighted various aspects of the corrosion process and led to different extents of corrosion. The glasses corroded by similar mechanisms, and a phenomenological description of their corrosion behavior is presented here. The initial leaching of soluble glass components results in the formation of an amorphous gel layer on the glass surface. The gel layer is a transient phase that transforms into a layer of clay crystallites, which equilibrates with the solution as corrosion continues. The clay layer does not act as a barrier to either water penetration or glass dissolution, which continues beneath it, and may eventually separate from the glass. Solubility limits for glass components may be established by the eventual precipitation of secondary phases; thus, corrosion of the glass becomes controlled by the chemical equilibrium between the solution and the assemblage of secondary phases. In effect, the solution is an intermediate phase through which the glass transforms to an energetically more favorable assemblage of phases. Implications regarding the prediction of long-term glass corrosion behavior are discussed.

1162 (ANL/CMT/CP-86022) **Optimization of magnetite carrier precipitation process for transuranic waste reduction.** Slater, S.A. (Argonne National Lab., IL (United States). Chemical Technology Div.); Chamberlain, D.B.; Aase, S.A.; Babcock, B.D.; Conner, C.; Sedlet, J.; Vandegrift, G.F. Argonne National Lab., IL (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-951057-5: 9. symposium on separation science and technology for energy applications, Gatlinburg, TN (United States), 22-26 Oct 1995). Order Number DE96005531. Source: OSTI; NTIS; INIS; GPO Dep.

Transuranic (TRU) waste that is being generated at Argonne National Laboratory has a TRU activity ranging from 10^2 to 10^7 nCi/g with a wide variety of chemical compositions. Currently, the waste is stored in highly acidic solutions that must be neutralized for intermediate storage. A magnetite carrier precipitation process has been adapted to concentrate TRU isotopes in a noncorrosive solid phase. In this paper, the authors report the results of a series of laboratory tests done to optimize the process. The parameters they optimized included (1) magnetite concentration used to precipitate the TRUs from solution, (2) formation of magnetite (in situ or ex situ), (3) processing pH, and (4) temperature and mixing time of the carrier precipitation. They also studied the effects of anions, cations, and complexing agents in the waste solutions on the carrier precipitation and the effect of magnetite solids loading on the filtration equipment. An overview is given of the planned full-scale process, which will be operated in a glovebox.

1163 (ANL/CMT/CP-86023) **Centrifugal contractors for laboratory-scale solvent extraction tests.** Leonard, R.A.; Chamberlain, D.B.; Conner, C. Argonne National Lab., IL (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-951057-9: 9. symposium on separation science and technology for energy applications, Gatlinburg, TN (United States), 22-26 Oct 1995). Order Number DE96007204. Source: OSTI; NTIS; INIS; GPO Dep.

A 2-cm contactor (minicontactor) was developed and used at Argonne National Laboratory for laboratory-scale testing of solvent extraction flowsheets. This new contactor requires only 1 L of simulated waste feed, which is significantly less than the 10 L required for the 4-cm unit that had previously been used. In addition, the volume requirements for the other aqueous and organic feeds are reduced correspondingly. This paper (1) discusses the design of the minicontactor, (2) describes results from having applied the minicontactor to testing various solvent extraction flowsheets, and (3) compares the minicontactor with the 4-cm contactor as a device for testing solvent extraction flowsheets on a laboratory scale.

1164 (ANL/CMT/CP-86025) **Quantitative SEM/EDS analysis of high-level waste glasses.** Luo, J.S. (and others); Wolf, S.; Ebert, W. Argonne National Lab., IL (United States). Mar 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950865-4: 29. annual meeting of the Microbeam Analysis Society, Breckenridge, CO (United States), 6-11 Aug 1995). Order Number DE95014080. Source: OSTI; NTIS; INIS; GPO Dep.

Silicate glass will be used to stabilize high-level radioactive wastes (HLW) for disposal in a geological repository. The chemical durability of waste glass in the repository will be determined by the nature and progress of the glass-water (underground water) reaction. Aqueous corrosion of HLW glasses is known to result in the chemical alteration of the glass surface and the formation of secondary phases. Accurate quantitative analysis the altered glass surface and the reaction products that form is important for understanding the reaction kinetics and mechanism of glass corrosion. SEM/EDS is a powerful tool to study the alteration of waste-disposal glasses through quantitatively characterizing the reaction products. It is able to detect trace elements at concentrations less than 1 wt.%: for example, Fig. 1 shows the uranium peaks detected by SEM/EDS of a typical simulated waste glass, which contains 0.25 wt.% uranium in the matrix glass according to ICP/MS analysis. Nickel (0.44 wt.%) and chromium (0.47 wt.%) peaks are also clearly distinguishable in the spectrum. However, quantitative analyses of glass compositions are complicated by the lack of well-characterized reference samples having known and homogeneous compositions for candidate waste glasses, which may contain a combination of more than 20 different elements in one matrix. It has been proposed that unreacted glass with known compositions could satisfactorily serve as standards for quantitative analysis of waste-disposal glasses and the secondary phases. The main advantage of using such standards is that they contain all the elements to be analyzed in the homogeneous vitreous matrices. In this paper, we evaluate several reference waste glasses with respect to their suitability as standard samples for quantitative SEM/EDS analysis. The precision and accuracy using such standards for quantitative analysis are also discussed. All the experiments were carried out on a Topeon ABT 60 SEM operating at 20 kV.

1165 (ANL/CMT/CP-86907) **Radionuclide content of simulated and fully radioactive SRLLL waste gl;asses: comparison of results from ICP-MS, gamma spectrometry and alpha spectrometry.** Wolf, S.F.; Bates, J.K. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-951155-67: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96007218. Source: OSTI; NTIS; INIS; GPO Dep.

We have measured the transuranic content of two transuranic=doped, simulated waste glasses, using inductively coupled plasma-mass spectrometry (ICP-MS), γ-spectrometry, and α-spectrometry. Average concentrations measured by each technique were within $\pm$ 10% of the as-doped concentrations. We also report the transuranic content of three fully radioactive SRL waste glasses that were determined using γ- and α-spectrometry measurements to deconvolute isobaric interferences present in the ICP-MS analyses.

1166 (ANL/CMT/CP-86953) **The release of technetium from defense waste processing facility glasses.** Ebert, W.L.; Wolf, S.F.; Bates, J.K. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-951155-63: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27

Nov - 1 Dec 1995). Order Number DE96007206. Source: OSTI; NTIS; INIS; GPO Dep.

Laboratory tests are being, conducted using two radionuclide-doped Defense Waste Processing, Facility (DWPF) glasses (referred to as SRL 13IA and SRL 202A) to characterize the effects of the glass surface area/solution volume (SN) ratio on the release and disposition of $T_c$and several actinide elements. Tests are being conducted at 90°C in a tuff ground water solution at SN ratios of 10, 2000, and 20,000 m^{-1} and have been completed through 1822 days. Thė formation of certain alteration phases in tests at 2000 and 20,000 m^{-1} results in an increase in the dissolution rates of both classes. The release of $T_c$parallels that of B and Na under most test conditions and its release increases when alteration phases form. However, in tests with SRL 202A glass at 20,000 $,^{-1}$, the $T_c$concentration in solution decreases coincidentally with an increase in the nitrite/nitrate ratio that indicates a decrease in the solution Eh. This may have occurred due to radiolysis, glass dissolution, the formation of alteration phases, or vessel interactions. Technetium that was reduced from T_c(VII) to T_c(IV) may have precipitated, thou-h the amount of $T_c$was too low to detect any T_c-bearing phases. These results show the importance of conducting long-term tests with radioactive glasses to characterize the behavior of radionuclides, rather than relying on the observed behavior of nonradioactive surrogates.

1167 (ANL/CMT/CP–88395) **Long-term corrosion behavior of environmental assessment glass.** Ebert, W.L.; Bates, J.K. Argonne National Lab., IL (United States). [1996]. 4p. 1168 (ANL/CMT/CP–88456) **Measurement of the glass dissolution rate in the presence of alteration phases.** Ebert, W.L. (Argonne National Lab., Idaho Falls, ID (United States)); Bakel, A.J.; Brown, N.R. Argonne National Lab., Idaho Falls, ID (United States); Pacific Northwest Lab., Richland, WA (United States). [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-960804–40: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96012694. Source: OSTI; NTIS; INIS; GPO Dep.

The dissolution rate of LD6-5412 glass was measured at 90oC in the presence of its alteration phases with the Product Consistency Test (PCT) Method B, the Vapor Hydration Test (VHT), and the Accelerated Dissolution Test (ADT). Alteration phases formed during the PCTs and VHTs, but variations in the time required for their nucleation resulted in large uncertainties in the measured rates. The alteration phases are generated separately for use in the SDTs, so the measured rates are not affected by the kinetics of alteration phase nucleation. The rates measured in the PCTs, VHTs, and ADTs were 0.4 g/(m^2•d) (a lower bound), 2 g/(m^2•d) (extrapolated from the results of tests run at high temperatures), and 1.4 g/(m^2•d), respectively. The solution pHs were about 12 in all the tests.

1169 (ANL/CMT/CP–88983) **Secondary phase formation and the microstructural evolution of surface layers during vapor phase alteration of the French SON 68 nuclear waste glass at 200°C.** Gong, W.L. (Univ. of New Mexico, Albuquerque, NM (United States)); Ewing, R.C.; Wang, L.M. Argonne National Lab., IL (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);CEA, 75 - Paris (France);New Mexico State Government, Santa Fe, NM (United States). DOE Contract W-31109-ENG-38. (CONF-951155–81: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96007210. Source: OSTI; NTIS; INIS; GPO Dep.

The SON 68 inactive "R7T7" composition is the French reference glass for the LWR nuclear waste glass. Vapor phase alteration was used to accelerate the reaction progress of glass corrosion and to develop the characteristic suite of secondary, alteration phases. Extensive solid-state characterization (AEM/SEM/HRTEM) was completed on six inactive R7T7 waste glasses which were altered in the presence of saturated water vapor (200°C) for 91, 241, 908, 1000, 1013, and 1021 days. The AEM samples were examined in cross-section (lattice-fringe imaging, microdiffraction, and quantitative thin-film EDS analysis). The glass monoliths were invariably covered with a thin altered rind. The layer became thicker with time: 0.5 μm for 22 days; 4 μm for 91 days; 6 μm for 241 days; 10 μm for 908 days; 26 μm for 1013 days; and <35 μm for 1021 days. The composite alteration layer of the SON 68 samples is at least four time less thick than that of the SRL 131 glass composition. Six distinctive zones, based on phase chemistry and microstructure, were distinguished within the well-developed surface layers. Numerous crystalline phases such as analcime, tobermorite, apatite, and weeksite were identified on the surfaces of the reacted glasses as precipitates. Two crystalline phases, Ag_2TeO_3 and $(Ca,Sr)Mo_3O_9(OH)_2$, were found within the inner zones of surface layers, and they must have nucleated in situ, indicating that Ag, Te, Sr, and Mo can be retained within the surface layer. The majority of the surface layer volume is composed of two morphologically and chemically different structures: one consists of well-crystallized fibrous smectite aggregates occurring along with cavities, the A-domain; and the other consists of poorly-crystallized regions containing needle-like smectite (montmorillonite) crystallites, a silica-rich amorphous matrix, and possibly ZrO_2 particles, the B-domain.

1170 (ANL/CMT/CP–89567) **Chemical effects of lanthanides and actinides in glasses determined with electron energy loss spectroscopy.** Fortner, J.A.; Buck, E.C.; Ellison, A.J.G.; Bates, J.K. Argonne National Lab., IL (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9608108–3: 30. annual meeting of Microbeam Analysis Society, Minneapolis, MN (United States), 11-15 Aug 1996). Order Number DE96012708. Source: OSTI; NTIS; INIS; GPO Dep.

Chemical and structural environments of f-electron elements in glasses are the origin of many of the important properties of materials with these elements; thus oxidation state and chemical coordination of lanthanides and actinides in host materials is an important design consideration in optically active glasses, magnetic materials, perovskite superconductors, and nuclear waste materials. We have made use of the line shapes of Ce to determine its oxidation state in alkali borosilicate glasses being developed for immobilization of Pu. Examination of several prototype waste glass compositions with EELS shows that the redox state of Ce doped to 7 wt% could be varied by suitable choice of alkali elements. EELS for a Pu-doped glass illustrate the small actinide N_4/N_5 intensity ratio and show that the Pu-$N_{4,5}$ white line cross section is comparable to that of Gd $M_{4,5}$.

1171 (ANL/CMT/CP--89578) **SEM/EDS analysis of boron in waste glasses with ultrathin window detector and digital pulse processor.** Luo, J.S.; Wolf, S.F.; Ebert, W.L.; Bates, J.K. Argonne National Lab., IL (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9608108--2: 30. annual meeting of Microbeam Analysis Society, Minneapolis, MN (United States), 11-15 Aug 1996). Order Number DE96012707. Source: OSTI; NTIS; INIS; GPO Dep.

Analysis of boron in waste glasses and in the reaction products that form during the reaction of glass is important for understanding the reaction kinetics and mechanism of glass corrosion. Two borosilicate waste glasses (1.55 and 3.47 wt% B) have been analyzed by SEM/EDS. The 1.55 wt% is the lowest B concentration detected with EDS. However, the B peaks severely overlap with the C peaks due to the carbon films used for conductive layers, but this problem can be solved by subtracting the C peaks, and possibly even lower B content could be detected by EDS with the digital pulse processor.

1172 (ANL/CMT/CP--89579) **Corroded spent nuclear fuel examined with EELS.** Buck, E.C.; Dietz, N.L.; Bates, J.K. Argonne National Lab., IL (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9608108--1: 30. annual meeting of Microbeam Analysis Society, Minneapolis, MN (United States), 11-15 Aug 1996). Order Number DE96012706. Source: OSTI; NTIS; INIS; GPO Dep.

Samples, exposed to dripping simulated groundwater, were prepared by ultramicrotomy for TEM. The alteration phase was identified as a layered Cs Mo uranyl oxide hydrate, structurally related to phases of the becquerelite group uranium minerals. Second-difference EELS of rare earth elements within the corroded particle detected low levels of TRUs.

1173 (ANL/CMT/CP--89865) **Chemistry and kinetics of waste glass corrosion.** Bates, J.K. Argonne National Lab., IL (United States). 1996. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9605162--1: National Academy of Sciences (NAS) on glass as a waste form and vitrification technology: an international workshop, Washington, DC (United States), 13 May 1996). Order Number DE96009424. Source: OSTI; NTIS; INIS; GPO Dep.

Under repository disposal conditions, the reaction of glass with water comprises the source term for release of radionuclides to the near-field environment. An understanding of glass reaction and the manner by which radionuclides are released is needed to design the waste package and to evaluate the total performance of the repository. The ASTM Standard C-1174-91 provides a general methodology for obtaining information related to the behavior of glass. This paper reviews the application of this standard to glass reaction. In the first step in the ASTM approach, the researcher identifies the materials and the conditions under which the long-term behavior is to be determined. Glass compositions have undergone a genesis over the past 15 years in response to concerns about feed streams, processing, and durability. A range of borosilicate compositions has been identified, but as new applications for vitrification occur, for example, immobilization of weapons plutonium and residue from plutonium processing, different compositions must be evaluated. The repository environment depends on the spatial emplacement of waste containers (glass and spent fuel), and both "hot" and "cold" scenarios have been proposed for the Yucca Mountain site. Regardless of the exact configuration, the near-field hydrology is expected to be unsaturated: that is, the waste packages are contacted initially by water vapor, and ultimately by small amounts of dripping or standing water. The behavior of glass can be studied as a function of composition within the constraints the environmental conditions place on the physical parameters that affect glass reaction (temperature, radiation field, groundwater composition, etc.). In the second step, the researcher reviews the literature and proposes a reaction pathway by which glass reacts in an unsaturated environment.

1174 (ANL/CMT/CP--89866) **Reproduction of natural corrosion by accelerated laboratory testing methods.** Luo, J.S.; Wronkiewicz, D.J.; Mazer, J.J.; Bates, J.K. Argonne National Lab., IL (United States). May 1996. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9605162--2: National Academy of Sciences (NAS) on glass as a waste form and vitrification technology: an international workshop, Washington, DC (United States), 13 May 1996). Order Number DE96009425. Source: OSTI; NTIS; INIS; GPO Dep.

Various laboratory corrosion tests have been developed to study the behavior of glass waste forms under conditions similar to those expected in an engineered repository. The data generated by laboratory experiments are useful for understanding corrosion mechanisms and for developing chemical models to predict the long-term behavior of glass. However, it is challenging to demonstrate that these test methods produce results that can be directly related to projecting the behavior of glass waste forms over time periods of thousands of years. One method to build confidence in the applicability of the test methods is to study the natural processes that have been taking place over very long periods in environments similar to those of the repository. In this paper, we discuss whether accelerated testing methods alter the fundamental mechanisms of glass corrosion by comparing the alteration patterns that occur in naturally altered glasses with those that occur in accelerated laboratory environments. This comparison is done by (1) describing the alteration of glasses reacted in nature over long periods of time and in accelerated laboratory environments and (2) establishing the reaction kinetics of naturally altered glass and laboratory reacted glass waste forms.

1175 (ANL/CMT/CP--89924) **Colloid formation during waste glass corrosion.** Mertz, C.J.; Buck, E.C.; Fortner, J.A.; Bates, J.K. Argonne National Lab., IL (United States). 1996. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9605162--3: National Academy of Sciences (NAS) on glass as a waste form and vitrification technology: an international workshop, Washington, DC (United States), 13 May 1996). Order Number DE96009460. Source: OSTI; NTIS; INIS; GPO Dep.

The long-term behavior of nuclear waste glass in a geologic repository may require a technical consideration of the role of colloids in the release and transport of radionuclides. The neglect of colloidal properties in assessing the near- and far-field migration behavior of actinides may lead to significant underestimates and poor predictions of biosphere exposure from high-level waste (HLW) disposal. Existing data on colloid-facilitated transport suggests that radionuclide migration may be enhanced, but the importance of colloids is not adequately assessed. Indeed, the occurrence of radionuclide transport, attributed to colloidal species, has been reported at Mortandad Canyon, Los Alamos and at the Nevada Test Site; both unsaturated regions are similar to the proposed HLW repository at Yucca Mountain. Although some developments have been made on understanding the transport characteristics of colloids, the characterization of colloids generated from the corrosion of the waste form has been limited. Colloids are known to incorporate radionuclides either from hydrolysis of dissolved species (real colloids) or from adsorption of dissolved species onto existing groundwater colloids (pseudocolloids); however, these colloids may be considered secondary and solubility limited when compared to the colloids generated during glass alteration.

1176 (ANL/CMT/VU–86003) **Application of single ion activity coefficients to determine solvent extraction mechanism for components of high level nuclear waste.** Nunez, L.; Vandegrift, G.F. Argonne National Lab., IL (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-951057–6: 9. symposium on separation science and technology for energy applications, Gatlinburg, TN (United States), 22-26 Oct 1995). Order Number DE96004291. Source: OSTI; NTIS; INIS; GPO Dep.

The TRUEX solvent extraction process is being developed to remove and concentrate transuranic (TRU) elements from high-level and TRU radioactive wastes currently stored at US Department of Energy sites. Phosphoric acid is one of the chemical species of concern at the Hanford site where bismuth phosphate was used to recover plutonium. The mechanism of phosphoric acid extraction with TRUEX-NPH solvent at 25°C was determined by phosphoric acid distribution ratios, which were measured by using phosphoric acid radiotracer and a variety of aqueous phases containing different concentrations of nitric acid and nitrate ions. A model was developed for predicting phosphoric acid distribution ratios as a function of the thermodynamic activities of nitrate ion and hydrogen ion. The Generic TRUEX Model (GTM) was used to calculate these activities based on the Bromley method. The derived model supports CMPO and TBP extraction of a phosphoric acid-nitric acid complex and a CMPO-phosphoric acid complex in TRUEX-NPH solvent.

1177 (ANL/EA/CP–89045) **Projected transuranic waste loads requiring treatment, storage, and disposal.** Hong, K.; Kotek, T. Argonne National Lab., IL (United States). [1996]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-960212–38: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96006902. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides information on the volume of TRU waste loads requiring treatment, storage, and disposal at DOE facilities for three siting configurations. Input consisted of updated inventory and generation data from. Waste Isolation Pilot plant Transuranic Waste Baseline Inventory report. Results indicate that WIPP's design capacity is sufficient for the CH TRU waste found throughout the DOE Complex.

1178 (ANL/EAD/TM–17-Draft) **High-level waste inventory, characteristics, generation, and facility assessment for treatment, storage, and disposal alternatives considered in the U.S. Department of Energy Environmental Management Programmatic Environmental Impact Statement.** Folga, S.M. (Argonne National Lab., IL (United States). Environmental Assessment Div.); Conzelmann, G.; Gillette, J.L.; Kier, P.H.; Poch, L.A. Argonne National Lab., IL (United States). Apr 1995. 160p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017834. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides data and information needed to support the risk and impact assessments of high-level waste (HLW) management alternatives in the US Department of Energy Waste Management (WM) Programmatic Environmental Impact Statement (PEIS). Available data on the physical form, chemical and isotopic composition, storage locations, and other waste characteristics of interest are presented. High-level waste management follows six implementation phases: current storage, retrieval, pretreatment, treatment, interim canister storage, and geologic repository disposal; pretreatment, treatment, and repository disposal are outside the scope of the WM PEIS. Brief descriptions of current and planned HLW management facilities are provided, including information on the type of waste managed in the facility, costs, product form, resource requirements, emissions, and current and future status. Data sources and technical and regulatory assumptions are identified. The range of HLW management alternatives (including decentralized, regionalized, and centralized approaches) is described. The required waste management facilities include expanded interim storage facilities under the various alternatives. Resource requirements for construction (e.g., land and materials) and operation (e.g., energy and process chemicals), work force, costs, effluents, design capacities, and emissions are presented for each alternative.

1179 (ANL/EAD/TM–22-Draft) **Transuranic waste inventory, characteristics, generation, and facility assessment for treatment, storage, and disposal alternatives considered in the U.S. Department of Energy waste management programmatic environmental impact statement.** Hong, K. (and others); Kotek, T.; Koebnick, B. Argonne National Lab., IL (United States). Environmental Assessment Div. Apr 1995. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017826. Source: OSTI; NTIS; INIS; GPO Dep.

Transuranic waste (TRUW) loads and potential contaminant releases at and en route to treatment, storage, and disposal sites in the U.S. Department of Energy (DOE) complex are important considerations in DOE's Waste Management Programmatic Environmental Impact Statement (WM PEIS). Waste loads are determined in part by the level of treatment the waste has undergone and the complexwide configuration of origination, treatment, storage, and disposal sites selected for TRUW management. Other elements that impact waste loads are treatment volumes, waste characteristics, and the unit operation parameters of the treatment technologies. Treatment levels and site configurations have been combined into 10 TRUW management alternatives for study in the WM PEIS. This supplemental report to the WM

PEIS gives the projected waste loads and contaminant release profiles for DOE treatment sites under each of the 10 TRUW management alternatives. It gives TRUW characteristics and inventories for current DOE generation and storage sites, describes the treatment technologies for three levels of TRUW treatment, and presents the representative unit operation parameters of the treatment technologies. The data presented are primary inputs to developing the costs, health risks, and socioeconomic and environmental impacts of treating, packaging, and shipping TRUW for disposal.

