DATA QUALITY REVIEW

I have reviewed the following data for completeness and for compliance with project requirements.

Analyte - ICP - Na2O2 Fusion and Acid Digestion

Data Package/Report - BY-108 Core 99

Project No. - 21372

ACL Numbers - 95-07932-A1 95-07932-A2 95-007932-A3 95-07932-A4 95-07932-A5
95-07941-N1 95-07941-N2 95-07941-N3
95-07945-N1 95-07946-N1 95-07947-N1 95-07948-N1

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Blank is reported adjusted for the an "average sample volume".
3) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
4) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
5) "ND" = Not Detected; Estimated Sample Detection Limit (ug/mL) = (IDL in ug/mL) * (Dil Fctr).
6) If Percent Difference (%D) >10% and sample results >5X MDL, chemical/physical interferences may exist.
7) ">MDL" indicates analyte found in process blank above the MDL.

8) Data, including calibration/QC, archived File ICP-325-405-1/95D255a

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Above 5 times MDL, precision is estimated at +/-10% and accuracy at +/-15%.
3) Where "Blank" results are >IDL the blank has been subtracted from the "Spike Control".
4) Spike Flag (N) indicates spike is outside the QC recovery criteria.
5) If 20% flag = "*", Then RPD >20% and both sample results >MDL.
6) If spike is <25% of sample concentration, Rec is not calculated as indicated by the "n/a".
7) If sample or duplicate results are <MDL then average is not calculated (i.e., "---").

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Blank is reported adjusted for the an "average sample volume".
3) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
4) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
5) "ND" = Not Detected; Estimated Sample Detection Limit (ug/mL) = (IDL in ug/mL) * (Dil Fctr).
6) If Percent Difference (%D) >10% and sample results >5X MDL, chemical/physical interferences may exist.
7) If 20% flag = "*", then RPD >20% AND both sample and duplicate results >MDL.

8) Data, including calibration/QC, archived File ICP-325-405-1/ 95D255a

Note:
1) Method Detecion Limit (MDL) = 10x IDL; "( )" results <MDL but =>IDL.
2) Above 5 times MDL, results reportable to 2 1/2 significant digits.
3) Blank is reported in ug/g "equivalence" to indicate blank effect on sample results.
4) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
5) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
6) "ND" = Not Detected; Estimated Sample Detection Limit (ug/g) = (IDL in ug/mL) * (Dil Fctr).
7) If RPD flagged with "*", then RPD >20% and sample & duplicate results >MDL.
8) If Percent Difference (%D) >10% and sample results >5x MDL, chemical/physical interferences may exist.
9) Data, including calibration/QC, archived File ICP-325-405-1/95D255a

Note:
1) Method Detecion Limit (MDL) = 10x IDL; "( )" results <MDL but =>IDL.
2) Above 5 times MDL, results reportable to 2 1/2 significant digits.
3) Blank is reported in ug/g "equivalence" to indicate blank effect on sample results.
4) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
5) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
6) "ND" = Not Detected; Estimated Sample Detection Limit (ug/g) = (IDL in ug/mL) * (Dil Fctr).
7) If RPD flagged with "*", then RPD >20% and sample & duplicate results >MDL.
8) If Percent Difference (%D) >10% and sample results >5x MDL, chemical/physical interferences may exist.
9) Data, including calibration/QC, archived File ICP-325-405-1/95D255a

[SP] System Performance [S]tandardization or calibration

[M]id-range Calibration Verificatio [P]rofile (2 ppm Cu)

*Mode (C or I) = (C)oncentration, (I)ntensity

Initial or Continuing Calibration [B]lank

[X] A solid vertical line denotes contiguous data.

M&TE # WD00560

Initial or Continuing Calibration [V]erification Standard

*ADF" = Analytical Dilution Factor (other than 1x).

DATA QUALITY REVIEW

I have reviewed the following data for completeness and for compliance with project requirements.

Analyte - ICP - KOH & Na2O2 Spike Re-runs

Data Package/Report - BY-108 Core 99

Project No. - 21372

ACL Numbers - 95-07941-N1 95-07941-H1T

PNL ACL Quality Representative

9/22/95
Date

Project: TWRS
Procedure: PNL-ALO-211

Note: 1) Method Detecion Limit (MDL) = 10x IDL; "( )" results <MDL but =>IDL.
2) Above 5 times MDL, results reportable to 2 1/2 significant digits.
3) Blank is reported in ug/g "equivalence" to indicate blank effect on sample results.
4) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
5) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
6) "ND" = Not Detected; Estimated Sample Detection Limit (ug/g) = (IDL in ug/mL) * (Dil Fctr).

DON'T SAY IT -- *Write It!*

Date: September 21, 1995

To: file: ICP-325-405-1

From: JJ Wagner

Subject: Post-Digestion Spike composition used on re-run 9-19-95

(file: 092195.DSI)

A post-digestion spike was prepared from two reagent solutions. Aliquots from each reagent was added to an aliquot of BY108 Core 99 fusion prepared sample and analyzed by ICPAES on 09-20-95 (95D262A). The post-digestion spike and sample aliquot mixture resulted in an equivalent sample dilution of 5 fold.

The post-digestion spike was prepared by thoroughly mixing 2 mL of 2% acid diluent (HNO_3), 1 mL of a quality control working standard "MCVA", 1 mL of "Dilute SST Spike" reagent[1], and 1 mL of sample (sample prepared by either KOH/Ni fusion or Na_2O_2/Zr fusion procedure).

Note[1]: "Dilute SST Spike" (barcode: 950907H901) was prepared from a 20 fold dilution of "SST Spike (8/95) Reagent" (barcode: 950830H901) on 09-07-95.

Following, on the next page, is a list of analytes and concentrations contained in each of the reagents used to prepare the Post-Digestion Spike.

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Blank is reported adjusted for the an "average sample volume".
3) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
4) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
5) "ND" = Not Detected; Estimated Sample Detection Limit (ug/mL) = (IDL in ug/mL) * (Dil Fctr).
6) If Percent Difference (%D) >10% and sample results >5X MDL, chemical/physical interferences may exist.
7) If 20% flag = "*", Then RPD >20% and both sample results >MDL.
8) Data, including calibration/QC, archived File ICP-325-405-1/950254a

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Blank is reported adjusted for the an "average sample volume".
3) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
4) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
5) "ND" = Not Detected; Estimated Sample Detection Limit (ug/mL) = (IDL in ug/mL) * (Dil Fctr).
6) If Percent Difference (%D) >10% and sample results >5X MDL, chemical/physical interferences may exist.
7) If 20% flag = "*", Then RPD >20% and both sample results >MDL.
8) Data, including calibration/QC, archived File ICP-325-405-1/95D254a

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Blank is reported in ug/g "equivalence" to indicate blank effect on sample results.
3) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
4) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
5) "ND" = Not Detected; Estimated Sample Detection Limit (ug/g) = (IDL in ug/mL) * (Dil Fctr).
6) If Percent Difference (%D) >10% and sample results >5X MDL, chemical/physical interferences may exist.
7) If 20% flag = "*", Then RPD >20% and both sample results >MDL.

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Blank is reported in ug/g "equivalence" to indicate blank effect on sample results.
3) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
4) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
5) "ND" = Not Detected; Estimated Sample Detection Limit (ug/g) = (IDL in ug/mL) * (Dil Fctr).
6) If Percent Difference (%D) >10% and sample results >5X MDL, chemical/physical interferences may exist.
7) If 20% flag = "*", Then RPD >20% and both sample results >MDL.

8) Data, including calibration/QC, archived File ICP-325-405-1/95D254a

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Blank is reported in ug/g "equivalence" to indicate blank effect on sample results.
3) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
4) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
5) "ND" = Not Detected; Estimated Sample Detection Limit (ug/g) = (IDL in ug/mL) * (Dil Fctr).
6) If Percent Difference (%D) >10% and sample results >5X MDL, chemical/physical interferences may exist.
7) If 20% flag = "*", Then RPD >20% and both sample results >MDL.
8) Data, including calibration/QC, archived File ICP-325-405-1/95D254a

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Blank is reported in ug/g "equivalence" to indicate blank effect on sample results.
3) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
4) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
5) "ND" = Not Detected; Estimated Sample Detection Limit (ug/g) = (IDL in ug/mL) * (Dil Fctr).
6) If Percent Difference (%D) >10% and sample results >5X MDL, chemical/physical interferences may exist.
7) If 20% flag = "*", Then RPD >20% and both sample results >MDL.
8) Data, including calibration/QC, archived File ICP-325-405-1/95D254a

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Blank is reported in ug/g "equivalence" to indicate blank effect on sample results.
3) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
4) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
5) "ND" = Not Detected; Estimated Sample Detection Limit (ug/g) = (IDL in ug/mL) * (Dil Fctr).
6) If Percent Difference (%D) >10% and sample results >5X MDL, chemical/physical interferences may exist.
7) If 20% flag = "*", Then RPD >20% and both sample results >MDL.
8) Data, including calibration/QC, archived File ICP-325-405-1/95D254a

Spike Recovery = [((Spike+Sample)-(Sample)*(Total Volume))/(Spike Vol.)*(Spike Std.)*(Sample DF)]*100%
Note: (For spike recovery when the sample conc. is less than detection limit you do NOT subtract sample conc.)
Duplicate Relative % Difference = ((Sample - Duplicate) / ((Sample + Duplicate) / 2) * 100%)
Less than Values are Calculated from the Detection Limit*Dilution Factor

Spike Recovery = [([Spike+Sample)-(Sample)*(Total Volume)]/[(Spike Vol.)*(Spike Std.)*(Sample DF)]* 100%
Note: (For spike recovery when the sample conc. is less than detection limit you do NOT subtract sample conc.)
Duplicate Relative % Difference = ((Sample - Duplicate) / ((Sample + Duplicate) / 2) * 100%)
Less than Values are Calculated from the Detection Limit*Dilution Factor

Spike Recovery = [((Spike+Sample)-(Sample)*(Total Volume))/((Spike Vol.)*(Spike Std.)*(Sample DF))*100%
Note: (For spike recovery when the sample conc. is less than detection limit you do NOT subtract sample conc.)
Duplicate Relative % Difference = ((Sample - Duplicate) / ((Sample + Duplicate) / 2) * 100%)
Less than Values are Calculated from the Detection Limit*Dilution Factor

Final page for worklist # 2795

Kim Thomas

10/11/95

Data Entry Comments:

The high RPD For 2011 is acceptable due to low sample alpha activity. The low spk recovery For this sample is also acceptable due to the low activity.

10/17/95

Units shown for QC (SPK & STD) may not reflect the actual units. DL = Detection Limit, S = Worklist Slot Number, R = Replicate Number, A = Aliquot Code.

Final page for worklist # 2796

Mark King 10/10/95 SE Hodgen 10/11/95

Data Entry Comments:

Low SPK recovery For Sample 2008 is acceptable due to the low activities of the sample.

10/12/95

Units shown for QC (SPK & STD) may not reflect the actual units. DL = Detection Limit, S = Worklist Slot Number, R = Replicate Number, A = Aliquot Code.

Final page for worklist # 2824

Data Entry Comments:

The control limits for STD 147B52 have shifted. the new limits (Placed in Labcore 10/17/95) are 107.69 ± 25.65 %. The STD recovery for 4 batch is within these limits and is therefore acceptable. 10/17

Units shown for QC (SPK & STD) may not reflect the actual units. DL = Detection Limit, S = Worklist Slot Number, R = Replicate Number, A = Aliquot Code.

60-DAY SAFETY SCREEN RESULTS FOR TANK 241-BY-108 ROTARY SAMPLES, CORE 98 AND CORE 104

ANALYTICAL SUMMARY

Core samples from tank 241-BY-108 (BY-108) were received at the 222-S Laboratories and underwent safety screening analyses, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity (*Tank 241-BY-108 Tank Characterization Plan* (TCP)[1]). Results of total organic carbon (TOC) and cyanide (CN) analyses are included for those samples which exceeded DSC action limit.

As required by the *Tank Safety Screening Data Quality Objective* (DQO) [2], a 95% confidence interval was calculated for the sample results exceeding an action limit. The precision requirements of the SAP were satisfied by comparing a one-sided 95% confidence interval of the mean for each sample to the action limit, rather than requiring a relative percent difference between sample and duplicate results of less than 10%. The DSC analysis at the 95% confidence level found the DSC results of three samples exceeded the maximum limit stated in the DQO (Table 4). Notifications by the Chemist and Project Coordinator were made as required.

Before samples were removed from BY-108, an industrial hygiene technician field tested the tank vapors. The technician purged the vapor probe sample tube for five minutes than field measured vapor stream contents using a combustible gas indicator (CGI) and an organic vapor meter (OVM). The technician verbally reported an LEL of 5.0%, an oxygen content of 20 R, and a total organic carbon content of 71.8 ppm using the OVM. Draeger tubes were not used to estimate the ammonia content.

When compared to the decision rules in the DQO, none of the data indicate that the tank should be considered "unsafe." The tank can be considered "safe" once it has been determined that no flammability concern exists in the tank vapor space.

SCOPE

This document serves as the 60-day report deliverable for the tank BY-108 core samples collected on July 27 through August 16, 1995 (Core 98, Segments 1-4 and Core 104 Segments 1-5). The 222-S Laboratories received, extruded, and analyzed each sample in accordance with the TCP. Included in this report are the primary safety screening results obtained from the analyses, and copies of all DSC and TGA raw data scans as requested in the SAP. Also included are the TOC and CN results for those samples that exceeded the DSC action limit. Any additional analyses conducted by the 222-S Laboratories on the BY-108 core samples will be included in a revision to this report. Partial BY-108 core segments from cores 97, 100 and 102 were received from BY-108 but were not analyzed as they duplicated segments of cores 98 and 104. Core 99, a core taken from the same riser as core 98, was sent to PNL's 325 Laboratory for analysis and the results of those analyses will be reported by PNL in a separate document.

SAMPLE RECEIPT, EXTRUSION, AND SUBSAMPLING

The subject core samples reported herein were taken from Tank BY-108. The two samples are identified as Core 98 and Core 104. These core segment samples were received at the 222-S Laboratory between July 28 and August 21, 1995 and extruded between August 1 and August 24, 1995. Table 1 provides the sampling and extrusion report for the two core samples. With the exception of segment 1, of both cores, the recovery was good and each segment was broken into quarter segments and homogenized. Segment 1, for both cores, was treated as a "whole" segment and homogenized. Additional extrusion results are presented in Table 2.

As shown in Table 1, there were some quarter segments missing upon extrusion, that is, there was a gap where that quarter segment would have been expected. Where drainable liquid was obtained, it is believed the liquid originally occupied this gap and accounts for the missing quarter segment. Subsamples for laboratory analyses and archiving were created per the tank TCP.

TABLE 1: SUMMARY DESCRIPTION OF AUGER SAMPLES

Core and Segment* Number	Riser	Sample Total Weight (Grams)	Sample Collection General Description
Core 98 Segment 1(W)	12A	366.8	Extruded approx. 5-6 inches of sample. Sample was wet. Texture of sample was crystalline and tended to "melt" on the sample tray. Sample was light brown to dirty white in color. Collected 170 ml of drainable liquid. Color of liquid was Yellow and opaque.
Core 98 Segment 2 (A),(C), (D)	12A	416.0	Collected 100 ml of drainable liquid, which was yellow brown in color and opaque. Extruded approx. 12 inches of sample. Facies present; Sample was divided into quarter segments. Sample texture ranged from a brown sludge to a material resembling a mixture of brown, beige and dirty white saltcake.
Core 98 Segment 3 (A),(C), (D)	12A	406.5	Collected 60 ml of drainable liquid, which was light brown in color and opaque. Extruded approx. 16.5 inches of sample. Facies present; Sample was divided into quarter segments. Sample texture ranged from a brown sludge to a material resembling a mixture of brown, beige and dirty white saltcake.

Core 98 Segment 4 (A),(B), (C),(D)	12A	490.0	No drainable liquid observed or collected. Extruded approx. 19.0 inches of sample; Sample retained its shape. Facies present; Sample was divided into quarter segments. Sample texture ranged from a brown sludge to a material resembling a mixture of brown sludge with white saltcake.
Core 104 Segment 1(W)	7	131.3	Extruded approx. 6-7 inches of sample. Sample was tan in color, dry, crystalline and granular in shape. No drainable liquids.
Core 104 Segment 2 (A),(B), (C)	7	383.5	No drainable liquid. Extruded approx. 19.0 inches of sample; Upper half segment retained its shape, lower half segment crumbled during extrusion. Facies present in upper quarter segment (crumbly saltcake to sludge). Sample was divided into three quarter segments. Sample texture ranged from a brown sludge to a material resembling a mixture of brown sludge with saltcake.
Core 104 Segment 3 (A),(C), (D)	7	288.8	No drainable liquid. Extruded approx. 17.0 inches of sample; Sample was wet, granular and did not retained its shape. Sample was divided into three quarter segments. Sample texture resembled a brown saltcake.
Core 104 Segment 4 (A),(C), (D)	7	318.3	No drainable liquid. Extruded approx. 18.0 inches of sample. Sample was wet, granular, crumbly and ranged from a yellow to brown crystalline saltcake. Sample was divided into three quarter segments.
Core 104 Segment 5 (A),(B), (C),(D)	7	422.7	No drainable liquid. Extruded approx. 18 inches of sample. Lower half retained its shape and was medium to dark brown, whereas the upper half was dark brown and partially retained its shape. Texture of material resembled a sludge. Sample was divided into four quarter segments.