1180 (ANL/EAD/TM–29-Draft-Vol.1) **Analysis of accident sequences and source terms at waste treatment and storage facilities for waste generated by U.S. Department of Energy Waste Management Operations, Volume 1: Sections 1-9.** Mueller, C. (and others); Nabelssi, B.; Roglans-Ribas, J. Argonne National Lab., IL (United States). Apr 1995. 144p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95017805. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the methodology, computational framework, and results of facility accident analyses performed for the U.S. Department of Energy (DOE) Waste Management Programmatic Environmental Impact Statement (WM PEIS). The accident sequences potentially important to human health risk are specified, their frequencies are assessed, and the resultant radiological and chemical source terms are evaluated. A personal computer-based computational framework and database have been developed that provide these results as input to the WM PEIS for calculation of human health risk impacts. The methodology is in compliance with the most recent guidance from DOE. It considers the spectrum of accident sequences that could occur in activities covered by the WM PEIS and uses a graded approach emphasizing the risk-dominant scenarios to facilitate discrimination among the various WM PEIS alternatives. Although it allows reasonable estimates of the risk impacts associated with each alternative, the main goal of the accident analysis methodology is to allow reliable estimates of the relative risks among the alternatives. The WM PEIS addresses management of five waste streams in the DOE complex: low-level waste (LLW), hazardous waste (HW), high-level waste (HLW), low-level mixed waste (LLMW), and transuranic waste (TRUW). Currently projected waste generation rates, storage inventories, and treatment process throughputs have been calculated for each of the waste streams. This report summarizes the accident analyses and aggregates the key results for each of the waste streams. Source terms are estimated and results are presented for each of the major DOE sites and facilities by WM PEIS alternative for each waste stream. The appendices identify the potential atmospheric release of each toxic chemical or radionuclide for each accident scenario studied. They also provide discussion of specific accident analysis data and guidance used or consulted in this report.

1181 (ANL/ET/CP–83253) **Capabilities for spent fuel characterization at Argonne National Laboratory.** Neimark, L.A.; Strain, R.V. Argonne National Lab., IL (United States). Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941207–37: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95012532. Source: OSTI; NTIS; INIS; GPO Dep.

Summaries of the status of spent nuclear fuel (SNF) owned by the Department of Energy have highlighted the need to obtain a better understanding of the current physical and chemical condition of the SNF as a foundation for establishing a clear path forward for the fuel's eventual geologic disposal in a long-term repository. To initiate obtaining the required information, DOE has generated an SNF Characterization Plan based on the needs for characterizing the materials stored at the individual major DOE storage sites. The principal focus of the plan is to characterize those fuel attributes that are key to the safe handling, transportation, and storage of the SNF. The drivers for specific attributes are regulatory requirements, resolution of technical issues, or a design need. Argonne National Laboratory's facilities in Illinois and Idaho possess capabilities that can be used to address many of the characterization issues that have been raised. This paper will describe these capabilities.

1182 (ANL/RE/CP–79448) **Effect of gravitation on the dynamic response of tanks containing two liquids.** Tang, Yu. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). (CONF-950740–70: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014079. Source: OSTI; NTIS; INIS; GPO Dep.

The exact solution to the dynamic response of circular cylindrical tanks containing two liquids, considering the gravitational (g) effect at the interface of the two liquids, is presented. Only rigid tanks were studied. The solution is expressed as the superposition of the so-called impulsive and convective solutions. The results are compared with those obtained by neglecting the gravitational effect at the interface to elucidate the g effect and with those of the tanks containing only one liquid to elucidate the effect of the interaction between two liquids. The response functions examined include the hydrodynamic pressure, base shear, base moments, sloshing motions at surface and at the interface of two liquids, and the associated sloshing frequencies. It is found that there are two natural frequencies associated with each sloshing mode in contrast to only one frequency associated with each sloshing mode if the g effect a-t the interface is neglected; also, the convective pressure has a discontinuity at the interface of two liquids, whereas the impulsive pressure is continuous at the interface. Further, it is shown that in a tank containing two liquids the maximum sloshing wave height may increase significantly, and the fundamental frequency of the sloshing motion is lower than that of an identical tank filled with only one liquid. Additionally, the well-known mechanical model for tanks containing one liquid is generalized for tanks containing two liquids.

1183 (ANL/RE/CP–85929) **Sloshing analysis of viscous liquid storage tanks.** Uras, R.Z. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950740–63: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014221. Source: OSTI; NTIS; INIS; GPO Dep.

The effect of viscosity on the sloshing response of tanks containing viscous liquids is studied using the in-house finite element computer code, FLUSTR-ANL. Two different tank sizes each filled at two levels, are modeled, and their dynamic responses under harmonic and seismic ground motions are simulated. The results are presented in terms of the wave height, and pressures at selected nodes and elements in the finite element mesh. The viscosity manifests itself as a damping effect, reducing the amplitudes. Under harmonic excitation, the dynamic response reaches the steady-state faster as the viscosity value becomes larger. The fundamental sloshing frequency for each study case stays virtually unaffected by an increase in viscosity. For the small tank case, a 5% difference is observed in the fundamental frequency of the smallest (1 cP) and the highest (1000 cP) viscosity cases considered in this study. The fundamental frequencies of the large tank are even less sensitive.

1184 (ANL/RE/CP–87833) **Sloshing impact in roofed tanks.** Uras, R.A. (Argonne National Lab., IL (United States). Reactor Engineering Div.). Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9511128–17: 5. Department of Energy (DOE) natural phenomena hazards mitigation symposium, Denver, CO (United States), 13-17 Nov 1995). Order Number DE96005263. Source: OSTI; NTIS; INIS; GPO Dep.

A large number of high-level waste (HLW) storage tanks exists in various tank farms. Seismic activities at those locations may cause significant sloshing in HLW tanks. These tanks are covered to avoid any spilling during large amplitude earthquakes. However, large amplitude sloshing may result in impact on the cover or the roof of the tank. Hence, a better understanding of the impact phenomenon is necessary to assess the safety of the tanks currently in existence, and to establish design guidelines for future designs. A pressure based formulation is derived to model sloshing impact in roofed tanks. It is incorporated into Argonne's in-house finite element code FLUSTR-ANL. A numerical test case with a harmonic input excitation is studied. The simulation results indicate that linear behavior is preserved beyond the first impact, and some mesh distortion is observed following a stronger second impact. During the impact, the displacement of the contacting surface nodes remains constant, and the velocities are reduced to zero. An identification of impacting nodes is possible from the dynamic pressures induced in surface elements.

1185 (BHI–00022-Rev.2) **Safety assessment for the 118-B-1 Burial Ground excavation treatability tests. Revision 2.** Zimmer, J.J.; Frain, J.M. Bechtel Hanford, Inc., Richland, WA (United States). Dec 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005707. Source: OSTI; NTIS; INIS; GPO Dep.

This revision of the Safety Assessment provides an auditable safety analysis of the hazards for the proposed treatability test activities per DOE-EM-STD-5502-94, DOE Limited Standard, Hazard Baseline Documentation (DOE 1994). The proposed activities are classified as radiological activities and as such, no longer require Operational Safety Limits (OSLs). The OSLS, Prudent Actions, and Institutional and Organization Controls have been removed from this revision and replaced with "Administrative Actions Important to Safety," as determined by the hazards analysis. Those Administrative Actions Important to Safety are summarized in Section 1.1, "Assessment Summary."

1186 (BHI–00174) **U Plant Aggregate Area Management study technical baseline report.** DeFord, D.H.; Carpenter, R.W. Bechtel Hanford, Inc., Richland, WA (United States). May 1995. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005836. Source: OSTI; NTIS; INIS; GPO Dep.

This document was prepared in support of an Aggregate Area Management Study of U Plant. It provides a technical baseline of the aggregate area and results from an environmental investigation that was undertaken by the Technical Baseline Section of the Environmental Engineering Group, Westinghouse Hanford Company (WHC), which is currently the Waste Site and Facility Research Office, Natural Resources, Bechtel Hanford, Inc. (BHI). It is based upon review and evaluation of numerous Hanford Site current and historical reports, drawings and photographs, supplemented with site inspections and employee interviews. U Plant refers to the 221-U Process Canyon Building, a chemical separation facility constructed during World War II. It also includes the Uranium Oxide (UO_3) Plant constructed at the same time as 221-U as an adjunct to the original plutonium separation process but which, like 221-U, was converted for other missions. Waste sites are associated primarily with U Plant's 1952 through 1958 Uranium Metal Recovery Program mission and the UO_3 Plant's ongoing UO_3 mission. Waste sites include cribs, reverse wells, french drains, septic tanks and drain fields, trenches, catch tanks, settling tanks, diversion boxes, a waste vault, and the lines and encasements that connect them. It also includes the U Pond and its feed ditches and an underground tank farm designed for high-level liquid wastes.

1187 (BHI–00176) **S Plant Aggregate Area Management study technical baseline report.** DeFord, D.H.; Carpenter, R.W. Bechtel Hanford, Inc., Richland, WA (United States). May 1995. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005834. Source: OSTI; NTIS; INIS; GPO Dep.

This document is prepared in support of an Aggregate Area Management Study of S Plant, 200 West Area, at the US Department of Energy's (DOE) Hanford Site near Richland, Washington. It provides a technical baseline of the aggregate area and the results from an environmental investigation undertaken by the Technical Baseline Section of the Environmental Engineering Group, Westinghouse Hanford Company (WHC). This document is based on review and evaluation of numerous Hanford Site current and historical reports, drawings and photographs, supplemented with site inspections and employee interviews. This report describes the REDOX facility and its waste sites, including cribs, french drains, septic tanks and drain fields, trenches, catch tanks, settling tanks, diversion boxes, underground tank farms designed for high-level liquid wastes, and the lines and encasements that connect them.

1188 (BHI–00177) **T Plant Aggregate Area Management Study technical baseline report.** DeFord, D.H.; Carpenter, R.W. Bechtel Hanford, Inc., Richland, WA (United States). Apr 1995. 192p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005833. Source: OSTI; NTIS; INIS; GPO Dep.

T Plant is located in the Hanford 200 West Area. This document provides a technical baseline of the aggregate area and results from an environmental investigation undertaken by the Technical Baseline Section of the Environmental Engineering Group, Westinghouse Hanford Co.(WHC), and by EBASCO, providing support to WHC. It describes T Plant and its waste sites, including cribs, french drains, septic tanks and drain fields, trenches and ditches, ponds, catch tanks, settling tanks, diversion boxes, underground tank farms for high- level liquid wastes, and the lines and encasements that connect them. Each waste site in the aggregate area is described separately. Close relations between waste units, such as overflow from one to another, are also discussed.

1189 (BHI-00178) **PUREX Plant aggregate area management study technical baseline report.** DeFord, D.H.; Carpenter, R.W. Bechtel Hanford, Inc., Richland, WA (United States). May 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005048. Source: OSTI; NTIS; INIS; GPO Dep.

The PUREX aggregate area is made up of six operable units; 200-PO-1 through 200-PO-6 and consists of liquid and solid waste disposal sites in the vicinity of, and related to, PUREX Plant operations. This report describes PUREX and its waste sites, including cribs, french drains, septic tanks and drain fields, trenches and ditches, ponds, catch tanks, settling tanks, diversion boxes, underground tank farms, and the lines and encasements that connect them. Each waste site in the aggregate area is described separately. Close relationships between waste units, such as overflow from one to another, are also discussed. This document provides a technical baseline of the aggregate area and results from an environmental investigation. This document is based upon review and evaluation of numerous Hanford Site current and historical reports, drawings and photographs, supplemented with site inspections and employee interviews. No intrusive field investigations or sampling were conducted.

1190 (BHI-00179) **B Plant aggregate area management study technical baseline report.** DeFord, D.H.; Carpenter, R.W. Bechtel Hanford, Inc., Richland, WA (United States). May 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005047. Source: OSTI; NTIS; INIS; GPO Dep.

The B aggregate area is made up of 13 operable units; 200-BP 1 through 200-BP 1 1, 200-IU-6, and 200-SS-1 that consist of liquid and solid waste disposal sites in the vicinity of, and related to, B Plant operations. This report describes B Plant and its waste sites, including cribs, french drains, septic tanks and drain fields, trenches and ditches, ponds, catch tanks, settling tanks, diversion boxes, underground tank farms designed for high-level liquid wastes, and the lines and encasements that connect them. Each waste site in the aggregate area is described separately. Close relationships between waste units, such as overflow from one to another, are also discussed. This document provides a technical baseline of the aggregate area and results from an environmental investigation. This document is based upon review and evaluation of numerous Hanford Site current and historical reports, drawings and photographs, supplemented with site inspections and employee interviews. No intrusive field investigations or sampling were conducted.

1191 (BHI-00247-Rev.1) **241-CX-70, 241-CX-71, and 241-CX-72 underground storage tanks at the strontium semiworks facility supplemental information to the Hanford Facility Contingency Plan.** Ingle, S.J. Bechtel Hanford, Inc., Richland, WA (United States). Mar 1996. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96008207. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a unit-specific contingency plan for the underground storage tanks at the Strontium Semiworks Facility and is intended to be used as a supplement to the Hanford Facility Contingency Plan. This unit-specific plan is to be used to demonstrate compliance with the contingency plan requirements of WAC 173-303 for certain Resource Conservation and Recovery Act of 1976 (RCRA) waste management units. Radioactive material is contained in three underground storage tanks: 241-CX-70, 241-CX-71, and 241-CX-72. Tank 241-CX-70 has been emptied, except for residual quantities of waste, and has been classified as an elementary neutralization tank under the RCRA. Tanks 241-CX-71 and 241-CX-72 contain radioactive and Washington State-only dangerous waste material, but do not present a significant hazard to adjacent facilities, personnel, or the environment. Currently, dangerous waste management activities are not being applied at the tanks. It is unlikely that any incidents presenting hazards to public health or the environment would occur at the Strontium Semiworks Facility.

1192 (BHI-00616-Rev.) **216-T-4 interim stabilization final report.** Smith, D.L. Bechtel Hanford, Inc., Richland, WA (United States). [1996]. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE96005931. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a general description of the activities performed for the interim stabilization of the 216-T-4-1 ditch, 216-T-4-2 ditch, and 216-T-4-2 pond. Interim stabilization was required to reduce the amount of surface-contaminated acres and to minimize the migration of radioactive contamination. Work associated with the 216-T4-1 ditch and 216-T-4-2 pond was performed by the Radiation Area Remedial Action (RARA) Project. Work associated with the 216-T-4-2 ditch was done concurrently but was funded by Westinghouse Hanford Company (WHC) Tank Waste Remediation Systems (TWRS).

1193 (BNL-52361(Rev.10/95)) **Seismic design and evaluation guidelines for the Department of Energy High-Level Waste Storage Tanks and Appurtenances.** Bandyopadhyay, K.; Cornell, A.; Costantino, C.; Kennedy, R.; Miller, C.; Veletsos, A. Brookhaven National Lab., Upton, NY (United States). Oct 1995. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE96004058. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides seismic design and evaluation guidelines for underground high-level waste storage tanks. The guidelines reflect the knowledge acquired in the last two decades in defining seismic ground motion and calculating hydrodynamic loads, dynamic soil pressures and other loads for underground tank structures, piping and equipment. The application of the guidelines is illustrated with examples. The guidelines are developed for a specific design of underground storage tanks, namely double-shell structures. However, the methodology discussed is applicable for other types of tank structures as well. The application of these and of suitably adjusted versions of these concepts to other structural types will be addressed in a future version of this document. The original version of this document was published in January 1993. Since then, additional studies have been performed in several areas and the results are included in this revision. Comments received from the users are also addressed. Fundamental concepts supporting the basic seismic criteria contained in the original version have since then been incorporated and published in DOE-STD-1020-94 and its technical basis documents. This information has been deleted in the current revision.

1194 (BNL–61646) **Aging mechanisms for steel components of high-level waste storage tanks.** Weeks, J.; Bandyopadhyay, K.; Bush, S.; Kassir, M.; Mather, B.; Shewmon, P.; Streicher, M.; Thompson, B.; van Rooyen, D. Brookhaven National Lab., Upton, NY (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–48: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95011775. Source: OSTI; NTIS; INIS; GPO Dep.

High level storage tanks in service at the present time were fabricated from either carbon steel or low-carbon stainless steel, in each case surrounded by a concrete vault. A variety of potential degradation mechanisms may affect these steel tanks, including corrosion, stress-corrosion cracking, fatigue, radiation, erosion, and hydrogen embrittlement. Historically, some of the non-stress-relieved carbon steel tanks have leaked; in the only failure analysis performed to date, stress corrosion cracking in the heat-affected zone (HAZ) of the weld was identified as the cause. Potentially significant aging mechanisms include general corrosion, pitting and/or crevice corrosion stress-corrosion cracking, microbiologically-induced corrosion, concentration cell attack, and corrosion of external tank surfaces by in-leakage of ground water. Aging mechanisms which are deemed non-significant include thermal and radiation embrittlement, creep and stress relaxation, fatigue, erosion and erosion/corrosion wear, and hydrogen embrittlement. Justification for the potential significance or non-significance for each mechanism is provided, based on the current understanding of these processes and the environments to which the tanks are exposed.

1195 (BNL–61647) **Nondestructive examination of DOE high-level waste storage tanks.** Bush, S.; Bandyopadhyay, K.; Kassir, M.; Mather, B.; Shewmon, P.; Streicher, M.; Thompson, B.; van Rooyen, D.; Weeks, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–46: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95011776. Source: OSTI; NTIS; INIS; GPO Dep.

A number of DOE sites have buried tanks containing high-level waste. Tanks of particular interest am double-shell inside concrete cylinders. A program has been developed for the inservice inspection of the primary tank containing high-level waste (HLW), for testing of transfer lines and for the inspection of the concrete containment where possible. Emphasis is placed on the ultrasonic examination of selected areas of the primary tank, coupled with a leak-detection system capable of detecting small leaks through the wall of the primary tank. The NDE program is modelled after ASME Section XI in many respects, particularly with respects to the sampling protocol. Selected testing of concrete is planned to determine if there has been any significant degradation. The most probable failure mechanisms are corrosion-related so that the examination program gives major emphasis to possible locations for corrosion attack.

1196 (BNL–61648) **An overview of the DOE high-level waste storage tank structural integrity assessment guidelines.** Bandyopadhyay, K.; Bush, S.; Kassir, M.; Mather, B.; Shewmon, P.; Streicher, M.; Thompson, B.; van Rooyen, D.; Weeks, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–38: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95010449. Source: OSTI; NTIS; INIS; GPO Dep.

The basic elements of a structural integrity program for high-level waste storage tanks include identifying significant aging degradation mechanisms, developing programs to monitor and control these degradation processes, and developing management options and procedures to minimize impact on the environment should tank leakage develop. A Waste Tank Structural Integrity Panel (TSIP) was established by Brookhaven National Laboratory at the request of the DOE Office of Environmental Restoration and Waste Management to review these elements and prepare a set of guidelines that could be used by DOE and its contractors to manage the structural integrity of these tanks. These guidelines emphasize the identification of significant degradation mechanisms for both the steel and concrete components of the tanks, the recommended monitoring and inspection programs, and the indicated management options.

1197 (BNL–61651) **Aging mechanisms for concrete components of High-Level Waste storage tanks.** Kassir, M.; Bandyopadhyay, K.; Bush, S.; Mather, B.; Shewmon, P.; Streicher, M.; Thompson, B.; van Rooyen, D.; Weeks, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–34: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95011403. Source: OSTI; NTIS; INIS; GPO Dep.

The age-related degradation mechanisms which affect the concrete and the reinforcing steel in the high-level waste (HLW) storage tanks art evaluated with respect to their potential significance to the continued performance of the concrete, and am classified into non-significant and potentially significant. The identified potentially significant degradation mechanisms include the effects of elevated temperature, freezing and thawing, leaching of calcium hydroxide, aggressive chemical attack, and corrosion of the reinforcing steel. To the extent that available knowledge permits, these mechanisms are generically evaluated and quantified so that site-specific plans may be developed to verify whether significant degradation has occurred in the concrete, and, if so, to formulate mitigating measures to avoid further deterioration and possibly repair the degradation or pursue other management options.

1198 (BNL–61711) **Seismic design evaluation guidelines for buried piping for the DOE HLW Facilities.** Lin, Chi-Wen (Consultant, Martinez, CA (United States)); Antaki, G.; Bandyopadhyay, K.; Bush, S.H.; Costantino, C.; Kennedy, R. Brookhaven National Lab., Upton, NY (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–45: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95011777. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the seismic design and evaluation guidelines for underground piping for the Department of Energy (DOE) High-Level-Waste (HLW) Facilities. The underground piping includes both single and double containment steel pipes and concrete pipes with steel lining, with particular emphasis on the double containment piping. The design and evaluation guidelines presented in this paper follow the generally accepted beam-on-elastic-foundation analysis principle and the inertial response calculation method, respectively, for piping directly in contact with the soil or contained in a jacket. A standard analysis procedure is described along with the discussion of factors deemed to be significant for the design of the underground piping. The following key considerations are addressed: the design feature and safety requirements for the inner (core) pipe and the outer pipe; the effect of soil strain and wave passage; assimilation of the necessary seismic and soil data; inertial response calculation for the inner pipe; determination of support anchor movement loads; combination of design loads; and code comparison. Specifications and justifications of the key parameters used, stress components to be calculated and the allowable stress and strain limits for code evaluation are presented.

1199 (BNL–62294) **Underground nuclear waste containments.** Bandyopadhyay, K.K. Brookhaven National Lab., Upton, NY (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9507189–1: IABSE colloquium on reliable containment for the future, London (United Kingdom), 11-12 Jul 1995). Order Number DE96001917. Source: OSTI; NTIS; INIS; GPO Dep.

In the United States, about a hundred million gallons of high-level nuclear waste are stored in underground containments. Basically, these containments are of two different designs: single-shell and double-shell structures. The single-shell structures consist of reinforced concrete cylindrical walls seated on circular mats and enclosed on top with torispherical domes or circular flat roofs. The walls and the basemats are lined with carbon steel. The double-shell structures provide another layer of protection and constitute a completely enclosed steel containment within the single-shell structure leaving an annular space between the two walls. Single-shell containments are of earlier vintage and were built in the period 1945-1965. Double-shell structures were built through the 1960s and 1970s. Experience gained in building and operating the single-shell containments was used in enhancing the design and construction of the double-shell structures. Currently, there are about 250 underground single-shell and double-shell structures containing the high-level waste with an inventory of about 800 million curies. During their service lives, especially in early stages, these structures were subjected to thermal excursions of varying extents; also, they have aged in the chemical environment. Furthermore, in their remaining service lives, the structures may be subjected to loads for which they were not designed, such as larger earthquakes or chemical explosions. As a result, the demonstration of safety of these underground nuclear containments poses a challenge to structural engineers, which increases with time. Regardless of current plans for gradual retrieval of the waste and subsequent solidification for disposal, many of these structures are expected to continue to contain the waste through the next 20-40 years. In order to verify their structural capabilities in fulfilling this mission, several studies were recently performed at Brookhaven National Laboratory.

1200 (BNL–63030) **Consideration of kinematic interaction in determining seismic responses of underground structures.** Xu, J. (City Univ. of New York, NY (United States)); Bandyopadhyay, K.K.; Miller, C.A. Brookhaven National Lab., Upton, NY (United States). [1996]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-960706–20: American Society of Mechanical Engineers (ASME) pressure vessels and piping conference, Montreal (Canada), 21-26 Jul 1996). Order Number DE96010691. Source: OSTI; NTIS; INIS; GPO Dep.

This paper investigates the effect of kinematic interaction on the seismic responses of underground structures through a parametric study. A buried concrete, cylindrical tank, typical of those found in DOE high-level waste sites, was analyzed for the seismic response using the computer program SASSI. The key response parameters were evaluated to identify the potential effects of kinematic interactions The results of the study are presented in this paper.

1201 (CAO–94-1005-Rev.1-Vol.1) **Waste Isolation Pilot Plant Transuranic Waste Baseline inventory report. Volume 1. Revision 1.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div.; USDOE Carlsbad Area Office, NM (United States). Feb 1995. 144p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95009611. Source: OSTI; NTIS; INIS; GPO Dep.

Report includes diskette designed to run on IBM PC or compatible equipment.

This document provides baseline inventories of transuranic wastes for the WIPP facility. Information on waste forms, forecasting of future inventories, and waste stream originators is also provided. A diskette is provided which contains the inventory database.

1202 (CAO–94-1005-Rev.1-Vol.2) **Waste Isolation Pilot Plant Transuranic Waste Baseline inventory report. Volume 2. Revision 1.** USDOE Carlsbad Area Office, NM (United States). Feb 1995. 887p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95009612. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the Baseline Inventory Report for the transuranic (alpha-bearing) wastes stored at the Waste Isolation Pilot Plant (WIPP) in New Mexico. Waste stream profiles including origin, applicable EPA codes, typical isotopic composition, typical waste densities, and typical rates of waste generation for each facility are presented for wastes stored at the WIPP.

1203 (CAO–94-1005-Rev.1-Vol.3) **Waste Isolation Pilot Plant Transuranic Waste Baseline inventory report. Volume 3. Revision 1.** USDOE Carlsbad Area Office, NM (United States). Feb 1995. 234p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95009613. Source: OSTI; NTIS; INIS; GPO Dep.

This report consists of information related to the waste forms at the WIPP facility from the waste originators. Data for retrievably stored, projected and total wastes are given.

1204 (CAO–94-1010) **Transuranic Waste Characterization Quality Assurance Program Plan.** USDOE Carlsbad Area Office, NM (United States). 30 Apr 1995. 258p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012993. Source: OSTI; NTIS; INIS; GPO Dep.

This quality assurance plan identifies the data necessary, and techniques designed to attain the required quality, to meet the specific data quality objectives associated with the DOE Waste Isolation Pilot Plant (WIPP). This report specifies sampling, waste testing, and analytical methods for transuranic wastes.

1205 (CONF-940401–19) **LINAC-based transuranic waste characterization system.** Schultz, F.J. (Oak Ridge National Lab., TN (United States)); Womble, P.C.; Vourvopoulos, G.; Roberts, M.L. Oak Ridge National Lab., TN (United States). [1994]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on methods and applications of radioanalytical chemistry; Kona, HI (United States); 10-16 Apr 1994. Order Number DE96010003. Source: OSTI; NTIS; INIS; GPO Dep.

Remote-handled transuranic nuclear waste poses a particular challenge for assaying due to the high neutron and gamma ray background that emanates from the non-fissile, but highly radioactive material, contained with the waste. The utilization of a RFQ linac with a neutron flux has shown that, in principle, the differential die-away technique can reliably assay this special class of nuclear waste.

1206 (CONF-950171–2) **Sludge washing and dissolution of Melton Valley Storage Tank waste.** Beahm, E.C. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Efficient Separations and Processing Integrated Program (ESPIP) technical integration and exchange (TIE) meeting; Gaithersburg, MD (United States); 24-26 Jan 1995. Order Number DE96008643. Source: OSTI; NTIS; INIS; GPO Dep.

Focus is on experimental and modeling R&D for comprehensive sludge/supernatant processing flowsheet being done for the Underground Storage Tank Integration Demonstration; emphasis is on Hanford tank waste disposal involving dissolution of the sluge before pretreatment. Combination of tests on actual Melton Valley Storage Tank (MVST) sludge, tests on sludge simulants, and modeling of sludge chemistry provides a broad evaluation of sludge and supernate processing. The information is useful for both MVST and Hanford tank wastes.

1207 (CONF-950232–32) **Testing of the West Valley Vitrification Facility transfer cart control system.** Halliwell, J.W.; Bradley, E.C. Oak Ridge National Lab., TN (United States); West Valley Nuclear Services Co., Inc., West Valley, NY (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; AC24-81NE44139. From 6. American Nuclear Society meeting on robotics and remote systems; Monterey, CA (United States); 5-10 Feb 1995. Order Number DE95006620. Source: OSTI; NTIS; INIS; GPO Dep.

Oak Ridge National Laboratory (ORNL) has designed and tested the control system for the West Valley Demonstration Project Vitrification Facility transfer cart. The transfer cart will transfer canisters of vitrified high-level waste remotely within the Vitrification Facility. The control system operates the cart under battery power by wireless control. The equipment includes cart-mounted control electronics, battery charger, control pendants, engineer's console, and facility antennas. Testing was performed in several phases of development: (1) prototype equipment was built and tested during design, (2) board-level testing was then performed at ORNL during fabrication, and (3) system-level testing was then performed by ORNL at the fabrication subcontractor's facility for the completed cart system. These tests verified (1) the performance of the cart relative to design requirements and (2) operation of various built-in cart features. The final phase of testing is planned to be conducted during installation at the West Valley Vitrification Facility.

1208 (CONF-950596–2) **Application of multisorbent traps to characterization and quantification of workplace exposure source terms.** Dindal, A.B.; Ma, Cheng-Yu; Jenkins, R.A.; Higgins, C.E.; Skeen, J.T.; Bayne, C.K. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on measurement of toxic and related air pollutants; Durham, NC (United States); 2-5 May 1995. Order Number DE95016354. Source: OSTI; NTIS; INIS; GPO Dep.

Multisorbent traps have been used for several years to characterize complex atmospheres. Only more recently have multisorbent traps been used for quantitative analysis. The traps provide an effective method for retaining a wide range of airborne Organic contaminants, since these carbonaceous sorbents are relatively hydrophobic, have large surface areas, do not have active functional groups, and have fewer chemical artifacts than other sorbents. Multisorbent traps, which are 76 mm in length and have a 6 mm outside diameter, contain sequentially loaded beds of Carbotrap C, Carbotrap, and Carbosieve SIII, similar to a commercially available trap. The injection port of a gas chromatograph is configured for thermal desorption analysis of the traps via an in-house modification. Currently, multisorbent traps are being used to sample the headspace of underground storage tanks at the Department of Energy's Hanford site, in Richland, Washington. The analyses are performed by flame ionization or mass spectrometric detection. Target organic analytes include C_6 to C_{13} alkanes, nitriles, alkyl ketones, dibutyl butyl phosphonate and tributyl phosphate. Pre-analytical holding times or practical reporting times for many target analytes are at least 84 days under either refrigerated or ambient conditions. Traps are fabricated, conditioned, and spiked with three surrogate standards in the vapor phase prior to shipment to the site. Recovery of the surrogates from the multisorbent traps serve as a statistical process control. Source concentrations of Hanford underground storage tank headspaces range from 0.96 mg/m^3 to 1200 mg/m^3.

1209 (CONF-9505101–1) **Batch test equilibration studies examining the removal of Cs, Sr, and Tc from supernatants from ORNL underground storage tanks by selected ion exchangers.** Collins, J.L.; Egan, B.Z.; Anderson, K.K.; Chase, C.W.; Bell, J.T. Oak Ridge National Lab., TN (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on challenges and innovations in the management of hazardous waste; Washington, DC (United States); 10-12 May 1995. Order Number DE95013204. Source: OSTI; NTIS; INIS; GPO Dep.

Bench-scale batch equilibration tests have been conducted with supernatants from two underground tanks at the

Melton Valley Storage Tank (MVST) Facility at Oak Ridge National Laboratory (ORNL) to determine the effectiveness of selected ion exchangers in removing cesium, strontium, and technetium. Seven sorbents were evaluated for cesium removal, nine for strontium removal, and four for technetium removal. The results indicate that granular potassium cobalt hexacyanoferrate was the most effective of the exchangers evaluated for removing cesium from the supernatants. The powdered forms of sodium titanate (NaTiO) and cystalline silicotitanate (CST) were superior in removing the strontium; however, for the sorbents of suitable particle size for column use, titanium monohydrogen phosphate (TiHP ϕ), sodium titanate/polyacrylonitrile (NaTiO-PAN), and titanium monohydrogen phosphate/polyacrylonitrile (TiP-PAN) gave the best results and were about equally effective. Reillex™ 402 was the most effective exchanger in removing the technetium; however, it was only slightly more satisfactory than Reillex™ HPQ.

1210 (CONF-9505101–5) **Waste processing demonstrations within the Waste Pretreatment and Processing Program of the Tank Focus Area.** Hunt, R.D.; McGinnis, C.P. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on challenges and innovations in the management of hazardous waste; Washington, DC (United States); 10-12 May 1995. Order Number DE95013984. Source: OSTI; NTIS; INIS; GPO Dep.

US Department of Energy (DOE) Office of Environmental Management has created a new approach for the development of technology for DOE environmental remediation problems. Previously, technology development was conducted on a site-by-site basis and managed by multiple organizations. This new DOE strategy consolidates and focuses all technology development efforts on five priority problems. The remediation of the 1 × 10^8 gal of radioactive waste in the underground storage tanks (USTs) at five DOE sites is one of the priority problems. All tank remediation projects will be integrated into the Tank Focus Area (TFA). The TFA mission is to manage an integrated technology development program that results in the safe and efficient remediation of UST waste across the DOE complex. The TFA has divided its efforts into several areas such as safety, characterization, retrieval, pretreatment and processing, immobilization, and site closure. A key predecessor of the Waste Pretreatment and Processing Program (WPPP) of the TFA was the Waste Processing and Disposal Program (WPDP) of the Underground Storage Tank – Integrated Demonstration. Nearly all of the FY 1995 WPDP projects have been transferred into the WPPP. These WPPP projects can be divided into four systems: cesium removal, comprehensive sludge and supernate, out-of-tank evaporation, and cross-flow filtration. The current status of these WPPP projects is presented. The goal of the projects is to minimize the volume of high-level waste and the radioactivity in low-level waste.

1211 (CONF-9507119–10) **Case study to remove radioactive hazardous sludge from long horizontal storage tanks.** Hylton, T.D.; Youngblood, E.L.; Cummins, R.L. Oak Ridge National Lab., TN (United States). [1995]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Summer national meeting of the American Institute of Chemical Engineers; Boston, MA (United States); 30 Jul - 2 Aug 1995. Order Number DE96010736. Source: OSTI; NTIS; INIS; GPO Dep.

The removal of radioactive hazardous sludge from waste tanks is a significant problem at several US Department of Energy (DOE) sites. The use of submerged jets produced by mixing pumps lowered into the supernatant/sludge interface to produce a homogeneous slurry is being studied at several DOE facilities. The homogeneous slurry can be pumped from the tanks to a treatment facility or alternative storage location. Most of the previous and current studies with this method are for flat-bottom tanks with vertical walls. Because of the difference in geometry, the results of these studies are not directly applicable to long horizontal tanks such as those used at the Oak Ridge National Laboratory. Mobilization and mixing studies were conducted with a surrogate sludge (e.g., kaolin clay) using submerged jets in two sizes of horizontal tanks. The nominal capacities of these tanks were 0.87 m^3 (230 gal) and 95 m^3 (25,000 gal). Mobilization efficiencies and mixing times were determined for single and bidirectional jets in both tanks with the discharge nozzles positioned at two locations in the tanks. Approximately 80% of the surrogate sludge was mobilized in the 95-m^3 tank using a fixed bidirectional jet (inside diameter = 0.035 m) and a jet velocity of 6.4 m/s (21 ft/s).

1212 (CONF-951006–29) **Quality assurance procedures for the analysis of TRU waste samples.** Glasgow, D.C. Giaquinto, J.M. (Oak Ridge National Lab., TN (United States). Chemical and Analytical Sciences Div.); Robinson, L. Oak Ridge National Lab., TN (United States). 5 Oct 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society (ANS); San Francisco, CA (United States); 29 Oct - 1 Nov 1995. Order Number DE96004599. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) project was undertaken in response to the growing need for a national repository for transuranic (TRU) waste. Guidelines for WIPP specify that any waste item to be interred must be fully characterized and analyzed to determine the presence of chemical compounds designated hazardous and certain toxic elements. The Transuranic Waste Characterization Program (TWCP) was launched to develop analysis and quality guidelines, certify laboratories, and to oversee the actual waste characterizations at the laboratories. ORNL is participating in the waste characterization phase and brings to bear a variety of analytical techniques including ICP-AES, cold vapor atomic absorption, and instrumental neutron activation analysis (INAA) to collective determine arsenic, cadmium, barium, chromium, mercury, selenium, silver, and other elements. All of the analytical techniques involved participate in a cooperative effort to meet the project objectives. One important component of any good quality assurance program is determining when an alternate method is more suitable for a given analytical problem. By bringing to bear a whole arsenal of analytical techniques working toward common objectives, few analytical problems prove to be insurmountable. INAA and ICP-AES form a powerful pair when functioning in this cooperative manner. This paper will provide details of the quality assurance protocols, typical results from quality control samples for both INAA and ICP-AES, and detail method cooperation schemes used.

1213 (CONF-951057–8) **Department of Energy pretreatment of high-level and low-level wastes.** McGinnis, C.P.; Hunt, R.D. Oak Ridge National Lab., TN (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From

9. symposium on separation science and technology for energy applications; Gatlinburg, TN (United States); 22-26 Oct 1995. Order Number DE96005398. Source: OSTI; NTIS; INIS; GPO Dep.

The remediation of the 1×10^8 gal of highly radioactive waste in the underground storage tanks (USTs) at five US Department of Energy (DOE) sites is one of DOE's greatest challenges. Therefore, the DOE Office of Environmental Management has created the Tank Focus Area (TFA) to manage an integrated technology development program that results in the safe and efficient remediation of UST waste. The TFA has divided its efforts into five areas, which are safety, characterization, retrieval/closure, pretreatment, and immobilization. All DOE pretreatment activities are integrated by the Pretreatment Technical Integration Manager of the TFA. For FY 1996, the 14 pretreatment tasks are divided into 3 systems: supernate separations, sludge treatment, and solid/liquid separation. The plans and recent results of these TFA tasks, which include two 25,000-gal demonstrations and two former TFA tasks on Cs removal, are presented. The pretreatment goals are to minimize the volume of high-level waste and the radioactivity in low-level waste.

1214 (CONF-9511189–1) **Design of microwave vitrification systems for radioactive waste.** White, T.L. (Oak Ridge National Lab., TN (United States)); Wilson, C.T.; Schaich, C.R.; Bostick, T.L. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Workshop on vitrification of low level waste: the process and potential; San Antonio, TX (United States); 5-6 Nov 1995. Order Number DE96005450. Source: OSTI; NTIS; INIS; GPO Dep.

Oak Ridge National Laboratory (ORNL) is involved in the research and development of high-power microwave heating systems for the vitrification of Department of Energy (DOE) radioactive sludges. Design criteria for a continuous microwave vitrification system capable of processing a surrogate filtercake sludge representative of a typical waste-water treatment operation are discussed. A prototype 915-MHz, 75-kW microwave vitrification system or "microwave melter" is described along with some early experimental results that demonstrate a 4 to 1 volume reduction of a surrogate ORNL filtercake sludge.

1215 (CONF-960158–2) **Task summary: Hot demonstration of proposed commercial nuclide removal technology.** Lee, D.D.; Travis, J.R. Oak Ridge National Lab., TN (United States). Nov 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Efficient separations and processing crosscutting program 1996 technical meeting; Gaithersburg, MD (United States); 16-19 Jan 1996. Order Number DE96005667. Source: OSTI; NTIS; INIS; GPO Dep.

Radionuclides represent only a small fraction of the components in millions of gallons of storage tank supernatant at various sites, including Oak Ridge, Hanford, Savannah River, and Idaho. Most of the radioactivity is contributed by cesium, strontium, and technetium along with high concentrations of sodium and potassium salts. The purpose of this task is to test and select sorbents and commercial removal technologies supplied by ESP for removing and concentrating the radionuclides, thereby reducing the volume of waste to be stored or disposed.

1216 (CONF-960158–3) **Solvent extraction of radionuclides from aqueous tank waste.** Bonnesen, P.V.; Sachleben, R.A.; Moyer, B.A. Oak Ridge National Lab., TN (United States). [1996]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Efficient separations and processing crosscutting program 1996 technical meeting; Gaithersburg, MD (United States); 16-19 Jan 1996. Order Number DE96005368. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this task is to develop an efficient solvent-extraction and stripping process for the removal of the fission products Tc-99, Sr-90, and Cs-137 from alkaline tank wastes, such as those stored at Hanford and Oak Ridge. As such, this task expands upon FY 1995's successful development of a solvent-extraction and stripping process for technetium separation from @e tank-waste solutions. This process has in fact already been extended to include the capability of removing both Tc and Sr simultaneously. In this form, the process has been given the name SRTALK and will be developed further in this program as a prelude to developing a system capable of removing Tc, Sr, and Cs together. Such a system could potentially simplify and improve fission-product removal from tank waste. In addition, it would possess the advantages already inherent in our Tc solvent-extraction process: No required feed adjustment, economical water stripping, low consumption of materials, and low waste volume.

1217 (CONF-960158–5) **Comprehensive supernate treatment: Task summary.** Egan, B.Z.; Collins, J.L.; Anderson, K.K.; Chase, C.W. Oak Ridge National Lab., TN (United States). 29 Nov 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Efficient separations and processing crosscutting program 1996 technical meeting; Gaithersburg, MD (United States); 16-19 Jan 1996. Order Number DE96005659. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. RADIOACTIVE WASTES/underground storage; CESIUM/sorption; STRONTIUM/sorption; TECHNETIUM/sorption; COBALT/sorption; ION EXCHANGE; RADIOACTIVE WASTE PROCESSING; CESIUM; SORPTION; STRONTIUM; TECHNETIUM; COBALT; MINIMIZATION; SEPARATION PROCESSES

1218 (CONF-960212–90) **The waste isolation pilot plant regulatory compliance program.** Mewhinney, J.A. (U.S. Dept. of Energy, Carlsbad, NM (United States)); Kehrman, R.F. Westinghouse Electric Corp., Carlsbad, NM (United States). [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. From Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment; Tucson, AZ (United States); 25-29 Feb 1996. Order Number DE96010277. Source: OSTI; NTIS; INIS; GPO Dep.

The passage of the WIPP Land Withdrawal Act of 1992 (LWA) marked a turning point for the Waste Isolation Pilot Plant (WIPP) program. It established a Congressional mandate to open the WIPP in as short a time as possible, thereby initiating the process of addressing this nation's transuranic (TRU) waste problem. The DOE responded to the LWA by shifting the priority at the WIPP from scientific investigations to regulatory compliance and the completion of prerequisites for the initiation of operations. Regulatory compliance activities have taken four main focuses: (1) preparing regulatory submittals; (2) aggressive schedules; (3) regulator interface; and (4) public interactions

1219 (CONF-960421–35) **Benefits/impacts of utilizing depleted uranium silicate glass as backfill for spent fuel waste packages.** Pope, R.B.; Forsberg, C.W.; Ashline, R.C.; DeHart, M.D.; Childs, K.W.; Tang, J.S. Oak Ridge National Lab., TN (United States). [1996]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-96OR22464. From 7. annual international high-level radioactive waste management conference; Las Vegas, NV (United States); 29 Apr - 3 May 1996. Order Number DE96008810. Source: OSTI; NTIS; INIS; GPO Dep.

An assessment has been made of the benefits and impacts which can be derived by filling a spent nuclear fuel multi-purpose canister with depleted uranium silicate (DUS) glass at a reactor site. Although the primary purpose of the DUS glass fill would be to enhance repository performance assessment and control criticality of geologic times, a number of benefits to the waste management system can be derived from adding the DUS glass prior to shipment from the reactor site.

1220 (DOE/AL/58309–59) **An analysis of the annual probability of failure of the waste hoist brake system at the Waste Isolation Pilot Plant (WIPP).** Greenfield, M.A. (Univ. of California, Los Angeles, CA (United States)); Sargent, T.J. New Mexico Inst. of Mining and Technology, Socorro, NM (United States). Nov 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-89AL58309. Order Number DE96003859. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Evaluation Group (EEG) previously analyzed the probability of a catastrophic accident in the waste hoist of the Waste Isolation Pilot Plant (WIPP) and published the results in Greenfield (1990; EEG-44) and Greenfield and Sargent (1993; EEG-53). The most significant safety element in the waste hoist is the hydraulic brake system, whose possible failure was identified in these studies as the most important contributor in accident scenarios. Westinghouse Electric Corporation, Waste Isolation Division has calculated the probability of an accident involving the brake system based on studies utilizing extensive fault tree analyses. This analysis conducted for the U.S. Department of Energy (DOE) used point estimates to describe the probability of failure and includes failure rates for the various components comprising the brake system. An additional controlling factor in the DOE calculations is the mode of operation of the brake system. This factor enters for the following reason. The basic failure rate per annum of any individual element is called the Event Probability (EP), and is expressed as the probability of failure per annum. The EP in turn is the product of two factors. One is the "reported" failure rate, usually expressed as the probability of failure per hour and the other is the expected number of hours that the element is in use, called the "mission time". In many instances the "mission time" will be the number of operating hours of the brake system per annum. However since the operation of the waste hoist system includes regular "reoperational check" tests, the "mission time" for standby components is reduced in accordance with the specifics of the operational time table.

1221 (DOE/AL/58309–60) **The influence of salt aerosol on alpha radiation detection by WIPP continuous air monitors.** Bartlett, W.T.; Walker, B.A. Environmental Evaluation Group, Albuquerque, NM (United States); Environmental Evaluation Group, Carlsbad, NM (United States). Jan 1996. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-89AL58309. (EEG–60). Order Number DE96004879. Source: OSTI; NTIS; INIS; GPO Dep.

Alpha continuous air monitors (CAMs) will be used at the Waste Isolation Pilot Plant (WIPP) to measure airborne transuranic radioactivity that might be present in air exhaust or in work-place areas. WIPP CAMs are important to health and safety because they are used to alert workers to airborne radioactivity, to actuate air-effluent filtration systems, and to detect airborne radioactivity so that the radioactivity can be confined in a limited area. In 1993, the Environmental Evaluation Group (EEG) reported that CAM operational performance was affected by salt aerosol, and subsequently, the WIPP CAM design and usage were modified. In this report, operational data and current theories on aerosol collection were reviewed to determine CAM quantitative performance limitations. Since 1993, the overall CAM performance appears to have improved, but anomalous alpha spectra are present when sampling-filter salt deposits are at normal to high levels. This report shows that sampling-filter salt deposits directly affect radon-thoron daughter alpha spectra and overall monitor efficiency. Previously it was assumed that aerosol was mechanically collected on the surface of CAM sampling filters, but this review suggests that electrostatic and other particle collection mechanisms are more important than previously thought. The mechanism of sampling-filter particle collection is critical to measurement of acute releases of radioactivity. 41 refs.