* (x) represents the quarter segment where "W" represents a whole segment and "A", "B", "C" and "D" represent the quarter segment location with "A" the top of the segment and "D" the bottom of the segment.

ANALYTICAL RESULTS

Analytical results are presented in Table 2.

Differential Scanning Calorimetry (DSC)

DSC analyses were performed under a nitrogen atmosphere using procedure LA-514-113, Rev. B-1 or procedure LA-514-114, Rev. B-0. The results are shown in Table 3 and the raw data scans are attached. The samples were analyzed in duplicate. Any exotherms on the scans would be visible as a rise (Mettler) or a sink (Perkin Elmer) from the baseline established at the beginning and ending of the scan.

Three of the samples exhibited exotherms above the action limit or 481 j/g, therefore, the upper 95% confidence level values calculated for each sample and the results are presented in Table 2.

Thermogravimetric Analysis (TGA)

Weight percent water is calculated from weight loss by TGA. These analyses were performed under a nitrogen atmosphere using procedure LA-560-112, Rev. A-2 or LA-514-114, Rev B-0. The samples and their related "immediate" samples from the un-homogenized extrusions were analyzed in duplicate. "Immediate" samples are samples for TGA analysis that were immediately taken directly from the un-homogenized sample as it was extruded onto the extrusion tray. TGA as well as DSC analyses were performed on homogenized samples for each sample. The results are presented in Table 2, and the raw data scans are attached.

Alpha Total

Analyses for total alpha activity were performed. Samples were prepared by fusion using procedure LA-549-141, Rev. D-0, and analyses were performed using procedure LA-508-101, Rev. D-2. Two fusions were prepared per sample (for duplicate results). Since all of the results were well below the safety screening limit of 41 μCi/g, reruns to improve standard and spike recoveries or relative percent difference (RPD) were deemed unnecessary. The total alpha results are presented in Table 2.

Total Organic Carbon (TOC)

Three samples which had DSC results above the action limit were submitted for TOC analysis. Analyses were performed in duplicate according to procedure LA-342-100, Rev. C-0. The results are presented in Table 3. The RPD for sample S95T001977 exceeded the required ± 10% range. A "triplicate" analysis was performed with a TOC result of 1.39 ug/g which closely resembles the "duplicate" value.

Cyanide

Three samples which had DSC results above the action limit were submitted for cyanide analysis. Analyses were performed in duplicate according to procedure LA-695-102, Rev. D-0. The results are presented in Table 3.

Responsible Project Coordinator: J. H. Baldwin

Table 4. 95% Upper Confidence Interval Limits for DSC (Units are in joules/g).

Sample Description	Sample Number	Differential Scanning Calorimetry (DSC) Dry Basis				TGA* Average
		Sample Result (J/g)	Dup. Result (J/g)	Average Result (J/g)	95 % UL	(%H20)
Quarter Segment B from Core 98 Segment 4	S95T001420	509.1	522.6	558.0	697.7	35.61
Rerun	S95T001420	481.3	409.5	445.4	672.0	35.61
Quarter Segment B from Core 104 Segment 5	S95T001976	593.5	522.6	558.0	781.8	36.66
Quarter Segment C from Core 104 Segment 5	S95T001977	548.7	507.9	528.3	657.1	35.50

TGA = Thermogravimetric Analysis
Quarter Segment B is approximately the second 5 inches of material of the segment. Quarter segment C is approximately the third 5 inches of material from the top of the segment.

Data Entry Comments: S95T001972 produced one endotherm at 131.9°C with a delta H of 945.6 J/g. The sample was run in triplicate due ~~Ø~~ to high RPD's, the sample and triplicate results were close. S95T001973 produced one endotherm at 108.3°C with a delta H of 972.8 J/g, this endothermic peak has two distinct peaks within it.

Units shown for QC (SPK & STD) may not reflect the actual units. DL = Detection Limit, S = Worklist Slot Number, R = Replicate Number, A = Aliquot Code.

This Data Package contains the results obtained by the Pacific Northwest Laboratory (PNL) 325 Analytical Chemistry Laboratory (ACL) and 325 High Level Radiochemistry Facility (HLRF) staff for the characterization and analyses of Core 99 taken from Single-Shell Tank (SST) BY-108. The characterization and analysis requirements for Tank BY-108 are outlined in the "Fiscal Year 1995 Tank Waste Remediation System Tank Waste Analysis Plan," (WHC-SD-WM-PLN-091, Revision 0). Specific characterization activities are detailed in the "Tank 241-BY-108 Tank Characterization Plan," (WHC-SD-WM-TP-275, Revision 0E).

As stated in the TCP, the work performed on Tank BY-108 represents an opportunistic venture; the results are to be used to gain further information/ insight on the nature of Tank BY-108.

The Tank Characterization Plan (TCP) prescribes the analytical requirements in the form of selected methods, analytes of interest, type of preparation, quality control, reporting units and notification limits. The TCP also establishes the analytical priority and provides decision points for the analytical laboratory on whether or not to proceed with additional analysis. The decision points are communicated by "if - then" type criteria. These decision points are administered as follows. If an analytical measurement exceeds a set notification threshold, then the lab proceeds with the additional analyses. This approach, although an effective means of eliminating analytical delays, requires that analyses be performed in series, thus requiring a defined amount of time. In the case of Tank BY-108 sample analyses, 35 calendar days were allotted to complete the entire scope of work. This relatively short analytical window precluded the effective utilization of the "if - then" decision strategy. As a result, a number of managerial decisions were made in the planning stage to perform additional analyses in advance of exceeding notification limits.

In Table C-4 of the TCP the analytes of interest were not identified for ion chromatography (IC) or inductively coupled plasma (ICP). For these

methods, the data quality objectives documents were reviewed and analytes of interest identified. The analytes of interest for the IC include nitrate, nitrite, sulfate and phosphate. The analytes of interest identified for the ICP were iron, aluminum, manganese, nickel, bismuth and sodium. These analytes of interest were evaluated against precision and accuracy requirements in the TCP. Two QC approaches were utilized to acquire the accuracy information; serial dilutions were used when the analyte concentration was expected to be high and matrix spikes were used when the analyte concentration was expected to be relatively low or unknown. Although the analytes of interest were the primary focus of each analysis, additional analytes/results were available and are provided for informational purposes.

Specific analyses for each segment and quarter segment taken from Core 99 are described in Test Instructions prepared by the PNL Project Manager in accordance with administrative procedures contained in the Analytical Chemistry Laboratory Procedure Compendium (PNL-MA-599).

Core 99 contained four segments. Each segment was extruded and sub-sampled into segments and quarter segments at the WHC 222-S Laboratory. The PNL HLRF received the last shipment of BY-108 segments on August 25, 1995. All of the samples were received without chain-of-custody documentation. During the extrusion and sub-sampling of each segment at 222-S, a separate aliquot of sample was removed for thermogravimetric analysis. These aliquots were placed in separate uniquely identified containers and shipped with the remaining sample material. All extruded sample material from Core 99 Segments 1 through 3 were transferred to PNL. Segment 4 was further subsampled and approximately 30 g of each quarter segment was shipped to PNL for analyses. The number of sample containers received, the approximate sample weights and volumes are as follows for Core 99, Segments 1-4. Segment 1 consisted of two sample containers of solids with a combined weight of 56 g. Segment 2 consisted of four sample containers, three had solids with a combined weight of 37 g while one had 230 mL of drainable liquid. Segment 3 consisted of three sample containers, two had solids with a combined weight of 22 g while one had 25 mL of drainable liquid. Segment 4 consisted of eight sample containers of solids with a combined weight of 118 g. Table 1-1 provides a

with a combined weight of 118 g. Table 1-1 provides a more detailed breakdown of sample identification and approximate sample volumes received from WHC.

All Core 99 sample material was homogenized prior to analysis. Segment 1 and Quarter Segment 4B were homogenized and sub-sampled from the top and bottom. Each sub-sample was analyzed in duplicate by ICP and GEA to test the homogenization methodology. The results of the homogenization test are presented in Table 1-2. The small volume of solid sample material received for each quarter segment made it difficult to thoroughly homogenize the samples. The relatively non-homogenous sample material, in conjunction with the small quantities of sample used in the preparations, increased the likelihood of having high relative percent differences (RPDs) between samples and associated duplicates. In some instances, the TCP precision requirement of 90-110% could not be met.

The ACL sample numbers assigned to the segment and quarter segment samples and the associated analyses are listed in Tables I-1 through I-4. The data within this package are divided into three groups: Physical Testing, Inorganic Analysis and Radiochemical Analysis. All chemical analysis data are reported on a wet-weight basis. That is, no corrections have been made for the water content in the samples. The analytical results for the drainable liquids were converted to a g/mL basis using a density of 1.43 g/mL. The density was calculated during the sample preparation (i.e., water leach). All required sample preparations were performed in duplicate. The quality control (QC) requirements for each sample are defined in the Test Instructions. Samples were prepared and analyzed as batches where feasible. A minimum number of QC samples were analyzed in each batch and all QC data are included in this data package.