1222 (DOE/AL/58309–61) **Review of the WIPP draft application to show compliance with EPA transuranic waste disposal standards.** Neill, R.H. (and others); Chaturvedi, L.; Clemo, T.M. Environmental Evaluation Group, Albuquerque, NM (United States). Mar 1996. 202p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-89AL58309. (EEG–61). Order Number DE96006160. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the New Mexico Environmental Evaluation Group (EEG) is to conduct an independent technical evaluation of the Waste Isolation Pilot Plant (WIPP) Project to ensure the protection of the public health and safety and the environment. The WIPP Project, located in southeastern New Mexico, is being constructed as a repository for the disposal of transuranic (TRU) radioactive wastes generated by the national defense programs. The EEG was established in 1978 with funds provided by the U.S. Department of Energy (DOE) to the State of New Mexico. Public Law 100-456, the National Defense Authorization Act, Fiscal Year 1989, Section 1433, assigned EEG to the New Mexico Institute of Mining and Technology and continued the original contract DE-AC04-79AL10752 through DOE contract DE-AC04-89AL58309. The National Defense Authorization Act for Fiscal Year 1994, Public Law 103-160, continues the authorization. EEG performs independent technical analyses of the suitability of the proposed site; the design of the repository, its planned operation, and its long-term integrity; suitability and safety of the transportation systems; suitability of the Waste Acceptance Criteria and the generator sites' compliance with them; and related subjects. These analyses include assessments of reports issued by the DOE and its contractors, other federal agencies and organizations, as they relate to the potential health, safety and environmental impacts from WIPP. Another important function of EEG is the independent environmental monitoring of background radioactivity in air, water, and soil, both on-site and off-site.

1223 (DOE/CAO–95-1077) **Performance demonstration program plan for RCRA constituent analysis of solidified wastes.** USDOE Carlsbad Area Office, NM (United States). Jun 1995. 43p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96003980. Source: OSTI; NTIS; INIS; GPO Dep.

Performance Demonstration Programs (PDPS) are designed to help ensure compliance with the Quality Assurance Objectives (QAOs) for the Waste Isolation Pilot Plant (WIPP). The PDPs are intended for use by the Department of Energy (DOE) Carlsbad Area Office (CAO) to assess and approve the laboratories and other measurement facilities supplying services for the characterization of WIPP TRU waste. The PDPs may also be used by CAO in qualifying laboratories proposing to supply additional analytical services that are required for other than waste characterization, such as WIPP site operations. The purpose of this PDP is to test laboratory performance for the analysis of solidified waste samples for TRU waste characterization. This performance will be demonstrated by the successful analysis of blind audit samples of simulated, solidified TRU waste according to the criteria established in this plan. Blind audit samples (hereinafter referred to as PDP samples) will be used as an independent means to assess laboratory performance regarding compliance with the QAOs. The concentration of analytes in the PDP samples will address levels of regulatory concern and will encompass the range of concentrations anticipated in actual waste characterization samples. Analyses that are required by the WIPP to demonstrate compliance with various regulatory requirements and which are included in the PDP must be performed by laboratories that demonstrate acceptable performance in the PDP. These analyses are referred to as WIPP analyses and the samples on which they are performed are referred to as WIPP samples for the balance of this document.

1224 (DOE/CAO–95-1095) **Remote-handled transuranic waste study.** USDOE Carlsbad Area Office, NM (United States). Oct 1995. 150p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96003973. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) was developed by the US Department of Energy (DOE) as a research and development facility to demonstrate the safe disposal of transuranic (TRU) radioactive wastes generated from the Nation's defense activities. The WIPP disposal inventory will include up to 250,000 cubic feet of TRU wastes classified as remote handled (RH). The remaining inventory will include contact-handled (CH) TRU wastes, which characteristically have less specific activity (radioactivity per unit volume) than the RH-TRU wastes. The WIPP Land Withdrawal Act (LWA), Public Law 102-579, requires a study of the effect of RH-TRU waste on long-term performance. This RH-TRU Waste Study has been conducted to satisfy the requirements defined by the LWA and is considered by the DOE to be a prudent exercise in the compliance certification process of the WIPP repository. The objectives of this study include: conducting an evaluation of the impacts of RH-TRU wastes on the performance assessment (PA) of the repository to determine the effects of Rh-TRU waste as a part of the total WIPP disposal inventory; and conducting a comparison of CH-TRU and RH-TRU wastes to assess the differences and similarities for such issues as gas generation, flammability and explosiveness, solubility, and brine and geochemical interactions. This study was conducted using the data, models, computer codes, and information generated in support of long-term compliance programs, including the WIPP PA. The study is limited in scope to post-closure repository performance and includes an analysis of the issues associated with RH-TRU wastes subsequent to emplacement of these wastes at WIPP in consideration of the current baseline design. 41 refs.

1225 (DOE/CAO–95-1121-Rev.3) **Transuranic waste baseline inventory report. Revision No. 3.** Sandia National Labs., Albuquerque, NM (United States). Jun 1996. 216p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96012535. Source: OSTI; NTIS; INIS; GPO Dep.

The Transuranic Waste Baseline Inventory Report (TWBIR) establishes a methodology for grouping wastes of similar physical and chemical properties from across the U.S. Department of Energy (DOE) transuranic (TRU) waste system into a series of "waste profiles" that can be used as the basis for waste form discussions with regulatory agencies. The purpose of Revisions 0 and 1 of this report was to provide data to be included in the Sandia National Laboratories/New Mexico (SNL/NM) performance assessment (PA) processes for the Waste Isolation Pilot Plant (WIPP). Revision 2 of the document expanded the original purpose and was also intended to support the WIPP Land Withdrawal Act (LWA) requirement for providing the total DOE TRU waste inventory. The document included a chapter and an appendix that discussed the total DOE TRU waste inventory, including nondefense, commercial, polychlorinated biphenyls (PCB)-contaminated, and buried (predominately pre-1970) TRU wastes that are not planned to be disposed of at WIPP.

1226 (DOE/CAO–95-2043-Draft) **Draft no-migration variance petition. Volume 1.** USDOE Albuquerque Operations Office, Carlsbad, NM (United States). Waste Isolation Pilot Plant Project Office. 31 May 1995. 519p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

The Department of Energy is responsible for the disposition of transuranic (TRU) waste generated by national defense-related activities. Approximately 2,6 million cubic feet of these waste have been generated and are stored at various facilities across the country. The Waste Isolation Pilot Plant (WIPP), was sited and constructed to meet stringent disposal requirements. In order to permanently dispose of TRU waste, the DOE has elected to petition the US EPA for a variance from the Land Disposal Restrictions of RCRA. This document fulfills the reporting requirements for the petition. This report is Volume 1 which discusses the regulatory frame work, site characterization, facility description, waste description, environmental impact analysis, monitoring, quality assurance, long-term compliance analysis, and regulatory compliance assessment.

1227 (DOE/CAO–95-2043-Vol.2-Draft) **Draft no-migration variance petition. Volume 2, Appendices: ADM, BAD, BECR.** USDOE Albuquerque Operations Office, Carlsbad, NM (United States). Waste Isolation Pilot Plant Project Office. 31 May 1995. 785p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

This is Volume 6 of the petition which presents details about the 1993 site environmental report; metorite impact; damage from rock mechanics; regulatory interpretations; and the quality assurance program.

1232 (DOE/CAO–95-2043-Vol.7-Draft) **Draft no-migration variance petition. Volume 7, Appendices: SUM, SURV, VOC, WAP.** USDOE Albuquerque Operations Office, Carlsbad, NM (United States). Waste Isolation Pilot Plant Project Office. 31 May 1995. 708p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

The Department of Energy is responsible for the disposition of transuranic (TRU) waste generated by national defense-related activities. Approximately 2,6 million cubic feet of these waste have been generated and are stored at various facilities across the country. The Waste Isolation Pilot Plant (WIPP), was sited and constructed to meet stringent disposal requirements. In order to permanently dispose of TRU waste, the DOE has elected to petition the US EPA for a variance from the Land Disposal Restrictions of RCRA. This document fulfills the reporting requirements for the petition. This report is volume 7 of the petition which presents details about the waste analysis plan for WIPP. VOC screening methodologies; and a summary of the site characterization studies conducted from 1983 through 1987 at WIPP.

1233 (DOE/CAO–2056-Vol.1-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 1.** USDOE Carlsbad Area Office, NM (United States). 31 Mar 1995. 440p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95012433. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) is a research and development facility for the demonstration of the permanent isolation of transuranic radioactive wastes in a geologic formation. The facility was constructed in southeastern New Mexico in a manner intended to meet criteria established by the scientific and regulatory community for the safe, long-term disposal of transuranic wastes. The US Department of

Energy (DOE) is preparing an application to demonstrate compliance with the requirements outlined in Title 40, Part 191 of the Code of Federal Regulations (CFR) for the permanent disposal of transuranic wastes. As mandated by the Waste Isolation Pilot Plant (WIPP) Land Withdrawal Act of 1992, the US Environmental Protection Agency (EPA) must evaluate this compliance application and provide a determination regarding compliance with the requirements within one year of receiving a complete application. Because the WIPP is a very complex program, the DOE has planned to submit the application as a draft in two parts. This strategy will allow for the DOE and the EPA to begin technical discussions on critical WIPP issues before the one-year compliance determination period begins. This report is the first of these two draft submittals.

1234 (DOE/CAO–2056-Vol.2-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 2: Appendices, AAC, BECR, BH.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 906p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95012436. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the conceptual design of a system the Department of Energy (DOE) may implement for compliance with the requirement to control access to the disposal site. In addition, this report addresses the scheduling process for control of inspection, maintenance, and periodic reporting related to Long Term Monitoring which addresses the monitoring of disposal system performance, environmental monitoring in accordance with the Consultation and Cooperation Agreement between the DOE and the state of New Mexico, and evaluation of testing activities related to the Permanent Marker System design. In addition to access control addressed by this report, the controlling or cleaning up of releases from the site is addressed in the Conceptual Decontamination and Decommissioning Plan. The monitoring of parameters related to disposal system performance is addressed in the Long Term Monitoring Design Concept Description. Together, these three documents address the full range of active institutional controls planned after disposal of the TRU waste in the WIPP repository.

1235 (DOE/CAO–2056-Vol.3-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 3: Appendix BIR Volume 1.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 559p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-93AL96904 ; AC04-86AL31950. (CAO–94-1005-Rev.1). Order Number DE95012437. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) Transuranic Waste Baseline Inventory Report (WTWBIR) establishes a methodology for grouping wastes of similar physical and chemical properties, from across the US Department of Energy (DOE) transuranic (TRU) waste system, into a series of "waste profiles" that can be used as the basis for waste form discussions with regulatory agencies. The majority of this document reports TRU waste inventories of DOE defense sites. An appendix is included which provides estimates of commercial TRU waste from the West Valley Demonstration Project. The WIPP baseline inventory is estimated using waste streams identified by the DOE TRU waste generator/storage sites, supplemented by information from the Mixed Waste Inventory Report (MWIR) and the 1994 Integrated Data Base (IDB). The sites provided and/or authorized all information in the Waste Stream Profiles except the EPA (hazardous waste) codes for the mixed inventories. These codes were taken from the MWIR (if a WTWBIR mixed waste stream was not in MWIR, the sites were consulted). The IDB was used to generate the WIPP radionuclide inventory. Each waste stream is defined in a waste stream profile and has been assigned a waste matrix code (WMC) by the DOE TRU waste generator/storage site. Waste stream profiles with WMCs that have similar physical and chemical properties can be combined into a waste matrix code group (WMCG), which is then documented in a site-specific waste profile for each TRU waste generator/storage site that contains waste streams in that particular WMCG.

1236 (DOE/CAO–2056-Vol.4-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 4: Appendix BIR Volume 2.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 704p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (CAO–94-1005-Rev.1). Order Number DE95012754. Source: OSTI; NTIS; INIS; GPO Dep.

This report consists of the waste stream profile for the WIPP transuranic waste baseline inventory at Lawrence Livermore National Laboratory. The following assumptions/modifications were made by the WTWBIR team in developing the LL waste stream profiles: since only current volumes were provided by LL, the final form volumes were assumed to be the same as the current volumes; the WTWBIR team had to assign identification numbers (IDs) to those LL waste streams not given an identifier by the site, the assigned identification numbers are consistent with the site reported numbers; LL Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID, these changes included word and spelling changes, the assigned Final Waste Form Groups are consistent with the information provided by LL; the volumes for the year 1993 were changed from an annual rate of generation (m^3/year) to a cumulative value (m^3).

1237 (DOE/CAO–2056-Vol.5-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 5: Appendices D and D, DEF, FAC.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 529p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (DOE/WIPP–95-2072). Order Number DE95012434. Source: OSTI; NTIS; INIS; GPO Dep.

This plan serves to describe the objectives of decommissioning for the Waste Isolation Pilot Plant (WIPP), identifies the elements necessary to accomplish the decommissioning, and defines the steps to execute those elements in a safe and environmentally sound manner. The plan provides a strategy for progressing from the final actions of the Disposal Phase, through the Decontamination and Decommissioning Phase, and into the initiation of the Long-Term Monitoring Phase. This plan describes a sequence of events for decontamination of the WIPP facilities and structures used to manage and contain TRU and TRU mixed waste during the receipt and emplacement operations. Alternative methods of decontamination are provided where practical.

The methods for packaging and disposal of the waste generated (derived waste) during this process are discussed. The best available technology at the time of this plan's development, may become outmoded by future technology and alternative strategies. If alternative technologies are identified the affected stakeholder(s), the Secretary of the Interior and the State will be consulted prior to implementation.

1238 (DOE/CAO–2056-Vol.6-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 6: Appendix GCR Volume 1.** USDOE Carlsbad Area Office, NM (United States); Sandia Labs., Albuquerque, NM (United States). 31 Mar 1995. 556p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (SAND–78-1596-Vol.1). Order Number DE95012435. Source: OSTI; NTIS; INIS; GPO Dep.

The Geological Characterization Report (GCR) for the WIPP site presents, in one document, a compilation of geologic information available to August, 1978, which is judged to be relevant to studies for the WIPP. The Geological Characterization Report for the WIPP site is neither a preliminary safety analysis report nor an environmental impact statement; these documents, when prepared, should be consulted for appropriate discussion of safety analysis and environmental impact. The Geological Characterization Report of the WIPP site is a unique document and at this time is not required by regulatory process. An overview is presented of the purpose of the WIPP, the purpose of the Geological Characterization Report, the site selection criteria, the events leading to studies in New Mexico, status of studies, and the techniques employed during geological characterization.

1239 (DOE/CAO–2056-Vol.7-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 7: Appendix GCR Volume 2.** USDOE Carlsbad Area Office, NM (United States); Sandia Labs., Albuquerque, NM (United States). 31 Mar 1995. 725p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (SAND–78-1596-Vol.2). Order Number DE95012752. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the second part of the geological characterization report for the Waste Isolation Pilot Plant. Both hydrology and geochemistry are evaluated. The following aspects of hydrology are discussed: surface hydrology; ground water hydrology; and hydrology drilling and testing. Hydrologic studies at the site and adjacent site areas have concentrated on defining the hydrogeology and associated salt dissolution phenomena. The geochemical aspects include a description of chemical properties of geologic media presently found in the surface and subsurface environments of southeastern New Mexico in general, and of the proposed WIPP withdrawal area in particular. The characterization does not consider any aspect of artificially-introduced material, temperature, pressure, or any other physico-chemical condition not native to the rocks of southeastern New Mexico.

1240 (DOE/CAO–2056-Vol.8-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 8: Appendices HYDRO, IRD, LTM, NUTS, PAR, PMR, QAPD, RBP.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 619p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95012753. Source: OSTI; NTIS; INIS; GPO Dep.

Geohydrologic data have been collected in the Los Medanos area at the US Department of Energy's proposed Waste Isolation Pilot Plant (WIPP) site in southeastern New Mexico since 1975 as part of a study evaluating the feasibility of storing defense-associated nuclear wastes within the bedded salt of the Salado Formation of Permian age. Drilling and hydrologic testing have identified three principal water-bearing zones above the Salado Formation and one below that could potentially transport wastes to the biosphere if the proposed facility were breached. The zones above the Salado are the contact between the Rustler and Salado Formations and the Culebra and Magenta Dolomite Members of the Rustler Formation of Permian age. The zone below the Salado Formation consists of channel sandstones in the Bell Canyon Formation of the Permian Delaware Mountain Group. Determinations of hydraulic gradients, directions of flow, and hydraulic properties were hindered because of the negligible permeability of the water-bearing zones. Special techniques in drilling, well completion, and hydraulic testing have been developed to determine the hydrologic characteristics of these water-producing zones.

1241 (DOE/CAO–2056-Vol.9-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 9: Appendices RM, SCR, SER, SUM, WRAC.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 580p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95012755. Source: OSTI; NTIS; INIS; GPO Dep.

The Rock Mechanics Program is important to the establishment of a radioactive waste repository in salt because rock mechanics deals with the prediction of creep closure and eventual encapsulation of the waste. The intent of this paper is to give the current status of the program. This program consists of three major modeling efforts: continuum creep, fracture, and the disturbed rock zone. These models, together with laboratory material parameters, plastic flow potentials, initial and boundary input data, and other peripheral information forms the predictive technology. The extent to which the predictive technology is validated against in situ test data adds certainty to the method. Application of the technology is through simulations of the test results, design, or performance using numerical codes. In summary, the predictive capabilities are technically sound and reasonable. The current status of the program is that which would be advanced for compliance.

1242 (DOE/EIS–0203-Summ.) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs: Final Environmental Impact Statement. Summary.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 78p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012049. Source: OSTI; NTIS; INIS; GPO Dep.

(This is a summary; following volumes contain Volumes 1, 2, 3, and appendices.) This document analyzes the potential environmental consequences over the next 40 years of transportation, receipt, processing, and storage of DOE spent fuel. It also analyzes INEL sitewide actions over the next 10 years for waste and spent fuel management and environmental resoration. Alternatives are analyzed.

1243 (DOE/EIS–0203-Vol.1) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs: Final Environmental Impact Statement. Volume 1.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 661p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012043. Source: OSTI; NTIS; INIS; GPO Dep.

US DOE is engaged in two related decisionmaking processes on the transportation, receipt, processing, and storage of spent nuclear fuel at INEL which will focus on the next 10 years, and on programmatic decisions on future spent nuclear fuel (SNF) management which will emphasize the next 40 years. DOE is analyzing the environment consequences of these spent fuel management actions in this two-volume Environmental Impact Statement (EIS). Volume 1 (this volume) supports broad programmatic decisions with application across the DOE complex and describes the purpose and need for this DOE action. Volume 2 is specific to actions at INEL; Volume 3 are public comments and responses. Volume 1 is supported by site-specific appendices (under separate cover) that provide detailed information for Hanford, INEL, Savannah River, naval SNF management facilities (including these at DOE facilities), other generator/storage sites, Oak Ridge, and NTS.

1244 (DOE/EIS–0203-Vol.1-App.B) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs: Final Environmental Impact Statement. Volume 1, Appendix B.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 275p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012036. Source: OSTI; NTIS; INIS; GPO Dep.

This Appendix B to Volume 1 considers the impacts on the INEL environment of the implementation of various DOE-wide spent spent nuclear fuel management alternatives. The Naval Nuclear Propulsion program, a joint Navy/DOE program, is responsible for spent naval nuclear fuel examination at INEL. (Naval fuel that has been examined at Naval Reactors Facility and turned over to DOE for storage is termed naval-type fuel.) This appendix evaluates the management of DOE spent fuel including naval-type fuel.

1245 (DOE/EIS–0203-Vol.1-App.C) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs: Final Environmental Impact Statement. Volume 1, Appendix C.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 304p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012037. Source: OSTI; NTIS; INIS; GPO Dep.

DOE is analyzing the environmental consequences of spent nuclear fuel management actions in this two-volume EIS. Volume 1 supports broad programmatic decisions that will be applicable across the DOE complex. Volume 2 is specific to actions at INEL. This document (appendix), which limits its discussion to the Savannah River Site (SRS) spent fuel management program, supports Volume 1 of the EIS. It contains an information background chapter, a chapter on alternatives for SRS, a chapter on existing SRS environmental resources that spent fuel activities could affect, and a chapter on the environmental consequences of each spent fuel management alternative and cumulative impacts.

1246 (DOE/EIS–0203-Vol.1-App.D-Pt.A) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs final environmental impact statement. Volume 1, Appendix D: Part A, Naval Spent Nuclear Fuel Management.** USDOE Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 481p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012038. Source: OSTI; NTIS; INIS; GPO Dep.

Volume 1 to the EIS evaluates a range of alternatives for managing naval spent nuclear fuel expected to be removed from US Navy nuclear-powered vessels and prototype reactors through the year 2035. This appendix covers aspects of the alternatives that involve managing naval spent nuclear fuel at four naval shipyards and the Naval Nuclear Propulsion Program Kesselring Site in West Milton, New York. It also covers impacts of alternatives involving examining naval spent fuel at the Expended Core Facility in Idaho and potential impacts of constructing and operating an inspection facility at any DOE facility considered in the EIS. Impacts of limited spent fuel examinations at Puget Sound Naval Shipyard are also considered. However, storage of naval spent fuel after inspection and transfer to DOE facilities is not addressed.

1247 (DOE/EIS–0203-Vol.1-App.D-Pt.B) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs: Final Environmental Impact Statement. Volume 1, Appendix D, Part B.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 477p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012039. Source: OSTI; NTIS; INIS; GPO Dep.

This part contains the following attachments: transportation of naval spent nuclear fuel, description of naval spent nuclear fuel receipt and handling at the Extended Core Facility at INEL, comparison of storage in new water pools vs dry container storage, descriptions of storage of naval spent nuclear fuel at servicing locations (shipyards and prototypes)and at alternate DOE facilities, analysis of normal operations and accident conditions, and comparison of the naval spent nuclear fuel storage environmental assessment and this EIS. Lists of glossary terms and of abbreviations and acronyms are also included.

1248 (DOE/EIS–0203-Vol.1-App.E) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs final environmental impact statement. Volume 1, Appendix E: Spent Nuclear Fuel Management Programs at other generator/storage locations.** USDOE Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 129p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012040. Source: OSTI; NTIS; INIS; GPO Dep.

DOE is performing a DOE-wide programmatic evaluation of spent nuclear fuel (SNF) management alternatives in order to determine the best way of managing SNF from now until the year 2035. Sites currently involved with major SNF management (Hanford, SRS, INEL), alternative sites being analyzed for SNF management (Oak Ridge, NTS), and sites involved with SNF from naval reactors are addressed in separate appendices to this volume of the environmental impact statement. This appendix addresses other DOE sites and locations which currently generate and manage small amounts of SNF: DOE, university, and other research and test reactors; commercial power reactors.

1249 (DOE/EIS–0203-Vol.1-App.F) **Department of Energy Programmatic Spent Nuclear Fuel management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs: Final Environmental Impact Statement. Volume 1, Appendix F.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 450p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012041. Source: OSTI; NTIS; INIS; GPO Dep.

This appendix addresses the interim storage of spent nuclear fuel at the Nevada Test Site and the Oak Ridge Reservation.

1250 (DOE/EIS–0203-Vol.2-Pt.A) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs: Final Environmental Impact Statement. Volume 2, Part A.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 753p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012044. Source: OSTI; NTIS; INIS; GPO Dep.

This volume covers the INEL Environmental Restoration and Waste Management programs, including site-specific spent nuclear fuel management. Five primary sections are presented that provide the purpose and need for an integrated 10-year environmental restoration, waste management, and spent fuel management program at INEL, background, management alternatives under consideration, the affected environment, and potential environmental consequences of each alternative.

1251 (DOE/EIS–0203-Vol.2-Pt.B) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs: Final Environmental Impact Statement. Volume 2, Part B.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 616p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012045. Source: OSTI; NTIS; INIS; GPO Dep.

This part includes the following appendices: primer on radioactivity and toxicology, consultation letters, information supporting the alternatives, acronyms and abbreviations, glossary, and technical methodologies and key data.

1252 (DOE/EIS–0203-Vol.3-Pt.A) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs: Final Environmental Impact Statement. Volume 3, Part A.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 496p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012046. Source: OSTI; NTIS; INIS; GPO Dep.

This part summarizes public comments and provides responses on: preference for alternatives, NEPA-related comments, policy, proposed action and alternatives, and technical issues for spent fuel management. It also includes discussions of how public comments influenced the identification of the preferred alternatives, the extent to which public comments led to changes in the EIS, and a description of how to find specific comment summaries and responses (see part B).

1253 (DOE/EIS–0203-Vol.3-Pt.B) **Department of Energy Programmatic Spent Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs: Final Environmental Impact Statement. Volume 3, Part B.** USAEC Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 462p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012034. Source: OSTI; NTIS; INIS; GPO Dep.

This part of the volume on response to public comments, includes chapters on spent nuclear fuel management specific, INEL ER&WM programs specific, naval program specific, and miscellaneous (unrelated comments). Appendices with comment/response document indexes are also provided.

1254 (DOE/EM–0255) **Radioactive Tank Waste Remediation Focus Area. Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Jun 1995. 111p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016251. Source: OSTI; NTIS; INIS; GPO Dep.

In February 1991, DOE's Office of Technology Development created the Underground Storage Tank Integrated Demonstration (UST-ID), to develop technologies for tank remediation. Tank remediation across the DOE Complex has been driven by Federal Facility Compliance Agreements with individual sites. In 1994, the DOE Office of Environmental Management created the High Level Waste Tank Remediation Focus Area (TFA; of which UST-ID is now a part) to better integrate and coordinate tank waste remediation technology development efforts. The mission of both organizations is the same: to focus the development, testing, and evaluation of remediation technologies within a system architecture to characterize, retrieve, treat, concentrate, and dispose of radioactive waste stored in USTs at DOE facilities. The ultimate goal is to provide safe and cost-effective solutions that are acceptable to both the public and regulators. The TFA has focused on four DOE locations: the Hanford Site in Richland, Washington, the Idaho National Engineering Laboratory (INEL) near Idaho Falls, Idaho, the Oak Ridge Reservation in Oak Ridge, Tennessee, and the Savannah River Site (SRS) in Aiken, South Carolina.

1255 (DOE/EM–0295) **Radioactive tank waste remediation focus area.** USDOE Office of Science and Technology, Washington, DC (United States). Office of Program Analysis. Aug 1996. 128p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96013518. Source: OSTI; NTIS; INIS; GPO Dep.

EM's Office of Science and Technology has established the Tank Focus Area (TFA) to manage and carry out an integrated national program of technology development for tank waste remediation. The TFA is responsible for the development, testing, evaluation, and deployment of remediation technologies within a system architecture to characterize, retrieve, treat, concentrate, and dispose of radioactive waste stored in the underground stabilize and close the tanks. The goal is to provide safe and cost-effective solutions that are acceptable to both the public and regulators. Within the DOE complex, 335 underground storage tanks have been used to process and store radioactive and chemical mixed waste generated from weapon materials production and manufacturing. Collectively, thes tanks hold over 90 million gallons of high-level and low-level radioactive liquid waste in sludge, saltcake, and as supernate and vapor. Very little has been treated and/or disposed or in final form.

1256 (DOE/EM–52368-Pt.1) **Life cycle cost report of VHLW cask.** General Nuclear Systems, Inc., Columbia, SC (United States). Jun 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-89AL53689. Order Number DE96012972. Source: OSTI; NTIS; INIS; GPO Dep.

This document, the Life Cycle Cost Report (LCCR) for the VHLW Cask, presents the life cycle costs for acquiring, using, and disposing of the VHLW casks. The VHLW cask consists of a ductile iron cask body, called the shielding insert, which is used for storage and transportation, and ultimately for disposal of Defense High Level Waste which has been vitrified and placed into VHLW canisters. Each ductile iron VHLW shielding insert holds one VHLW canister. For transportation, the shielding insert is placed into a containment overpack. The VHLW cask as configured for transportation is a legal weight truck cask which will be licensed by NRC. The purpose of this LCCR is to present the development of the life cycle costs for using the VHLW cask to transport VHLW canisters from the generating sites to a disposal site. Life cycle costs include the cost of acquiring, operating, maintaining, and ultimately dispositioning the VHLW cask and its associated hardware. This report summarizes costs associated with transportation of the VHLW casks. Costs are developed on the basis of expected usage, anticipated source and destination locations, and expected quantities of VHLW which must be transported. DOE overhead costs, such as the costs associated with source and destination facility handling of the VHLW, are not included. Also not included are costs exclusive to storage or disposal of the VHLW waste.

1257 (DOE/EM–52368-Pt.2) **Safety analysis report vitrified high level waste type B shipping cask.** General Nuclear Systems, Inc., Columbia, SC (United States). Mar 1995. 203p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-89AL53689. Order Number DE96012872. Source: OSTI; NTIS; INIS; GPO Dep.

This Safety Analysis Report describes the design, analyses, and principle features of the Vitrified High Level Waste (VHLW) Cask. In preparing this report a detailed evaluation of the design has been performed to ensure that all safety, licensing, and operational goals for the cask and its associated Department of Energy program can be met. The functions of this report are: (1) to fully document that all functional and regulatory requirements of 10CFR71 can be met by the package; and (2) to document the design and analyses of the cask for review by the Nuclear Regulatory Commission. The VHLW Cask is the reusable shipping package designed by GNSI under Department of Energy contract DE-AC04-89AL53-689 for transportation of Vitrified High Level Waste, and to meet the requirements for certification under 10CFR71 for a Type B(U) package. The VHLW cask has been designed as packaging for transport of canisters of Vitrified High Level Waste solidified at Department of Energy facilities.

1258 (DOE/ID–10515) **Vitrification melter study.** Jones, J.A. USDOE Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96001155. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of a study performed to identify the most promising vitrification melter technologies that the Department of Energy (EM-50) might pursue with available funding. The primary focus was on plasma arc systems and graphite arc melters. The study was also intended to assist EM-50 in evaluating competing technologies, formulating effective technology strategy, developing focused technology development projects, and directing the work of contractors involved in vitrification melter development.

1259 (DOE/ID/12584–252) **Modeling needs assessment for Hanford Tank Farm Operations. Vadose Zone Characterization Project at the Hanford Tank Farms.** Rust Geotech, Inc., Grand Junction, CO (United States). Apr 1996. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86ID12584. (GJPO-HAN–2). Order Number DE96013696. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of a modeling-needs assessment conducted for Tank Farm Operations at the Hanford Site. The goal of this project is to integrate geophysical logging and subsurface transport modeling into a broader decision-based framework that will be made available to guide Tank Farm Operations in implementing future modeling studies. In support of this goal, previous subsurface transport modeling studies were reviewed, and stakeholder surveys and interviews were completed (1) to identify regulatory, stakeholder, and Native American concerns and the impacts of these concerns on Tank Farm Operations, (2) to identify technical constraints that impact site characterization and modeling efforts, and (3) to assess how subsurface transport modeling can best be used to support regulatory, stakeholder, Native American, and Tank Farm Operations needs. This report is organized into six sections. Following an introduction, Section 2.0 discusses background issues that relate to Tank Farm Operations. Section 3.0 summarizes the technical approach used to appraise the status of modeling and supporting characterization. Section 4.0 presents a detailed description of how the technical approach was implemented. Section 5.0 identifies findings and observations that relate to implementation of numerical modeling, and Section 6.0 presents recommendations for future activities.

1260 (DOE/ID/12584–266) **Biannual recalibration of two spectral gamma-ray logging systems used for baseline characterization measurements in the Hanford Tank Farms. Vadose Zone Characterization Project at the Hanford Tank Farms.** Koizumi, C.J. USDOE Grand Junction Projects Office, CO (United States). May 1996. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86ID12584. (GJPO-HAN–3). Order Number DE96013697. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy's (DOE's) Grand Junction Projects Office (GJPO) is engaged in establishing an initial, or baseline, characterization of the gamma-ray-emitting contaminants in the subsurface of the Tank Farms at the DOE Hanford site in the State of Washington. These baseline data are gathered by logging existing monitoring boreholes with two high-resolution passive gamma-ray logging systems informally known as Gamma 1 and Gamma 2. Calibration of the logging systems is crucial to the assurance of data quality. The project document Spectral Gamma-Ray borehole Geophysical Logging Characterization and Baseline Monitoring Plan for the Hanford Single-Shell Tanks (DOE 1995a) specifies that the initial, or base, calibration of both systems must be performed before commencement of field measurements at Hanford and that both systems must be recalibrated every 6 months thereafter using the calibration standards at the Hanford borehole logging calibration center. Data collection for the base calibrations was completed in April 1995; the results were published in Calibration of Two Spectral Gamma-Ray Logging Systems for Baseline Characterization Measurements in the Hanford Tank Farms (DOE 1995b). This report documents the first recalibration of the two systems that was performed in October 1995 at the Hanford Site. Analyses of data collected during the recalibrations are presented.

1261 (DOE/LLW–223) **National high-level waste systems analysis plan.** Kristofferson, K.; Oholleran, T.P.; Powell, R.H.; Thiel, E.C. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). May 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002301. Source: OSTI; NTIS; INIS; GPO Dep.

This document details the development of modeling capabilities that can provide a system-wide view of all US Department of Energy (DOE) high-level waste (HLW) treatment and storage systems. This model can assess the impact of budget constraints on storage and treatment system schedules and throughput. These impacts can then be assessed against existing and pending milestones to determine the impact to the overall HLW system. A nation-wide view of waste treatment availability will help project the time required to prepare HLW for disposal. The impacts of the availability of various treatment systems and throughput can be compared to repository readiness to determine the prudent application of resources or the need to renegotiate milestones.

1262 (DOE/LLW–226) **National high-level waste systems analysis report.** Kristofferson, K.; Oholleran, T.P.; Powell, R.H. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002204. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the assessment of budgetary impacts, constraints, and repository availability on the storage and treatment of high-level waste and on both existing and pending negotiated milestones. The impacts of the availabilities of various treatment systems on schedule and throughput at four Department of Energy sites are compared to repository readiness in order to determine the prudent application of resources. The information modeled for each of these sites is integrated with a single national model. The report suggests a high-level-waste model that offers a national perspective on all high-level waste treatment and storage systems managed by the Department of Energy.

1263 (DOE/MC/29467–5042) **Decontamination systems information and research program – Literature review in support of development of standard test protocols and barrier design models for in situ formed barriers project.** National Research Center for Coal and Energy, Morgantown, WV (United States). Dec 1994. 158p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29467. Order Number DE96000573. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy is responsible for approximately 3,000 sites in which contaminants such as carbon tetrachloride, trichlorethylene, perchlorethylene, non-volatile and soluble organic and insoluble organics (PCBs and pesticides) are encountered. In specific areas of these sites radioactive contaminants are stored in underground storage tanks which were originally designed and constructed with a 30-year projected life. Many of these tanks are now 10 years beyond the design life and failures have occurred allowing the basic liquids (ph of 8 to 9) to leak into the unconsolidated soils below. Nearly one half of the storage tanks located at the Hanford Washington Reservation are suspected of leaking and contaminating the soils beneath them. The Hanford site is located in a semi-arid climate region with rainfall of less than 6 inches annually, and studies have indicated that very little of this water finds its way to the groundwater to move the water down gradient toward the Columbia River. This provides the government with time to develop a barrier system to prevent further contamination of the groundwater, and to develop and test remediation systems to stabilize or remove the contaminant materials. In parallel to remediation efforts, confinement and containment technologies are needed to retard or prevent the advancement of contamination plumes through the environment until the implementation of remediation technology efforts are completed. This project examines the various confinement and containment technologies and protocols for testing the materials in relation to their function in-situ.

1264 (DOE/MC/31388–5141) **Stabilization of vitrified wastes: Task 4. Topical report, October 1994–September 1995.** Nowok, J.W.; Pflughoeft-Hassett, D.F.; Hassett, D.J.; Hurley, J.P. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. Sep 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-94MC31388. Order Number DE96004364. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this task was to work with private industry to refine existing vitrification processes to produce a more stable vitrified product. The initial objectives were to (1) demonstrate a waste vitrification procedure for enhanced stabilization of waste materials and (2) develop a testing protocol to understand the long-term leaching behavior of the stabilized waste form. The testing protocol was expected to be based on a leaching procedure called the synthetic groundwater leaching procedure (SGLP). This task will contribute to the US DOE's identified technical needs in waste characterization, low-level mixed-waste processing, disposition technology, and improved waste forms. The proposed work was to proceed over 4 years in the following steps: literature surveys to aid in the selection and characterization of test mixtures for vitrification, characterization of optimized vitrified test wastes using advanced leaching protocols, and refinement and demonstration of vitrification methods leading to commercialization. For this year, literature surveys were completed, and computer modeling was performed to determine the feasibility of removing heavy metals from a waste during vitrification, thereby reducing the hazardous nature of the vitrified material and possibly producing a commercial metal concentrate. This report describes the following four subtasks: survey of vitrification technologies; survey of cleanup sites; selection and characterization of test mixtures for vitrification and crystallization; and selection of crystallization methods based on thermochemistry modeling.

1265 (DOE/MC/32113–96/CO633) **Nitrate to Ammonia Ceramic (NAC) bench scale stabilization study.** Caime, W.J.; Hoeffner, S.L. Rust Federal Services, Inc., Anderson, SC (United States). 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-95MC32113. (CONF-9510108–30: Environmental technology development through industry partnership, Morgantown, WV (United States), 3-5 Oct 1995). Order Number DE96003689. Source: OSTI; NTIS; INIS; GPO Dep.

Department of Energy (DOE) sites such as the Hanford site, Idaho National Engineering Laboratory (INEL), Savannah River site, Oak Ridge National Laboratory (ORNL) have large quantities of sodium-nitrate based liquid wastes. At INEL alone there are 800,000 gallons. The largest quantity of these wastes is the 149 single shell tanks (SSTs) tanks at Hanford which can hold 1 million gallons each. The nitrate to ammonia ceramic (NAC) process has been developed to remove a majority of the nitrate content from the wastes.

1266 (DOE/RL--89-16-Rev.A) **Single-shell tank closure work plan. Revision A.** USDOE Richland Operations Office, WA (United States). Jun 1995. 534p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE96001202. Source: OSTI; NTIS; INIS; GPO Dep.

In January 1994, the Hanford Federal Facility Agreement and Conset Order (Tri-Party Agreement) was amended to reflect a revised strategy for remediation of radioactive waste in underground storage tanks. These amendments include milestones for closure of the single-shell tank (SST) operable units, to be initiated by March 2012 and completed by September 2024. This SST-CWP has been prepared to address the principal topical areas identified in Tri-Party Agreement Milestone M-45-06 (i.e., regulatory pathway, operable unit characterization, waste retrieval, technology development, and a strategy for achieving closure). Chapter 2.0 of this SST-CWP provides a brief description of the environmental setting, SST System, the origin and characteristics of SST waste, and ancillary equipment that will be remediated as part of SST operable unit closure. Appendix 2A provides a description of the hydrogeology of the Hanford Site, including information on the unsaturated sediments (vadose zone) beneath the 200 Areas Plateau. Chapter 3.0 provides a discussion of the laws and regulations applicable to closure of the SST farm operable units. Chapter 4.0 provides a summary description of the ongoing characterization activities that best align with the proposed regulatory pathway for closure. Chapter 5.0 describes aspects of the SST waste retrieval program, including retrieval strategy, technology, and sequence, potential tank leakage during retrieval, and considerations of deployment of subsurface barriers. Chapter 6.0 outlines a proposed strategy for closure. Chapter 7.0 provides a summary of the programs underway or planned to develop technologies to support closure. Ca. 325 refs.

1267 (DOE/SNF/REP--002-Rev.3) **National spent fuel program preliminary report RCRA characteristics of DOE-owned spent nuclear fuel DOE-SNF-REP-002. Revision 3.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Spent Fuel Management and Special Projects. Jul 1995. 171p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003485. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents information on the preliminary process knowledge to be used in characterizing all Department of Energy (DOE)-owned Spent Nuclear Fuel (SNF) types that potentially exhibit a Resource Conservation and Recovery Act (RCRA) characteristic. This report also includes the process knowledge, analyses, and rationale used to preliminarily exclude certain SNF types from RCRA regulation under 40 CFR §261.4(a)(4), "Identification and Listing of Hazardous Waste," as special nuclear and byproduct material. The evaluations and analyses detailed herein have been undertaken as a proactive approach. In the event that DOE-owned SNF is determined to be a RCRA solid waste, this report provides general direction for each site regarding further characterization efforts. The intent of this report is also to define the path forward to be taken for further evaluation of specific SNF types and a recommended position to be negotiated and established with regional and state regulators throughout the DOE Complex regarding the RCRA-related policy issues.

1268 (DOE/SR/18035--T3) **Vitrification of cesium-contaminated organic ion exchange resin.** Sargent, T.N. Jr. (Clemson Univ., SC (United States)). Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1994. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE96011535. Source: OSTI; NTIS; INIS; GPO Dep.

Thesis submitted to Clemson Univ., SC.

Vitrification has been declared by the Environmental Protection Agency (USEPA) as the Best Demonstrated Available Technology (BDAT) for the permanent disposal of high-level radioactive waste. Savannah River Site currently uses a sodium tetraphenylborate (NaTPB) precipitation process to remove Cs-137 from a wastewater solution created from the processing of nuclear fuel. This process has several disadvantages such as the formation of a benzene waste stream. It has been proposed to replace the precipitation process with an ion exchange process using a new resorcinol-formaldehyde resin developed by Savannah River Technical Center (SRTC). Preliminary tests, however, showed that problems such as crust formation and a reduced final glass wasteform exist when the resin is placed in the melter environment. The newly developed stirred melter could be capable of overcoming these problems. This research explored the operational feasibility of using the stirred tank melter to vitrify an organic ion exchange resin. Preliminary tests included crucible studies to determine the reducing potential of the resin and the extent of oxygen consuming reactions and oxygen transfer tests to approximate the extent of oxygen transfer into the molten glass using an impeller and a combination of the impeller and an external oxygen transfer system. These preliminary studies were used as a basis for the final test which was using the stirred tank melter to vitrify nonradioactive cesium loaded organic ion exchange resin. Results from this test included a cesium mass balance, a characterization of the semi-volatile organic compounds present in the off gas as products of incomplete combustion (PIC), a qualitative analysis of other volatile metals, and observations relating to the effect the resin had on the final redox state of the glass.

1269 (DOE/WIPP--069-Rev.5) **Waste acceptance criteria for the Waste Isolation Pilot Plant.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. Apr 1996. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE96010619. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) Waste Acceptance Criteria (WAC), DOE/WIPP-069, was initially developed by a U.S. Department of Energy (DOE) Steering Committee to provide performance requirements to ensure public health and safety as well as the safe handling of transuranic (TRU) waste at the WIPP. This revision updates the criteria and requirements of previous revisions and deletes those which were applicable only to the test phase. The criteria and requirements in this document must be met by participating DOE TRU Waste Generator/Storage Sites (Sites) prior to shipping contact-handled (CH) and remote-handled (RH) TRU waste forms to the WIPP. The WIPP Project will comply with applicable federal and state regulations and requirements, including those in Titles 10, 40, and 49 of the Code of Federal Regulations (CFR). The WAC, DOE/WIPP-069, serves as the primary directive for assuring the safe handling, transportation, and disposal of TRU wastes in the WIPP and for the certification of these wastes. The WAC identifies strict requirements that must be met by participating Sites before these TRU wastes may be shipped for disposal in the WIPP facility. These criteria and requirements will be reviewed and revised as appropriate, based on new technical or regulatory requirements. The WAC is a controlled document. Revised/changed pages will be supplied to all holders of controlled copies.

1270 (DOE/WIPP–91-005-Pt.B-Vol.2) **Resource Conservation and Recovery Act: Part B Permit application. Volume 2, Chapter C, Appendix C1-Appendix C8.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 311p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

Volume 2 contains appendices for the following: chemical compatibility analysis of waste forms and container materials; data accumulated from headspace-gas analyses; totals analysis versus toxicity characteristic leaching procedure; waste characterization sampling methods; applicability of real-time radiography; quality assurance objectives for waste characterization sampling and analytical methods; quality assurance project plan requirements; and Waste Isolation Pilot Plant generator/storage site waste screening and acceptance audit program.

1271 (DOE/WIPP–91-005-Rev.5-Pt.B-Vol.3) **Resource Conservation and Recovery Act. Part B permit application, Volume 3. Chapter D, Appendix D1 (beginning).** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 873p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (SAND–88-0157-Vol.3). Source: OSTI.

Volume three contains the following siting reports: Summary of site- characterization studies conducted from 1983 through 1987 at the Waste Isolation Pilot Plant (WIPP) site, southeastern New Mexico; and Waste Isolation Pilot Plant design validation final report.

1272 (DOE/WIPP–91-005-Rev.5-Pt.B-Vol.4) **Resource Conservation and Recovery Act, Part B permit application. Volume 4, Revision 5.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 968p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

This volume contains the following appendices: DOE stipulated agreement with state of New Mexico (partial); geologic correlations; mathematical simulation of underground in situ behavior; C & SH shaft geologic logs and maps; waste shaft geologic logs and maps; exhaust shaft geologic log; test rooms geologic maps and sections; drift cross sections; facility level geologic core hole logs; geomechanical instrumentation data plots; and analytical data plots.

1273 (DOE/WIPP–91-005-Rev.5-Pt.B-Vol.5) **Resource Conservation and Recovery Act: Part B permit application. Volume 5. Chapter D, Appendix D1 (continued).** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 560p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (SAND–78-1596-Vol.5). Source: OSTI.

Volume 5 contains geological characterization report for the Waste Isolation Pilot Plant (WIPP), a compilation of geologic information available to August, 1978. Contents include regional geology, site geology, seismology, hydrology, geochemistry, resources, special studies of WIPP repository rocks, and continuing studies.

1274 (DOE/WIPP–91-005-Rev.5-Pt.B-Vol.6) **Resource Conservation and Recovery Act: Part B permit application. Volume 6, Revision 5.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 895p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (SAND–78-1596-Vol.6). Source: OSTI.

Volume 6 contains Geological characterization report, Waste Isolation Pilot Plant (WIPP) site. The following topics are covered: surface hydrology; ground water hydrology; hydrology drilling and testing summary; geochemistry; resources; specific studies of WIPP repository rocks; and continuing studies.

1275 (DOE/WIPP–91-005-Rev.5-Pt.B-Vol.7) **Resource Conservation and Recovery Act: Part B permit application. Volume 7, Chapter D, Appendix D3. Revision 5.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

Volume seven contains appendix for detailed plans and drawings of the Waste Isolation Pilot Plant project. Engineering drawings for this project are identified as report no. CAPE-3105.