In several instances, the precision and accuracy identified in the TCP could not be met. This fact is clearly identified and discussed in the following sections. The limited quantity and complex nature of the material tested and the small quantities taken for preparation negatively impact the laboratory's ability to meet the TCP criteria. The TCP criteria appears to be unattainable with any consistency for this matrix.

4D	Unhomogenized TGA	95-07940	7317	5.3 g	95-S-095	8/25/95

The unhomogenized TGA samples were taken to Room 517 in the 325 Building where thermal analyses were performed. The remaining samples were homogenized

using PNL technical procedure PNL-ALO-135. The sample mass of the subsampled solids from the quarter segments was small; therefore, these samples were homogenized by stirring the sample with a micro spatula. A magnetic stir bar and plate was used to homogenize the drainable liquid samples. The drainable liquids were subsampled to produce TGA samples. These TGA samples were transferred to Room 517 for thermal analysis.

The effectiveness of the homogenization process was verified on two samples (Segments 1 and 4B). GEA and ICP analyses were performed in duplicate on samples from the top and bottom portions of the homogenized samples. The major components and their concentrations for these homogenization subsamples are reported in Table 1-2.

Table 1-2: Tank BY-108, Core 99 Homogenization Check Results

Sample Preparation: The work scope for Tank BY-108 is comprised of segment, quarter segment and drainable liquid samples. These samples were transferred from the HLRF to the SAL. Due to the high level of radioactivity associated

with the samples from Tank BY-108, all of the analytical preparations were completed in the hot cell.

Table 1-3 lists the procedures that were used to prepare Tank BY-108 samples for the requested suite of analyses. Also included in the listing is the carbon procedure that was used to conduct in-cell analytical carbon determinations.

Table 1-3: Tank BY-108, Core 99 SAL Procedure List

PNL Procedure Number	Procedure Title
PNL-ALO-103, Rev. 1	Water Leach of Sludges, Soils and Other Solid Samples
PNL-ALO-114, Rev. 1	Solubilization of Metals From Solids Using a Na_2O_2-NaOH Fusion
PNL-ALO-115, Rev. 1	Solubilization of Metals From Solids Using a KOH-KNO_3 Fusion
PNL-ALO-128, Rev. 0	HNO_3-HCl Acid Extraction of Liquids for Metals Analysis Using a Dry-Block Heater
PNL-ALO-129, Rev. 0	HNO_3-HCL Acid Extraction of Solids Using a Dry-Block Heater
PNL-ALO-285, Rev. 0	Total Cyanide by Remote Microdistillation and Argentometric Titration
PNL-ALO-381, Rev. 1	Direct Determination of TC, TOC, and TIC in Radioactive Sludges and Liquids by Hot Persulfate Method

Segment 1 and Quarter Segment 4B homogenization check samples were prepared for ICP and GEA by Ni/KOH-KNO_3 fusion. Portions of the same segment/quarter segment were acid digested for solubility observations. Segment 1 acid dissolution resulted in a clear solution with a few milligrams of gray solids on the container bottom. Segment 4B acid dissolution resulted in a clear solution with a layer of gray or reddish particulates at the top of the aqueous layer. When disturbed, the layer moved downward to the container bottom subsequently turning the entire solution very cloudy. The particulates remained suspended for hours before reforming in a layer at the top of the container.

Table 1-4 describes subjective visual data for each of the 10 segment/quarter segments samples received from the HLRF.

Table 1-4: Tank BY-108, Core 99 Visual Observations

Segment/Quarter Segment Identification	Observation
Segment 1 Solids	Beige colored, concrete textured sludge with dark colored flecks throughout.
Segment 2 Drainable Liquid	Approximately 200 mL of clear liquid with a thin layer of light beige colored solids on the bottom of the container.
Quarter Segment 2A Solids	Appearance like that of ground ice. Slides across container bottom in the same manner as wet ice.
Quarter Segment 2D Solids	Sandy beige colored sludge with a small 1/8" layer of clear liquid standing on top.
Segment 3 Drainable Liquid	Approximately 50 mL of clear liquid with a thin layer of reddish colored solids on the bottom of the container.
Quarter Segment 3A Solids	Moist, concrete textured, reddish brown sludge
Quarter Segment 4A Solids	Dark, sticky, thick, red sludge
Quarter Segment 4B Solids	Dark, sticky, thick, red sludge
Quarter Segment 4C Solids	Dark, sticky, thick, red sludge
Quarter Segment 4D Solids	Dark, sticky, thick, red sludge

Sample preparations/distributions of two drainable liquids and 8 solids samples involved:

- Water leaching of liquid and solid samples for IC and ICP.
- Ni/KOH-KNO_3 fusions of solid samples for ICP, GEA, Total Alpha, Total Beta, AEA for Pu,Np,Am, Uranium, and Sr/Y-90.
- Zr/Na_2O_2-NaOH fusions of solid samples for ICP.
- Acid digestions of liquid samples for ICP, Total Alpha, Total Beta and GEA.

- Microdistillation of liquid and solid samples for Cyanide.

Predigestion spikes were performed for ICP metals (drainable liquid samples only), IC anions, cyanide, and TOC (hot persulfate only). Post digestion spiking, where required by the Test Instruction, was done by the functional group performing the analysis.

During sample preparation, the SAL may have made deliberate minor deviations to sample preparatory procedures for one or more of the following reasons:

- Insufficient sample was available to conduct the analyses per procedure while maintaining the level of quality control requested.
- Sample weights and/or final volumes were reduced to facilitate waste minimization.
- Sample weights and/or final volumes were altered to increase the concentration of certain analytes of interest. This was done to meet the procedural concentration ranges needed to perform the analyses.

Sample sizes and final volumes for all sample preparations are documented on the Sample Preparation Data Sheets included in Appendix A. Table 1-5 lists the sample preparatory procedure deviations performed during the processing of Tank BY-108.

Table 1-5: Tank BY-108, Core 99 Sample Preparation Procedural Deviations

ALO Number	Prep Method	Sample Size Deviation	Sample Volume Deviation	Reagent Deviation	Observed Effect
95-07932-A	Acid	Yes	No	No	None
95-07935-A	Acid	Yes	No	No	None

95-07948-C	Water	Yes	Yes	No	None

Thermal Analysis

Scanning Thermogravimetric Analysis (TGA) and Differential Scanning Calorimetry (DSC) were performed on the unhomogenized solids and drainable liquids from Core 99 Segments 1 through 4. These two thermal analysis techniques are useful in determining the thermal stability and reactivity of the material. DSC measures heat released or absorbed while the temperature of the sample is increased at a constant rate. Data generated by the DSC analysis is often used to measure thermal decomposition temperatures, heats of reaction, reaction temperatures, melting points and solid-solid transition temperatures. TGA measures the mass of a sample while the temperature of the sample is increased at a constant rate. The TGA data is used to measure thermal decomposition temperatures, water content and reaction temperatures. Both methods can be modified to measure isothermal changes in the material and provide complimentary information.

The calibration of the DSC and TGA instruments were checked before running these samples. An indium standard was run on the DSC to check the temperature and enthalpy calibrations. The balance calibration of the TGA was checked with a 100 mg standard weight, and the temperature calibration was checked with a lead standard. The temperature and enthalpy calibration checks were all within 1°C and 0.2 J/g of their reported values, and the balance calibration was within 0.01 mg.

The results from the DSC and TGA analyses are reported in Tables 1-6 and 1-7, respectively. The temperature range of the scans was from ambient to 550°C, with a scan rate of 10°C per minute. These analyses were all performed in platinum pans under nitrogen cover gas.

The major transition in all of these samples was an endotherm due to water loss from the sample. This was also the major mass loss in all of the samples. The onset temperature of this transition could not be measured because the transition began at the initial temperature of the run (ambient temperature). The water loss endotherm ends at approximately 200°C. This endotherm is a complicated system of several unresolvable transitions with each sample containing slightly different proportions of these transitions.

An exotherm was identified in all quarter segment samples from Segment 4 and the drainable liquids. This exotherm has an onset temperature of between 197 and 225°C. The enthalpy of this transition varied with each quarter segment. The temperature range for this transition was from 195 to 400°C. It appears that this exotherm is commingled with some endothermic behavior which cannot be resolved; therefore, it is difficult to determine onset temperatures for each sample. The enthalpy of this transition is also dependent upon resolution of this exotherm for the commingled endotherms and the initial water loss endotherm. In most cases the most conservative approach (the largest exothermic energy) has been taken.

In Segments 1 through 3 a second endotherm is observed. Several transitions are observed in this endotherm and the onset temperature varies depending upon the size of the first transition in comparison with the second

transition. It appears that the onset temperature for the first transition in this endotherm is 220°C, and the onset temperature for the second transition is between 250 and 260°C.

The TGA analysis also indicated two different waste types in this core sample. All of the segments had a large mass loss associated with the water loss endotherm. This mass loss was observed between ambient temperature and 180°C. A small mass loss was observed over the remainder of the temperature range of the TGA analysis for all of the Segment 4 samples, but no significant transitions were observed at higher temperatures. In the Segment 1 through 3 solid samples, a second significant mass loss was observed. This mass loss has an onset temperature of approximately 245°C. This transition correlates with the second endothermic transition observed in the DSC analyses. These samples also continued to have a small mass loss throughout the remainder of the temperature range.

Density

The density of each sample with the exception of Quarter Segment 2A was measured using a displacement method. Due to the limited sample available for these analyses, only a single measurement was made for each sample. The density of Segment 2A was not measured because sufficient sample was not available to perform an accurate density measurement. The density methods described in PNL technical procedure PNL-ALO-501 could not be followed because of the limited sample available. The results of density measurements are given in Table 1-8.

Table 1-8: Tank BY-108, Core 99 Density Results

WHC Sample Number	Segment ID	Density (g/mL)
7313	1	1.59
7314	2D	1.36
7397	2 Drainable Liquid	1.21
7316	3A	1.57
7398	3 Drainable Liquid	1.21
7322	4A	1.51
7319	4B	1.51
7318	4C	1.53
7317	4D	1.55

Experimental Procedure

The density of the solid samples was obtained by a displacement method. The samples were placed in preweighed graduated cylinder with a known volume and mass of mineral oil. After the sample was placed in the mineral oil, the volume and mass of the sample and oil were measured. The density of the sample was then calculated from the sample mass and sample volume obtained from subtracting the mass and volume of the mineral oil from the mass and volume of the sample plus mineral oil. The density of the drainable liquid

was obtained by accurately measuring the mass of the liquid pipetted from a fixed volume pipet.

Inductively Coupled Plasma (ICP) Spectrometry Analysis

Sample Preparation and Analysis:

ICP analyses were performed on fusions prepared from homogenized material from Core 99 Segment 1 and Quarter Segments 2A, 2D, 3A, and 4A through 4D. The samples were prepared following procedures PNL-ALO-114 "Solubilization of Metals from Solids Using a Na_2O_2-NaOH Fusion" and PNL-ALO-115 "Solubilization of Metals from Solids Using a KOH-KNO_3 Fusion." Also, ICP analyses were performed on acid digestions of the drainable liquids from Segment 2 and Segment 3. The drainable liquids samples were prepared following procedure PNL-ALO-128 "HNO_3-HCl Acid Extraction of Liquids for Metals Analysis Using a Dry-block Heater." The core material fusions and drainable liquid acid digestions were performed in the Shielded Analytical Laboratory (SAL) with sample solution aliquots being transferred to the Inorganic Analysis Group for ICP analysis. All ICP metals analyses were performed on a Jarrell-Ash ICP 800A system following procedure PNL-ALO-211, "Determination of Elements by Inductively Coupled Argon Plasma Atomic Emission Spectrometry".

Analytical Results:

The KOH-KNO_3 fusion analytical results are presented in Tables 2.1a through 2.1e, the Na_2O_2-NaOH fusion results are presented in Tables 2.2a through 2.2c, and the drainable liquid HNO_3-HCl digestion results are presented in Tables 2.3a and 2.3b. In general, the agreement between the results from the two fusion methods is good, considering the very small sample sizes used (i.e., approximately 0.2 grams) and the difficulty in obtaining homogeneous samples. An estimate of the sample detection limit can be obtained from the tables by multiplying the estimated instrument detection limit (IDL) for each analyte by the appropriate sample processing/dilution factor (Dil Fctr). It should be noted that the processing blank has not been subtracted from any of the reported sample results. Based on the crucible material used for each fusion, nickel and potassium results should be obtained from the Na_2O_2-NaOH fusions and the sodium, zirconium and phosphorus results should be obtained from the KOH-KNO_3 fusions. Of interest for the core

sludge material is the significant decrease in aluminum and significant increase in calcium, iron, nickel, strontium, and uranium with depth (i.e., from Segment 1 to Segment 4).

Quality Control, Precision, and Accuracy:

The results for both drainable liquids and each segment and quarter segment sample (except Segment 2A for the Na_2O_2-NaOH fusion) are reported, along with the associated batch processing blanks. Duplicate sample results are reported for both drainable liquids and for all segments and quarter segments prepared by KOH-KNO_3 fusions; however, only Segment 1 was prepared and analyzed in duplicate from the Na_2O_2-NaOH fusion. Pre-digestion blank spike and matrix spike results are included with the drainable liquid reports, and post-fusion blank spike and matrix spike results are included with both the KOH-KNO_3 and Na_2O_2-NaOH fusion reports.

To evaluate the precision of the analytical laboratory sampling, preparation, and analysis, the relative percent difference (RPD) between duplicates is used. The RPD is shown for all samples analyzed in duplicate, and the RPD is flagged with a "*" whenever the RPD has exceeded the 10% criteria required by the TCP and the sample and duplicate results exceed 10 times the instrument detection limit (IDL). As can be seen in the tables, RPDs are very high for many of the segments and quarter segments analyzed. The inconsistency seen in the RPDs is attributed primarily to the difficulties in obtaining fully homogenized samples (either due to the limited sample available or the consistency/texture of the sample material), the complexity and diversity of each of the segments, and the very small sample sizes prepared for analysis.

The accuracy of the ICP results for the analytes of interest is estimated by either the pre/post spike recovery or percent difference (%D) from serial dilution. For serial dilution, the %D is calculated and reported when the initial sample exceeds fifty times the IDL; interferences are suspected if the reported %D exceeds 10%. Except in a very few isolated instances, the %D is well within the TCP 10% criteria. For post spikes of the initial analytical

runs, the TCP requirement of 90-110% matrix spike recovery was not met for all analytes of interest. This is attributed primarily to the sample matrix or the manual dilution operation, since analytical QC samples, such as the continuing calibration verifications, have acceptable results. The $KOH-KNO_3$ and Na_2O_2-NaOH fusions post spiking reanalyses results using a special mixed spiking solution containing 31 analytes are shown in Tables 2.1e and 2.2c. Except for a few analytes (specifically, Al, Be, Na, Tl, and U on the $KOH-KNO_3$ fusions, and Al, As, Ca, Li, Sb, Tl, and U on the Na_2O_2-NaOH fusions), the TCP recovery criteria has been met; the failures are attributed to final analyte concentrations below the method detection limit (i.e., 10 times the IDL) or high analyte concentrations in the samples. In general the recoveries for the post blank spike track the recoveries for the post matrix spike, suggesting that the failures are not matrix related. Typically for those analytes demonstrating spike recoveries exceeding the 90%-110% TCP criteria, recoveries were within 85%-115%.

The processing blank provides information on contamination potentially introduced during the fusion processing. The sodium contamination in the $KOH-KNO_3$ fusion blank is above 10 times the IDL; however, since the sodium concentration is very high, the level of contamination does not impact the reported sodium results. However, iron, manganese, and boron contamination in the $KOH-KNO_3$ fusion blank render these results questionable for all but those samples containing high analyte levels. The calcium and boron contamination is sufficient enough in the Na_2O_2-NaOH fusion blank to render calcium results on Segments 1, 2A, 2D, and 3A and boron results on all segments unusable. The sodium contamination in the HNO_3-HCl acid digestion blank is above 10 times the IDL; however, the level of contamination has no effect on the reported high sodium concentration. Boron is also above 10 times the IDL, rendering the low concentration of boron found in the drainable liquid samples unreliable.

The majority of analytes reported (including the TCP analytes of interest defined in the introduction) are supported by the required verification QC (e.g., verification standards and blanks analyzed every 10 samples). However, some reported analytes (specifically, Ce, Eu, La, Nd, P, Pd, Rh, Sn, Te, Th,

Te, Th, Tl, U, W and Y) have only beginning and closing QC verification, and are presented for information only. In general the analytical results for these analytes are expected to be good; however, the QC performed with the analytical run does not conform to the governing QA plan.

Additional Analyses:

Besides the analyses required by the TCP, core homogenization tests of Segment 1 and Segment 4B and water leach analyses of sludge segments, quarter segments, and drainable liquids were performed. Although no spiking was performed for these analyses, all other processing QC (e.g., duplicates and blanks) and analytical QC (e.g., verification standards) analyses were performed. The reports and data from the ICP analysis for the homogenization test samples and water leach samples can be found in Appendix C.