1276 (DOE/WIPP–91-005-Rev.5-Pt.B-Vol.8) **Resource Conservation and Recovery Act: Part B permit application. Volume 8, Revision 5.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 744p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

This is the tenth Annual Site Environmental Report (ASER), documenting the progress of environmental programs at the US Department of Energy (DOE) Waste Isolation Pilot Plant (WIPP). The most significant change affecting the WIPP facility in 1993 was the cancellation of the Test Phase. All activities pertaining to the Test Phase will now be conducted at the Idaho National Engineering laboratory. Even though the cancellation of the Test Phase was a significant change in work scope for the WIPP, there are still numerous environmental monitoring and reporting activities that must be preformed as a routine part of daily operations. These activities, and the WIPP's ability to demonstrate compliance with both state and federal environmental compliance requirements, are documented in this report. This report is a compilation and summarization of environmental data collected at the WIPP site.

1277 (DOE/WIPP–91-005-Rev.5.Pt.B-Vol.9) **Resource Conservation and Recovery Act: Part B permit application. Volume 9. Chapter E, Appendix E1-Chapter H, Appendix H3.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 580p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

Volume nine contains the following appendices: RCRA groundwater protection information; Examples of inspection sheets, logs and instructions for systems/equipment requiring inspection under 20 NMAC 4.1, Subpart V; Material safety data sheets; List of hazardous waste management job titles; and Waste Isolation Pilot Plant RCRA hazardous waste management job description.

1278 (DOE/WIPP–91-005-Rev.5-Pt.B-Vol.10) **Resource Conservation and Recovery Act: Part B permit application. Volume 10, Chapter I, Appendix I1-Chapter L, Appendix L1.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 861p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

Volume ten contains the following appendices; Conceptual design for operational phase panel closure systems; Repository seals program baseline position paper; Co-detection of hazardous and radioactive waste releases; Post-closure archived information and distribution; Solid waste management unit characterization sheets; Biennial environmental compliance report, October 1994; Summary of agreements between the U.S. Department of Energy and other agencies that affect the Waste Isolation Pilot Plant environmental program; and No-migration determination for the proposed test phase.

1279 (DOE/WIPP–91-005-Rev.-Pt.B-Vol.1) **Resource Conservation and Recovery Act: Part B permit application. Volume 1.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 534p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

Volume one contains the following: Regulatory cross-reference; Hazardous waste permit application part B; Facility description; Waste analysis plan; Facility and process information; Groundwater monitoring; Procedure to prevent hazards; RCRA contingency plan; Personnel training; Closure plans, post-closure plans, and financial requirements; Corrective action for solid waste management units; Other Federal laws; No-migration variance petition; and Certification.

1280 (DOE/WIPP–95-1149) **Carlsbad Area Office strategic plan.** USDOE Albuquerque Operations Office, NM (United States). Waste Isolation Pilot Plant Project Office. Oct 1995. 18p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96005827. Source: OSTI; NTIS; INIS; GPO Dep.

This edition of the Carlsbad Area Office Strategic Plan captures the U.S. Department of Energy's new focus, and supercedes the edition issued previously in 1995. This revision reflects a revised strategy designed to demonstrate compliance with environmental regulations earlier than the previous course of action; and a focus on the selected combination of scientific investigations, engineered alternatives, and waste acceptance criteria for supporting the compliance applications. An overview of operations and historical aspects of the Waste Isolation Pilot Plant near Carlsbad, New Mexico is presented.

1281 (DOE/WIPP–95-2060) **Waste disposal in underground mines – A technology partnership to protect the environment.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE96010278. Source: OSTI; NTIS; INIS; GPO Dep.

Environmentally compatible disposal sites must be found despite all efforts to avoid and reduce the generation of dangerous waste. Deep geologic disposal provides the logical solution as ever more categories of waste are barred from long-term disposal in near-surface sites through regulation and litigation. Past mining in the US has left in its wake large volumes of suitable underground space. EPA studies and foreign practice have demonstrated deep geologic disposal in mines to be rational and viable. In the US, where much of the mined underground space is located on public lands, disposal in mines would also serve the goal of multiple use. It is only logical to return the residues of materials mined from the underground to their origin. Therefore, disposal of dangerous wastes in mined underground openings constitutes a perfect match between mining and the protection and enhancement of the environment.

1282 (DOE/WIPP–95-2120) **The WIPP RCRA Part B permit application for TRU mixed waste disposal.** Johnson, J.E. (Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div.); Snider, C.A. Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE96010279. Source: OSTI; NTIS; INIS; GPO Dep.

In August 1993, the New Mexico Environment Department (NMED) issued a draft permit for the Waste Isolation Pilot Plant (WIPP) to begin experiments with transuranic (TRU) mixed waste. Subsequently, the Department of Energy (DOE) decided to cancel the on-site test program, opting instead for laboratory testing. The Secretary of the NMED withdrew the draft permit in 1994, ordering the State's Hazardous and Radioactive Waste Bureau to work with the DOE on submittal of a revised permit application. Revision 5 of the WIPP's Resource Conservation and Recovery Act (RCRA) Part B Permit Application was submitted to the NMED in May 1995, focusing on disposal of 175,600 m^3 of TRU mixed waste over a 25 year span plus ten years for closure. A key portion of the application, the Waste Analysis Plan, shifted from requirements to characterize a relatively small volume of TRU mixed waste for on-site experiments, to describing a complete program that would apply to all DOE TRU waste generating facilities and meet the appropriate RCRA regulations. Waste characterization will be conducted on a waste stream basis, fitting into three broad categories: (1) homogeneous solids, (2) soil/gravel, and (3) debris wastes. Techniques used include radiography, visually examining waste from opened containers, radioassay, headspace gas sampling, physical sampling and analysis of homogeneous wastes, and review of documented acceptable knowledge. Acceptable knowledge of the original organics and metals used, and the operations that generated these waste streams is sufficient in most cases to determine if the waste has toxicity characteristics, hazardous constituents, polychlorinated biphenyls (PBCs), or RCRA regulated metals.

1283 (DOE/WIPP–95-2132) **WIPP WAC REV. 5 applicability.** Bisping, R.L. (U.S. Dept. of Energy, Carlsbad, NM (United States)); Kelley, C.R. Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1996]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (CONF-960212–97: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96014293. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) is preparing for disposal operations at the Waste Isolation Pilot Plant (WIPP) in 1998. WIPP is a deep geological repository designed for the safe and efficient disposal of transuranic (TRU) wastes. The Waste Acceptance Criteria (WAC) for WIPP were initially developed by a DOE steering committee in 1980. Revision 5 reflects the latest negotiations and permit requirements from the Environmental Protection Agency (EPA), the State of New Mexico Environment Department (NMED), and the Nuclear Regulatory Commission (NRC). The regulatory requirements are combined with the requirements derived from the WIPP safety analysis performed for disposal operations and the original criteria established for safe waste handling operations. The WIPP WAC provides a comprehensive overview of the requirements and basis for developing waste acceptance criteria to meet today's rules and regulations for transportation and disposal of TRU wastes. The authors believe that it is a comprehensive criteria and a guidance manual for generator/storage sites who must characterize and certify TRU waste for disposal at WIPP. It also provides valuable insight to future projects that may develop their own waste acceptance criteria. The WIPP WAC presents the requirements from the following sources: 1) Resource Conservation and Recovery Act (RCRA) Permit Application; 2) Land Disposal No-migration Variance Petition; 3) 40 CFR 191 Draft Compliance Certification Application; 4) Certificate of Compliance (C of C) from the NRC for a Type B shipping container; 5) Federal Land Withdrawal Act for WIPP; WIPP Safety Analysis Report; 7) WIPP System Design Descriptions (SDDs). The WIPP WAC combines operations and nuclear safety requirements with transportation and hazardous waste regulatory requirements to provide a comprehensive set of criteria and requirements that ensure the safe disposal of TRU waste.

1284 (DOE/WIPP–95-2135) **Engineered alternatives cost/benefit study. Draft report.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. Sep 1995. 1100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Source: OSTI.

The Waste Isolation Pilot Plant (WIPP) is a United States Department of Energy (DOE) project designed to demonstrate the safe disposal of Transuranic (TRU) waste in deep, geologic, bedded salt. The WIPP site is located in southeastern New Mexico. By law the WIPP site has been withdrawn from public use and has been set aside for use in the safe disposal of TRU waste. Also by law, disposal of TRU waste must comply with rules and regulations promulgated by the U.S. Environmental Protection Agency (EPA). The disposal system design consists of multiple barriers, both natural and man-made, located in a geologic salt deposit, 2,150 feet (655.3 meters) below ground. These barriers were selected because of their ability to permanently isolate the waste from the accessible environment as required to comply with subparts B and C of Title 40 Code of Federal Regulations Part 191 (40 CFR 191). As a part of the assurance requirements, 40 CFR §191.14 requires that barriers of different types shall be used to isolate the waste. The WIPP design uses both a geologic (natural) and engineered barriers for waste isolation as specified by these regulations. However, to provide additional confidence in containment prediction calculations used to demonstrate compliance with the containment requirements, Engineered Alternatives (EA) could be used as additional assurance measures beyond those used to meet the containment requirements. This report uses the term EA to represent engineered barriers that are technically feasible processes, technologies, methods, repository designs, or waste from modifications which make a significant positive impact on the disposal system in terms of reducing uncertainty in performance calculations or improving long-term performance. These EAs, if used, function as barriers to the release of radioactive material.

1285 (DOE/WIPP–95-2140) **Environmental impact statement for initiation of transuranic waste disposal at the waste isolation pilot plant.** Johnson, H.E. (U.S. Dept. of Energy, Carlsbad, NM (United States) Carlsbad Area Office); Whatley, M.E. Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1996]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (CONF-960911–2: Canadian Nuclear Society (CNS) international conference on deep geological disposal of radioactive waste, Winnipeg (Canada), 15-18 Sep 1996). Order Number DE96014289. Source: OSTI; NTIS; INIS; GPO Dep.

WIPP's long-standing mission is to demonstrate the safe disposal of TRU waste from US defense activities. In 1980, to comply with NEPA, US DOE completed its first environmental impact statement (EIS) which compared impacts of alternatives for TRU waste disposal. Based on this 1980 analysis, DOE decided to construct WIPP in 1981. In a 1990 decision based on examination of alternatives in a 1990 Supplemental EIS, DOE decided to continue WIPP development by proceeding with a testing program to examine WIPP's suitability as a TRU waste repository. Now, as DOE's Carlsbad Area Office (CAO) attempts to complete its regulatory obligations to begin WIPP disposal operations, CAO is developing WIPP's second supplemental EIS (SEIS-II). To complete the SEIS-II, CAO will have to meet a number of challenges. This paper explores both the past and present EISs prepared to evaluate the suitability of WIPP. The challenges in completing an objective comparison of alternatives, while also finalizing other critical-path compliance documents, controlling costs, and keeping stakeholders involved during the decision-making process are addressed.

1286 (DOE/WIPP–95-2154) **Basic data report for WQSP 1; WQSP 2; WQSP 3; WQSP 4; WQSP 5; WQSP6; and WQSP 6a.** USDOE Albuquerque Operations Office, NM (United States). Waste Isolation Pilot Plant Project Office. [1996]. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE96010604. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) is located in southeastern New Mexico about 30 miles east of Carlsbad, New Mexico. The WIPP was authorized by Congress in 1979 (Public Law 96-194) and given the mission to provide "···a research and development facility to demonstrate the safe disposal of radioactive wastes resulting from the defense activities and programs of the United States exempted from regulation by the Nuclear Regulatory Commission." The WIPP is intended to receive, handle, and permanently dispose of transuranic waste. To fulfill this mission, the U.S. Department of Energy is constructing a full scale facility to demonstrate both technical and operational principles of the permanent storage/disposal of transuranic waste. Technical aspects are those concerned with the design, construction, and performance of subsurface structures. Operational aspects refer to-the receiving, handling, and emplacement of transuranic waste in salt. The facility is also designed for in situ studies and experiments in salt. The Water Quality

Sampling Program (WQSP) evaluates the physical and chemical properties of the groundwater above the repository horizon that are part of the technical performance aspects.

1287 (DOE/WIPP–96-2087) **Time domain reflectometry as a rock mass monitoring technique.** Francke, J.L.; Terrill, L.J.; Allen, W.W. Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1996]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (CONF-960303–2: Annual meeting and exhibition of the Society for Mining, Metallurgy and Exploration, Phoenix, AZ (United States), 11-14 Mar 1996). Order Number DE96010276. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the practices and methods used in a study of Time Domain Reflectometry (TDR) as an inexpensive deformation monitoring tool in underground excavations at the Waste Isolation Pilot Plant (WIPP). The WIPP is being developed near Carlsbad, New Mexico, for the disposal of transuranic nuclear wastes in bedded salt 655 m (2150 ft) below the surface. Data collected from WIPP geomechanical monitoring are used to characterize conditions, confirm design assumptions, and understand and predict the performance of the deep salt excavation. The geomechanical monitoring techniques ranging from inspection of observation boreholes to advanced radar surveys. In 1989 TDR was introduced as a monitoring tool with the installation of 12.7 mm (0.5 in) diameter TDR cables in the underground excavations. In 1993, a new TDR system was installed in a separate location. Based on experience with the previous installation, enhancements were implemented into the new TDR system that: (1) extended the period of performance by increasing cable diameter to 22. 2 mm (0.875 in), (2) increased accuracy in locating areas of deformation by aligning cables with nearby observation boreholes, and (3) improved data acquisition and analyses using a standard laptop computer, eliminating the chart recorder previously used. In summary, the results of a correlation between the TDR signatures to nearby observation boreholes and geomechanical instrumentation will be presented.

1288 (DOE/WIPP–96-2175) **Hazard and consequence analysis for waste emplacement at the Waste Isolation Pilot Plant.** Gerstner, D.M.; Clayton, S.G.; Farrell, R.F.; McCormick, J.A.; Ortiz, C.; Standiford, D.L. Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. [1996]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE96010280. Source: OSTI; NTIS; INIS; GPO Dep.

The Carlsbad Area Office established and analyzed the safety bases for the design and operations as documented in the WIPP Safety Analysis Report (SAR). Additional independent efforts are currently underway to assess the hazards associated with the long-term (10,000 year) isolation period as required by 40 CFR 191. The structure of the WIPP SAR is unique due to the hazards involved, and the agreement between the State of New Mexico and the DOE regarding SAR content and format. However, the hazards and accident analysis philosophy as contained in DOE-STD-3009-94 was followed as closely as possible, while adhering to state agreements. Hazards associated with WIPP waste receipt, emplacement, and disposal operations were systematically identified using a modified Hazard and Operability Study (HAZOP) technique. The WIPP HAZOP assessed the potential internal, external, and natural phenomena events that can cause the identified hazards to develop into accidents. The hazard assessment identified deviations from the intended design and operation of the waste handling system, analyzed potential accident consequences to the public and workers, estimated likelihood of occurrence, and evaluated associated preventative and mitigative features. It was concluded from the assessment that the proposed WIPP waste emplacement operations and design are sufficient to ensure safety of the public, workers, and environment, over the 35 year disposal phase.

1289 (DOE/WIPP–96010611) **Waste treatability guidance program. User's guide. Revision 0.** Toth, C. Stoller (S.M.) Associates, New York, NY (United States). 21 Dec 1995. 25p. Sponsored by USDOE, Washington, DC (United States). Order Number DE96010611. Source: OSTI; NTIS; INIS; GPO Dep.

DOE sites across the country generate and manage radioactive, hazardous, mixed, and sanitary wastes. It is necessary for each site to find the technologies and associated capacities required to manage its waste. One role of DOE HQ Office of Environmental Restoration and Waste Management is to facilitate the integration of the site- specific plans into coherent national plans. DOE has developed a standard methodology for defining and categorizing waste streams into treatability groups based on characteristic parameters that influence waste management technology needs. This Waste Treatability Guidance Program automates the Guidance Document for the categorization of waste information into treatability groups; this application provides a consistent implementation of the methodology across the National TRU Program. This User's Guide provides instructions on how to use the program, including installations instructions and program operation. This document satisfies the requirements of the Software Quality Assurance Plan.

1290 (EGG-TMI–7385-Rev.1) **TMI-2 core bore acquisition summary report.** Tolman, E.L.; Smith, R.P.; Martin, M.R.; McCardell, R.K.; Broughton, J.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1987. 182p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE96014149. Source: OSTI; NTIS; GPO Dep.

Core bore samples were obtained from the severely damaged TMI-2 core during July and August, 1986. A description of the TMI-2 core bore drilling unit used to obtain samples; a summary and discussion of the data from the ten core bore segments which were obtained; and the initial results of analysis and evaluation of these data are presented in this report. The impact of the major findings relative to our understanding of the accident scenario is also discussed.

1291 (INEL–94/0054) **Design documentation: Krypton encapsulation preconceptual design.** Knecht, D.A. (Idaho National Engineering Lab., Idaho Falls, ID (United States)). Lockheed Idaho Technologies Co., Idaho Falls, ID (United States); Parsons-Redpath, Pasadena, CA (United States). Oct 1994. 300p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002937. Source: OSTI; NTIS; INIS; GPO Dep.

US EPA regulations limit the release of Krypton-85 to the environment from commercial facilities after January 1, 1983. In order to comply with these regulations, Krypton-85, which would be released during reprocessing of commercial nuclear fuel, must be collected and stored. Technology currently exists for separation of krypton from other inert gases, and for its storage as a compressed gas in steel cylinders. The requirements, which would be imposed for 100-year storage of Krypton-85, have led to development of processes for encapsulation of krypton within a stable solid matrix. The objective of this effort was to provide preconceptual engineering designs, technical evaluations, and life cycle costing data for comparison of two alternate candidate processes for encapsulation of Krypton-85. This report has been prepared by The Ralph M. Parsons Company for the US Department of Energy.

1292 (INEL–94/0067) **INEL metal recycle annual report, FY-94.** Bechtold, T.E. (ed.). Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Sep 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002950. Source: OSTI; NTIS; INIS; GPO Dep.

In 1992, the mission of the Idaho Chemical Processing Plant was changed from reprocessing of spent nuclear fuels to development of technologies for conditioning of spent nuclear fuels and other high-level wastes for disposal in a geologic repository. In addition, the Department of Energy (DOE) directed Idaho National Engineering Laboratory (INEL) to develop a program plan addressing the management of radioactive contaminated scrap metal (RSM) within the DOE complex. Based on discussions with the EM-30 organization, the INEL Metal Recycle program plan was developed to address all issues of RSM management. Major options considered for RSM management were engineered interim storage, land disposal as low-level waste, and beneficial reuse/recycle. From its inception, the Metal Recycle program has emphasized avoidance of storage and disposal costs through beneficial reuse of RSM. The Metal Recycle program plan includes three major activities: Site-by-site inventory of RSM resources; validation of technologies for conversion of RSM to usable products; and identification of parties prepared to participate in development of a RSM recycle business.

1293 (INEL–94/00106) **Evaluation of a potential nuclear fuel repository criticality: Lessons learned.** Wilson, J.R.; Evans, D. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950740–99: Joint American Society of Mechanical Engineers (ASME)/Japan Society of Mechanical Engineers (JSME) pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE96001616. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents lessons learned from a Probabilistic Risk Assessment (PRA) of the potential for a criticality in a repository containing spent nuclear fuel with high enriched uranium. The insights gained consisted of remarkably detailed conclusions about design issues, failure mechanisms, frequencies and source terms for events up to 10,000 years in the future. Also discussed are the approaches taken by the analysts in presenting this very technical report to a non-technical and possibly antagonistic audience.

1294 (INEL–94/0119) **ICPP radioactive liquid and calcine waste technologies evaluation final report and recommendation.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Apr 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001338. Source: OSTI; NTIS; INIS; GPO Dep.

Using a formalized Systems Engineering approach, the Latched Idaho Technologies Company developed and evaluated numerous alternatives for treating, immobilizing, and disposing of radioactive liquid and calcine wastes at the Idaho Chemical Processing Plant. Based on technical analysis data as of March, 1995, it is recommended that the Department of Energy consider a phased processing approach – utilizing Radionuclide Partitioning for radioactive liquid and calcine waste treatment, FUETAP Grout for low-activity waste immobilization, and Glass (Vitrification) for high-activity waste immobilization – as the preferred treatment and immobilization alternative.

1295 (INEL–94/0395) **Criticality evaluation and protocol for DOE-owned spent nuclear fuels.** Cresap, D.A. (and others); Sentieri, P.J.; Wilson, J.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002193. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a continuation of repository criticality evaluation work. Both the probability and consequences of a criticality were considered. A long-term, low-power, water-moderated criticality was the most likely of those considered. Its probability was low but not low enough to be dismissed. The governing regulation, 40 CFR 191, allows an event to be dismissed if it has less than one chance in 10,000 of occurring in 10,000 years. This implies a regulatory concern threshold of 10-8/yr. Even if such an event occurred, the repository inventory would still be dominated by the disposed fuel and waste and no significant additional releases would be expected. The major categories of criticality investigated were: water-moderated with fast or slow reactivity insertion, dry (hard-spectrum) with fast or slow reactivity insertion, water-moderated on the surface due to human intrusion, and far field. Fault trees were prepared to assess these scenarios. As a result of this study, the probability of a criticality in 10,000 years was revised from $3x10^{-3}$ to $5x10^{-4}$, primarily through the elimination of conservatism and correction of assumptions. The presence of water is a major concern in criticality studies. The possibility of flooding due to water table rise had been dismissed in previous studies. Conservative models indicate that this is a defensible position. The possibility of a silica moderated criticality was considered briefly. The preliminary study identified isotopes of concern for release and these were verified by several comparative methods. Most isotopes had similar ratios across source categories and those that did not could be accounted for by fuel or waste characteristics. The ORIGEN2 code was validated to be sufficiently accurate for PA purposes for the low-power, long-term scenario considered in the criticality study.

1296 (INEL–95/0041) **Selection of a glass-ceramic formulation to immobilize fluorinel- sodium calcine.** Staples, B.A.; Wood, H.C. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Dec 1994. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002932. Source: OSTI; NTIS; INIS; GPO Dep.

One option for immobilizing calcined high level wastes produced by nuclear fuel reprocessing activities at the Idaho Chemical Processing Plant (ICPP) is conversion to a glass-ceramic form through hot isostatic pressing. Calcines exist in several different chemical compositions, and thus candidate formulations have been developed for converting each to glass-ceramic forms which are potentially resistant to aqueous corrosion and stable enough to qualify for repository storage. Fluorinel/Na, a chemically complex calcine type, is one of the types being stored at ICPP, and development efforts have identified three formulations with potential for immobilizing it. These are a glass forming additive that uses aluminum metal to enhance reactivity, a second glass forming additive that uses titanium metal to enhance reactivity and a third that uses not only a combination of silicon and titanium metals but enough phosphorous pentoxide to form a calcium phosphate host phase in the glass-ceramic product. Glass-ceramics of each formulation performed well in restricted characterization tests. However, none of the three was subjected to rigorous testing that would provide information on whether each was processable, that is able to retain favorable characteristics over a practical range of processing conditions.