Note:
1) Method Detection Limit (MDL) = 10x IDL; "( )" results <MDL but =>IDL.
2) Above 5 times MDL, results reportable to 2 1/2 significant digits.
3) Blank is reported in ug/g "equivalence" to indicate blank effect on sample results.
4) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
5) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
6) "ND" = Not Detected; Estimated Sample Detection Limit (ug/g) = (IDL in ug/mL) * (Dil Fctr).
7) If RPD flagged with "*", then RPD >20% and sample & duplicate results >MDL.
8) If Percent Difference (%D) >10% and sample results >5x MDL, chemical/physical interferences may exist.
9) Data, including calibration/QC, archived File ICP-325-405-1/95D256a

Note:
1) Method Detecion Limit (MDL) = 10x IDL; "( )" results <MDL but =>IDL.
2) Above 5 times MDL, results reportable to 2 1/2 significant digits.
3) Blank is reported in ug/g "equivalence" to indicate blank effect on sample results.
4) The process "blank" has not been subtracted from the "Sample & Duplicate" results.
5) Above 5 times the MDL, precision is estimated at +/-10% and accuracy at +/-15%.
6) "ND" = Not Detected; Estimated Sample Detection Limit (ug/g) = (IDL in ug/mL) * (Dil Fctr).
7) If RPD flagged with "*", then RPD >20% and sample & duplicate results >MDL.
8) If Percent Difference (%D) >10% and sample results >5x MDL, chemical/physical interferences may exist.
9) Data, including calibration/QC, archived File ICP-325-405-1/95D255a

Note:
1) Above 5 times MDL, results reportable to 2 1/2 significant digits. "( )" results <MDL but =>IDL.
2) Above 5 times MDL, precision is estimated at +/-10% and accuracy at +/-15%.
3) Where "Blank" results are >IDL the blank has been subtracted from the "Spike Control".
4) Spike Flag (N) indicates spike is outside the QC recovery criteria.
5) If 20% flag = "*", Then RPD >20% and both sample results >MDL.
6) If spike is <25% of sample concentration, Rec is not calculated as indicated by the "n/a".
7) If sample or duplicate results are <MDL then average is not calculated (i.e., "---").

Ion Chromatographic Analysis

Sample Preparation and Analysis:

The IC analyses were performed on the water leaches prepared from homogenized material from Core 99 Segment 1 and Quarter Segments 2A, 2D, 3A, and 4A through 4D and on dilutions of the drainable liquids from Segment 2 and Segment 3. The water leach samples were prepared following procedures PNL-ALO-103, "Water Leach of Sludges, Soils, and Other Solid Samples." The leaches and dilutions were performed in the SAL with sample and QC solution aliquots being transferred to the Inorganic Analysis Group for IC analysis. All IC analyses for the anions fluoride, chloride, nitrite, nitrate, phosphate, and sulfate were performed on a Dionex 4500i Ion Chromatograph system following procedure PNL-ALO-212, "Determination of Inorganic Anions by Ion Chromatography."

Analytical Results:

The IC analytical results are presented in Tables 2.4a through 2.4e. The IC analyses were conducted on 9/14/95, 9/18/95, and 9/28/95; the results reported are restricted to the 9/14/95 and 9/28/95 runs due to consistent failure of the verification standards on 9/18/95. The results for the drainable liquids are reported in μg/mL and the results for the water leaches of the sludges in μg/g. After applying the dilution and leaching processing factors, the typical detection limits are 30 μg/mL (or 30 μg/g) halides and 50 μg/mL (or 50 μg/g) oxy-anions. However, due to the necessity to dilute the samples to assure that all reported results fell within the calibration range, some reported detection limits are adjusted for additional analytical dilutions.

Quality Control, Precision, and Accuracy:

Sample and duplicate results are reported for both drainable liquids and water leaches of the sludge segment and quarter segment samples. Matrix spikes, blank spikes, and leach processing blanks are also reported for the

sludge samples, as well as a dilution blank for drainable liquids. Significant difficulties were experienced with fluoride and phosphate analyses. The fluoride is impacted by significant interferences (most probably from organic anions which elute near the same retention times a fluoride), and the phosphate appeared to experience a matrix-related interference or column degradation (i.e., the verification standard for phosphate experienced consistent failure). The phosphate is considered to be reasonably reliable since ICP phosphorus analysis of the same samples confirms the reported phosphate results; however, the fluoride results are considered best available estimates. Beside phosphate and fluoride, nitrite and sulfate also slightly degrades with time and additional sample loading on the column. Based on the continuing calibration verifications standards, nitrite and sulfate may be bias high by as much as ten percent.

The RPD between duplicates is used to evaluate the precision of the sample processing, analytical sampling, and IC analysis. The majority of RPD values meet the TCP 10% criteria; however, a few anions demonstrate very poor RPDs (i.e., up to 90%) for specific samples. The poor RPDs are attributed primarily to the inconsistency of the sample material and/or the inability to obtain fully representative analytical samples. Reanalyses were performed for the majority of the samples exhibiting greater than 20% RPD; the reanalyses confirmed the original results. Very large RPD are restricted primarily to Segment 4 samples (4A through 4D); this is not unrealistic since Segment 4 is most likely the tank heel and may represent the largest variability in the tank material.

The accuracy of the IC results is estimated by the matrix spike recovery. Low recoveries on matrix spikes provide indications of matrix interferences which may adversely affect the reported analytical results. The matrix spiking solution was prepared based on the best available information on the anion concentrations suspected within Tank BY-108. Unfortunately, many of the matrix spikes are unusable due to the fact that the tank concentrations are significantly higher than anticipated. The spikes for Cl, NO_2, and NO_3 for the drainable liquids, F and PO_4 for the sludges could not be recovered due to the high concentration of the anions in the samples. The only matrix spike

spike meeting the 90-110% TCP criteria was SO_4 for the drainable liquids. However, other than those spikes too low to recover, all matrix spikes recovered within the 75%-125% acceptance criteria of the governing QA plan. In general, recoveries on blank spikes were good, except for Cl for the sludges (i.e., 120%) and NO_2 for both the sludges and drainable liquids (i.e., 86% and 88%, respectively). Degradation of the column, most likely caused by insoluble sample matrix components depositing on the column, was observed for all runs which involved Tank BY-108 leach samples.

The leaching/dilution processing blanks provide information on the contamination potentially introduced during the dilution process. Very slight chloride, nitrate, and sulfate blank concentrations were observed. However, these blanks typically have no impact on the reported results, since the anion concentration in the samples is high compared to the blank concentration.

The IC water leach blanks reported in Tables 2.4a through 2.4e have been increased from those reported in the IC data package (see Appendix C). The IC blank is typically calculated using an nominal 1 mL (or 1 g) "equivalent" sample size. However, the drainable liquids were processed using an average 0.2 mL samples size and the sludges were processed using a average 0.5 mL sample size. Therefore, the blank concentrations (or detection limits) reported in the data package have been increased 5-fold for the drainable liquids and 2-fold for the sludges. This provides a better representation of the blank's contribution to the sample concentration. Also, the IC results reported in the data package for the drainable liquid samples are calculated in $\mu g/g$; the results reported in Tables 2.4a through 2.4e have been adjusted for density and reported as $\mu g/mL$.

Sample Preparation and Analysis:

The total cyanide analyses were performed "directly" on homogenized material from Core 99 Segment 1 and Quarter Segments 2A, 2D, 3A, and 4A through 4D, and on diluted drainable liquids from Segment 2 and Segment 3. The sludge and drainable liquid samples were pre-treated and distilled following procedure PNL-ALO-285, "Total Cyanide by Remote Microdistillation and Argentometric Titration". The microdistillations were performed in the SAL and distillates transferred to the Inorganic Analysis Group for subsequent cyanide determination. Total cyanide was determined either by argentometric titration or calorimetrically using a Lachat Autoanalyzer following procedure PNL-ALO-289, "Total Cyanide Determination by Spectrophotometry (Manual or Automated) or Argentometric Titration".

Analytical Results:

The total cyanide results are presented in Tables 2.4a through 2.4e. Since the total CN was anticipated to be very high in Tank BY-108, titrations were initiated on the distillates prepared from the microdistillation operation. The initial samples were titrated, i.e., sludge Segments 1 sample and duplicate and Segment 2A sample and duplicate, and measured essentially no appreciable cyanide. Based on this information, the residual solutions from these samples and the remaining segment samples were analyzed calorimetrically. The results reported from agrentometric titration for sludge Segment 1 sample is an upper estimate only, and since the entire sample was titrated, there is no calorimetric result available. All sludge samples are reported in μg/g and the drainable liquids are reported in μg/mL.

Quality Control, Precision, and Accuracy:

Sample and duplicate results are reported for both drainable liquids and each segment and quarter segment. Distillation blanks, matrix spikes, and spike blanks are also reported for the distillation batch. In addition to the

SAL distillation batch QC samples, an additional distillation was performed by the Inorganic Analysis Group to provide an alternate verification standard to validate the calibration curve established by the calibration standards. For total cyanide, the distilled blank spike is considered the laboratory control standard; this standard recovered at 89% and 88%. Although this recovery is within the 85%-115% acceptance criteria for the governing QA Plan, it exceeds the 90%-110% criteria of the TCP. Besides the control standard, the continuing calibration verification standard failed to meet the 90%-110% TCP accuracy requirement, but is also within the 85%-115% acceptance criteria of the governing QA plan.

The TCP has established a 10% criteria for precision; the RPD between sample and duplicate is used to evaluate the precision of the cyanide analysis. Sludge Segment 1 RPD is unavailable due to the inability of the titration method to accurately measure low cyanide concentration. Also, since Segment 4C sample and Segment 4D duplicate were lost during the microdistillation, no RPDs could be calculated for these segments.

The accuracy of the total cyanide method (i.e., distillation and analysis) is estimated by the use of matrix spikes. Low recoveries on matrix spikes suggest that the reported results may be bias due to matrix interferences. The spike levels were selected based on the expected cyanide content of the tank material; however, in general the tank drainable liquids and sludge contained significantly less cyanide than anticipated. The spike recoveries were reasonably good at 88% for the drainable liquid and 79% for the sludge. Although the spike recovery for the sludge did not meet the TCP 90%-110% criteria, the spike is not considered representative of the samples since the spike is two orders of magnitude above the maximum sample concentration and required very high dilutions to be measured calorimetrically.

The distillation blank provides information regarding cyanide contamination introduced during the distillation and/or measurement process. Except for the Segment 4C sample and the Segment 4D duplicate, which have suspect results, the blank contributed less than 1% to any sample.

Besides the estimate reported for the Segment 1 sample, the results for the Segment 1 duplicate and the Segment 2A sample and duplicate are also reported as estimates, since the initial volume of the distillate and the final volume remaining (after attempts at measuring the cyanide by titration) are not accurately known. The volumes remaining after the attempt at titrating these samples is required to calculate the concentration of cyanide in the aliquots taken for the calorimetric measurement. These volumes have been estimated by weighing; however, errors associated with estimating the volume are not expected to affect the final reported concentration for these segments by more than five to ten percent. Due to the small added uncertainty for Segment 1 and Segment 2A results, and the loss of the Segment 4C sample and 4D duplicate, redistillation and analysis was considered for these segments. However, with the highest cyanide concentration being about 25 times lower than the threshold action limit, no reruns were performed.

Total Organic Carbon, Total Inorganic Carbon, & Total Carbon Analysis

Sample Preparation and Analysis:

The total organic carbon, total inorganic carbon, and total carbon (TOC/TIC/TC) analyses were performed "directly" on homogenized material from Core 99 Segment 1 and Quarter Segments 2A, 2D, 3A, and 4A through 4D, and on diluted drainable liquids from Segment 2 and Segment 3. The TOC/TIC/TC analyses of the core sludge segments and quarter segments were performed by the SAL using a UIC Coulometrics system following procedure PNL-ALO-381, "Determination of TC, TOC, and TIC in Radioactive Liquids, Soils, and Sludges by the Hot Persulfate Method." Dilutions of the drainable liquids were also performed in the SAL and sample aliquots then transferred to the Inorganic Analysis Group for subsequent UV-catalyzed TOC/TIC/TC analysis using a Dohrmann DC80 system following procedure PNL-ALO-382, "Solution Analysis: Carbon."

Analytical Results:

The TOC/TIC/TC analytical results are presented in Tables 2.4a through 2.4e. The drainable liquids are reported in μg/mL and the sludge segments and quarter segments are reported in μg/g. For all TOC/TIC/TC analyses, the results exceed the estimated method detection limit of the method used; that is, 30 μg/g TIC and 50 μg/g TOC for the hot persulfate method, and 50 μg/mL TC or TIC for the UV-catalyzed solution method. For the hot persulfate method, the TIC and TOC are analyzed on each sample and the TC is obtained by summation. For the UV-catalyzed solution method, the TC and TIC are analyzed on each sample and the TOC is obtained by difference.

Quality Control, Precision, and Accuracy:

Sample and duplicate results are reported for both drainable liquids and each segment and quarter segment sample. Processing blanks are also reported for the drainable liquids, since the drainable liquids were diluted by SAL prior to TOC/TIC/TC analysis. However, no processing blanks are reported for the sludge segment samples analyzed by the direct hot persulfate method. This method requires results to be corrected for the average blank carbon levels, as well as the average check standard recoveries. Therefore, all sludge sample results have been corrected for the blank contribution and the check standard recovery. Matrix spikes are included for both the drainable liquid UV-catalyzed analyses and the sludge segment hot persulfate analyses.

Neither the hot persulfate method nor the UV-catalyzed method undergo user calibration for the carbon measurements; the calibration of the instrumentation is established by the manufacturer. Both methods verify instrument response by the use of check standards. The hot persulfate method uses the check standards to adjust the reported result for the average standard recovery. The recoveries demonstrated by the hot persulfate method ranged from 90.5% to 97.1% for TIC and 87% to 96.6% for TOC. Although two TOC standards recovered at less than the 90% recovery required by the TCP, the average TOC recovery used to correct the analytical results was above 90% for each analytical run. Since the analytical results are corrected for the

average standard recovery, the demonstrated recovery should not affect the quality of the reported results.

The RPD between duplicates is used to evaluate the precision of the analytical laboratory sample processing and analysis. The majority of the RPD values for sludges (analyzed by the hot persulfate method) meet the TCP 10% criteria. However, a few sludge samples and both drainable liquid samples (analyzed by the UV-catalyzed method) do demonstrate very poor RPDs (i.e., up to 58% for the sludges and 75% for drainable liquids). The poor RPDs for the sludges are attributed primarily to the inconsistency of the sample material and/or the inability to obtain fully representative analytical samples. In the case of TOC for the UV-catalyzed method, the poor RPDs are attributed to the small difference between the TC and TIC sample concentrations.

The accuracy of the TOC/TIC/TC results is estimated by the matrix spike recovery. Low recoveries on matrix spikes provide indications of matrix interferences which may adversely affect the reported analytical results. The hot persulfate TOC/TIC/TC results show excellent recovery for Segment 1, but very low recovery for Quarter Segment 4A. Although the TOC/TIC are very high in Quarter Segment 4A, the TOC/TIC spikes added were 25% above the TOC/TIC measured in the sample, which should have provided adequate spike for determining recovery. Considering this and the fact that the RPD for Quarter Segment 4A is very good, suggests that the low spike recovery is matrix-related (perhaps a high salt content), and that the carbon values reported may be bias low. The UV-catalyzed TOC/TIC/TC sample spike recoveries were quite poor for both TC and TIC, recovering at 130% and 69%, respectively. Since the blank spike recoveries are within the 90%-110% acceptance criteria, the poor spike recoveries on the drainable liquids are attributed to poor analytical reproducibility (i.e., 28% RPD on TIC) and matrix interferences (e.g., possible residual suspended solids after filtering).

The processing blank for the drainable liquid samples analyzed by the UV-catalyzed method provides information on the contamination potential introduced during the dilution process. A very slight TC blank concentration

was observed. However, it has no impact on the reported results, since the TC concentration in the samples is very high compared to the blank concentration.

SECTION 3

RADIOCHEMISTRY

THIS PAGE INTENTIONALLY
LEFT BLANK

Radiochemical Analysis

Radiochemical analyses were performed on fusion preparations of samples from Segments 1, 2A, 2D, 3A, 4A, 4B, 4C, and 4D and on acid digestions of the drainable liquids from Segments 2 and 3. In all cases a sample and a duplicate were analyzed; for each batch of samples, a hot cell blank was also analyzed. The fused samples were analyzed for total alpha, total beta, ^{90}Sr, $^{238,239+240}Pu$, uranium, and by gamma energy analysis. The drainable liquids were only analyzed for total alpha, total beta, and by gamma energy analysis. Initially, all of the fusion samples were obtained from the potassium hydroxide fusion preparation. Due to contamination problems noted with one of the blanks for this fusion, analyses were also performed for two samples and a blank prepared by sodium peroxide fusions.

Results for all radiochemical analysis performed on Tank BY-108 are presented in Tables 3-1 through 3-4. It should be noted that both the relative percent difference (RPD) and mean difference (MD) have been calculated. The MD takes individual sample uncertainty into account. Thus, a mean difference less than 1.96 indicates that there is 95% confidence that the sample and duplicate results are in agreement. When the RPD fails but the MD meets this criteria (<1.96) sample precision should be considered acceptable.