1297 (INEL–95/0063) **Waste form product characteristics.** Taylor, L.L.; Shikashio, R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jan 1995. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002938. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy has operated nuclear facilities at the Idaho National Engineering Laboratory (INEL) to support national interests for several decades. Since 1953, it has supported the development of technologies for the storage and reprocessing of spent nuclear fuels (SNF) and the resultant wastes. However, the 1992 decision to discontinue reprocessing of SNF has left nearly 768 MT of SNF in storage at the INEL with unspecified plans for future dispositioning. Past reprocessing of these fuels for uranium and other resource recovery has resulted in the production of 3800 M^3 calcine and a total inventory of 7600 M^3 of radioactive liquids (1900 M^3 destined for immediate calcination and the remaining sodium-bearing waste requiring further treatment before calcination). These issues, along with increased environmental compliance within DOE and its contractors, mandate operation of current and future facilities in an environmentally responsible manner. This will require satisfactory resolution of spent fuel and waste disposal issues resulting from the past activities. A national policy which identifies requirements for the disposal of SNF and high level wastes (HLW) has been established by the Nuclear Waste Policy Act (NWPA) Sec.8,(b) para(3)) [1982]. The materials have to be conditioned or treated, then packaged for disposal while meeting US Environmental Protection Agency (EPA) and Nuclear Regulatory Commission (NRC) regulations. The spent fuel and HLW located at the INEL will have to be put into a form and package that meets these regulatory criteria. The emphasis of Idaho Chemical Processing Plant (ICPP) future operations has shifted toward investigating, testing, and selecting technologies to prepare current and future spent fuels and waste for final disposal. This preparation for disposal may include mechanical, physical and/or chemical processes, and may differ for each of the various fuels and wastes.

1298 (INEL–95/0097) **Experimental results: Pilot plant calcine dissolution and liquid feed stability.** Herbst, R.S.; Fryer, D.S.; Brewer, K.N.; Johnson, C.K.; Todd, T.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002944. Source: OSTI; NTIS; INIS; GPO Dep.

The dissolution of simulated Idaho Chemical Processing Plant pilot plant calcines, containing none of the radioactive actinides, lanthanides or fission products, was examined to evaluate the solubility of calcine matrix materials in acidic media. This study was a necessary precursor to dissolution and optimization experiments with actual radionuclide-containing calcines. The importance of temperature, nitric acid concentration, ratio of acid volume to calcine mass, and time on the amount, as a weight percentage of calcine dissolved, was evaluated. These parameters were studied for several representative pilot plant calcine types: (1) Run No. 74 Zirconia calcine; (2) Run No. 17 Zirconia/Sodium calcine; (3) Run No. 64 Zirconia/Sodium calcine; (3) Run No. 1027 Alumina calcine; and (4) Run No. 20 Alumina/Zirconia/Sodium calcine. Statistically designed experiments with the different pilot plant calcines indicated the effect of the studied process variables on the amount of calcine dissolved decreases in the order: Acid/Calcine Ratio > Temperature > HNO_3 Concentration > Dissolution Time. The following conditions are suitable to achieve greater than 90 wt. % dissolution of most Zr, Al, or Na blend calcines: (1) Maximum nitric acid concentration of 5M; (2) Minimum acid/calcine ratio of 10 mL acid/1 gram calcine; (3) Minimum dissolution temperature of 90°C; and (4) Minimum dissolution time of 30 minutes. The formation of calcium sulphate ($CaSO_4$) precipitates was observed in certain dissolved calcine solutions during the dissolution experiments. Consequently, a study was initiated to evaluate if and under what conditions the resulting dissolved calcine solutions would be unstable with regards to precipitate formation. The results indicate that precipitate formation in the calcine solutions prepared under the above proposed dissolution conditions are not anticipated.

1299 (INEL–95/00124) **Technology integration plan.** Henry, R.; Sumpter, K.C. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9502113–2: 1995 ACR conference on improving productivity in system development, Phoenix, AZ (United States), 6-10 Feb 1995). Order Number DE96003517. Source: OSTI; NTIS; INIS; GPO Dep.

In 1992, the Secretary of Energy directed the Assistant Secretary for Environmental Management (EM) to develop an integrated, long-term, spent nuclear fuel (SNF) management program. In response, EM created the Integrated SNF Program to assess the US Department of Energy (DOE) SNF and SNF storage facilities. As shown in Figure 1 the Integrated SNF Program is responsible for life-cycle management of DOE SNF; that is characterization, processing, interim storage and preparation for disposal. In order to implement the Program it was recognized that technology needs must be identified. A Technology Integration Program was formed to integrate the DOE complex-wide efforts for establishing timely, cost effective and consistent technical criteria for the development of technical solutions. The program is directed toward identification of: (a) what activities need to be done, (b) when they need to be completed, and (c) what priority should be assigned to the various activities.

1300 (INEL–95/0127-Draft) **Life-cycle costs for the Department of Energy waste management programmatic environmental impact statement (draft).** Sherick, M.J.; Shropshire, D.E.; Hsu, K.M. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1995. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002191. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) Office of Environmental Management has produced a Programmatic Environmental Impact Statement (PEIS) in order to assess the potential consequences resulting from a cross section of possible waste management strategies for the DOE complex. The PEIS has been prepared in compliance with the National Environmental Policy Act, and includes evaluations of a variety of alternatives. The analysis performed for the PEIS included the development of life-cycle cost estimates for the different waste management alternatives being considered. These cost estimates were used in the PEIS to support the identification and evaluation of economic impacts. Information developed during the preparation of the life-cycle cost estimates was also used to support risk and socioeconomic analyses performed for each of the alternatives. This technical report provides an overview of the methodology used to develop the life-cycle cost estimates for the PEIS alternatives. The methodology that was applied made use of the Waste Management Facility Cost Information Reports, which provided a consistent approach and estimating basis for the PEIS cost evaluations. By maintaining consistency throughout the cost analyses, life-cycle costs of the various alternatives can be compared and evaluated on a relative basis. This technical report also includes the life-cycle cost estimate results for each of the PEIS alternatives evaluated. Summary graphs showing the results for each waste type are provided in the main document, and tables showing different breakdowns of the cost estimates are provided in the Appendices A-D. Appendix E contains PEIS cost information that was developed using an approach different than the standard methodology described in this report.

1301 (INEL–95/0130) **TRUEX flowsheet development as applied to ICPP sodium-bearing waste using centrifugal contactors.** Law, J.D.; Herbst, R.S. Idaho National Engineering Lab., Idaho Falls, ID (United States). Feb 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002860. Source: OSTI; NTIS; INIS; GPO Dep.

Previous lab-scale work using batch contacts with sodium- bearing waste (SEW) simulant and samples of radioactive SEW from tank WM-185 suggested a potential flowsheet for partitioning actinides using solvent extraction (the TRUEX process). The suggested baseline flowsheet includes: an extraction section to remove actinides from liquid SEW into the TRUEX solvent (0.2 M CMP01 1.4 M TBP in Isopar-L); a dilute nitric acid scrub (0.07- 0.2 M HNO_3) to back extract co-extracted matrix materials (primarily Fe, Zr, and HNO_3) from the loaded solvent; thermally unstable complexants (TUCS) to back extract actinides; and a carbonate wash section for solvent cleanup. The purpose of the flowsheet development studies was to test and develop the baseline TRUEX flowsheet for ICPP SEW under continuous, countercurrent conditions using centrifugal contactors. All testing was performed using non-radioactive SEW simulant. Potential flowsheets were evaluated with regards to the behavior of the non-radioactive components known to be extracted by the TRUEX solvent. In general, the behavior of the individual components closely paralleled that anticipated from batch testing. The results indicate that eight extraction stages are more than sufficient to reduce the actinide content in the SEW to levels well below the NRC Class A LLW criteria of 10 nCi/g. Iron was effectively scrubbed from the organic and 5% ended up in the high-activity waste (HAW) fraction. Zirconium scrubbing was not as effective and as much as 60% of the Zr in the feed could end up in the HAW fraction. The TUCS strip was effective at quantitatively stripping all metals except mercury from the TRUEX solvent. Carbonate washing effectively back extracted mercury from the stripped solvent, resulting in 99.4% of the mercury selectively partitioned from the SEW.

1302 (INEL–95/0131) **A document review to characterize Atomic International SNAP fuels shipped to INEL 1966–1973.** Wahnschaffe, S.D.; Lords, R.E. (eds.); Kneff, D.W.; Nagel, W.E.; Pearlman, H.; Schaubert, V.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Sep 1995. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002841. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides the results of a document search and review study to obtain information on the spent fuels for the following six Nuclear Auxiliary Power (SNAP) reactor cores now stored at the Idaho National Engineering Laboratory (INEL): SNAP-2 Experimental Reactor, SNAP-2 Development Reactor, SNAP-10A Ground Test Reactor, SNAP-8 Experimental Reactor, SNAP-8 Development Reactor, and Shield Test Reactor. The report also covers documentation on SNAP fuel materials from four in-pile materials tests: NAA-82-1, NAA-115-2, NAA-117-1, and NAA-121. Pieces of these fuel materials are also stored at INEL as part of the SNAP fuel shipments.

1303 (INEL–95/0145) **Results of intermediate-scale hot isostatic press can experiments.** Nelson, L.O.; Vinjamuri, K. Idaho National Engineering Lab., Idaho Falls, ID (United States). May 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001579. Source: OSTI; NTIS; INIS; GPO Dep.

Radioactive high-level waste (HLW) has been managed at the Idaho Chemical Processing Plant (ICPP) for a number of years. Since 1963, liquid HLW has been solidified into a granular solid (calcine). Presently, over 3,800 m^3 of calcine is stored in partially-underground stainless steel bins. Four intermediate- scale HLW can tests (two 6-in OD × 12-in tall and two 4-in OD × 7-in tall) are described and compared to small-scale HIP can tests (1- to 3-in OD × 1- to 4.5-in tall). The intermediate-scale HIP cans were loaded with a 70/30 calcine/frit blend and HIPped at an off-site facility at 1050°C; and 20 ksi. The dimensions of two cans (4-in OD × 7-in tall) were monitored during the HIP cycle with eddy-current sensors. The sensor measurements indicated that can deformation occurs rapidly at 700°C; after which, there is little additional can shrinkage. HIP cans were subjected to a number of analyses including calculation of the overall packing efficiency (56 to 59%), measurement of glass-ceramic (3.0 to 3.2 g/cc), 14-day MCC-1 leach testing (total mass loss rates < 1 g/m^2 day), and scanning electron microscopy (SEM). Based on these analyses, the glass-ceramic material produced in intermediate-scale cans is similar to material produced in small-scale cans. No major scale-up problems were indicated. Based on the packing efficiency observed in intermediate- and small-scale tests, the overall packing efficiency of production-scale (24-in OD × 36- to 190-in tall) cans would be approximately 64% for a pre-HIP right-circular cylinder geometry. An efficiency of 64% would represent a volume reduction factor of 2.5 over a candidate glass waste prepared at 33 wt% waste loading.

1304 (INEL–95/0161) **Emissions model of waste treatment operations at the Idaho Chemical Processing Plant.** Schindler, R.E. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract

AC07-94ID13223. Order Number DE96001181. Source: OSTI; NTIS; INIS; GPO Dep.

An integrated model of the waste treatment systems at the Idaho Chemical Processing Plant (ICPP) was developed using a commercially-available process simulation software (ASPEN Plus) to calculate atmospheric emissions of hazardous chemicals for use in an application for an environmental permit to operate (PTO). The processes covered by the model are the Process Equipment Waste evaporator, High Level Liquid Waste evaporator, New Waste Calcining Facility and Liquid Effluent Treatment and Disposal facility. The processes are described along with the model and its assumptions. The model calculates emissions of NO_x, CO, volatile acids, hazardous metals, and organic chemicals. Some calculated relative emissions are summarized and insights on building simulations are discussed.

1305 (INEL–95/0184) **Estimation of alkali metal mole percent and weight of calcined solids for ICPP calcine.** O'Brien, B.H. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Mar 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001549. Source: OSTI; NTIS; INIS; GPO Dep.

An updated method is given for estimation of the weight of calcined solids and volume reduction factor for calcine, and mole percent sodium plus potassium in calcine produced from radioactive waste in a fluidized-bed calciner at the Idaho Chemical Processing Plant (ICPP). It incorporates new information on a calcine chemistry from a study by K. N. Brewer and G. F. Kessinger in which they determined the compounds formed during calcination by both high temperature thermodynamic equilibrium calculations and by analyses of pilot-plant calcines. An explanation of the assumptions made in the calculations, along with several example calculations and comparisons with the previous calculation methods are included. This method allows calculation of the heat generation rate and sodium content of the calcine, which are used to determine the suitability of the calcine for storage in the ICPP bin sets. Although this method accurately predicts the weight of calcine and mole percent Na + K for its intended purpose, the compounds predicted should only be used as a first approximation for other purposes since the calculation does not incorporate all of the compounds, such as mixed-metal oxides, which may form during calcination.

1306 (INEL–95/0194) **Reliability evaluation methodologies for ensuring container integrity of stored transuranic (TRU) waste.** Smith, K.L. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jun 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001339. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides methodologies for providing defensible estimates of expected transuranic waste storage container lifetimes at the Radioactive Waste Management Complex. These methodologies can be used to estimate transuranic waste container reliability (for integrity and degradation) and as an analytical tool to optimize waste container integrity. Container packaging and storage configurations, which directly affect waste container integrity, are also addressed. The methodologies presented provide a means for demonstrating Resource Conservation and Recovery Act waste storage requirements.

1307 (INEL–95/0224) **TRUEX partitioning from radioactive ICPP sodium bearing waste.** Herbst, R.S.; Brewer, K.N.; Tranter, T.J.; Todd, T.A. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001188. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho Chemical Processing Plant (ICPP) located at the Idaho National Engineering Laboratory in Southeast Idaho is currently evaluating several treatment technologies applicable to waste streams generated over several decades of-nuclear fuel reprocessing. Liquid sodium bearing waste (SBW), generated primarily during decontamination activities, is one of the waste streams of interest. The TRansUranic EXtraction (TRUEX) process developed at Argonne National Laboratory is currently being evaluated to separate the actinides from SBW. On a mass basis, the amount of the radioactive species in SBW are low relative to inert matrix components. Thus, the advantage of separations is a dramatic decrease in resulting volumes of high activity waste (HAW) which must be dispositioned. Numerous studies conducted at the ICPP indicate the applicability of the TRUEX process has been demonstrated; however, these studies relied on a simulated SBW surrogate for the real waste. Consequently, a series of batch contacts were performed on samples of radioactive ICPP SBW taken from tank WM-185 to verify that actual waste would behave similarly to the simulated waste. The test results with SBW from tank WM-185 indicate the TRUEX solvent effectively extracts the actinides from the samples of actual waste. Gross alpha radioactivity, attributed predominantly to Pu and Am, was reduced from 3.14E+04 dps/mL to 1.46 dps/mL in three successive batch contacts with fresh TRUEX solvent. This reduction corresponds to a decontamination factor of DF = 20,000 or 99.995% removal of the gross a activity in the feed. The TRUEX solvent also extracted the matrix components Zr, Fe, and Hg to an appreciable extent ($D_{Zr} > 10$, $D_{Fe} \approx 2$, $D_{Hg} \approx 6$). Iron co-extracted with the actinides can be successfully scrubbed from the organic with 0.2 M HNO_3. Mercury can be selectively partitioned from the actinides with either sodium carbonate or nitric acid ($\geq$ 5 M HNO_3) solutions.

1308 (INEL–95/0225) **Actinide partitioning from actual ICPP dissolved zirconium calcine using the TRUEX solvent.** Brewer, K.N. (and others); Herbst, R.S.; Tranter, T.J. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001184. Source: OSTI; NTIS; INIS; GPO Dep.

The TRansUranic EXtraction process (TRUEX), as developed by E.P. Horwitz and coworkers at Argonne National Laboratory (ANL), is being evaluated as a TRU extraction process for Idaho Chemical Processing Plant (ICPP) wastes. A criteria that must be met during this evaluation, is that the aqueous raffinate must be below the 10 nCi/g limit specified in 10 CFR 61.55. A test was performed where the TRUEX solvent (0.2 M octyl(phenyl)-N-N-diisobutylcarbamoylmethyl-phosphine oxide (CMPO), and 1.4 M tributylphosphate (TBP) in an Isopar-L diluent) was contacted with actual ICPP dissolved zirconium calcine. Two experimental flowsheets were used to determine TRU decontamination factors, and TRU, Zr, Fe, Cr, and Tc extraction, scrub, and strip distribution coefficients. Results from these two flowsheets show that >99.99% of the TRU alpha activity was removed from the acidic feed after three contacts with the TRUEX solvent (fresh solvent being used for each contact). The resulting aqueous raffinate solution contained an approximate TRU alpha activity of 0.02 nCi/g, which is well below the non-TRU waste limit of 10 nCi/g specified in 10 CFR 61.55. Favorable scrub and strip distribution coefficients were also observed for Am-241, Pu-238, and Pu-239, indicating the feasibility of recovering these isotopes from the TRUTEX solvent. A solution of 0.04 M 1-hydroxyethane-1,1-diphosphonic acid (HEDPA) in 0.04 M HNO_3 was used to successfully strip the TRUs from the TRUEX solvent. The results of the test using actual ICPP dissolved zirconium calcine, and subsequent GTM evaluation, show the feasibility of removing TRUs from the dissolved zirconium calcine with the TRUEX solvent and the deleterious effects zirconium poses with the ICPP zirconium calcine waste. Test results using actual ICPP zirconium calcine reveal the necessity of preventing zirconium from following the TRUs.

1309 (INEL--95/00290) **Zirconia solubility in boroaluminosilicate glass.** Raman, S.V. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Bopp, R.; Batcheller, T.A.; Yan, Q. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96004672. Source: OSTI; NTIS; INIS; GPO Dep.

In the Idaho Chemical Processing Plant (ICPP) waste streams, zirconia is often the waste load limiting species. It modifies the glass network, enhances durability, increases viscosity and induces crystallization. The limits of its dissolution in boroaluminosilicate glass, with magnesia and soda additions were experimentally determined. A ternary compositional surface is evolved to present the isothermal regimes of liquid, liquid + zircon, liquid + forsterite, and liquid phase sintered ceramic. The potential of partitioning the transuranics, transition elements and solutes in these regimes is discussed. The visible Raman spectroscopic results are presented to elucidate the dependence among glass composition, structure and chemical durability.

1310 (INEL--95/00343) **Hot Isostatic Press (HIP) vitrification of radwaste concretes.** Siemer, D.D. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Scheetz, B.; Gougar, M.L.D. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-951155--19: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 27 Nov - 1 Dec 1995). Order Number DE96003502. Source: OSTI; NTIS; INIS; GPO Dep.

Properly formulated and properly "canned" radwaste concretes can be readily hot-isostatically-pressed (HIPed) into materials that exhibit performance equivalent to typical radwaste-type glasses. The HIPing conditions (temperature/pressure) required to turn a concrete waste form into a "vitrified" waste form are quite mild and therefore consistent with both safety and high productivity. This paper describes the process and its products with reference to its potential application to Idaho Chemical Processing Plant (ICPP) reprocessing wastes.

1311 (INEL--95/00390) **Characteristics of DOE spent nuclear fuel affecting pretreatment and final disposition.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9508178--2: Russia Federation/United States technical exchange on the non-reactor nuclear safety and waste management, Los Alamos, NM (United States), 14-17 Aug 1995). Order Number DE96001627. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) has more than 150 different types of Spent Nuclear Fuel (SNF), comprising more than 200,000 units, in storage at DOE, private non-DOE, university facilities across the United States and foreign countries. The present DOE SNF management plan does not include reprocessing the fuel for the recovery of uranium, but involves interim storage until DOE is prepared to disposition the fuel in a national repository. Prior to any long term actions the SNF will need to be characterized sufficiently to support the proposed actions. The determination of which characteristics will be important will depend on the proposed action. Some characteristics will be universally important. There is a need to understand the characteristics of the SNF and to put the fuel in categories of SNF with similar characteristics. This will allow the evaluation of the SNF and the proposed dispositioning options by categories rather than individually.

1312 (INEL--95/00410) **Remote inspection of the IFSF spent fuel storage rack.** Uldrich, E.D. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960426--10: 58. annual meeting of the American power conference, Chicago, IL (United States), 9-11 Apr 1996). Order Number DE96010447. Source: OSTI; NTIS; INIS; GPO Dep.

The Irradiated Fuel Storage Facility (IFSF) is a dry storage facility for spent nuclear fuels located at the Idaho Chemical Processing Plant; it was constructed in the 1970's specifically for the Fort Saint Vrain spent reactor fuels. Currently, it is being used for various spent fuels. It was not known if IFSF would met current DOE seismic criteria, so re-analysis was started, with the rack being analyzed first. The rack was inspected to determine the as-built condition. LazrLyne and VideoRuler were used in lieu of using a tape measure with the camera. It was concluded that when a visual inspection shows widely varying weld sizes, the engineer has to use all resources available to determine the most probable specified weld sizes.

1313 (INEL--95/00437) **Drying studies of simulated DOE aluminum plate fuels.** Lords, R.E. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Windes, W.E.; Crepeau, J.C.; Sidwell, R.W. Idaho National Engineering Lab., Idaho Falls, ID (United States). 1996. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9606116--44: Annual meeting of the American Nuclear Society (ANS), Reno, NV (United States), 16-20 Jun 1996). Order Number DE96010440. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments have been conducted to validate the Idaho National Engineering Laboratory (INEL) drying procedures for preparation of corroded aluminum plate fuel for dry storage in an existing vented (and filtered) fuel storage facility. A mixture of hydrated aluminum oxide bound with a clay was used to model the aluminum corrosion product and sediment expected in these Department of Energy (DOE) owned fuel types. Previous studies demonstrated that the current drying procedures are adequate for removal of free water inside the storage canister and for transfer of this fuel to a vented dry storage facility. However, using these same drying procedures, the simulated corrosion product was found to be difficult to dry completely from between the aluminum clad plates of the fuel. Another related set of experiments was designed to ensure that the fuel would not be damaged during the drying process. Aluminum plate fuels are susceptible to pitting damage on the cladding that can result in a portion of UAl_x fuel meat being disgorged. This would leave a water-filled void beneath the pit in the cladding. The question was whether bursting would occur when water in the void flashes to steam, causing separation of the cladding from the fuel, and/or possible rupture. Aluminum coupons were fabricated to model damaged fuel plates. These coupons do not rupture or sustain any visible damage during credible drying scenarios.

1314 (INEL–95/00438) **Criticality safety for deactivation of the Rover dry headend process.** Henrikson, D.J. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9606116–17: Annual meeting of the American Nuclear Society (ANS), Reno, NV (United States), 16-20 Jun 1996). Order Number DE96009020. Source: OSTI; NTIS; INIS; GPO Dep.

The Rover dry headend process combusted Rover graphite fuels in preparation for dissolution and solvent extraction for the recovery of ^{235}U. At the end of the Rover processing campaign, significant quantities of ^{235}U were left in the dry system. The Rover Dry Headend Process Deactivation Project goal is to remove the remaining uranium bearing material (UBM) from the dry system and then decontaminate the cells. Criticality safety issues associated with the Rover Deactivation Project have been influenced by project design refinement and schedule acceleration initiatives. The uranium ash composition used for calculations must envelope a wide range of material compositions, and yet result in cost effective final packaging and storage. Innovative thinking must be used to provide a timely safety authorization basis while the project design continues to be refined.

1315 (INEL–95/0442) **Nondestructive examination technologies for inspection of radioactive waste storage tanks.** Anderson, M.T.; Kunerth, D.C.; Davidson, J.R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Aug 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96001334. Source: OSTI; NTIS; INIS; GPO Dep.

The evaluation of underground radioactive waste storage tank structural integrity poses a unique set of challenges. Radiation fields, limited access, personnel safety and internal structures are just some of the problems faced. To examine the internal surfaces a sensor suite must be deployed as an end effector on a robotic arm. The purpose of this report is to examine the potential failure modes of the tanks, rank the viability of various NDE technologies for internal surface evaluation, select a technology for initial EE implementation, and project future needs for NDE EE sensor suites.

1316 (INEL–95/00460) **The TRUPACT-II Matrix Depletion Program.** Connolly, M.J. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Djordjevic, S.M.; Loehr, C.A.; Smith, M.C.; Banjac, V.; Lyon, W.F. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950216–159: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 Mar 1995). Order Number DE96003508. Source: OSTI; NTIS; INIS; GPO Dep.

Contact-handled transuranic (CH-TRU) wastes will be shipped and disposed at the Waste Isolation Pilot Plant (WIPP) repository in the Transuranic Package Transporter-II (TRUPACT-II) shipping package. A primary transportation requirement for the TRUPACT-II is that the concentration of potentially flammable gases (i.e., hydrogen and methane) must not exceed 5 percent by volume in the package or the payload during a 60-day shipping period. Decomposition of waste materials by radiation, or radiolysis, is the predominant mechanism of gas generation during transport. The gas generation potential of a target waste material is characterized by a G-value, which is the number of molecules of gas generated per 100 eV of ionizing radiation absorbed by the target material. To demonstrate compliance with the flammable gas concentration requirement, theoretical worst-case calculations were performed to establish allowable wattage (decay heat) limits for waste containers. The calculations were based on the G-value for the waste material with the highest potential for flammable gas generation. The calculations also made no allowances for decreases of the G-value over time due to matrix depletion phenomena that have been observed by many experimenters. Matrix depletion occurs over time when an alpha-generating source particle alters the target material (by evaporation, reaction, or decomposition) into a material of lower gas generating potential. The net effect of these alterations is represented by the "effective G-value."

1317 (INEL–95/00466) **Remediating the INEL's buried mixed waste tanks.** Kuhns, D.J. (Lockheed Idaho Technologies Co., Idaho Falls, ID (United States)); Matthern, G.E.; Reese, C.L. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 28 Feb 1996. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960212–14: Waste management '96: HLW, LLW, mixed wastes and environmental restoration - working towards a cleaner environment, Tucson, AZ (United States), 25-29 Feb 1996). Order Number DE96007276. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory (INEL), formerly the National Reactor Testing Station (NRTS), encompasses 890 square miles and is located in southeast Idaho. In 1949, the United States Atomic Energy Commission, now the Department of Energy (DOE), established the NRTS as a site for the building and testing of nuclear facilities. Wastes generated during the building and testing of these nuclear facilities were disposed within the boundaries of the site. These mixed wastes, containing radionuclides and hazardous materials, were often stored in underground tanks for future disposal. The INEL has 11 buried mixed waste storage tanks regulated under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) ranging in size from 400 to 50,000 gallons. These tanks are constructed of either stainless or carbon steel and are located at 3 distinct geographic locations across the INEL. These tanks have been grouped based on their similarities in an effort to save money and decrease the time required to complete the necessary remediation. Environmental Restoration and Technology Development personnel are teaming in an effort to address the remediation problem systematically.

1318 (INEL–95/0477) **CPP-603 Underwater Fuel Storage Facility Site Integrated Stabilization Management Plan (SISMP), Volume I.** Denney, R.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). Oct 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96002185. Source: OSTI; NTIS; INIS; GPO Dep.

The CPP-603 Underwater Fuel Storage Facility (UFSF) Site Integrated Stabilization Management Plan (SISMP) has been constructed to describe the activities required for the relocation of spent nuclear fuel (SNF) from the CPP-603 facility. These activities are the only Idaho National Engineering Laboratory (INEL) actions identified in the Implementation Plan developed to meet the requirements of the Defense Nuclear Facilities Safety Board (DNFSB) Recommendation 94-1 to the Secretary of Energy regarding an improved schedule for remediation in the Defense Nuclear Facilities Complex. As described in the DNFSB Recommendation 94-1 Implementation Plan, issued February 28, 1995, an INEL Spent Nuclear Fuel Management Plan is currently under development to direct the placement of SNF currently in existing INEL facilities into interim storage, and to address the coordination of intrasite SNF movements with new receipts and intersite transfers that were identified in the DOE SNF Programmatic and INEL Environmental Restoration and Waste Management Environmental Impact Statement Record, of Decision. This SISMP will be a subset of the INEL Spent Nuclear Fuel Management Plan and the activities described are being coordinated with other INEL SNF management activities. The CPP-603 relocation activities have been assigned a high priority so that established milestones will be meet, but there will be some cases where other activities will take precedence in utilization of available resources. The Draft INEL Site Integrated Stabilization Management Plan (SISMP), INEL-94/0279, Draft Rev. 2, dated March 10, 1995, is being superseded by the INEL Spent Nuclear Fuel Management Plan and this CPP-603 specific SISMP.

1319 (INEL–95/00505) **Implementation process and deployment initiatives for the regionalized storage of DOE-owned spent nuclear fuel.** Dearien, J.A.; Smith, N.E.L. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9606116–42: Annual meeting of the American Nuclear Society (ANS), Reno, NV (United States), 16-20 Jun 1996). Order Number DE96009017. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes how DOE-owned spent nuclear fuel (SNF) will be stored in the interim 40-year period from 1996 to 2035, by which time it is expected to be in a National Nuclear Repository. The process is described in terms of its primary components: fuel inventory, facilities where it is stored, how the fuel will be moved, and legal issues associated with the process. Tools developed to deploy and fulfill the implementation needs of the National Spent Nuclear Fuel Program are also discussed.

1320 (INEL–95/00507) **National high-level waste systems analysis.** Kristofferson, K.; O'Holleran, T.P. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1996]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960804–23: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96009060. Source: OSTI; NTIS; INIS; GPO Dep.

Previously, no mechanism existed that provided a systematic, interrelated view or national perspective of all high-level waste treatment and storage systems that the US Department of Energy manages. The impacts of budgetary constraints and repository availability on storage and treatment must be assessed against existing and pending negotiated milestones for their impact on the overall HLW system. This assessment can give DOE a complex-wide view of the availability of waste treatment and help project the time required to prepare HLW for disposal. Facilities, throughputs, schedules, and milestones were modeled to ascertain the treatment and storage systems resource requirements at the Hanford Site, Savannah River Site, Idaho National Engineering Laboratory, and West Valley Demonstration Project. The impacts of various treatment system availabilities on schedule and throughput were compared to repository readiness to determine the prudent application of resources. To assess the various impacts, the model was exercised against a number of plausible scenarios as discussed in this paper.

1321 (INEL–95/0534) **Potential dispositioning flowsheets for ICPP SNF and wastes.** Olson, A.L. (ed.) (and others); Anderson, P.A.; Bendixsen, C.L. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Nov 1995. 141p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003535. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho Chemical Processing Plant (ICPP), located at the Idaho National Laboratory (INEL), has reprocessed irradiated nuclear fuels for the US Department of Energy (DOE) since 1953. This activity resulted mainly in the recovery of uranium and the management of the resulting wastes. The acidic radioactive high-level liquid waste was routinely stored in stainless steel tanks and then calcined to form a dry granular solid. The calcine is stored in stainless steel bins that are housed in underground concrete vaults. In April 1992, the DOE discontinued the practice of reprocessing irradiated nuclear fuels. This decision has left a legacy of 1.8 million gallons of radioactive liquid wastes (1.5 million gallons of radioactive sodium-bearing liquid wastes and 0.3 million gallons of high-level liquid waste), 3800 cubic meters of calcine waste, and 289 metric tons of heavy metal within unprocessed spent nuclear fuel (SNF) left in inventory at the ICPP. The nation's radioactive waste policy has been established by the Nuclear Waste Policy Act (NWPA), which requires the final disposal of SNF and radioactive waste in accordance with US Environmental Protection Agency (EPA) and Nuclear Regulatory Commission (NRC) standards. In accordance with these regulations and other legal agreements between the State of Idaho and the DOE, the DOE must, among other requirements, (1) complete a final Environmental Impact Statement by April 30, 1995, (2) evaluate and test sodium-bearing waste pre-treatment technologies, (3) select the sodium-bearing and calcine waste pretreatment technology, if necessary, by June 1, 1995, and (4) select a technology for converting calcined waste into an appropriate disposal form by June 1, 1995.

1322 (INEL–95/00603) **TRUEX process applied to radioactive Idaho Chemical Processing Plant high-level waste calcine.** Brewer, K.N.; Herbst, R.S.; Law, J.D.; Todd, T.A.; Olson, A.L. Idaho National Engineering Lab., Idaho Falls, ID (United States). 1996. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract

AC07-76ID01570. (CONF-960804–26: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96010437. Source: OSTI; NTIS; INIS; GPO Dep.

Equal volume batch contact experiments were performed with dissolved, radioactive high-level waste (HLW) calcine and the TRansUranic EXtraction (TRUEX) process solvent. Extraction, scrub, and strip distribution coefficients (D) were obtained for the transuranic (TRU) elements in order to evaluate the efficiency of the TRUEX process in treating this waste. The extraction, scrub, and strip behavior of other elements, such as chromium, zirconium, and technetium, was also observed. A TRU alpha decontamination factor of >10,000 was achieved; after three extraction batch contacts TRU alpha activity was reduced from 1,420 nCi/g to 0.02 nCi/g. Dilute nitric acid was used to scrub extracted acid, zirconium, and iron from the solvent prior to stripping. Dilute 1-hydroxyethane, 1-1, diphosphonic acid (HEDPA) was used as a gross TRU stripping reagent to recover the extracted TRUs. Data from these batch contact experiments were used to develop a counter-current flowsheet for TRU removal using the Generic TRUEX Model (GTM). Process improvements and optimizations of the flowsheet have been evaluated using a non-radioactive dissolved calcine simulant spiked with tracers to obtain additional distribution coefficient data. These data were used in the GTM to refine the flowsheet. The flowsheet was then evaluated using a counter-current 5.5 cm centrifugal contactor pilot plant with a non-radioactive dissolved calcine simulant. The experiments involving radioactive waste provided crucial data for developing a baseline TRUEX process flowsheet which can effectively separate TRU components from ICPP high-level waste.

1323 (INEL–95/0642) **The extraction of rare earth elements from ICPP sodium-bearing waste and dissolved zirconium calcine by CMP and TRUEX solvents.** Todd, T.A.; Glagolenko, I.Y.; Herbst, R.S.; Brewer, K.N. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Nov 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96003835. Source: OSTI; NTIS; INIS; GPO Dep.

The extraction of stable isotopes of Eu and Ce was investigated from simulated sodium-bearing waste (SBW) and dissolved zirconium calcine by TRUEX and CMP solvents at the Idaho Chemical Processing Plant (ICPP). Single batch contacts were carried out in order to evaluate the rare earth behavior in the extraction, scrub, strip and wash sections for the proposed flowsheets. It has been shown that these lanthanides are efficiently extracted from the sodium-bearing wastes into either solvent, are not scrubbed and are stripped from both of the extractants with dilute HEDPA. The extraction distribution coefficients for Ce and Eu are higher in the TRUEX solvent (D_{Ce} = 11.7, D_{Eu} = 14.9) compared with CMP (D_{Ce} = 9.3, D_{Eu} = 7.23) for SBW. The extraction distribution coefficients for Ce and Eu are considerably less in the TRUEX solvent (D_{Ce}=1.13, D_{Eu}=1.8) than in the CMP solvent (D_{Ce}=7.4, D_{Eu}=6.1) for dissolved zirconium calcine feeds. The lower distribution coefficients for the extraction of lanthanides in the TRUEX/dissolved zirconium calcine system can be explained by zirconium loading of the solvent. The data obtained also confirmed that Ce and Eu can be used as non-radioactive surrogates for Am in separation experiments with acidic solutions.

1324 (INEL–96/0036) **Actinide extraction from ICPP sodium bearing waste with 0.75 M DHDECMP/TBP in Isopar L®.** Herbst, R.S.; Brewer, K.N.; Garn, T.G.; Law, J.D.; Rodriguez, A.M.; Tillotson, R.T. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jan 1996. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96007521. Source: OSTI; NTIS; INIS; GPO Dep.

Recent process development efforts at the Idaho Chemical Processing Plant include examination of solvent extraction technologies for actinide partitioning from sodium bearing waste (SBW) solutions. The use of 0.75 M dihexyl-N, N-diethylcarbamoylmethylphosphonate (DHDECMP or simply CMP) and 1.0 M tri-n-butyl phosphate (TBP) diluted in Isopar L® was explored for actinide removal from simulated SBW solutions. Experimental evaluations included batch contacts in radiotracer tests with simulated sodium bearing waste solution to measure the extraction and recovery efficiency of the organic solvent. The radioactive isotopes utilized for this study included Pu-238, Pu-239, Am-241, U-233, Np-239, Zr-95, Tc-99m, and Hg-203. Extraction contacts of the organic solvent with the traced SBW stimulant, strip (back-extraction) contacts of the loaded organic solvent with either a 1-hydroxyethane-1, 1-diphosphonic acid (HEDPA) in nitric acid solution or an oxalic acid in nitric acid solution, and solvent wash contacts with sodium carbonate were performed.

1325 (INEL–96/0067) **Independent review of design and analysis for Holtec spent fuel storage racks of CPP 666 Pool 1.** Miller, G.K. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Mar 1996. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96009670. Source: OSTI; NTIS; INIS; GPO Dep.

This document summarizes the analyses and review performed to develop and validate the design of the new fuel storage racks for the Idaho Chemical Processing Plant (ICPP) Fuel Storage Area (FSA). Holtec International is responsible for the design and fabrication of the storage racks. This report describes the issues raised in the review effort and the resolutions to these issues. The conclusion is reached that the review issues for the racks of Pool 1 have been satisfactorily resolved in the final design and analysis for these racks. Section 1 of this report gives a brief description of the project. Section 2 describes the approach that Holtec used in analyzing the racks and results from these analyses. Section 3 describes the independent review process. Section 4 discusses the identification of and resolution to comments on the design analysis. Section 5 describes additional analysis performed to address major concerns with the Holtec design analysis. Section 6 presents a summary of AEC's independent review, which is based on AEC's final review report. Finally, Section 7 gives the Lockheed Idaho Technologies Company (LITCO) position on the acceptability of Holtec's design.

1326 (INEL–96/0094) **A comparision of TRUEX and CMP solvent extraction processes for actinide removal from ICPP wastes.** Herbst, R.S. (and others); Brewer, K.N.; Garn, T.G.; Law, J.D. Idaho National Engineering Lab., Idaho Falls, ID (United States). Apr 1996. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96010356. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho Chemical Processing Plant (ICPP) is currently engaged in development efforts for the decontamination of high-level radioactive wastes generated from decades of nuclear fuel reprocessing. These wastes include several types of calcine, generated by high temperature solidification of reprocessing raffinates. In addition to calcine, there are smaller quantities of secondary wastes from decontamination and solvent wash activities which are typically referred to as sodium-bearing waste (SBW). Solvent extraction technologies based on octyl(phenyl)-N,N-diisobutyl-carbamoylmethylphosphine oxide (CMPO, the active extractant in the TRUEX process) and dihexyl-N,N-diethylcarbamoylmethylphosphonate (DHDECMP, the active extractant in the CMP process) are being evaluated for actinide partitioning from these waste streams. Calcines must first be dissolved in an appropriate acidic solution prior to treatment in solvent extraction based processes. The SBW is currently stored as an acidic solution and readily amenable to liquid extraction techniques. Development efforts to date have revolved around defining and refining baseline flowsheets with the TRUEX and CMP processes for each waste stream. Another objective of this work was to determine which of these technologies are best suited for the treatment of ICPP wastes. Laboratory batch contacts were performed to identify relevant chemistry and distribution coefficients. This information was then used to establish baseline flowsheet configuration with regard to chemistry. The laboratory data were used to model the behavior of the actinides and other constituents in the wastes in countercurrent, continuous processes based on centrifugal contactor technology. The laboratory data and modelling results form the basis for comparison of the two processes.

1327 (INEL–96/00134) **Drying studies for corroded DOE aluminum plate fuels.** Lords, R.E. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Windes, W.E.; Crepeau, J.C.; Sidwell, R.W. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-960804–29: SPECTRUM '96: international conference on nuclear and hazardous waste management, Seattle, WA (United States), 18-23 Aug 1996). Order Number DE96010448. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory (INEL) currently stores a wide variety of spent nuclear fuel. The fuel was originally intended to be stored underwater for a short period of thermal cooling, then removed and reprocessed. However, it has been stored underwater for much longer thank originally anticipated. During this time dust and airborne desert soil have entered the oldest INEL pool, accumulating on the fuel. Also, the aluminum fuel cladding has corroded compromising the exposed surfaces of the fuel. Plans are now underway to move some the the more vulnerable aluminum plate type fuels into dry storage in an existing vented and filtered fuel storage facility. In preparation for dry storage of the fuel a drying and canning station is being built at the INEL. The two primary objectives of this facility are to determine the influence of corrosion products on the drying process and to establish temperature distribution inside the canister during heating.

1328 (INEL–96/0140) **Initial evaluation of dry storage issues for spent nuclear fuels in wet storage at the Idaho Chemical Processing Plant.** Guenther, R.J. (and others); Johnson, A.B. Jr.; Lund, A.L.; Gilbert, E.R. Idaho National Engineering Lab., Idaho Falls, ID (United States). Nov 1994. 168p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96014176. Source: OSTI; NTIS; INIS; GPO Dep.

The Pacific Northwest Laboratory has evaluated the basis for moving selected spent nuclear fuels in the CPP-603 and CPP-666 storage pools at the Idaho Chemical Processing Plant from wet to dry interim storage. This work is being conducted for the Lockheed Idaho Technologies Company as part of the effort to determine appropriate conditioning and dry storage requirements for these fuels. These spent fuels are from 22 test reactors and include elements clad with aluminum or stainless steel and a wide variety of fuel materials: UAl_x, UAl_x-Al and U_3O_8-Al cermets, U-5% fissium, UMo, $UZrH_x$, UErZrH, UO_2-stainless steel cermet, and U_3O_8-stainless steel cermet. The study also included declad uranium-zirconium hydride spent fuel stored in the CPP-603 storage pools. The current condition and potential failure mechanisms for these spent fuels were evaluated to determine the impact on conditioning and dry storage requirements. Initial recommendations for conditioning and dry storage requirements are made based on the potential degradation mechanisms and their impacts on moving the spent fuel from wet to dry storage. Areas needing further evaluation are identified.

1329 (INEL–96/0187) **TRU drum corrosion task team report.** Kooda, K.E.; Lavery, C.A.; Zeek, D.P. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). May 1996. 143p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96013296. Source: OSTI; NTIS; INIS; GPO Dep.

During routine inspections in March 1996, transuranic (TRU) waste drums stored at the Radioactive Waste Management Complex (RWMC) were found with pinholes and leaking fluid. These drums were overpacked, and further inspection discovered over 200 drums with similar corrosion. A task team was assigned to investigate the problem with four specific objectives: to identify any other drums in RWMC TRU storage with pinhole corrosion; to evaluate the adequacy of the RWMC inspection process; to determine the precise mechanism(s) generating the pinhole drum corrosion; and to assess the implications of this event for WIPP certifiability of waste drums. The task team investigations analyzed the source of the pinholes to be Hcl-induced localized pitting corrosion. Hcl formation is directly related to the polychlorinated hydrocarbon volatile organic compounds (VOCs) in the waste. Most of the drums showing pinhole corrosion are from Content Code-003 (CC-003) because they contain the highest amounts of polychlorinated VOCs as determined by headspace gas analysis. CC-001 drums represent the only other content code with a significant number of pinhole corrosion drums because their headspace gas VOC content, although significantly less than CC-003, is far greater than that of the other content codes. The exact mechanisms of Hcl formation could not be determined, but radiolytic and reductive dechlorination and direct reduction of halocarbons were analyzed as the likely operable reactions. The team considered the entire range of feasible options, ranked and prioritized the alternatives, and recommended the optimal solution that maximizes protection of worker and public safety while minimizing impacts on RWMC and TRU program operations.

1330 (INEL–96/0189) **HWMA closure plan for the Waste Calcining Facility at the Idaho National Engineering Laboratory.** Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). May 1996. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract

AC07-94ID13223. Order Number DE96012819. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Calcining Facility (WCF) calcined and evaporated aqueous wastes generated from the reprocessing of spent nuclear fuel. The calciner operated from 1963 to 1981, primarily processing high level waste from the first cycle of spent fuel extraction. Following the calciner shutdown the evaporator system concentrated high activity aqueous waste from 1983 until 1987. In 1988, US Department of Energy Idaho Operations Office (DOE-ID) requested interim status for the evaporator system, in anticipation of future use of the evaporator system. The evaporator system has not been operated since it received interim status. At the present time, DOE-ID is completing construction on a new evaporator at the New Waste Calcining Facility (NWCF) and the evaporator at the WCF is not needed. The decision to not use the WCF evaporator requires Lockheed Idaho Technologies Company (LITCO) and DOE-ID to close these units. After a detailed evaluation of closure options, LITCO and DOE-ID have determined the safest option is to fill the voids (grout the vessels, cells and waste pile) and close the WCF to meet the requirements applicable to landfills. The WCF will be covered with a concrete cap that will meet the closure standards. In addition, it was decided to apply these closure standards to the calcining system since it is contained within the WCF building. The paper describes the site, waste inventory, closure activities, and post-closure care plans.

1331 (INEL–96/0246) **Radioactive liquid waste generation goals at the ICPP.** Tripp, J.L. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jul 1996. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE96014180. Source: OSTI; NTIS; INIS; GPO Dep.

Processes at ICPP generating hazardous radioactive liquid wastes (which are sent to the tank farm) include NWCF, PEW evaporator, LET&D, tank farm, fuel storage operations, etc. In May 1994, the INEL Radioactive Liquid Waste Management Plan was issued but not implemented. Waste generation goals have been reviewed and updated in this report (details are given in appendix). A meeting was held to determine the new waste generation goals and best approach to reaching them. Waste streams were individually analyzed in this meeting and several adjustments made both during the meeting and following the meeting. The information was adjusted and modeling completed to determine the waste reduction achieved (spreadsheets are included in appendix). Results of this update indicate that there has been a significant reduction in the waste generation goals from 2 years ago. If the updated baseline goals are met, a 35% waste reduction will be achieved; this coupled with increased calcination rate, will enable the waste in the tank farm to be processed by 2012; however a program is needed to ensure these waste goals are met. A monitoring and reporting function in conjunction with company level incentives will fill this need; a logic diagram of this monitoring program is given.

1332 (INEL–96/00251) **Comparison of spent nuclear fuel management alternatives.** Beebe, C.L.; Caldwell, M.A,. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1996]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-960767–30: 37. annual meeting of the Institute of Nuclear Materials Management, Naples, FL (United States), 28-31 Jul 1996). Order Number DE96014123. Source: OSTI; NTIS; INIS; GPO Dep.

This paper reports the process an results of a trade study of spent nuclear fuel (SNF)management alternatives. The purpose of the trade study was to provide: (1) a summary of various SNF management alternatives, (2) an objective comparison of the various alternatives to facilitate the decision making process, and (3) documentation of trade study rational and the basis for decisions.