Total Alpha Analyses -- Table 3-1: Total alpha analyses were initially performed according to procedures PNL-ALO-420/421. In this method, small aliquots are dried on counting disks and counted using Ludlum scintillation counters. Two problems were noted leading to further analyses. First, the samples for this tank have a very high beta-gamma/alpha ratio. Attempts to make counting plates with reasonable levels of alpha activity resulted in unacceptably high levels of beta-gamma activity. Consequently, samples had to be further diluted resulting in very weak alpha activity and prolonged counting times of 4-8 hours. It was further observed that the counting plates contained residual solids, suggesting probable alpha attenuation due to the residual mass. Although the mass loading due to the sample material was very low (typically < 0.1 mg), solids loading from the fusion flux may have resulted in an alpha absorption effect. Selected samples were reanalyzed

using about half the amount of material in an attempt to determine potential mass absorption effects. Since these tests indicated that mass absorption of the alphas was indeed a problem, most of the samples were reanalyzed with and without a matrix spike of a ^{239}Pu standard. The net ^{239}Pu count rate data was then averaged resulting in an average mass absorption correction of 0.722 ± 20%. This factor was applied uniformly to all data for fused samples. No correction was applied to the drainable liquid data since these samples were prepared by acid digestion (no additional salt flux).

The large relative uncertainty for the mass absorption correction is attributable to the loading density on the 1-inch counting plates. This uncertainty more fairly represents the "gross" nature of the alpha measurement from a complex matrix. At the low alpha levels detected in these samples, a 20% uncertainty should be inconsequential. Isotope-specific analyses are needed to obtain more accurate alpha data.

As a check on the quality of the data, an attempt was made to compare the total alpha results with the sum of the Pu and Am measurements. Unfortunately, ^{241}Am data are not available for most of the samples since Am analyses were not requested. Although ^{241}Am can also be detected by gamma energy analysis, positive results were only obtained for three samples. The compton scattering background from the higher-energy, high-activity ^{137}Cs precludes direct gamma measurement of ^{241}Am in the rest of the samples. Hence, there are only three cases where a direct comparison of total alpha and Pu/Am data can be made. In these cases, results are in reasonable agreement; in the other cases it appears that the results are consistent, but not conclusive.

The general agreement between samples and duplicates is poor; however, the uncertainties are quite high for the total alpha data. As discussed below, sample contamination is clearly evident in some of the samples accounting for the high RPD values seen with samples for Segments 1 and 2.

It is also evident that hot cell blanks for the first hot cell preparation batch (95-07941-HCB and 95-07942-H3) indicate significant

contamination above the required level of 5% of the sample activity; however, this was not a problem for subsequent hot cell preparation blanks. Sample 95-07942-H3 is the worst case with alpha contamination higher than the sample, but less than the sample duplicate. Consequently, analyses were rerun on the sodium peroxide hot cell fusion preparation, where samples were available. (Such samples have an "N" label, rather than a "H.") The hot cell blank for this preparation (95-07941-N3) indicated no detectable alpha activity. Unfortunately, such samples were not available for sample 95-07942; however, total alpha results for samples 95-07943 and 95-07944 are slightly less than the original fusion preparation results, suggesting that some alpha contamination may be present for these samples.

Plutonium Analyses -- Table 3-1: Plutonium separations and alpha energy analyses were performed for all of the fusion samples following procedures PNL-ALO-423/422. Samples were run in three batches, as indicated in the tables, and standard and matrix spike recoveries for ^{239}Pu were excellent for all three batches. Agreement between samples and duplicates is poor for the first hot cell preparation batch, although agreement is better for the subsequent hot cell preparation batches.

The first hot cell preparation blanks (especially 95-07942-H3) indicate significant plutonium contamination, falling between the sample and duplicate for ^{238}Pu and exceeding both the sample and duplicate for $^{239+240}Pu$. It is further interesting to note that the hot cell contamination appears to be predominately ^{238}Pu whereas the samples themselves are predominately $^{239+240}Pu$. This ratio can thus also be used to gauge the extent of the hot cell contamination. The sodium peroxide hot cell prep blanks indicate a much lower level of contamination and, as with the total alpha, the Pu levels are also lower than the first contaminated hot cell prep samples. Although the hot cell blanks still exceed the 5% criteria even for the sodium peroxide fusion, the absolute alpha activity levels are quite low (< 1 nCi/g). Hence, it might be concluded that it is difficult to measure such low levels of alpha activity for samples prepared in our hot cells due to facility contamination.

Most of the Pu activity appears to be concentrated in Segment 4 where Pu levels are typically 100 times higher than for the other segments. This trend is also mirrored in the total alpha data, although Segment 1 may indicate some contamination problems due to the high 238/239+240 Pu ratio. Hence, although contamination problems are evident for both total alpha and plutonium measurements in Segments 1 and 2, these segments appear to contain only about 1% of the alpha activity contained in the Core 99.

Total Beta Analyses -- Table 3-2: Total beta analyses were performed on all samples using procedures PNL-ALO-430/431. In this method, small aliquots of the prepared samples are dried on counting plates and counted using beta gas flow proportional counters. Due to the much longer range of beta particles, there was no concern regarding mass absorption effects as seen with the total alpha measurements.

Most of the total beta measurements show reasonable agreement between the sample and duplicate except for sample 95-07946. The reasons for this difference are not understood, but may be due to sample heterogeneity, as will be discussed later.

As with the alpha and plutonium data, the first hot cell prep batch also shows significant beta contamination, especially for the blank 95-07942-H3. The sodium peroxide fusion blank shows no beta contamination; however, the total beta results for these samples are in good agreement with the potassium hydroxide fusion samples.

The total beta activity results are in good agreement with the sum of the $^{90}Sr/^{90}Y$ and ^{137}Cs data, as discussed later.

^{90}Sr Analyses -- Table 3-2: ^{90}Sr separations were performed for all of the fusion samples following procedure PNL-ALO-433/431. In this method, ^{90}Sr is separated, dried on counting plates, and counted using beta gas flow proportional counters. A count is taken as soon as possible after the

separation and about three days later to measure the ingrowth of the ^{90}Y daughter activity.

The agreement between samples and duplicates is acceptable except for samples 95-07944 and 95-07946. The first hot cell fusion preparation batch again shows significant ^{90}Sr contamination in the blank 95-07942-H3, which is significantly higher than many of the samples. This may account for the high RPD value seen for sample 95-07944. The high RPD for sample 95-07946 may be attributable to sample heterogeneity, as discussed later.

Gamma Energy Analyses -- Table 3-3: Gamma energy analyses were performed for all samples using procedure PNL-ALO-450. Ten milliliters of the sampled prepared in the hot cell were directly counted using germanium gamma detectors. In all cases, the ^{137}Cs activity completely dominated the gamma measurements. ^{241}Am was detected in three samples and $^{154,155}Eu$ was seen in four samples. ^{60}Co was seen in some samples; however, the data are quite erratic suggesting that this might be due to hot cell contamination. ^{40}K was also detected; however, this was not reported since this activity may be due to naturally occurring ^{40}K contained in the potassium hydroxide fusion prep material.

The agreement between samples and duplicates for ^{137}Cs is generally quite good, except for sample 95-07942 (RPD = 32%) where there is known to be significant hot cell contamination, as evidenced in the blank 95-07942-H3 and discussed previously for other analyses. The sodium peroxide hot cell blank indicates no contamination and the samples prepared by this method are in good agreement with the ^{137}Cs results for the potassium hydroxide fusion.

As a check on the quality of the data, the total beta activities were compared to the sum of twice the ^{90}Sr (to account for the ^{90}Y daughter) results plus the ^{137}Cs data. Although each beta emitter has a different efficiency for detection, $^{90}Sr/^{90}Y$ and ^{137}Cs have nearly identical beta counting efficiencies. The good agreement between the total beta activity and the $^{90}Sr/^{90}Y$ and ^{137}Cs activity sum indicates that these three isotopes account for nearly all of the measured beta activity.

Sample 95-07946 appears to show significant heterogeneity effects between the sample and duplicate for both the total beta, ^{90}Sr, and ^{137}Cs results. All three results have high RPD values; however, the total beta activity is in excellent agreement with the sum of the $^{90}Sr/^{90}Y$ and ^{137}Cs activities. This suggests that a real difference between the sample and duplicate exist and may have occurred during the hot cell preparation.

Uranium Analyses -- Table 3-4: Total uranium measurements were performed for all of the fused samples following procedure PNL-ALO-445. In this method, the fluorescence induced by a laser is measured with the sample in solution both before and after the addition of a uranium standard (method of standard addition).

Agreement between samples and duplicates is generally acceptable except for samples 95-07942 where hot cell contamination is quite evident, as discussed previously. Unfortunately, the sodium peroxide hot cell blank also indicates similar levels of uranium contamination. However, it should also be pointed out that most of the uranium is contained in Segment 4 and that the uranium concentrations are at least a factor of 100 times lower in the other segments. As with the alpha problem, this may again be pointing to difficulties in detecting low levels of uranium in samples prepared in our hot cells.

Also, it should be noted that the uranium results from the ICP (see Tables 2-1c and 2-1d) track very favorably with the fluorescence uranium result.
